
CLIMASP Course Syllabi and Course Modules

Deliverable Number: D4.2
Contractual Date of Delivery: 30/009/2014
Actual Date of Delivery: 10/10/2014
Title of Deliverable: CLIMASP course syllabi and course modules
Work-Package contributing to the Deliverable: WP4
Dissemination Level: IL
Nature of the Deliverable: R
Author(s): Nelly Kostoulas and Vassilios Makrakis University of Crete and
Marlene Mader Leuphana University (ULG)
Version Date Comments & Status Distribution 25/09/2014 initial version
Draft 30/09/2014 comments from all project team

Project Funding
Project Full Title**: Developing an Interdisciplinary Minor in Climate Change and Sustainability Policy**
Project Acronym: **CLIMASP**
Project number: **543879 TEMPUS-1-2013-1-GR-TEMPUS-JPCR**
EC Programme: **TEMPUS**
Agreement number: **JPCR (2013-2013-5043/001-001)**
Start date: **1st December, 2013**
Duration: **3 years**
Budget: **1 246 635 €**

Executive Summary

The CLIMASP course curriculum development started in June, 2015. Every Working Group led by the institutional design team in each partner university proceed to the development of 24-30 course syllabi and course modules in the CLIMASP three concentration areas on the basis of stakeholders' inputs. The courses to be revised were identified and described in the previous deliverable. The methodological approach for the development was based on modularity, including the following steps: Formulate goal statements indicating the principle(s)/concept(s) at the completion of each course. Select the primary content base which will serve as the catalyst for content and instruction. Identify events, discoveries, and writings within other disciplines that relate to the primary content base in a meaningful way. Determine the key points of intersection between the disciplines which correspond to the set

instructional objectives. Formulate instructional/learning objectives, using the SMART method (specific, measurable, achievable, realistic, timed). Identify the necessary prerequisite knowledge that students must possess in each CLIMASP concentration area. The modular characteristic of the course modules provided flexibility that enabled adapting the different course modules to a wide range of academic requirement and enabled each partner institution to tailor CLIMASP according to its specific needs. As pointed in the previous deliverable, 240-300 course modules were identified to be developed in Arabic and English across the 10 partner universities. The inter-university design team in cooperation with the institutional design teams will define the minimum requirements that undergraduate students have to fulfil in order to qualify for the supplementary interdisciplinary CLIMASP minor in addition to their major disciplinary degree.

For the CLIMASP course syllabi/modules development, specific guidelines were given, especially the CLIMASP Toolkit and training sessions were carried out during the implementation phase. The courses developed are enlisted in the following section.

Course Description/Overview

The present course is intended to raise the students' awareness. It introduces students to the fundamentals of air pollution with a background on historical perspective on air pollution and a commentary on current air quality policies and standards It focuses on understanding the atmospheric phenomena and the destruction of natural balance, including noise pollution, inevitably brought about by human activities, It provides an overview of the history of air pollution, air pollutants, effect of air pollution on climate, air quality management, and indoor air pollution. It does so through tackling the following aspects: 1) natural sources of air pollution; 2) anthropogenic sources of air pollution; 3) airborne particulate matter; 4) size distribution of atmospheric aerosols; 5) negative impacts; 6) global warming; 7) air pollution act; 8) atmospheric stability; 9) thermal invasion; 10) modelling of air pollution and control devices. That is they are asked to read and summarize articles on air pollution and its sources. They are invited to discuss effect of air pollution on climate at local, national and international scales. In short, the course provides an appropriate chance for the students to get the minimum knowledge of major air pollutants; their sources and their effects (environmental, economic and health) and how emissions are estimated from road traffic and industrial sources.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of air pollution; b) to raise awareness of the learners about effects of air pollution on climate; c) help learners use traditional and electronic tools to identify the risks the different types of air pollutants; and d) to highlight the importance of renewable energy resources as clean and safe resources to the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

8. Discuss the effects of air pollution on vegetation, soils, fresh water, and buildings.
9. Identify the characteristics of air pollution, relevant regulations, and control technologies.
10. Identify the different types of air pollutants.
11. Anticipate possible future environmental change and identify possible development consequences.

12. Estimate air pollution concentrations as a function of emission, meteorology, topography and the built environment for a combination of road and industrial sources.
13. Disseminate emission and air quality results to a wider audience.
14. Estimate health impact of changes in air pollution

Required Course Texts and Materials

Hands-out prepared by the instructor for the

- Environmental pollution and control , Ann Arbor, 1982.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		History of air pollution;
2		Current policies, standards and objectives;
3		Sources of air pollution;
4		Effects of major air pollutants;
6		Monitoring of emissions and air pollutants in ambient air;
7		Modelling and control of emission from road transport;
8		Modelling and control of emission from industrial sources;
9		Chemistry and dispersion of air pollution in atmosphere;
10		Air pollution modelling approaches;
11		Commercial air quality models (ADMS, USEPA models;
12		Indoor air pollution;
13		Personal exposure to air pollution

Course Description/Overview

This course examines the dynamics of the biosphere through the study of the natural state of ecosystems. Emphasis is on the explanation of the relationships between organisms and their environment and on managing human and water resources. The application of physics to the study of the atmosphere attempts to model Earth's atmosphere and the atmospheres of the other planets using fluid flow equations, chemical models, radiation balancing, and energy transfer processes in the atmosphere (as well as how these tie into other systems such as the oceans). In order to model weather systems, atmospheric physicists employ elements of scattering theory, wave propagation models, cloud physics, statistical mechanics and spatial statistics which are highly mathematical and related to physics. It has close links to meteorology and climatology and also covers the design and construction of instruments for studying the atmosphere and the interpretation of the data they provide, including remote sensing instruments.

Course Learning Objectives

The overreaching goals of this course are: a) to examines of the dynamics of the biosphere through the study of the natural state of ecosystems; b) to provide the basic knowledge of environmental and resources studies; c) to raise awareness of the learners about the need to examine the relationships between organisms and their environment and managing human and water resources.; d) to model Earth's atmosphere and the atmospheres of the other planets using fluid flow equations, chemical models, radiation balancing, and energy transfer processes in the atmosphere (as well as how these tie into other systems such as the oceans).; e) to employ elements of scattering theory, wave propagation models, cloud physics, statistical mechanics and spatial statistics which are highly mathematical and related to physics.; f) to examine the links to meteorology and climatology; g) and also covers the design and construction of instruments for studying the atmosphere and the interpretation of the data they provide, including remote sensing instruments.

Course Objectives Learning Outcomes

Upon successful completion of this course, students will be able to:

9. Describe the biosphere through the study of the natural state of ecosystems, the relationships between organisms and their environment and managing human and water resources.
10. Explain the relationships between organisms and their environment and managing human and water resources.

11. Question the relationships between Earth's atmosphere and the atmospheres of the other planets using fluid flow equations, chemical models, radiation balancing, and energy transfer processes in the atmosphere (as well as how these tie into other systems such as the oceans).
12. Anticipate possible future environmental changes and possible development consequences.
13. Understand scattering theory, wave propagation models, cloud physics, statistical mechanics and spatial statistics which are highly mathematical and related to physics
14. Demonstrate the knowledge and understanding of the links of atmospheric physics to meteorology and climatology.
15. Use the different tools and equipments to collect data needed for studying the atmosphere and atmospheric changes,
16. Anticipate the effect of atmosphere on climate change.

Course Description/Overview

This course provides an interdisciplinary survey of environmental and resources studies, examining its physical, chemical, biological, political and economic dimensions. Emphasis will be on concepts and methods that can be applied to the analysis and understanding of a range of specific environmental problems. A survey of environmental systems, human interactions with them and the use of distinctive areas on Earth are introduced. Emphasis is on environmental concepts, problems, and research methods in Egypt. This course examines the dynamics of the biosphere through the study of the natural state of ecosystems. Emphasis is on the explanation of the relationships between organisms and their environment and on managing human and water resources. In short, the course provides an appropriate chance for the students to get the minimum knowledge of safe environment.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of environmental and resources studies; b) to raise awareness of the learners about the need to examine physical, chemical, biological, political and economic dimensions of environment; c) emphasize on concepts and methods that can be applied to the analysis and understanding of a range of specific environmental problems; d) help learners to conduct survey of environmental systems, human interactions with them and the use of distinctive areas on Earth; e) use traditional and electronic tools to identify the risks of the degradation of environment; and f) to highlight the importance of the biosphere through the study of the natural state of ecosystems.

Course Objectives Learning Outcomes

Upon successful completion of this course, students will be able to:

11. Discuss the basic terminology and core concepts of environmental sciences.
12. Identify the physical, chemical, biological, political and economic dimensions of environment.
13. Conduct survey of environmental systems, human interactions with them and the use of distinctive areas on Earth.

14. Identify the risks of the degradation of environment.
15. Question the relation between sustainable development and clean environment.
16. Anticipate possible future environmental change and possible development consequences.
17. Appreciate the positive impacts of reasonable use of environmental resources.
18. Demonstrate knowledge and understanding of relationship between poverty and unsafe environment.
19. Use the different tools and equipments to conduct survey of environmental systems, human interactions with them and the use of distinctive areas on Earth.
20. Appreciate the importance of the biosphere through the study of the natural state of ecosystems.

Description of the Environmental Psychology Course

List of cognitive concepts

Basic competencies	Psychological Traits	Skills	Knowledge
Explains the causes of environmental pollution	Balances between psychological bases and entrances to the interpretation of the relationship between behavior and environment	Uses the Correlation Method	Clarifies the concept of the environment
Uses the Internet and global networks in search for programs of the most important environmental education	Concludes the goals of environmental Education	Displays the causal relationship within the framework of the experimental method	Defines the concept of environmental psychology
Acquires skills of individual's positive personal behavior	Mentions examples of types of pollution in the environment	Masters methods of collecting information and data about the	States the concept of environmental education

		phenomenon studied	
Collects reports and information about people's responses to environmental conditions	Suggests a roadmap for Environmental Action to try to limit environmental pollution	Builds projective tests and measurements	Mentions the concept of environmental education
Communicates with peers to complete assigned work.	Mentions evidence on the existence of pollution in the surroundings	Masters writing self-reports	Explains the concept of perception
Tackles self-dependence in writing research on the role of community in the reduction of environmental pollution	Concludes the negative impact on health, resulting from water pollution	Identifies the causes that lead to the occurrence or non-occurrence of a phenomenon in the context of the Descriptive Method	Enumerates the concept of environmental perception
Acquires skills of positive behavior towards the environment	Discusses ways of changing psychological attitudes toward environment	Plans to explain how difficult it is to apply the scientific method and experimental control	Clarifies principles of learning

Draws a comprehensive blueprint for the most important types of environmental pollution that resulted in climatic changes in the world	Proposes new methods to help parents raise children properly	Criticize the conduct of laboratory experiments in environmental psychology	Mentions the theoretical bases of the interpretation of the relationship between the environment and behavior

* Definition of the course:
- Course No.:

- Course Title: Environmental Psychology
- Place:
- Timing of the lectures:
- Prerequisite:
- College Website:

*** Brief description of the course: (about 15 lines)**

The course of environmental psychology includes the following:
Chapter one: includes definition of environmental psychology, its topics, scientific methods, and the necessity that led to its emergence. Chapter two depends on developing positive behavior towards the environment and all fields in which we can improve human behavior regarding environmental issues. This means a paramount necessity for the existence of the so-called environmental instruction and environmental education in addition to causes that led to the failure of all environmental educational programs in Arab societies. The proof of this is the suffering of the environment around us from many problems, including problems of pollution, wastes, water and energy saving. In chapter three, we can recognize the psychology of environment, study its psychological and health effects on human society, and know the sources and causes of environmental pollution. Chapter four deals with ways to cure problems of the environment through the role the community and university play in the development and improvement of environment in the fight against pollution. Chapter five contains presentation of the theoretical foundations and introductions that constitute the relationship between the environment and human behavior, the formation of environmental perception and factors that affect this perception, environmental trends, and the role of the principles of learning in their composition and how they are measured.

*** Learning outcomes included in the Content; derived from the list of concepts:**

- Mention the theoretical foundations for the interpretation of the relationship between the environment and behavior.
- Explain the causes of environmental pollution.
- Acquire the skills of positive behavior towards the environment.

- Draw a comprehensive blueprint for the most serious types of pollution in the environment, which resulted in climatic changes in the world.

- Discuss ways of changing psychological attitudes toward environment.

*** Assignments and methods of Assessment:**

- Assessment will be graded on a scale of zero to 10 marks, and the degree of success starts at 50% or 60%
- Assessment Policy

Assignments	80

Tests	----
Attendance and participation	20
Total	100

*** Policies adopted in teaching the course:**

- Delays in the delivery of assignments?!
- Methods or **(policies)** of classroom management:
- Dealing with learners with disabilities:

*** Timetable of lectures (lessons):**

Week	Date	Subject
One & Two		Environmental Psychology: definition, theme and methods
Three & Four		The development of positive behavior towards the environment
Five & Six		Psychology of the environment, and its health and psychological effects
Seven & Eight		Ways to solve environmental problems

Nine & Ten		Theoretical bases that explain the relationship between environment and behavioral - environmental perception
Eleven & Twelve		Environmental attitudes
Thirteen & fourteen		Suggested activities

*** Guiding model for course modules**

Module I: Environmental Psychology: definition, themes, and methods

- The basic concepts of the module: concept of the environment - concept of environmental psychology
- A brief description of the Module: definition of the environment and its types, topics of environmental psychology and necessity that led to its emergence, curricula used in it, and what characterizes it
- Module goal: is to identify the environment and its types, and environmental psychology as a science that should be studied
- Learning Outcomes: It is expected that the student will be, after the completion of the lesson, able to:

(A) state the concept of environmental psychology.
(B) discuss the necessity that led to the emergence of environmental psychology.
(C) clarify the curricula used in the study of environmental psychology with no errors.

*** Activities**

1. Visiting the Association and the Council of Environmental Protection, and attempting to execute their objectives
2. Designing or developing a program for environmental awareness

3 Picking pictures out of newspapers and magazines, and analyzing their content, then comparing among them in terms of their expected impact
4. Coming up with the concept of each of these four words: information - fact - law - theory
5. Choosing one of the theories of psychology, and the stages of concluding it.
6. Student presents: what s/he feels, and how s/he behaves when s/he faces one of the situations mentioned in the introductions assigned for the interpretation of the relationship between environment and behavior, for his/her peers.
7. A student presents one of the situations in which s/he feels adapted, and the ones in which s/he lacks his/her ability, and compares between the causes of each feeling.
8 What is the relationship among the following processes: sensation, attention, perception?
9 In one situation, different individuals develop different perceptions. Explain via environmental situations you have experienced?
10 Students' choice of two environmentally different residential areas and recording the reaction of the population at the time of the processes of repair in their streets for a relatively long period; perspective of the student to express his/her opinion is to be taken into account.
11. Posing an open-ended question on at least ten members whether they are aware of the dangers threatening the environment in which they are present
12 Making a comparison between the four different definitions of psychological attitude, using a number of references
13. The attitude of student may change towards an a particular environmental or social issue, and then s/he identifies the factors that were behind the change.
14. Concluding the relationship between programs that some candidates present and voters' attitudes in certain areas.
15. Thinking in a certain way to get to know the attitudes of population of the local environment towards a large project will lead to a comprehensive environmental change.

Course Description/Overview

The present course is intended to raise the students' awareness of energy consumption and environmental pollution. It presents a discussion of the scientific principles of energy and thermodynamics, and the current and future prospects for energy production, conversion, storage and transmission. It also discusses the availability of solar energy, wind energy, hydroelectric energy and nuclear energy. It introduces students to the benefits of using clean energy resources. It does so through tackling the following aspects: 1) environmental pollution energy resources; 2) impact of energy consumption on environment; 3); 4) clean energy resources and climate change; 5) air, thermal and nuclear pollution; and 6) energy consumption, current and future global climate change. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on renewable energy resources. They are invited to discuss impacts of energy resources on environment at local, national and international scales.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of energy production, conversion, storage and transmission; b) to raise awareness of the learners about the need to explore clean energy resources to achieve the goals of sustainable development; c) help learners use traditional and electronic tools to identify the risks of pollution a result of increasing consumption of petroleum and gas; and d) to highlight the importance of controlling energy resources consumption as clean and safe resources to the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Discuss the basic terminology and core concepts of energy.
2. Identify the impacts of traditional energy resources on environment.
3. Compare the advantages and disadvantages of different energy resources.
4. Understand the basic principles of production, conversion, storage and transmission of energy.

5. Question the relation between sustainable development and the use of energy resources.
6. Identify the different types of pollution sources.
7. Anticipate possible future environmental change and identify possible development consequences.
8. Appreciate the positive impacts of utilizing renewable energy resources on the environment.
9. Demonstrate knowledge and understanding of relationship between poverty, environment, climate change, and the insufficient supply of energy.
10. Use the different tools and equipments of pollution measurements.
11. Recognize the availability of solar, wind, hydroelectric and nuclear energy resources in Egypt.

Course Website(s)

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Energy Resources and Supply.
3		Renewable energies and clean technologies.
		Solar Energy, solar cells, solar thermal heating systems, and electricity generation.
		Tidal and Hydro as renewable energy resources.
		Renewable Energy Integration and Energy Efficiency in the Built Environment
		Research Design Methods.

Environmental Studies

Course Description/Overview

The present course aims to equip students to integrate an understanding of the environment with other academic fields and their personal life. It prepares students for meaningful lifetime engagement with the environmental challenges that are facing society. This course emphasizes active, interdisciplinary learning with the overall objective of instilling the necessary skills to conserve biodiversity and integrate the principles of sustainability with respect to management of complex environmental systems. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on environmental issues.

Course Learning Objectives

The overarching goals of this course are: a) to develop an awareness about environmental issues; b) to train students to locate and comprehend relationships between the natural, social and cultural environment; and c) nurture the curiosity and creativity of the student particularly in relation to the natural environment (including artifacts and people);

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

5. Develop an understanding based on observation and illustration, drawn from lived experiences and physical, biological, social and cultural aspects of life, rather than abstractions;

6. Create cognitive capacity and resourcefulness to make the child curious about social phenomena, starting with the family and moving on to wider spaces;

7. Engage the child in exploratory and hands-on activities to acquire basic cognitive and psychomotor skills through observation, classification, inference, etc.;

8. Critically address gender concerns and issues of marginalisation and oppression with values of equality and justice, and respect for human dignity and rights

Faculty Web Page:

Course Description/Overview

Anthropology is interested in studying human, like other human sciences, which are closely linked to the humanitarian community in which they exist, they reflect its core values prevailing in it, and then help the community improvement and development, the study of environmental and climatic changes has become one of the social sciences and humanities concerns, which including the Anthropology, some of the recent trends in environmental studies, anthropological have been occurred , and these trends study the human adaptive with global environmental changes and developing solutions to many of the environmental problems, and this course shows the nature of the relationship between Anthropology and climate change as the results for man's behavior towards his environment, the course has been divided into five sections: the first section entitled "what is Anthropology," this section deals with the concept of Anthropology, and its objectives, and scope, and its relations to other sciences, the second section entitled "environmental Education", and deals with the concept of environmental education, its goals, and the process of environmental awareness, the third section titled "global climate changes, current and future," it deals with the most important global climate changes, and then the fourth section entitled "The harms of climate changes," it deals with harms of climatic changes and their impact on human health and the physical and natural environment, and finally the fifth section entitled "Mechanisms of the development of environmental awareness

among members of the community" by clarifying the role of formal and informal educational institutions in achieving and reduce environmental harms from climate changes.

Course Learning Objectives

The overarching goals of this course are:
1- Identify the communities cultures and behaviors towards climate changes.
2 Monitor the most important risks of climate changes on the environment and humans.
3 Raise the level of community awareness towards the dangers and harms of climate changes.
4 providing a critical study of the individuals behaviors to various climatic changes.
5. Activating the role of formal and informal educational institutions, in achieving and reduce environmental harms from climate change.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Define the concept of Anthropology and its most important fields and objectives.
2. Clarify the relationship between Anthropology and other sciences.
3. Comparison between the fields of anthropological studies.
4. Show the awareness of global climate changes.
5. Benefit from the programs of educational institutions in modifying the behavior of individuals towards the environment.
6. Develop proposals for how to deal with global climate changes.

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		The concept of Anthropology- inception - objectives - fields
3		Relationship between Anthropology and other scienc
4		The concept of environmental education and its goals

5		The Current and Future Global Climate Changes
6		The Harms of Climate Changes on the Natural Environment
7		The Harms of Climate Changes on the physical environment
8		The Harms of Climate Changes on human health
9		The role of formal educational institutions in raising awareness of the climate changes harms and reduce it.
10		The role of informal educational institutions in raising awareness of the climate changes harms and reduce it.
11		The role of technology in reducing the harms of climate changes
12		Activation of social networking sites to modify some of the behaviors that cause climate changes through action or animated videos and other.

APENDIX II: The CLIMASP Course Modules Template Example

Course	**Environmental Education Anthropology**
Module 1	Curriculum: What is Anthropology
Key Concepts	Anthropology and its goals , fields and types
Overview	This Module appears Introduction to Anthropology and its importance in the study of the cultural history of human society, and the most important areas that concerned and its relationship to other sciences.
Aim	The main objective of this Module to know the nature of science Anthropology and its relationship to human behaviors, which is the main reason for the occurrence of climatic changes.
Learning Outcomes	At the end of this module learners will be able to: Identify the concept and the nature of Anthropology. Compare between the different areas of anthropology. Clarify the relationship of Anthropology and other sciences.
Units	Unit 1.1 Anthropology (concept, objectives and fields) Unit 1.2: The Relationship between Anthropology and of

	sciences.
Readings	Fulya Damla Kentli (2009). Comparison of hidden curriculum theories. European Journal of Educational Studies 1 (2) 83-88. Grundy, S. (1987) *Curriculum: Product or Praxis*, Lewes: Falmer Aristotle (1976) *The Nicomachean Ethics* ('Ethics'), Harmondsworth: Penguin. Chapter 3: Curriculum Theory. http://www.sagepub.com/upm-data/6042_Chapter_3_Glatthorn_(Sage)_I_Proof_2.pdf Watson, D. (2001). Pedagogy before technology: Re-thinking the relationship between ICT and teaching. Education and Information Technologies 6:4, 251–266
Activity	Writing an essay about the role of Anthropology in studying the human culture throughout the ages.
Module 2	Environmental Education
Key Concepts	Environmental Education- population
Overview	This Module appears the nature of environmental education and its most important fields, and objectives, and how to use technology

	in the preservation of the environment.
Aim	The objective of this Module is knowing the concept of environmental education and its objectives, and to clarify the impact of population activities on the environment, as well as to provide students with some practices associated with environmental education, and how to use technology to preserve them.
Learning Outcomes	• At the end of this module learners will be able to: • Define the concept of environmental education and goals. • Knowing the global efforts towards the preservation of the environment. • Optimize the use of technology to solve environmental problems. • Diagnosis of the current situation of environmental pollution.
Units	Unit 2.1: Environmental Education (concept - targets). Unit 2.2: The role of technology in preserving the environment. Unit 2.3: The global efforts to preserve the environment
Readings	Magdy Aziz Ibrahim: environmental education in the curricula of public education, the Anglo-Egyptian Library, Cairo, 2001.
Activity	**Overview**
	1-View documentary film about how to recycle waste. 2-Implementation workshops on how to recycle waste

	3-Conducting field research on the most important aspects of environmental pollution in the local community. 4-Implementation of a forestation campaigns for the local community to reduce air pollution.
Module 3	Climate changes
Key Concepts	Climate changes
Overview	This Module appears the nature of climate changes and the most important forms and causes, and the role of human behavior in its occurrence.
Aim	This module aims at knowing the forms of climate changes and its most important reasons, and the most important international practices relating to the policies of adaptation to climate changes and mitigation.
Learning Outcomes	At the end of this module learners will be able to: • Identify the causes of climate changes. • Compare the best international practices on adaptation to climate changes and mitigation.

Units	Unit 3.1: Climate change: forms and causes Unit 3.2: The International practices to adapt to climate change and reduce its impact.
Readings	Abdul Wahab Bin Rajab Hashim bin Sadiq: Environmental Crimes and ways of confrontation, the Center for Studies and Research, Naif Arab University for Security Sciences, Riyadh, 2006.
Activity	Make Atlas illustrates the most important of climate changes forms, its causes and the most affected areas by them.
Module 4	The harms of climate changes
Key Concepts	harms of climate changes
Overview	This Module appears the harms of climate changes on the physical and natural environment and human health, and revenge on the countries' economies and food security.
Aim	The overriding aim of this module is to study the impact of climate changes on human and natural and physical environment.
Learning Outcomes	At the end of this module learners will be able to: • Identify the harms of climate changes. • Educate communities with the climate changes effects
Units	Unit 3.1: The Harm of climate change on human health. Unit 3.2: The Harm of climate change on physical environment

	Unit 3.3: The Harm of climate change on natural environment
Readings	1- Ahmed Midhat Islam: the problem of environmental pollution era, wrote a series of monthly issued by the National Council for Culture, Arts and Letters, the world of knowledge, Kuwait, 1990. 2- Rachid Salmi: the impact of environmental pollution in economic development in Algeria, Ph.D. thesis, Faculty of Economic Sciences of management, University of Algiers 2006. 3- Mohamed Mahmoud Sergani: liability for environmental damage, a comparative study between international law and Islamic law, Umm Al-Qura University Journal of Educational Sciences, social, humanitarian, first edition, Volume XIII, presses Umm Al Qura University, Mecca, in January 2001
Activity	**Overview**
	Make field research on the most important harms of climate changes in the community.
Module 5	Mechanisms for the development of environmental awareness among members of the community
Key Concepts	environmental awareness

Overview	This Module appears the mechanisms development of environmental awareness to members of the community and reduce harms of the climate changes through activating the role of formal educational institutions (schools and universities) and informal (family - the media - civil society organizations).
Aim	The overriding aim of this module is to raise the level of environmental awareness among students is to help them adapt to climate change and the reduction of increasing severity.
Learning Outcomes	At the end of this module learners will be able to: • Define the role of formal and informal educational institutions, in developing the environmental awareness among members of the community. • practice patterns behaviors aimed at adapting to climate change and work on mitigation
Units	Unit 5.1: - The role of formal educational institutions in limiting the harms of climate changes. Unit 5.2: The role of informal educational institutions in limiting the harms of climate changes.
Readings	Najib Saab: the environment in the Arab media, the first Arab Media Forum for Environment and Sustainable Development,

	Cairo, 2006.
Activity	**Overview**
	Designing educational videos shows the harms of climate changes and how to deal with it. Designing Videos emphasizes the rejection of wrong behaviors that cause climate change.

Course Description/Overview

This course introduces environmental processes and the influence of human activities upon them. Topics include environmental sustainability, ecology and evolution, population growth, natural resources, and a focus on current environmental problems from scientific, social, political, and economic perspectives. Upon completion, students should be able to demonstrate an understanding of environmental interrelationships and of contemporary environmental issues. This course has been approved to satisfy the Comprehensive Articulation Agreement general education core requirement in natural sciences/mathematics.

Course Learning Objectives

The overarching goals of this course are: a) to provide a a broad base of ecosystems biology, environmental microbiology, pollution monitoring, ecotoxicology and environmental biochemistry; b) to raise awareness of the learners about the important aspects of ecosystems and biodiversity, evolution, animal and plant physiology, environmental microbiology and molecular and cellular biology; c) and help learners Prepare for a careers in such field as environmental protection, research, consultancy and ecosystems management.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1) Discuss current environmental issues with an understanding of the basic ecological concepts involved.
2) Use an interdisciplinary approach to analyze environmental issues/problems; show
knowledge of the interplay between the ecological, political, social, cultural and economic aspects of environmental problems.
3) Develop a worldview related to an understanding of current environmental issues and how global problems affect us locally.

4) Demonstrate an understanding of core ecological principles, and define scientific principles and concepts as related to environmental studies and sustainability.
5) Participate in basic field ecology research and experiments according to the scientific method.

Course Resources

Course Website(s)

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Teachers have the potential to be what Giroux and McLaren described as transformative intellectuals who combine scholarly reflection and practice in the service of educating students to be thoughtful, active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the environmental challenges resulting from climate change. It does so through tackling the following logically sequenced seven issues: 1) Environmental awareness; 2)Environmental ethics; 3) Biodiversity and climate change; 4) Climate change adaptation; 5) Urbanization's role in climate change; 6) Water resources and climate change Social learning processes; and 7) Water management and recycling. Issues 5-7 are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is, they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of water resources at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the negative environmental consequences of climate changes – at local, national and international scales - in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for the management of critical environmental issues; and c) use traditional and electronic resources as well as social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

- Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community.
- Analyse methods of ensuring local participation in climate change adaptation.
- Analyze the effects of climate change from both male and female perspectives
- Compare and contrast the impacts of major climatic hazards on livelihoods of the community.
- Comprehend the significance of the climate change problem locally and globally.
- Describe the relationship between human activities and climate change.
- Demonstrate an understanding of the natural carbon cycle.
- Explore solutions to problems that cause climate change.
- Identify ways to reduce the school's carbon footprint.
- Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in.
- Investigate the causes of climate change.
- Propose solutions to climate change issues.
- Understand how human actions are contributing to global environmental change. Course Resources

Course Modules

Course	Environmental Sciences
Module 1	Environment: Ethics and Awareness
Key Concepts	Environmental awareness, Environmental ethics
Overview	Environmental awareness is to understand the fragility of our environment and the importance of its protection. Promoting environmental awareness is an easy way to become an environmental steward and participate in creating a brighter future for our children. To define environmental awareness we must first understand the environmentalist movement. Environmentalism is an ideology that evokes the necessity and responsibility of humans to respect, protect, and preserve the natural world from its anthropogenic (caused by humans) afflictions. Environmental awareness is an integral part of the movement's success. By teaching our students, friends and family that the physical environment is fragile and indispensable. Students need to start fixing the problems that threaten it. Environmental ethics, on the other hand, is the part of environmental philosophy which considers extending the traditional boundaries of ethics from solely including humans to including the non-human world. It exerts influence on a large range of disciplines including environmental law, environmental sociology, ecotheology, ecological economics, ecology and geography. There are many ethical decisions that human beings make with respect to the environment. Throughout this module, students are invited to share and exchange ideas about issues related to : clear cut forests for the sake of human consumption, propagation of species, gasoline powered vehicles, etc.
Aim	The overriding aim of this module is to turn students able to discourse how human actions are contributing to global environmental change.
Learning Outcomes	At the end of this module learners will be able to: • Collect, interpret and present information about strategies to confront

	climate change to a variety of audiences, including other students, parents and the local community. • understand how human actions are contributing to global environmental change.
Units	Unit 1.1: Environmental awareness Unit 1.2: Environmental ethics
Readings	• Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986** • **Paul Pojman** Environmental Ethics: Readings in Theory and Application Paperback – January 1, 2007 • Oxford Dictionary of Philosophy: environmental ethics, **http://www.answers**. com/topic/environmental-ethics
Activity	**Overview** Assignment 1.1: Reflecting Upon the following issues: • clear cut forests for the sake of human consumption. • propagating our species, and life itself. • make gasoline powered vehicles. • environmental obligations needed to keep for future generations. • the extinction of a species for the convenience of humanity. • Methods for best use and conserve of the space environment to secure and expand life.
Module 2	Biodiversity and Climate Change
Key Concepts	Biodiversity, Climate, Climate Change
Overview	In the atmosphere, gases such as water vapour, carbon dioxide, ozone, and methane act like the glass roof of a greenhouse by trapping heat and warming the planet. These gases are called greenhouse gases. The natural levels of these

	gases are being supplemented by emissions resulting from human activities, such as the burning of fossil fuels, farming activities and land-use changes. As a result, the Earth's surface and lower atmosphere are warming, and this rise in temperature is accompanied by many other changes. Rising levels of greenhouse gases are already changing the climate. These changes are affecting the entire world, from low-lying islands in the tropics to the vast polar regions. Also, Climate change affects biodiversity. It becomes one of the most significant drivers of biodiversity loss by the end of the century. It is already forcing biodiversity to adapt either through shifting habitat, changing life cycles, or the development of new physical traits. In this module, students need to realize that, conserving natural terrestrial, freshwater and marine ecosystems and restoring degraded ecosystems (including their genetic and species diversity) is essential for human well-being. Biodiversity can support efforts to reduce the negative effects of climate change. Conserved or restored habitats can remove carbon dioxide from the atmosphere, thus helping to address climate change by storing carbon (for example,reducing emissions from deforestation and forest degradation). Moreover, conserving in-tact ecosystems, such as mangroves, for example, can help reduce the disastrous impacts of climate change such as flooding and storm surges.
Aim	The overriding aim of this module is to realize the interrelationship between biodiversity and climate change
Learning Outcomes	Students will be able to: • Analyse methods of ensuring local participation in climate change adaptation. • Analyze the effects of climate change from both male and female perspectives
Units	Unit 2.1: Biodiversity, Climate, Unit 2.2: Climate Change

	Unit 2.3: Climate Change Adaptation
Readings	Shah, Anup. "Biodiversity." *Global Issues*. 19 Jan. 2014. Web. 10 Sep. 2014. <http://www.globalissues.org/issue/169/biodiversity>. • Doucet, C. (2007) *Urban Meltdown: Cities, Climate Change and Politics as Usual*, New Society Publishers, Gabriola Island BC. • Dow, K. and Downing, T. (2006) *The Atlas of Climate Change: Mapping the World's Greatest Challenge*, University of California Press, Berkeley. • Flannery, T. (2005) *The Weather Makers: How Man is Changing the Climate and What It Means for Life on Earth*, Atlantic Monthly Press NY. • Hansen, J. (2010) *Storms of My Grandchildren: The Truth about the Coming Climate Catastrophe and Our Last Chance to Save Humanity*, Bloomsbury, New York. • Henson, R. (2008) *The Gough Guide to Climate Change: The Symptoms, The Science, The Solutions*, Rough Guides, London.
Activity	**Overview**
	Work in group to: - Collect information on biodiversity in your local environment. - Collect evidence on the effects of climate change on biodiversity in your local environment during the last fifty years. - Propose a strategy to protect biodiversity in your local environment.
Module 3	**Urbanization and Climate Change**
Key Concepts	Urbanization
Overview	This Module deals with the implications of population growth and urbanization for climate change in terms of the contribution of urban populations (and centres) to human induced climate change. It emphasizes how it is not the growth in (urban or rural) population but the growth in consumption that drives

	the growth in greenhouse gas emissions and that a significant proportion of the world's urban (and rural) population have consumption levels that are so low that they contribute little or nothing to such emissions. In this module students discuss how in the much-needed planning for global emissions reduction, provisions must be made to allow low-income low-consumption households with greenhouse gas emissions below the 'fair-share' level to increase their consumption.
Aim	This module aims at examining the relationship between urbanization and climate change.
Learning Outcomes	At the end of this module learners will be able to: • Describe the relationship between human activities and climate change. • Demonstrate an understanding of the natural carbon cycle.
Units	Unit 3.1: Urbanization *Unit 3.2: Urbanization a Mixed Blessing* Unit 3.3: Urbanization and Climate Change
Readings	• David Satterthwaite The implications of population growth and urbanization for climate change, Paper presented at Expert-Group Meeting on Population Dynamics and Climate Change, UNFPA and IIED In Collaboration with UN-HABITAT and the Population Division, UN/DESA 24 to 25 June 2009 • Holper, P. and Torok, S. (2008) *Climate Change: What You Can do about It at Work, at Home, at School*, Pan Macmillan,Sydney. • Hulme, M. (2009) *Why We Disagree About Climate Change: Understanding Controversy, Inaction and Opportunity*, Cambridge University Press, Cambridge. • Johansen, B. (2006) *Global Warming in the Twenty-First Century*, Praeger Publishers, Westport CT.

	• Moser, S. and Dilling, L. (eds) (2007) *Creating a Climate for Change: Communicating Climate Change and Facilitating Social Change*, Cambridge University Press, Cambridge.
Activity	**Overview**
	Assignment : Prepare a lecture either of following themes 1. Urbanization: cons and pros 2. Urbanization and Carbon Cycle
Module 4	Water Resources and Climate Change
Key Concepts	Water resources management, Social learning processes
Overview	Water resources are important to both society and ecosystems. We depend on a reliable, clean supply of drinking water to sustain our health. We also need water for agriculture, energy production, navigation, recreation, and manufacturing. Many of these uses put pressure on water resources, stresses that are likely to be exacerbated by climate change. In many areas, climate change is likely to increasewater demand while shrinking water supplies. This shifting balance would challenge water managers to simultaneously meet the needs of growing communities, sensitive ecosystems, farmers, ranchers, energy producers, and manufacturers. In this module need to realize that in some areas, water shortages will be less of a problem than increases in runoff, flooding, or sea level rise. These effects can reduce the quality of water and can damage the infrastructure that we use to transport and deliver water.
Aim	The overriding aim of this module is realize the interrelationship between water resources management and climate change
Learning Outcomes	At the end of this module learners will be able to: • Compare and contrast the impacts of major climatic hazards on livelihoods of the community. • Comprehend the significance of the climate change problem locally and

	globally. • Explore solutions to problems that cause climate change.
Units	Unit 4.1: Water Resources and Climate Change Unit 4.2: Climate change Social learning processes
Readings	• CCSP (2008). *The Effects of Climate Change on Agriculture, Land Resources, Water Resources, and Biodiversity in the United States* . (Coordinating Lead Author), Anderson, K.E., Cahoon, D.R., Gesch, D.B., Gill, S.K., Gutierrez, B.T., Thieler, E.R., Williams, S.J. (Lead Authors).

	U.S. Environmental Protection Agency, Washington, DC, USA. • CCSP (2008). *Preliminary Review of Adaptation Options for Climate-Sensitive Ecosystems and Resources* . A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Julius, S.H., J.M. West (eds.), J.S. Baron, B. Griffith, L.A. Joyce, P. Kareiva, B.D. Keller, M.A. Palmer, C.H. Peterson, and J.M. Scott (authors). U.S. Environmental Protection Agency, Washington, DC, USA.
Activity	**Overview**
	• **Assignment**: plan a seminar on major climatic hazards on livelihoods of the community comparing the problems of water shortages and those of water increases
Module 5	**Water Management and Recycling**
Key Concepts	Water management and recycling processes, techniques
Overview	Water cycle is a delicate balance of precipitation, evaporation, and all of the steps in between. Warmer temperatures increase the rate of evaporation of water into the atmosphere, in effect increasing the atmosphere's capacity to "hold" water. Increased evaporation may dry out some areas and fall as excess precipitation on other areas. Changes in the amount of rain falling during storms provide evidence that the water cycle is already changing. Rising temperatures cause snow to begin melting earlier in the year. This alters the timing of stream flow in rivers that have their sources in mountainous areas. As temperatures rise, people and animals need more water to maintain their health and thrive. Many important economic activities, like producing energy at power plants, raising livestock, and growing food crops, also require water. The amount of water available for these activities may be reduced as Earth warms, and if competition for water resources increases.
Aim	The overriding aim of this module is to equip students with the capacity to debate on water management and recycling processes, techniques and feasibility>

Learning Outcomes	At the end of this module learners will be able to: • Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in. • Investigate the causes of climate change. • Propose solutions to climate change issues.
Units	Unit 5.1: Water management (concepts; national and international models) Unit 5.2: Water recycling techniques feasibility and consequences
Readings	• United Nations Development Programme (2007) *Fighting Climate Change: Human Solidarity in a Divided World: Human Development Report 2007-2008*, Palgrave Macmillan, Basingstoke, UK. • *Layperson's Guide to Water Recycling and Reuse*, published in 1992 by the Water Education Foundation, Sacramento, California. • Video, entitled *Water from Water: Recycling*, produced in 1995 by National Water Research Institute, Fountain Valley, California. • Research On Recycled Water is done by EPA through the Office of Research and Development. • Water Recycling and Reuse: The Environmental Benefits http://www.epa.gov/region9/water/recycling/
Activity	**Overview** **Students are to plan and implement three-sessions workshop on the following themes:** • Water management (concepts; national and international models) • Water recycling techniques feasibility and consequences

Geography of Development

KNOWLEDGE (Concepts, theories, processes)	**SKILLS (Tools, methodologies, dynamics)**	**ATTRIBUTES (Innate abilities)**	**CLIMASP CORE COMPETENCES**
92. Environmental awareness 93. Weather and climate 94. Climate change and livelihoods 95. Climate change communication 96. Fairness and climate change justice 97. Future climate change scenarios 98. Course Description/Overview

The present course provides students with an overview of ideas and themes in development with a particular emphasis on what it means to understand it in terms of geography. It seeks to help students understand both the geographical causes and consequences of varying development. Studies compare More Economically Developed Countries (MEDCs) with Less Economically Developed Countries (LEDCs). Within development geography, sustainable development is also studied in an attempt to understand how to meet the needs of the present without compromising the needs of future generations to meet their own needs. In addition, it explores that 'thinking geographically' about development involves understanding how the meaning of places and regions are socially constructed, and how theoretical and conceptual frameworks about development have been debated. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on geography of development.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the thematic fields within the human geography of developing countries– at local, national and international scales; b) raise awareness of the role of the learners to reflect critically the major theories of development and underdevelopment; and c) use traditional and electronic resources as well as social networking technologies as tools to identify geographical causes and consequences of varying development.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

6. Critically assess the role of governments, international agencies, private actors and NGO's with regard to poverty and development.

7. Critically examine the central concepts underlying development theory and relate them to wider issues of how local societies conceive their long-term sustainability and well-being.
8. Identify how debates and concepts in the field of development geography are being translated in development policies and practice.
9. Discuss certain thematic fields within the human geography of developing countries.
10. Explain the major theories of development and underdevelopment.

Course Resources

Course Website(s)

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Description/Overview

The present course is intended to provide students with the key concepts about the geography and climate, the important elements of climate and how they are measured and recorded and handled statistically. It also illustrates the importance of the gaseous envelope of the planet and the threats it faces and how protect it. It familiarizes student elements of the climate and the factors affecting it and its geographical distribution and the skillful representation of the elements of the climate on the maps using the suitable symbols. Students are asked to read and summarize articles on elements of the climate. In short, the course provides an appropriate chance for the students to get the minimum knowledge of the climate processes and elements.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of geography of climate ; b) to raise awareness of the learners about elements of the climate and the factors affecting it; c) and help learners use traditional and electronic tools to identify the the elements of the climate on the maps using the suitable symbols.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the geographic distributions of climate processes such as temperature, precipitation, and weather.
2. Explain the processes that determine global climate patterns.
3. Interpret weather maps and data.
4. Analyze the causes and explain the implications of global warming.
5- Identify the elements of the climate and the factors affecting it.
7- Identify the elements of the climate on the maps using the suitable symbols.
8- Discuss the concepts of atmospheric disturbances, hurricanes, and how they occur and geographically spread.

Course Description/Overview

Though the political thought cared about the Human rights' issue since ever, this care has not reached the nowadays level but recently; only when the Human rights' issue has become an important issue on the international level during the last decade of the twentieth century. The Human rights' issue has been connected to what distinguish man as a man. This can start with ensuring the right of every child in life even before he is born. Then, his rights extend to his care all his life, as he has the right in security, assurance, education, accommodation, health besides his right in political participation and expressing his opinion.

This course is divided into five parts: the first is titled: The Essence of Human Rights. It deals with the concept of human rights, its importance, beginnings, and the human rights and the peoples' rights. The second part is titled: Judiciary and Human Rights. It tackles the role of judiciary in maintaining the human rights, and the types of human rights as well. The third part is: The Procedures of Human Rights. It deals with the procedures of Human Rights on the international, regional and national levels. The fourth is titled: Applications of Human Rights. This one discusses the applications in the fields of medicine, engineering, agriculture and science. The fifth is titled:

The Islamic and International Declarations of Human Rights, a comparison between the Islamic and International Declarations of Human Rights.

Course Learning Objectives

The overarching goals of this course are:

1. Recognizing the concept of Human Rights and its importance
2. Defining the types of Human Rights
3. Recognizing the procedures of Human Rights, their beginnings and sources
4. Applying Human Rights' procedures in various fields
5. Discussing the restrictions on Human Rights
6. Learning about the historical development of Human Rights and Democracy
7. Determining the relation between Democracy and Human Rights

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Recognize the Human Rights and their procedures
2. State the Civil, Political, Economic and Social Rights
3. Demonstrate the beginnings, sources and procedures of Human Rights
4. Explain some models of Human Rights' Applications on different levels
5. Analyze the Human Rights' procedures on the international, regional and national levels
6. Analyze the international charters of Human Rights
7. Differentiate between the Human Rights in both the Islamic and Western Civilizations

Course Resources

1. Fadl-ullah Muhammad Isma'eil: Human Rights between the Western Thought and the Islamic, Bustan Elma'refa, Alexandria, 2006.

APENDIX II: The CLIMASP Course Modules Template Example

Course	
Module 1	
Key Concepts	The Essence of Human Rights
Overview	This module tackles the essence of Human Rights and its importance in establishing societies, the beginnings of Human Rights and the most important factors which paved the way for the Human Right Movement within the society.
Aim	The main objective is to identify the concept of Human Rights, its beginning, and the factors which affected it.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Clarify the Human Rights concept, and its importance. • Recognize the historical development of the concept. • Be exposed to the beginning and the sources of Human Rights
Units	• Human Rights: Concept and Importance

	• The Beginning and sources of Human Rights • Human Rights and Peoples' Rights
Readings	Muhammad Salam Zanaty, Human Rights (Historical Introducti 1992.
Activity	
	Writing an essay about the essence of Human Rights and its importance in establishing societies.
Module 2	
Key Concepts	Judiciary and Human Rights
Overview	This module deals with the role of justiciary in maintaining the Human Rights as every individual has the rights to have an effective legal tool in the national court specialized in the deeds violating the Human Rights given to individuals by judiciary or constitution.

	People are equal before judiciary, and therefore have equal protection without any discrimination by judiciary.
Aim	The main aim of this module is recognizing the role and importance of judiciary in maintaining Human Rights, and recognizing the rights given to humans.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Recognize the role of judiciary in maintaining Human Rights • Determine types of Human Rights • Discuss the restrictions on Human Rights
Units	1. The Role of judiciary in maintaining Human Rights 2. Human Rights' Types and Restrictions on them
Readings	Lotfy Mahmoud Abd El-Haleem: Human Rights Between the United Nations' Declarion and the Holy Qur'an, Dar Almisbah, Cairo, 1992
Activity	
	Preparing critical researches on some thoughts presented in the content
Module 3	
Key Concepts	Human Rights' Procedures
Overview	This module deals with the procedures necessary for applying the Human Rights within the society as these rights are

	integrated and no right overwhelms another. Besides, an individual's rights are not separated from the rights of the society. Therefore, procedures are imposed to apply the Human Rights.
Aim	The main goal of this module is recognizing the procedures necessary for applying the Human Rights whether on the international, regional or national levels.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Recognize the Procedures of Applying the Human Rights • Analyze the Human Rights' Procedures on the international, regional or national levels.
Units	1. Human Rights' Procedures on the international level. 2. Human Rights' Procedures on the regional level. 3. Human Rights' Procedures on the national level.
Readings	Muhammad No'man Galal, Egypt and the Human Rights between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
Activity	Using the Internet in holding a research on the Human Rights' Procedures on the International, Regional and National Levels
Module 4	
Key Concepts	Human Rights' Applications

Overview	This module focuses on how to apply the Human Rights in the field of medicine for maintaining the patient's rights on the physician, in medical treatment, and in sickness confidentiality. In the field of Engineering, the application is held by the syndicate commitment to the laborers' rights. In Agriculture, it is guaranteed by the protection of the new plant species, etc. In Science, Human Rights are applied via maintaining copyrights as well as other applications.
Aim	The main goal of this module is recognizing the most important Human Rights' Applications in different fields.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Identify the Human Rights' Applications in different fields. • Suggest procedures to apply the Human Rights' Applications in different fields.
Units	1. Human Rights' Applications in the fields of Medicine and Engineering 2. Human Rights' Applications in the fields of Agriculture and Science
Readings	Muhammad No'man Galal, Egypt and the Human Rights between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
Activity	

	Holding civil researches about how to apply Human Rights on different fields
Module 5	
Key Concepts	The Islamic and International Declarations of Human Rights
Overview	
Aim	To recognize human rights in both the Islamic and European Civilizations and to learn about the international charters of human rights
Learning Outcomes	By the end of this module, learners are expected to be able to: • Differentiate between human rights in both the Islamic and European Civilizations • Analyze the international charters of human rights
Units	1. The Islamic Declaration of Human Rights 2. The International Declaration of Human Rights 3. A comparison between the Islamic and International Declarations of Human Rights
Readings	Mohammad No'man Galal, Egypt and Human Rights between Truth and Slander (a documentary study), the Egyptian General Association for Books, Cairo, 1993.
Activity	
	Writing an essay that clarifies the most important principals in the

	Islamic and International Declarations of Human Rights

Course Description/Overview

The present course is intended to provide students with the key concepts about physical and chemical properties of water, hydrogeochemical processes, influence of aquifer materials on groundwater quality, representations of results of chemical analyses, groundwater origin and genesis, water quality modelling, sources of groundwater pollution, municipal, agricultural, mining, industrial sources, water treatment, the distribution of biota, nutrients and contaminants in the aquatic environment. Topics will include the hydrologic cycle, the carbonate system and pH control, weathering and water chemistry, redox equilibria, and hydrologic transport.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of hydrogeochemical processes and influence of aquifer materials on groundwater quality; b) to raise awareness of the learners about the need for new sources of water needed for irrigation and drink; c) and help learners to acquire water quality modeling: and d) give the basic understanding of hydrologic cycle, carbonate system, weathering and hydrologic transport

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the physical and chemical properties of water.
2. Explain the groundwater origin and genesis, water quality modelling, sources of groundwater pollution,.
3- Discuss weathering and water chemistry.
4- Identify the elements of the climate on the maps using the suitable symbols.
5- Explore the influence of aquifer materials on groundwater quality.

Course Description/Overview

The present course is intended to provide students with practical and detailed examination of the enactment, enforcement and limitations of environmental law and policy. The course will 'provide a comprehensive overview of environmental law. It critically explores modes of decision-making in contemporary institutions with special emphasis on methods of evaluation in environmental management. Decision analysis, risk assessment and other techniques of 'scientific' decision/evaluation are studied using both theoretical and case-study approaches. The course focuses on perspectives, actors, institutions, and economic relationships as they relate to global environmental policy.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of environmental law; b) to raise awareness of the learners about the need for new methods of evaluation in environmental management; and c) provide students with a solid understanding of linkages between the global political system and the natural environment

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the issues arising from the impact of industrial and development policies on the natural environment.
2. Explain the limitations of environmental law.
3- Discuss perspectives, actors, institutions, and economic relationships as they relate to global environmental policy.
4- Identify the methods of evaluation in environmental management..
5- Explore the linkages between the global political system and the natural environment.

Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Domination of Nature.
3		The ethics of scarcity
4		Animal and environmental rights.
5		social benefit and technological risk, and the debate among deep ecologists
6		Social ecologists and eco-feminists over the care of the earth.

Man and Environment

KNOWLEDGE (Concepts, theories, processes)	SKILLS (Tools, methodologies, dynamics)	ATTRIBUTES (Innate abilities)	CLIMASP CORE COMPETENCES
8. Environmental awareness 9. Environmental ethics 10. Biodiversity and climate change 11. Climate change adaptation 12. Urbanization's role in climate change 13. Water resources and climate change Social learning processes 14. Risk assessment 15. Climate change and health 16. Pollution and health 17. Gender and climate change 18. Mitigation of pollution	23. Adaptive learning and self-reflection; 24. Awareness and advocacy raising 25. Carbon literacy for procurement 26. Communicating 27. Contextualising 28. Critical, systemic and futures thinking 29. Debating 30. Discourse 31. Emergency psychology 32. Futures thinking 33. Global dynamics 34. Integrated assessment 35. Leadership 36. Local knowledge 37. Mapping gender impacts 38. Motivate and manage change 39. Networked learning 40. Prioritising 41. Problem solving	23. Accountability 24. Confident 25. Decisive 26. Democratic 27. Empathy 28. Environmental justice 29. Gender-sensitive 30. Global mind-set/ consciousness 31. Interdependency 32. Needs vs. wants 33. Nonviolence & peace 34. Openness to novelty and change 35. Optimism 36. Organised 37. Respect and care for the community 38. Respect for diversity 39. Social cohesion 40. Social responsibility 41. Stewardship 42. Tolerance	14. Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community. 15. Analyse methods of ensuring local participation in climate change adaptation. 16. Analyze the effects of climate change from both male and female perspectives 17. Compare and contrast the impacts of major climatic hazards on human health and the community. 18. Comprehend the significance of the climate change problem locally and globally. 19. Describe the relationship between human activities and climate change. 20. Demonstrate an understanding of the effect of pollution on human health 21. Explore solutions to problems that cause climate change. 22. Identify ways to reduce the school's carbon footprint. 23. Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in. 24. Investigate the mitigation of climate change.

	42. Resolve ethical dilemmas 43. Scenario analysis and planning 44. Team management	43. Transparency 44. Virtue	25. Propose solutions to climate change issues. 26. Understand how human actions are contributing to global environmental change.

Course Syllabus

Course Number:

Man and Environment

University of Port Said, Faculty of medicine , Department of Community medicine

Fall Semester, 2013-2014

Instructor Information

Instructor: Prof. EnasElsheikh

Office Location: Faculty of Medicine

Telephone: Office – +20663428168

Office Hours: Tuesday 14.30- 17.00, Wednsday 14.00 – 16.00

E-mail: eelsheikh47@gmail.com

Website:

Course Identification

Course Number: **Γ1**

Course Name: **Man and Environment**

Course Location: Faculty of medicine

Class Times: Wednesday 8:30pm – 11:30am

Prerequisites:
Faculty Web Page: www.psu.edu.eg

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Physician have the potential to be decision maker and practice in the service of educating patients to be active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the environmental challenges resulting from climate change. It does so through tackling the following logically sequence issues: 1) Environmental awareness; 2)Environmental ethics; 3) Biodiversity and climate change; 4) Climate change adaptation; 5) Urbanization's role in climate change; 6) Water resources and climate change Social learning processes; and 7) natural sources of pollution and man madepollutions 8) air pollution, noise pollution and human activity 9) effect of pollution on health Issues are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is, they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of water resources at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the negative environmental consequences of climate changes – at local, national and international scales -in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for the management of critical environmental issues; and c) use traditional and electronic resources as well as social networking technologies as tools tohelp the community, including children, identify risks and develop climate change adaptation strategies. d) to raise the awareness of the learner about the need to examine physical, chemical, biological, political and economic dimension of environment

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

- Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community.
- Discuss the basic terminology and core concepts of environment
- Identify the physical chemical biological political and economic dimension of environment
- Conduct survey of environmental system , human interaction
- Analyse methods of ensuring local participation in climate change adaptation.
- Analyze the effects of climate change from both male and female perspectives
- Compare and contrast the impacts of major climatic hazards on human beings and the community.
- Comprehend the significance of the climate change problem locally and globally.
- Describe the relationship between human activities and climate change.
- Describe the relationship between poverty and unsafe environment
- Demonstrate an understanding of the different types of pollutions and its impact on human health
- Explore solutions and mitigation process to problems that cause climate change.
- Identify ways to reduce the impact of climate changes
- Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in.
- Investigate the causes of climate change and pollution
- Propose solutions to climate change issues.
- Understand how human actions are contributing to global environmental change. Course Resources

Course Website(s)

Required Course Texts and Materials

- Hands-out prepared by the instructor for the class
- Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness &id=7141986**
- **Paul Pojman**Environmental Ethics: Readings in Theory and ApplicationPaperback – January 1, 2007
- Oxford Dictionary of Philosophy: environmental ethics,**http://www.answers**.com/topic/environmental-ethics

Keller, M.A. Palmer, C.H. Peterson, and J.M. Scott (authors). U.S. Environmental Protection Agency, Washington, DC, USA.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Environmental awareness
3		Environmental ethics
4		Biodiversity and climate change /health
5		Climate change adaptation / health
6		Urbanization's role in climate change /health
7		Water resources and climate change Social learning processes (FORUM 1)
8		Air pollution and climate change Social learning processes (FORUM 2)
9		Gender and climate change Social learning processes (FORUM 3)
10-15		Mitigation and health (concepts, feasibility and consequences, techniques, national and international models)

Course Modules

Course	Man and Environment
Module 1	Environment: Ethics and Awareness
Key Concepts	Environmental awareness, Environmental ethics
Overview	Environmental awareness is to understand the fragility of our environment and the importance of its protection. Promoting environmental awareness is an easy way to become an environmental steward and participate in creating a brighter future for our children.To define environmental awareness we must first understand the environmentalist movement. Environmentalism is an ideology that evokes the necessity and responsibility of humans to respect, protect, and preserve the natural world from its anthropogenic (caused by humans) afflictions. Environmental awareness is an integral part of the movement's success. By teaching our students, friends and family that the physical environment is fragile and indispensable. Students need to start fixing the problems that threaten it. Environmental ethics, on the other hand, is the part of environmental philosophy which considers extending the traditional boundaries of ethics from solely including humans to including the non-human world. It exerts influence on a large range of disciplines including environmental law, environmental sociology, ecotheology, ecological economics, ecology and geography. There are many ethical decisions that human beings make with respect to the environment. Throughout this module, students are invited to share and exchange ideas about issues related to :clear cut forests for the sake of human consumption, propagation of species, gasoline powered vehicles, etc.
Aim	The overriding aim of this module is to turn students able to discourse how human actions are contributing to global environmental change.
Learning	At the end of this module learners will be able to:

Outcomes	• Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community. • understand how human actions are contributing to global environmental change.
Units	Unit 1.1:Environmental awareness Unit 1.2: Environmental ethics
Readings	• Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986** • **Paul Pojman**Environmental Ethics: Readings in Theory and ApplicationPaperback – January 1, 2007 • Oxford Dictionary of Philosophy: environmental ethics, **http://www.answers**.com/topic/environmental-ethics
Activity	**Overview** Assignment 1.1: Reflecting Upon the following issues: • clear cut forests for the sake of human consumption. • propagating our species, and life itself. • make gasoline powered vehicles. • environmental obligations needed to keep for future generations. • the extinction of a species for the convenience of humanity. • Methods for best use and conserve of the space environment to secure and expand life.
Module 2	Biodiversity and Climate Change
Key Concepts	Biodiversity, Climate, Climate Change
Overview	In the atmosphere, gases such as water vapour, carbon dioxide, ozone, and methane act like the glass roof of a greenhouse by trapping heat and warming

	the planet. These gases are called greenhouse gases. The natural levels of these gases are being supplemented by emissions resulting from human activities, such as the burning of fossil fuels, farming activities and land-use changes. As a result, the Earth's surface and lower atmosphere are warming, and this rise in temperature is accompanied by many other changes. Rising levels of greenhouse gases are already changing the climate. These changes are affecting the entire world, from low-lying islands in the tropics to the vast polar regions. Also, Climate change affects biodiversity. It becomes one of the most significant drivers of biodiversity loss by the end of the century. It is already forcing biodiversity to adapt either through shifting habitat, changing life cycles, or the development of new physical traits. In this module, students need to realize that, conserving natural terrestrial, freshwater and marine ecosystems and restoring degraded ecosystems (including their genetic and species diversity) is essential for human well-being. Biodiversity can support efforts to reduce the negative effects of climate change. Conserved or restored habitats can remove carbon dioxide from the atmosphere, thus helping to address climate change by storing carbon (for example,reducing emissions from deforestation and forest degradation). Moreover, conserving in-tact ecosystems, such as mangroves, for example, can help reduce the disastrous impacts of climate change such as flooding and storm surges.
Aim	The overriding aim of this module is to realize the interrelationship between biodiversity and climate change
Learning Outcomes	Students will be able to: • Analyse methods of ensuring local participation in climate change adaptation. • Analyze the effects of climate change from both male and female perspectives
Units	Unit 2.1: Biodiversity, Climate,

	Unit 2.2: Climate Change Unit 2.3: Climate Change Adaptation
Readings	Shah, Anup. "Biodiversity." *Global Issues*. 19 Jan. 2014. Web. 10 Sep. 2014. <http://www.globalissues.org/issue/169/biodiversity>. • Doucet, C. (2007) *Urban Meltdown: Cities, Climate Change and Politics as Usual*, New Society Publishers, Gabriola Island BC. • Dow, K. and Downing, T. (2006) *The Atlas of Climate Change: Mapping the World's Greatest Challenge*, University of California Press, Berkeley. • Flannery, T. (2005) *The Weather Makers: How Man is Changing the Climate and What It Means for Life on Earth*, Atlantic Monthly Press NY. • Hansen, J. (2010) *Storms of My Grandchildren: The Truth about the Coming Climate Catastrophe and Our Last Chance to Save Humanity*, Bloomsbury, New York. • Henson, R. (2008) *The Gough Guide to Climate Change: The Symptoms, The Science, The Solutions*, Rough Guides, London.
Activity	**Overview**
	Work in group to: - Collect information on biodiversity in your local environment. - Collect evidence on the effects of climate changeon biodiversity in your local environment during the last fifty years. - Propose a strategy to protect biodiversity in your local environment.
Module 3	**Urbanization and Climate Change**
KeyConcepts	Urbanization
Overview	This Module deals with the implications of population growth and urbanization for climate change in terms of the contribution of urban populations (and centres) to human induced climate change. It emphasizes how it is not the

	growth in (urban or rural) population but the growth in consumption that drives the growth in greenhouse gas emissions and that a significant proportion of the world's urban (and rural) population have consumption levels that are so low that they contribute little or nothing to such emissions. In this module students discuss how in the much-needed planning for global emissions reduction, provisions must be made to allow low-income low-consumption households with greenhouse gas emissions below the 'fair-share' level to increase their consumption.
Aim	This module aims at examining the relationship between urbanization and climate change.
Learning Outcomes	At the end of this module learners will be able to: • Describe the relationship between human activities and climate change. • Demonstrate an understanding of the natural carbon cycle.
Units	Unit 3.1: Urbanization *Unit 3.2: Urbanization a Mixed Blessing* Unit 3.3: Urbanization and Climate Change
Readings	• David Satterthwaite The implications of population growth and urbanization for climate change, Paper presented at Expert-Group Meeting on Population Dynamics and Climate Change, UNFPA and IIED In Collaboration with UN-HABITAT and the Population Division, UN/DESA 24 to 25 June 2009 • Holper, P. and Torok, S. (2008) *Climate Change: What You Can do about It at Work, at Home, at School*, Pan Macmillan,Sydney. • Hulme, M. (2009) *Why We Disagree About Climate Change: Understanding Controversy, Inaction and Opportunity*, Cambridge University Press, Cambridge. • Johansen, B. (2006) *Global Warming in the Twenty-First Century*, Praeger

	Publishers, Westport CT. • Moser, S. and Dilling, L. (eds) (2007) *Creating a Climate for Change: Communicating Climate Change and Facilitating Social Change*, Cambridge University Press, Cambridge.
Activity	**Overview**
	Assignment : Prepare a lecture either of following themes 3. Urbanization: cons and pros 4. Urbanization and Carbon Cycle
Module 4	Water Resources and Climate Change
Key Concepts	Water resources management, Social learning processes
Overview	Water resources are important to both society and ecosystems. We depend on a reliable, clean supply of drinking water to sustain our health. We also need water for agriculture, energy production, navigation, recreation, and manufacturing. Many of these uses put pressure on water resources, stresses that are likely to be exacerbated by climate change. In many areas, climate change is likely to increasewater demand while shrinking water supplies. This shifting balance would challenge water managers to simultaneously meet the needs of growing communities, sensitive ecosystems, farmers, ranchers, energy producers, and manufacturers. In this module need to realize that in some areas, water shortages will be less of a problem than increases in runoff, flooding, or sea level rise. These effects can reduce the quality of water and can damage the infrastructure that we use to transport and deliver water.
Aim	The overriding aim of this module is realize the interrelationship between water resources management and climate change
Learning Outcomes	At the end of this module learners will be able to: • Compare and contrast the impacts of major climatic hazards on livelihoods

	of the community. • Comprehend the significance of the climate change problem locally and globally. • Explore solutions to problems that cause climate change.
Units	Unit 4.1: Water Resources and Climate Change Unit 4.2: Climate change Social learning processes
Readings	• CCSP (2008). *The Effects of Climate Change on Agriculture, Land Resources, Water Resources, and Biodiversity in the United States*. A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Backlund, P., A. Janetos, D. Schimel, J. Hatfield, K. Boote, P. Fay, L. Hahn, C. Izaurralde, B.A. Kimball, T. Mader, J. Morgan, D. Ort, W. Polley, A. Thomson, D. Wolfe, M. Ryan, S. Archer, R. Birdsey, C. Dahm, L. Heath, J. Hicke, D. Hollinger, T. Huxman, G. Okin, R. Oren, J. Randerson, W. Schlesinger, D. Lettenmaier, D. Major, L. Poff, S. Running, L. Hansen, D. Inouye, B.P. Kelly, L Meyerson, B. Peterson, and R. Shaw. Freshwater resources and their management. In: *Climate Change 2007: Impacts, Adaptation and Vulnerability*. EXIT Disclaimer *Contribution of Working Group II to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change* [Parry, M.L., O.F. Canziani, J.P. Palutikof, P.J. van der Linden and C.E. Hanson (eds.)]. Cambridge University Press, Cambridge, United Kingdom. • CCSP (2009). *Coastal Sensitivity to Sea-Level Rise: A Focus on the Mid-Atlantic Region*. A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Titus, J.G.

	(Coordinating Lead Author), Anderson, K.E., Cahoon, D.R., Gesch, D.B., Gill, S.K., Gutierrez, B.T., Thieler, E.R., Williams, S.J. (Lead Authors). U.S. Environmental Protection Agency, Washington, DC, USA. • CCSP (2008). *Preliminary Review of Adaptation Options for Climate-Sensitive Ecosystems and Resources* . A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Julius, S.H., J.M. West (eds.), J.S. Baron, B. Griffith, L.A. Joyce, P. Kareiva, B.D. Keller, M.A. Palmer, C.H. Peterson, and J.M. Scott (authors). U.S. Environmental Protection Agency, Washington, DC, USA.
Activity	**Overview**
	• **Assignment**:plan a seminar on major climatic hazards on livelihoods of the community comparingthe problems of water shortages and those of water increases
Module 5	**Water Management and Recycling**
Key Concepts	Water management and recyclingprocesses, techniques
Overview	Water cycle is a delicate balance of precipitation, evaporation, and all of the steps in between. Warmer temperatures increase the rate of evaporation of water into the atmosphere, in effect increasing the atmosphere's capacity to "hold" water.Increased evaporation may dry out some areas and fall as excess precipitation on other areas.Changes in the amount of rain falling during storms provide evidence that the water cycle is already changing. Rising temperatures cause snow to begin melting earlier in the year. This alters the timing of streamflow in rivers that have their sources in mountainous areas. As temperatures rise, people and animals need more water to maintain their health and thrive. Many important economic activities, like producing energy at power plants, raising livestock, and growing food crops, also require water. The amount of water available for these activities may be reduced as Earth warms, and if competition for water resources increases.
Aim	The overriding aim of this module is to equip students with the capacity to

	debate on water management and recycling processes, techniques and feasibility>
Learning Outcomes	At the end of this module learners will be able to: • Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in. • Investigate the causes of climate change. • Propose solutions to climate change issues.
Units	Unit 5.1: Water management (concepts; national and international models) Unit 5.2: Water recycling techniques feasibility and consequences
Readings	• United Nations Development Programme (2007) *Fighting Climate Change: Human Solidarity in a Divided World: Human Development Report 2007-2008*, Palgrave Macmillan, Basingstoke, UK. • *Layperson's Guide to Water Recycling and Reuse*, published in 1992 by the Water Education Foundation, Sacramento, California. • Video, entitled *Water from Water: Recycling*, produced in 1995 by National Water Research Institute, Fountain Valley, California. • Research On Recycled Water is done by EPA through the Office of Research and Development. • Water Recycling and Reuse: The Environmental Benefits http://www.epa.gov/region9/water/recycling/
Activity	**Overview**
	Students are to plan and implement three-sessions workshop on the following themes: • Water management (concepts; national and international models) • Water recycling techniques feasibility and consequences

MAPPING COURSES RELATED TO CLIMATE CHANGE EDUCATION AND SUSTAINABLE DEVELOPMENT				
	COURSE NAME	FACULTY	NAME OF INSTRUCTOR	SHORT DESCRIPTION OF THE COURSE
1	Fish adaptation and climatic change	Fish and fisheries technology	Dr Ahmed Otify	Scientific bases of climate change and the greenhouse effect on earth and Fisheries. Greenhouse gases and carbon dioxide emissions. The land as a container for the storage of carbon emissions and ways to monitor the degradation of land and water resources as a result of climate change. The role of farming plants in reducing the impact of carbon dioxide and the use of computer models in the management of climate change.
2	Paleoecology Course	Science	Prof Abdel- ziz Tantawy	Overview of environmental changes through time, local environmental changes and regional to global climate change of the past, synecology of fossils, paleobiodiversity, changes in communities over geologic time, stable isotopes of oxygen and carbon, paleotemperature. Objectives - to learn and apply methods for determining how environments and climate on Earth have changed through time.

				Learning Outcomes - an understanding of how paleoenvironments and paleoclimate change are studied in the field and lab, and major changes that have occurred.
3	Economic Geology	Science	Dr. Ashraf Emam	This course is an introduction to the geologic and economic factors that result in the development of commercial concentrations of non-energy mineral resources. Course content varies depending on the interests and backgrounds of the students each semester (course may be repeated for credit). Emphasis will be placed on the descriptive geology and origin of economic mineral concentrations within the context of their overall geologic settings. The geologic and economic nature of metallic and industrial mineral commodities in both "hard rock" and "soft rock" geologic environments will be discussed. Related topics to be discussed include importance of mineral resources to the global economy, mineral exploration and evaluation, and mineral extraction and processing
4	Flora	Science	Prof Mohamed sheded	Plants are grouped into floras based on region, period, special environment, or climate. Regions can be geographically distinct habitats like mountain vs. flatland. Floras can mean plant life of a historic era as in fossil flora. Lastly, floras may be subdivided by special environments. The course study plant life occurring in a particular region or time, generally the naturally occurring

				or indigenous—native plant life.
5	Plant community	Science	Prof Mohamed sheded	Study the plant distribution and taxonomy in different regions in Egypt with relation to soil and climatic factors which effect of the distribution of these species.
6	Plant Ecology	Science	Dr Usama Mahalel	Climatic factors affecting on the plant environment and how it effect on the plant cover. Climatic factors effect on soil type and soil formation. The negative and passive relationships among the biotic components of the environment.
7	Ecology of Algae	Science	Dr Ahmed El-Otify	Environment of algae and effects of climatic factors such as light temperature on life cycle of algae and its biomass. Phytoplankton blooming in relation with climatic change.
8	Environmental Geology	Science	Dr. Ashraf Emam	Environmental geology is a science which objectively studies geologic information and applies it to contemporary environmental problems such as pollution, waste management, resource extraction, natural hazards, and human health. An environmental geologist might evaluate the risk and damage potential from natural hazards such as floods, landslides, volcanoes, or earthquakes. The environmental changes on local to global scales can be placed into an earth systems science perspective through examining the evolution and structure of our planet's components, and how these components naturally

				interact. This course is designed to introduce students to the relationship between humans and our Earth. It focuses on environmental and geosciences subjects that facilitate greater awareness of the interactions between the different Earth's components. The course discusses the geologic processes that shape the surface of the Earth, and how these processes affect and are affected by human activity. Moreover, the relationships between the lithosphere, hydrosphere, and atmosphere will be discussed. Particular attentions are given to the subjects of soil, mineralogy, biogeochemical cycles, climate change, and pollution by human activities. The scientific methods that allow studying, prediction, and mitigation of environmental problems will be discussed.
9	Biostatistics	Science	Dr Adel Abdel -Faheem	The course deals with the data come from Biology. The functions of Biostatics are collecting data and organized it, then it can be easily analysis and studying. Making the decisions one strongly depend on the analyses of the data.
10	Engineering and energy history	Engineering	Dr. Mohamed Shaaban	By the end of the course the students will be able to Know: the engineering history in different fields. Know the energy and different sources of it. Know different fields and different programs of engineering Know about the engineer jobs in different pogroms. Understand the engineering

				job ethics
11	Project management	Engineering	Dr. Muntasser Dwidar	By the end of the course the students will be able to: Know The concept and the elements of management: concept of management - Elements of management. - The concept of marketing: define of marketing, The importance of marketing, - The marketing system. Organizing of the marketing functions: Definition of organizing, The organizing of the marketing functions. Consumer behavior: The concept of the consumer behavior, The aspects of the consumer behavior, Studying the markets. The product strategy: The product mix, The product life cycle, New products. The pricing strategy: The importance of pricing, Methods of pricing. Distribution strategy: Distribution channels, Distribution outlets.
12	Thermodynamics fundamentals	Engineering	Dr Waleed Abdel_Fadeel	- By the end of the course the students will be able to: Define the concept of the energy, and different basic concepts like properties, state, process, equilibrium, and cycles. -Identify the different between the ideal gases and the pure substance and understand the property relations relevant to engineering thermodynamics and how to deal with thermodynamic tables. -Identify the concept of energy and mass conservation and apply this concept on different applications
13	Energy conversion and utilization	Engineering	Dr.Ezzat Gad	**By the end of the course the students will be able to:** Demonstrate knowledge and

				understanding of electromechanical energy conversion principles for electromagnetic and electrostatic systems. - Understand the traction systems. - Recognize and analyze illumination and heating systems. - Analyze and understand essential industrial drives aspects. -The student shall attain the above mentioned objectives efficiently under controlled guidance and supervision. -To recognize the concepts and basics of electric power transmission and distribution theory.
14	Heat and mass transfer	Engineering	Dr. Mahmuod Hasan	By the end of the course the students will be able to: - Demonstrate knowledge of heat transfer definitions and terminology, including heat flux, thermal conductivity, and heat transfer coefficients. - Demonstrate knowledge of conduction and the equivalent resistance formula, convective and use of the overall heat transfer coefficient, radiant heat transfer, including black bodies, gray bodies and emissivity. - Demonstrate knowledge of heat exchangers, including the different types and how they operate, application. - Demonstrate knowledge of mass transfer definition and compare it with convenient heat transfer. - Apply this knowledge on various engineering application. - Share ideas and work in a team in an efficient and effective manner under controlled supervision or independently.

15	Renewable energy resources industrial	Engineering	Dr. Salama Abdel-Hady	By the end of the course the students will be able to: Identity different renewable energy, resources for power production such as wind, Solar, and non-conventional by hydro-power. Recognize natural sources of wind and solar ? energies in Egypt. Practice the operation and Design of Horizontal and Vertical Axis wind Turbines. Practice the Operation and Design of Solar flat plate collectors, concentrator systems, photovoltaic systems and other solar applications. Practice the operation of non-conventional hydro Power Systems Such as wave Energy and Tidal Energy. Recognize other renewable energy technologies such as Biomass, Ocean Thermal Energy …etc.
16	Pollution	Engineering	Dr. Mohamed Fathi	By the end of the course the students will be able to know: definition of pollution- Sources of pollution - Types of pollution and their effect on lumen health. Methods of measurement - methods of pollutant reduction.
17	Social Science rural and urban	Social Work	Dr. Mohamed Nagdy	Study the traditionally associated with the study of social structure and conflict rural areas although topical areas such as food and agriculture or natural resource access transcend traditional rural spatial boundaries
18	Introduction to Social Welfare	Social Work	Dr Mohamed Gaber Abbas	Study the social welfare function as t rank social states (alternative complete descriptions of the society) as less desirable, more desirable, or

				indifferent for every possible pair of social states. Inputs of the function include any variables considered to affect the economic welfare of a society. In using welfare measures of persons in the society as inputs, the social welfare function is individualistic in form. One use of a social welfare function is to represent prospective patterns of collective choice as to alternative social states.
19	Community health	Social Work	Dr Modather Seleem	This course is an introduction to the theory and practice of public and community health. The influence of public health professionals on the past, present and future health status of society through the examination of critical health issues will be described. Programming models, theories and policy development are included
20	Introduction to Social planning	Social Work	Dr. Kawther Kenawy	Speaking of this decision for the basis of and methods entrances and planning mechanisms for social programs and social services and is also interested in general political social.
21	Social work in one of the developed fields	Social Work	Dr Ali Dandarawy	This course deals with social service in the field of environment and sustainable development and to support community-based organizations working in the field of environment.
22	Populations and Environmental Studies	Social Work	Dr. Mohamded Abdel-Razik Dr. Mohamed Sayed	This course focuses on both sides, the first dimension of the population is interested in different societies, and the second deals with the concepts of environmental and environmental problems in the community

23	Environmental studies	Education	Dr Saied Sadeek	Knowledge of environmental concepts such as the environment and environmental pollution study the main features of the program to protect the environment. Identify the role of education in the face of environmental problems. Compare between the environment and environmental education.
24	Principles of Psychology	Education	Dr Adel Abaady	Study different types of psychology such as Environmental Psychology and the environmental factors that affect human health.
25	Adult education and environment Work	Education	Dr Abde Hay Mohamed Ali	This course aims to give a general idea about the importance of adult education and literacy as a requirement necessary for the development of society, especially in the current era, which is characterized as the era of knowledge it is true that there will be individuals in the community do not know how to read and write. In addition the environmental problems that affect individuals

Course Description/Overview

The present course is intended to provide students with the key concepts about the remote sensing, collection of data, sensing devices, evaluation of the collected data, applications of remote sensing techniques in geological purposes, image data processing, image rectification processing, image display and enhancement processing, edge enhancement processing, digital mosaics processing, contrast stretching processing, color composition, principle component analysis (PCA), decorrelation stretch , aerial photography, (elements, airphoto interpretation (instrumentation and procedures), principles of landform identification and evaluation, applications of aerial photographs in geology), earth resources satellites, multispectral scanners, digital image processing, applications of remote sensing and geographic information systems in geology.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of applications of remote sensing techniques in geological purposes; b) to train learners in geographic information systems and remote sensing as applied to geological exploration c) and help learners to

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the types of remote sensing.
2. Explain the principles and process of remote sensing.
3- Discuss the different remote sensing systems.
4- Differentiate between the active and passive sensors.
5- Explore the remote sensing platforms.

Course Resources

Course Website(s)

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Concept of remote sensing.
3		Sensor on the ground, in the air and in the space
4		Elements of climate.
5		Types of remote sensing
6		Applications of remote sensing techniques in geological purposes.

Course Description/Overview

The present course is intended to raise the students' awareness of renewable energy resources. It introduces them to the benefits of using clean energy resources. It does so through tackling the following aspects: 1) traditional and renewable energy resources; 2) impact of energy consumption on environment; 3); clean energy resources and climate change; 4) availability of solar and wind energy in Egypt; and 5) energy and future global climate change. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on renewable energy resources. They are invited to discuss impacts of energy resources on environment at local, national and international scales. In short, the course provides an appropriate chance for the students to get the minimum knowledge of the advantages and disadvantages of renewable energy resources.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of the renewable energy resources; b) to raise the learners' awareness of the need to explore renewable energy resources in order to achieve the goals of community development; c) help learners use traditional and electronic tools to identify the risks of the petroleum and natural gas limitations in Egypt; and d) to highlight the importance of renewable energy resources as clean and safe resources to the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

24. Explain the impacts of traditional energy resources on environment.
25. Compare and contrast the advantages and disadvantages of renewable energy resources with the advantages and disadvantages of traditional energy resources.
26. Identify the basic principles of renewable energy technologies.
27. Question the relation between sustainable development and the use of renewable energy resources.
28. Discuss the different types of renewable energy resources.

29. Anticipate possible future environmental change and identify possible development consequences.
30. Appreciate the positive impacts of utilizing renewable energy resources on the environment.
31. Explain the relationship between poverty, environment, climate change, and the insufficient supply of energy.
32. Use the different tools and equipments of renewable energy resources .

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Teachers have the potential to be what Giroux and McLaren described as transformative intellectuals who combine scholarly reflection and practice in the service of educating students to be thoughtful, active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the challenges resulting from climate change. . It does so through tackling the following logically sequenced six issues: 1) Weather and climate; 2) Climate change and livelihoods; 3) Gender-sensitive response to climate change; 4) Climate change communication; 5) Fairness and climate change justice; and 6) Future climate change scenarios. Issues 3-6 are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of climate changes at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the consequences of climate changes – at local, national and international scales - in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for a sustainable future for all; and c) use traditional and electronic resources as well as social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

32. Become familiar with the basic terminology and core concepts of climate change adaptation planning.
33. Identify the most likely impacts of local climatic hazards.
34. Articulating what good climate resilient development actually look like.
35. Compare local problems with problems elsewhere and to gain adaptation ideas from this comparison.

36. Comprehend the opportunities for planners and the social, economic and ecological risks of climate change.
37. Understand historical community reactions to and coping strategies for climatic hazards.
38. Contribute to the debate on global environmental change and societal adaptation strategies; to become an informed citizen and decision maker.
39. Demonstrate capacities for self-reflection and self-evaluation as integral aspects of the adaptive learning cycle.
40. Questioning business as usual can threaten our ideals, values, beliefs, business strategies and technical understanding and is not necessarily what everyone wants to hear.
41. Draw on active teaching and learning approaches to empower learner, young people and civic engagement.
42. Anticipate possible future environmental change and identify possible development consequences.
43. Appreciate the importance and practical characteristics of adaptive approaches.
44. Demonstrate knowledge and understanding of relationship between poverty, environment, climate change, economics and social issues.
45. Relate climate change and sustainability policy to a range of curricular areas in formal, non formal and informal education.

Course Modules

Course	Scientifc Culture
Module 1	**Climate Change : Environmental Impacts**
Key Concepts	Climate Change, Environment
Overview	The term environment may be vague for many students, Some of them my be concerned with the physical environment around them. They might ignore my cultural components of environment which are responsible for shaping mans attitudes, and in turn, influence our behaviour. Such behaviour might aggregate or alleviate the environmental challenges. Mans behaviour may be affected by climate change. So, his reaction toward the environment is almost disastrous!! Issues addressed in this module include: definition of environment, components of environment: physical and cultural; basic differences between weather and climate; and impacts of local climatic hazards.
Aim	The aim of this module is to turn students able to discourse on basic concepts related to environment and the impact of climate change.
Learning Outcomes	At the end of this module learners will be able to: 1. Become familiar with the basic terminology and core concepts of climate change adaptation planning. 2. Identify the most likely impacts of local climatic hazards. 3. Articulating what good climate resilient development actually look like.
Units	Unit 1.1: Environment: Physical and Cultural Unit 1.2: Man VS Environment Unit 1.3: Weather and Climate
Readings	• Climate Change: Key Concepts. **http://www.careclimatechange.org/tk/cba/en/cba_**basics/key_concepts.html • The Intergovernmental Panel on Climate Change (IPCC) is a body set up to

provide scientific, technical and socio-economic information in a policy-relevant but policy neutral way to decision makers.

Activity	**Overview** Assignment 1.1: Reflecting Upon environmental issues 1. To what extent is responsible for environmental problems? (3-4 paragraphs) 2. What can we do to alleviate environmental problems? 3. draw a table of comparison to show the main differences between climate and weather. Assignment 1.2: Investigate local environmental problems to: - Make a list of most serious environmental problems - Interview a sample of citizens to identify their awareness of such problems. Access and explore the following report to identify and summarize its main ideas with regard the management of the environmental impacts of Climate Change: World Bank 2009. Convenient Solutions to an Inconvenient Truth: Ecosystem-based Approaches to Climate Change. Environment Department, World Bank.
Module 2	Climate Change and Livelihoods: Problems and Solutions
Key Concepts	Climate change , livelihoods (man, plant, animals)

Overview	The world is highly susceptible to a number of natural hazards droughts including, floods and hurricanes. Increasing in frequency and ferocity as a result of changing climate systems, these disasters are placing increased stress on inhabitants and severely impairing economic growth as they batter climate vulnerable sectors like tourism and agriculture upon which the region is financially reliant.In order to avoid risks and damage and to strengthen human resilience to natural disasters, governments need to be prepared. However, in developing countries, the ability of governments to help is often very limited. The impacts of loss and damage associated with natural disasters can set back development by increasing the incidence and severity of poverty. Poverty and vulnerability are fundamentally intertwined: the poor have fewer resources to cope with climate risk and thus their resource base is further diminished with every extreme weather event, deepening their poverty. This module is intended to raise the students awareness towards local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas for the management of such problems.
Aim	The overriding aim of this module is to identify local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas from this comparison.
Learning Outcomes	At the end of this module learners will be able to compare local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas from this comparison.
Units	Unit 2.1: Climate change and livelihoods Unit 2.2: Climate change and livelihoods (man, plant, animals)

Activity	**Overview**
	Design poster showing local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas for the management of such problems.
Module 3	**Gender-Sensitive Response to Climate Change**
Key Concepts	Gender-Sensitive
Overview	A gender-sensitive response does not mean having a set of disaggregated data showing that climate change has differential impacts on women and men. In fact, it is obvious. So more than that, it requires an understanding of the nature of existing inequalities between women and men, their consequences, and then coming up with strategies to nullify them. However, due to their social status men may have greater access to vital information on climate change mitigation or adaptation strategies, or women are too busy with caring and other domestic responsibilities so they lack this information. Therefore, lack of information and lack of opportunity to voice their concerns about adaptation and mitigation strategies could jeopardize their safety when climate change events strike.

	To counter this situation, strategies need to be planned so that women receive as much information on climatic events and conditions as men do. Women are also more likely than men to be absent from decision-making, right from home, to community, to national, to international levels for two reasons. One, their opinion is not given importance and two, they don't have time or confidence or opportunity to share. Therefore, whatever the reasons are they are simply marginalized; and the same is true for elderly and children. The net result is that they remain more vulnerable than men. Thus, if effective adaptation strategies have to be chalked out for them they must be drawn out to participate in the climate change discussions which in turn, means challenging the traditional assumptions about their capabilities and redefining their gender equation. For centuries, women have passed on their skills in water management, forest management and the management of biodiversity, among others. Through these experiences, women have acquired valuable knowledge that will allow them to contribute positively to the identification of appropriate adaptation and mitigation techniques, if only they are given the opportunity. The present module is concerned with: Male/Female awareness of climate change consequences; as well as their role in the management of climate change consequences.
Aim	This module encourages the students to the debate on global environmental change and societal adaptation
Learning Outcomes	At the end of this module learners will be able to: • Contribute to the debate on global environmental change and societal adaptation strategies; to become an informed citizen and decision maker. • Demonstrate capacities for self-reflection and self-evaluation as integral aspects of the adaptive learning cycle.
Units	Unit 3.1: Gender-sensitive response to climate change

	Unit 3.2: Male/Female: awareness of climate change consequences Unit 3.3: Male/Female: how to alleviate climate change consequences
Readings	• Gender and Climate Change Adaptation: Tools for Community-level Action in Nigeria, http://africanclimate.net/en/node/8979 • Intergovernmental Panel on Climate Change (IPCC) Working Group 2, 2001. *Third Assessment Report, Annex B: Glossary of Terms.* • IPCC, 2007: *Climate Change 2007: Impacts, Adaptation and Vulnerability. Hanson, Eds., Cambridge University Press, Cambridge, UK, 976pp.
Activity	**Overview**
	Assignment 1: Propose a strategy to: 1- Raise the awareness of both Male and Female citizen towards the climate change consequences in your local environment 2- how to involve both Male and Female citizen in the management of climate change consequences in your local environment
Module 4	**Climate Change Communication**
Key Concepts	social, economic and ecological risks of climate change; civic engagement

Overview	The rapid development of multimedia and hypermedia technologies has provided new avenues for merging images, sound, movies and animation together with texts. These can serve as effective tools for communicating information and data related to climate change concepts, causes and consequences. Climate change is the result of human actions and choices. Limiting climate change – and protecting people and ecosystems to the degree possible from unavoidable changes in the climate – will require significant public engagement in the issue so that difficult decisions can be made by members of the public and policy makers. So, the need emerges for unbiased social science research that will facilitate such public engagement. In other words, students should be trained on how to use social science research methods – experiments, surveys, in-depth interviews and other methods – to find ways of effectively engaging the public and policy makers in the problem, and in considering and enacting solutions. Social science research has played important roles in many social change campaigns over the past several decades, including reducing smoking and littering, and increasing seat belt use and recycling. So, they can conduct unbiased public engagement research - and help government agencies, non-profit organizations, and companies apply the results of this research - so that collectively, we can stabilize our planet's life sustaining climate.
Aim	The overriding aim of this module is encourage the students explore and use appropriate tools to communicate social, economic and ecological risks of climate change.
Learning Outcomes	At the end of this module learners will be able to: - Comprehend the opportunities for planners and the social, economic and ecological risks of climate change. - Understand historical community reactions to and coping strategies for climatic hazards. - Questioning business as usual can threaten our ideals, values, beliefs,

	business strategies and technical understanding and is not necessarily what everyone wants to hear. - Draw on active teaching and learning approaches to empower learner, young people and civic engagement.
Units	Unit 3.1: Climate Change Communication (Concepts) Unit 3.2: Climate Change Communication (tools: design) Unit 3.3: Climate Change Communication (tools: implementation/analysis)
Readings	• Adapted from: UNISDR, 2009. Terminology: Basic terms of disaster risk reduction and IISD et al, 2007. Community-based Risk Screening – Adaptation and Livelihoods (CRiSTAL) User's Manual, Version 3.0. • UNISDR, 2009. Terminology: Basic terms of disaster risk reduction. Department for International Development, UK (DFID). 2001. *Sustainable Livelihoods Guidance Sheet*. Available at **http://www.nssd.net/pdf/sectiont.pdf**.
Activity	**Overview**
	Assignment: Students are invited to work in groups to: - Design appropriate tools to communicate social, economic and ecological risks of climate change. - Write a report on the obtained results of communicating social, economic and ecological risks of climate change. - Orally present the outcomes of the above report
Module 5	Climate Change: Justice and Future Scenarios
Key Concepts	climate change fairness, justice; future scenarios.
Overview	This module is about climate change scenarios. Socioeconomic scenarios are used by analysts to make projections of future greenhouse gas (GHG) emissions and to assess future vulnerability to climate change. Producing scenarios requires estimates of future population levels, economic activity, the structure of governance, social values, and patterns of

	technological change. Economic and energy modelling (such as via the World3 or the POLES models) can be used to analyse and quantify the effects. These scenarios can be thought of as stories of possible futures. They allow the description of factors that are difficult to quantify, such as governance, social structures, and institutions. However, researcher claim a considerable variety among scenarios, ranging from variants of sustainable development, to the collapse of social, economic, and environmental systems.
Aim	The overriding aim of this module is to equip students with the capacity to actualise issues such as fairness and climate change justice; future climate change scenarios.
Learning Outcomes	At the end of this module learners will be able to contribute to group discussion with regard: • possible future environmental change and identify possible development consequences. • the importance and practical characteristics of adaptive approaches. • The relationship between poverty, environment, climate change, economics and social issues. • climate change and sustainability policy and a range of curricular areas in formal, non formal and informal education.
Units	Unit 5.1: Fairness and climate change justice Unit 5.2: Future climate change scenarios

Course Description/Overview

The present course is intended to raise the students' awareness of soil . The course concentrates on the techniques employed in the analysis of the physical, hydrological, chemical, and biological properties of soils as well as those processes which control the development of the soil. It introduces students to the fundamentals of soil pollution with a background on historical perspective on soil pollution and a commentary on current soil quality policies and standards. It does so through tackling the following aspects: 1) natural sources of soil pollution, 2) anthropogenic sources of soil pollution, 3) airborne particulate matter, 5) negative impacts, 6) global warming, 7) soil pollution act, 8) atmospheric stability, 9) thermal invasion, 10) modelling of soil pollution and control devices. That is they are asked to read and summarize articles on soil pollution and its treatment. They are invited to discuss impacts of soil pollution on environment at local, national and international scales.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of soil pollution; b) to raise awareness of the learners about effects of soil pollution on climate; c) help learners use traditional and electronic tools to identify the risks the different types of soil pollutants; and d) to identify risks of soil pollution.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

8. Discuss the sources of domestic, agricultural and industrial wastes and pollutants.
9. Identify the problems arising at pollution sites.
10. Devise solutions to the soil pollution problems.
11. Design soil treatment and water treatment process systems, among environmental processes.
12. Anticipate possible future environmental change and identify possible development consequences.

13. Estimate health impact of changes in soil pollution
14. Identify the different types of soil pollutants.

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Description/Overview

The present course is intended to provide students with the key concepts about the methods and principles of environmental assessment of the impacts of activities and pollutants (predicting dispersion and ecological distribution of pollutants during discharge and after emission) with the introduction of the basics of project formulation, relationships between organisms and their environment and managing human, air and soil resources, A course which will familiarize students with a wide range of laboratory and held methods directly applicable to the study of environmental problems.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of methods and principles of environmental assessment of the impacts of activities and pollutants; b) to raise awareness of the learners about the need for predicting dispersion and ecological distribution of pollutants during discharge and after emission; c) and help learners to acquire the basics of project formulation, relationships between organisms and their environment and managing human, air and soil resources and d) give the basic understanding of a wide range of laboratory and held methods directly applicable to the study of environmental problems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Identify methods and principles of environmental assessment of the impacts of activities and pollutants.

2-Explain the dispersion and ecological distribution of pollutants during discharge and after emission.

3- Discuss the basics of project formulation, relationships between organisms and their environment and managing human, air and soil resources.

4- Explore the influence of economic activities on surrounding environment.

5- Summarize a wide range of laboratory and held methods directly applicable to the study of environmental problems.

Course Description/Overview

The present course is intended to raise the students' awareness water. It introduces them to the benefits of using clean energy resources. It does so through tackling the following aspects: 1) natural sources of air pollution, 2) anthropogenic sources of air pollution, 3) airborne particulate matter, 4) size distribution of atmospheric aerosols, 5) negative impacts, 6) global warming, 7) air pollution act, 8) atmospheric stability, 9) thermal invasion, 10) modelling of air pollution and control devices. That is they are asked to read and summarize articles on renewable energy resources. They are invited to discuss impacts of energy resources on environment at local, national and international scales. In short, the course provides an appropriate chance for the students to get the minimum knowledge of the advantages and disadvantages of renewable energy resources.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of air pollution; b) to raise awareness of the learners about effects of air pollution on climate; c) help learners use traditional and electronic tools to identify the risks the different types of air pollutants; and d) to highlight

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

43. Discuss the sources of domestic, agricultural and industrial wastes and pollutants.
44. Identify the problems arising at pollution sites.
45. Devise solutions to the water pollution problem.
46. Design water treatment and wastewater treatment process systems, among environmental processes.
47. Apply the different steps of the monitoring cycle in rivers and lakes.

48. Anticipate possible future environmental change and identify possible development consequences.
49. Appreciate the positive impacts of utilizing renewable energy resources on the environment.
50. Apply common statistical techniques for water quality data evaluation.
51. Use the different tools and equipments of renewable energy resources .
52. Apply concepts of water pollution processes in rivers and lakes.

Course Description/Overview

Though the political thought cared about the Human rights' issue since ever, this care has not reached the nowadays level but recently; only when the Human rights' issue has become an important issue on the international level during the last decade of the twentieth century. The Human rights' issue has been connected to what distinguish man as a man. This can start with ensuring the right of every child in life even before he is

born. Then, his rights extend to his care all his life, as he has the right in security, assurance, education, accommodation, health besides his right in political participation and expressing his opinion.

This course is divided into five parts: the first is titled: The Essence of Human Rights. It deals with the concept of human rights, its importance, beginnings, and the human rights and the peoples' rights. The second part is titled: Judiciary and Human Rights. It tackles the role of judiciary in maintaining the human rights, and the types of human rights as well. The third part is: The Procedures of Human Rights. It deals with the procedures of Human Rights on the international, regional and national levels. The fourth is titled: Applications of Human Rights. This one discusses the applications in the fields of medicine, engineering, agriculture and science. The fifth is titled: The Islamic and International Declarations of Human Rights, a comparison between the Islamic and International Declarations of Human Rights.

Course Learning Objectives

The overarching goals of this course are:

8. Recognizing the concept of Human Rights and its importance
9. Defining the types of Human Rights
10. Recognizing the procedures of Human Rights, their beginnings and sources
11. Applying Human Rights' procedures in various fields
12. Discussing the restrictions on Human Rights
13. Learning about the historical development of Human Rights and Democracy
14. Determining the relation between Democracy and Human Rights

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

8. Recognize the Human Rights and their procedures

9. State the Civil, Political, Economic and Social Rights
10. Demonstrate the beginnings, sources and procedures of Human Rights
11. Explain some models of Human Rights' Applications on different levels
12. Analyze the Human Rights' procedures on the international, regional and national levels
13. Analyze the international charters of Human Rights
14. Differentiate between the Human Rights in both the Islamic and Western Civilizations

Course Resources

8. Fadl-ullah Muhammad Isma'eil: Human Rights between the Western Thought and the Islamic, Bustan Elma'refa, Alexandria, 2006.
9. Lotfy Mahmoud Abd El-Haleem: Human Rights Between the United Nations' Declarion and the Holy Qur'an, Dar Almisbah, Cairo, 1992.
10. Muhammad El-Ghazaly: Human Rights between the Islamic Instructions and the United Nations' Declaration, Dar Elkotob Elhaditha, Cairo, 1965.
11. Muhammad Abd El-Ma'boud Morsy and al.: Human Rights Suez Canal University, (University Requirement).
12. Muhammad Fathy Othman: Human Rights between the Islamic Law and the Western Legal Thought, Dar El-Shorouk, Beirut, 1982.
13. Muhammad No'man, Egypt and the Human Rights between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
14. Muhammad Salam Zanaty, Human Rights (Historical Introduction), 1992.

Course Website(s)

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	40%
Exams	40%
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and

stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Disability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		Human Rights, Concept and Importance
2		Beginnings and Sources of Human Rights

3		Human Rights and Peoples' Rights
4		The Role of judiciary in Maintaining Human Rights
5		Types of Human Rights and the Restrictions on them
6		Human Rights' Procedures on the International Level
7		Human Rights' Procedures on the Regional Level
8		Human Rights' Procedures on the National Level
9		Human Rights' Applications in the field of Engineering, Medicine, Agriculture and Science
10		The Islamic Declaration of Human Rights
11		The International Declaration of Human Rights
12		A Comparison Between The Islamic and International Declarations of Human Rights

APENDIX II: The CLIMASP Course Modules Template Example

Course	
Module 1	
Key Concepts	The Essence of Human Rights
Overview	This module tackles the essence of Human Rights and its importance in establishing societies, the beginnings of Human Rights and the most important factors which paved the way for the Human Right Movement within the society.

Aim	The main objective is to identify the concept of Human Rights, its beginning, and the factors which affected it.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Clarify the Human Rights concept, and its importance. • Recognize the historical development of the concept. • Be exposed to the beginning and the sources of Human Rights
Units	• Human Rights: Concept and Importance • The Beginning and sources of Human Rights • Human Rights and Peoples' Rights
Readings	Muhammad Salam Zanaty, Human Rights (Historical Introducti 1992.
Activity	
	Writing an essay about the essence of Human Rights and its importance in establishing societies.

Module 2	
Key Concepts	Judiciary and Human Rights
Overview	This module deals with the role of justiciary in maintaining the Human Rights as every individual has the rights to have an effective legal tool in the national court specialized in the deeds violating the Human Rights given to individuals by judiciary or constitution. People are equal before judiciary, and therefore have equal protection without any discrimination by judiciary.
Aim	The main aim of this module is recognizing the role and importance of judiciary in maintaining Human Rights, and recognizing the rights given to humans.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Recognize the role of judiciary in maintaining Human Rights • Determine types of Human Rights • Discuss the restrictions on Human Rights
Units	3. The Role of judiciary in maintaining Human Rights 4. Human Rights' Types and Restrictions on them
Readings	Lotfy Mahmoud Abd El-Haleem: Human Rights Between the United Nations' Declarion and the Holy Qur'an, Dar Almisbah,

	Cairo, 1992
Activity	
	Preparing critical researches on some thoughts presented in the content
Module 3	
Key Concepts	Human Rights' Procedures
Overview	This module deals with the procedures necessary for applying the Human Rights within the society as these rights are integrated and no right overwhelms another. Besides, an individual's rights are not separated from the rights of the society. Therefore, procedures are imposed to apply the Human Rights.
Aim	The main goal of this module is recognizing the procedures necessary for applying the Human Rights whether on the international, regional or national levels.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Recognize the Procedures of Applying the Human Rights • Analyze the Human Rights' Procedures on the international, regional or national levels.
Units	4. Human Rights' Procedures on the international level. 5. Human Rights' Procedures on the regional level. 6. Human Rights' Procedures on the national level.
Readings	Muhammad No'man Galal, Egypt and the Human Rights

	between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
Activity	Using the Internet in holding a research on the Human Rights' Procedures on the International, Regional and National Levels
Module 4	
Key Concepts	Human Rights' Applications
Overview	This module focuses on how to apply the Human Rights in the field of medicine for maintaining the patient's rights on the physician, in medical treatment, and in sickness confidentiality. In the field of Engineering, the application is held by the syndicate commitment to the laborers' rights. In Agriculture, it is guaranteed by the protection of the new plant species, etc. In Science, Human Rights are applied via maintaining copyrights as well as other applications.
Aim	The main goal of this module is recognizing the most important Human Rights' Applications in different fields.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Identify the Human Rights' Applications in different fields. • Suggest procedures to apply the Human Rights' Applications in different fields.

Units	3. Human Rights' Applications in the fields of Medicine and Engineering 4. Human Rights' Applications in the fields of Agriculture and Science
Readings	Muhammad No'man Galal, Egypt and the Human Rights between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
Activity	
	Holding civil researches about how to apply Human Rights on different fields
Module 5	
Key Concepts	The Islamic and International Declarations of Human Rights
Overview	
Aim	To recognize human rights in both the Islamic and European Civilizations and to learn about the international charters of human rights
Learning Outcomes	By the end of this module, learners are expected to be able to: • Differentiate between human rights in both the Islamic and European Civilizations • Analyze the international charters of human rights
Units	4. The Islamic Declaration of Human Rights 5. The International Declaration of Human Rights

	6. A comparison between the Islamic and International Declarations of Human Rights
Readings	Mohammad No'man Galal, Egypt and Human Rights between Truth and Slander (a documentary study), the Egyptian General Association for Books, Cairo, 1993.
Activity	
	Writing an essay that clarifies the most important principals in the Islamic and International Declarations of Human Rights

Course Description/Overview

The present course is intended to provide students with the key concepts about physical and chemical properties of water, hydrogeochemical processes, influence of aquifer materials on groundwater quality, representations of results of chemical analyses, groundwater origin and genesis, water quality modelling, sources of groundwater pollution, municipal, agricultural, mining, industrial sources, water treatment, the distribution of biota, nutrients and contaminants in the aquatic environment. Topics will include the hydrologic cycle, the carbonate system and pH control, weathering and water chemistry, redox equilibria, and hydrologic transport.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of hydrogeochemical processes and influence of aquifer materials on groundwater quality; b) to raise awareness of the learners about the need for new sources of water needed for irrigation and drink; c) and help learners to acquire water quality modeling: and d) give the basic understanding of hydrologic cycle, carbonate system, weathering and hydrologic transport

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the physical and chemical properties of water.
2. Explain the groundwater origin and genesis, water quality modelling, sources of groundwater pollution,.
3- Discuss weathering and water chemistry.
4- Identify the elements of the climate on the maps using the suitable symbols.
5- Explore the influence of aquifer materials on groundwater quality.

Course Description/Overview

The present course is intended to provide students with practical and detailed examination of the enactment, enforcement and limitations of environmental law and policy. The course will 'provide a comprehensive overview of environmental law. It critically explores modes of decision-making in contemporary institutions with special emphasis on methods of evaluation in environmental management. Decision analysis, risk assessment and other techniques of 'scientific' decision/evaluation are studied using both theoretical and case-study approaches. The course focuses on perspectives, actors, institutions, and economic relationships as they relate to global environmental policy.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of environmental law; b) to raise awareness of the learners about the need for new methods of evaluation in environmental management; and c) provide students with a solid understanding of linkages between the global political system and the natural environment

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the issues arising from the impact of industrial and development policies on the natural environment.
2. Explain the limitations of environmental law.
3- Discuss perspectives, actors, institutions, and economic relationships as they relate to global environmental policy.
4- Identify the methods of evaluation in environmental management..
5- Explore the linkages between the global political system and the natural environment.

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Physician have the potential to be decision maker and practice in the service of educating patients to be active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the environmental challenges resulting from climate change. It does so through tackling the following logically sequence issues: 1) Environmental awareness; 2)Environmental ethics; 3) Biodiversity and climate change; 4) Climate change adaptation; 5) Urbanization's role in climate change; 6) Water resources and climate change Social learning processes; and 7) natural sources of pollution and man madepollutions 8) air pollution, noise pollution and human activity 9) effect of pollution on health Issues are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is, they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of water resources at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the negative environmental consequences of climate changes – at local, national and international scales -in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for the management of critical environmental issues; and c) use traditional and electronic resources as well as social networking technologies as tools tohelp the community, including children, identify risks and develop climate change adaptation strategies. d) to raise the awareness of the learner about the need to examine physical, chemical, biological, political and economic dimension of environment

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

- Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community.
- Discuss the basic terminology and core concepts of environment
- Identify the physical chemical biological political and economic dimension of environment
- Conduct survey of environmental system , human interaction
- Analyse methods of ensuring local participation in climate change adaptation.
- Analyze the effects of climate change from both male and female perspectives
- Compare and contrast the impacts of major climatic hazards on human beings and the community.
- Comprehend the significance of the climate change problem locally and globally.
- Describe the relationship between human activities and climate change.
- Describe the relationship between poverty and unsafe environment
- Demonstrate an understanding of the different types of pollutions and its impact on human health
- Explore solutions and mitigation process to problems that cause climate change.
- Identify ways to reduce the impact of climate changes
- Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in.
- Investigate the causes of climate change and pollution
- Propose solutions to climate change issues.
- Understand how human actions are contributing to global environmental change. Course Resources

6		Urbanization's role in climate change /health
7		Water resources and climate change Social learning processes (FORUM 1)
8		Air pollution and climate change Social learning processes (FORUM 2)
9		Gender and climate change Social learning processes (FORUM 3)
10-15		Mitigation and health (concepts, feasibility and consequences, techniques, national and international models)

Course Modules

Course	Man and Environment
Module 1	Environment: Ethics and Awareness
Key Concepts	Environmental awareness, Environmental ethics
Overview	Environmental awareness is to understand the fragility of our environment and the importance of its protection. Promoting environmental awareness is an easy way to become an environmental steward and participate in creating a brighter future for our children.To define environmental awareness we must first understand the environmentalist movement. Environmentalism is an ideology that evokes the necessity and responsibility of humans to respect, protect, and preserve the natural world from its anthropogenic (caused by humans) afflictions. Environmental awareness is an integral part of the movement's success. By teaching our students, friends and family that the physical environment is fragile and indispensable. Students need to start fixing the problems that threaten it. Environmental ethics, on the other hand, is the part of environmental philosophy which considers extending the traditional boundaries of ethics from solely including humans to including the non-human world. It exerts influence on a large range of disciplines including environmental law, environmental sociology, ecotheology, ecological economics, ecology and geography. There are many ethical decisions that human beings make with respect to the environment. Throughout this module, students are invited to share and exchange ideas about issues related to :clear cut forests for the sake of human consumption, propagation of species, gasoline powered vehicles, etc.
Aim	The overriding aim of this module is to turn students able to discourse how human actions are contributing to global environmental change.
Learning	At the end of this module learners will be able to:

Outcomes	• Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community. • understand how human actions are contributing to global environmental change.
Units	Unit 1.1:Environmental awareness Unit 1.2: Environmental ethics
Readings	• Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986** • **Paul Pojman**Environmental Ethics: Readings in Theory and ApplicationPaperback – January 1, 2007 • Oxford Dictionary of Philosophy: environmental ethics, **http://www.answers**.com/topic/environmental-ethics
Activity	**Overview** Assignment 1.1: Reflecting Upon the following issues: • clear cut forests for the sake of human consumption. • propagating our species, and life itself. • make gasoline powered vehicles. • environmental obligations needed to keep for future generations. • the extinction of a species for the convenience of humanity. • Methods for best use and conserve of the space environment to secure and expand life.
Module 2	Biodiversity and Climate Change
Key Concepts	Biodiversity, Climate, Climate Change
Overview	In the atmosphere, gases such as water vapour, carbon dioxide, ozone, and methane act like the glass roof of a greenhouse by trapping heat and warming

	the planet. These gases are called greenhouse gases. The natural levels of these gases are being supplemented by emissions resulting from human activities, such as the burning of fossil fuels, farming activities and land-use changes. As a result, the Earth's surface and lower atmosphere are warming, and this rise in temperature is accompanied by many other changes. Rising levels of greenhouse gases are already changing the climate. These changes are affecting the entire world, from low-lying islands in the tropics to the vast polar regions. Also, Climate change affects biodiversity. It becomes one of the most significant drivers of biodiversity loss by the end of the century. It is already forcing biodiversity to adapt either through shifting habitat, changing life cycles, or the development of new physical traits. In this module, students need to realize that, conserving natural terrestrial, freshwater and marine ecosystems and restoring degraded ecosystems (including their genetic and species diversity) is essential for human well-being. Biodiversity can support efforts to reduce the negative effects of climate change. Conserved or restored habitats can remove carbon dioxide from the atmosphere, thus helping to address climate change by storing carbon (for example,reducing emissions from deforestation and forest degradation). Moreover, conserving in-tact ecosystems, such as mangroves, for example, can help reduce the disastrous impacts of climate change such as flooding and storm surges.
Aim	The overriding aim of this module is to realize the interrelationship between biodiversity and climate change
Learning Outcomes	Students will be able to: • Analyse methods of ensuring local participation in climate change adaptation. • Analyze the effects of climate change from both male and female perspectives
Units	Unit 2.1: Biodiversity, Climate,

	Unit 2.2: Climate Change Unit 2.3: Climate Change Adaptation
Readings	Shah, Anup. "Biodiversity." *Global Issues*. 19 Jan. 2014. Web. 10 Sep. 2014. <http://www.globalissues.org/issue/169/biodiversity>. • Doucet, C. (2007) *Urban Meltdown: Cities, Climate Change and Politics as Usual*, New Society Publishers, Gabriola Island BC. • Dow, K. and Downing, T. (2006) *The Atlas of Climate Change: Mapping the World's Greatest Challenge*, University of California Press, Berkeley. • Flannery, T. (2005) *The Weather Makers: How Man is Changing the Climate and What It Means for Life on Earth*, Atlantic Monthly Press NY. • Hansen, J. (2010) *Storms of My Grandchildren: The Truth about the Coming Climate Catastrophe and Our Last Chance to Save Humanity*, Bloomsbury, New York. • Henson, R. (2008) *The Gough Guide to Climate Change: The Symptoms, The Science, The Solutions*, Rough Guides, London.
Activity	**Overview**
	Work in group to: - Collect information on biodiversity in your local environment. - Collect evidence on the effects of climate changeon biodiversity in your local environment during the last fifty years. - Propose a strategy to protect biodiversity in your local environment.
Module 3	**Urbanization and Climate Change**
KeyConcepts	Urbanization
Overview	This Module deals with the implications of population growth and urbanization for climate change in terms of the contribution of urban populations (and centres) to human induced climate change. It emphasizes how it is not the

	growth in (urban or rural) population but the growth in consumption that drives the growth in greenhouse gas emissions and that a significant proportion of the world's urban (and rural) population have consumption levels that are so low that they contribute little or nothing to such emissions. In this module students discuss how in the much-needed planning for global emissions reduction, provisions must be made to allow low-income low-consumption households with greenhouse gas emissions below the 'fair-share' level to increase their consumption.
Aim	This module aims at examining the relationship between urbanization and climate change.
Learning Outcomes	At the end of this module learners will be able to: • Describe the relationship between human activities and climate change. • Demonstrate an understanding of the natural carbon cycle.
Units	Unit 3.1: Urbanization *Unit 3.2: Urbanization a Mixed Blessing* Unit 3.3: Urbanization and Climate Change
Readings	• David Satterthwaite The implications of population growth and urbanization for climate change, Paper presented at Expert-Group Meeting on Population Dynamics and Climate Change, UNFPA and IIED In Collaboration with UN-HABITAT and the Population Division, UN/DESA 24 to 25 June 2009 • Holper, P. and Torok, S. (2008) *Climate Change: What You Can do about It at Work, at Home, at School*, Pan Macmillan,Sydney. • Hulme, M. (2009) *Why We Disagree About Climate Change: Understanding Controversy, Inaction and Opportunity*, Cambridge University Press, Cambridge. • Johansen, B. (2006) *Global Warming in the Twenty-First Century*, Praeger

	Publishers, Westport CT. • Moser, S. and Dilling, L. (eds) (2007) *Creating a Climate for Change: Communicating Climate Change and Facilitating Social Change*, Cambridge University Press, Cambridge.
Activity	**Overview**
	Assignment : Prepare a lecture either of following themes 5. Urbanization: cons and pros 6. Urbanization and Carbon Cycle
Module 4	Water Resources and Climate Change
Key Concepts	Water resources management, Social learning processes
Overview	Water resources are important to both society and ecosystems. We depend on a reliable, clean supply of drinking water to sustain our health. We also need water for agriculture, energy production, navigation, recreation, and manufacturing. Many of these uses put pressure on water resources, stresses that are likely to be exacerbated by climate change. In many areas, climate change is likely to increasewater demand while shrinking water supplies. This shifting balance would challenge water managers to simultaneously meet the needs of growing communities, sensitive ecosystems, farmers, ranchers, energy producers, and manufacturers. In this module need to realize that in some areas, water shortages will be less of a problem than increases in runoff, flooding, or sea level rise. These effects can reduce the quality of water and can damage the infrastructure that we use to transport and deliver water.
Aim	The overriding aim of this module is realize the interrelationship between water resources management and climate change
Learning Outcomes	At the end of this module learners will be able to: • Compare and contrast the impacts of major climatic hazards on livelihoods

	of the community. • Comprehend the significance of the climate change problem locally and globally. • Explore solutions to problems that cause climate change.
Units	Unit 4.1: Water Resources and Climate Change Unit 4.2: Climate change Social learning processes
Readings	• CCSP (2008). *The Effects of Climate Change on Agriculture, Land Resources, Water Resources, and Biodiversity in the United States*. A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Backlund, P., A. Janetos, D. Schimel, J. Hatfield, K. Boote, P. Fay, L. Hahn, C. Izaurralde, B.A. Kimball, T. Mader, J. Morgan, D. Ort, W. Polley, A. Thomson, D. Wolfe, M. Ryan, S. Archer, R. Birdsey, C. Dahm, L. Heath, J. Hicke, D. Hollinger, T. Huxman, G. Okin, R. Oren, J. Freshwater resources and their management. In: *Climate Change 2007: Impacts, Adaptation and Vulnerability*. EXIT Disclaimer *Contribution of Working Group II to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change* [Parry, M.L., O.F. Canziani, J.P. Palutikof, P.J. van der Linden and C.E. Hanson (eds.)]. Cambridge University Press, Cambridge, United Kingdom. • CCSP (2009). *Coastal Sensitivity to Sea-Level Rise: A Focus on the Mid-Atlantic Region*. A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Titus, J.G.

	(Coordinating Lead Author), Anderson, K.E., Cahoon, D.R., Gesch, D.B., Gill, S.K., Gutierrez, B.T., Thieler, E.R., Williams, S.J. (Lead Authors). U.S. Environmental Protection Agency, Washington, DC, USA. • CCSP (2008). *Preliminary Review of Adaptation Options for Climate-Sensitive Ecosystems and Resources* . A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Julius, S.H., J.M. West (eds.), J.S. Baron, B. Griffith, L.A. Joyce, P. Kareiva, B.D. Keller, M.A. Palmer, C.H. Peterson, and J.M. Scott (authors). U.S. Environmental Protection Agency, Washington, DC, USA.
Activity	**Overview**
	• **Assignment**:plan a seminar on major climatic hazards on livelihoods of the community comparingthe problems of water shortages and those of water increases
Module 5	**Water Management and Recycling**
Key Concepts	Water management and recyclingprocesses, techniques
Overview	Water cycle is a delicate balance of precipitation, evaporation, and all of the steps in between. Warmer temperatures increase the rate of evaporation of water into the atmosphere, in effect increasing the atmosphere's capacity to "hold" water.Increased evaporation may dry out some areas and fall as excess precipitation on other areas.Changes in the amount of rain falling during storms provide evidence that the water cycle is already changing. Rising temperatures cause snow to begin melting earlier in the year. This alters the timing of streamflow in rivers that have their sources in mountainous areas. As temperatures rise, people and animals need more water to maintain their health and thrive. Many important economic activities, like producing energy at power plants, raising livestock, and growing food crops, also require water. The amount of water available for these activities may be reduced as Earth warms, and if competition for water resources increases.
Aim	The overriding aim of this module is to equip students with the capacity to

	debate on water management and recycling processes, techniques and feasibility>
Learning Outcomes	At the end of this module learners will be able to: • Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in. • Investigate the causes of climate change. • Propose solutions to climate change issues.
Units	Unit 5.1: Water management (concepts; national and international models) Unit 5.2: Water recycling techniques feasibility and consequences
Readings	• United Nations Development Programme (2007) *Fighting Climate Change: Human Solidarity in a Divided World: Human Development Report 2007-2008*, Palgrave Macmillan, Basingstoke, UK. • *Layperson's Guide to Water Recycling and Reuse*, published in 1992 by the Water Education Foundation, Sacramento, California. • Video, entitled *Water from Water: Recycling*, produced in 1995 by National Water Research Institute, Fountain Valley, California. • Research On Recycled Water is done by EPA through the Office of Research and Development. • Water Recycling and Reuse: The Environmental Benefits http://www.epa.gov/region9/water/recycling/
Activity	**Overview**
	Students are to plan and implement three-sessions workshop on the following themes: • Water management (concepts; national and international models) • Water recycling techniques feasibility and consequences

MAPPING COURSES RELATED TO CLIMATE CHANGE EDUCATION AND SUSTAINABLE DEVELOPMENT				
	COURSE NAME	FACULTY	NAME OF INSTRUCTOR	SHORT DESCRIPTION OF THE COURSE
1	Fish adaptation and climatic change	Fish and fisheries technology	Dr Ahmed Otify	Scientific bases of climate change and the greenhouse effect on earth and Fisheries. Greenhouse gases and carbon dioxide emissions. The land as a container for the storage of carbon emissions and ways to monitor the degradation of land and water resources as a result of climate change. The role of farming plants in reducing the impact of carbon dioxide and the use of computer models in the management of climate change.
2	Paleoecology Course	Science	Prof Abdel- ziz Tantawy	Overview of environmental changes through time, local environmental changes and regional to global climate change of the past, synecology of fossils, paleobiodiversity, changes in communities over geologic time, stable isotopes of oxygen and carbon, paleotemperature. Objectives - to learn and apply methods for determining how environments and climate on Earth have changed through time.

				Learning Outcomes - an understanding of how paleoenvironments and paleoclimate change are studied in the field and lab, and major changes that have occurred.
3	Economic Geology	Science	Dr. Ashraf Emam	This course is an introduction to the geologic and economic factors that result in the development of commercial concentrations of non-energy mineral resources. Course content varies depending on the interests and backgrounds of the students each semester (course may be repeated for credit). Emphasis will be placed on the descriptive geology and origin of economic mineral concentrations within the context of their overall geologic settings. The geologic and economic nature of metallic and industrial mineral commodities in both "hard rock" and "soft rock" geologic environments will be discussed. Related topics to be discussed include importance of mineral resources to the global economy, mineral exploration and evaluation, and mineral extraction and processing
4	Flora	Science	Prof Mohamed sheded	Plants are grouped into floras based on region, period, special environment, or climate. Regions can be geographically distinct habitats like mountain vs. flatland. Floras can mean plant life of a historic era as in fossil flora. Lastly, floras may be subdivided by special environments. The course study plant life occurring in a particular region or time, generally the naturally occurring

				or indigenous—native plant life.
5	Plant community	Science	Prof Mohamed sheded	Study the plant distribution and taxonomy in different regions in Egypt with relation to soil and climatic factors which effect of the distribution of these species.
6	Plant Ecology	Science	Dr Usama Mahalel	Climatic factors affecting on the plant environment and how it effect on the plant cover. Climatic factors effect on soil type and soil formation. The negative and passive relationships among the biotic components of the environment.
7	Ecology of Algae	Science	Dr Ahmed El-Otify	Environment of algae and effects of climatic factors such as light temperature on life cycle of algae and its biomass. Phytoplankton blooming in relation with climatic change.
8	Environmental Geology	Science	Dr. Ashraf Emam	Environmental geology is a science which objectively studies geologic information and applies it to contemporary environmental problems such as pollution, waste management, resource extraction, natural hazards, and human health. An environmental geologist might evaluate the risk and damage potential from natural hazards such as floods, landslides, volcanoes, or earthquakes. The environmental changes on local to global scales can be placed into an earth systems science perspective through examining the evolution and structure of our planet's components, and how these components naturally

				interact. This course is designed to introduce students to the relationship between humans and our Earth. It focuses on environmental and geosciences subjects that facilitate greater awareness of the interactions between the different Earth's components. The course discusses the geologic processes that shape the surface of the Earth, and how these processes affect and are affected by human activity. Moreover, the relationships between the lithosphere, hydrosphere, and atmosphere will be discussed. Particular attentions are given to the subjects of soil, mineralogy, biogeochemical cycles, climate change, and pollution by human activities. The scientific methods that allow studying, prediction, and mitigation of environmental problems will be discussed.
9	Biostatistics	Science	Dr Adel Abdel -Faheem	The course deals with the data come from Biology. The functions of Biostatics are collecting data and organized it, then it can be easily analysis and studying. Making the decisions one strongly depend on the analyses of the data.
10	Engineering and energy history	Engineering	Dr. Mohamed Shaaban	By the end of the course the students will be able to Know: the engineering history in different fields. Know the energy and different sources of it. Know different fields and different programs of engineering Know about the engineer jobs in different pogroms. Understand the engineering

				job ethics
11	Project management	Engineering	Dr. Muntasser Dwidar	By the end of the course the students will be able to: Know The concept and the elements of management: concept of management - Elements of management. - The concept of marketing: define of marketing, The importance of marketing, - The marketing system. Organizing of the marketing functions: Definition of organizing, The organizing of the marketing functions. Consumer behavior: The concept of the consumer behavior, The aspects of the consumer behavior, Studying the markets. The product strategy: The product mix, The product life cycle, New products. The pricing strategy: The importance of pricing, Methods of pricing. Distribution strategy: Distribution channels, Distribution outlets.
12	Thermodynamics fundamentals	Engineering	Dr Waleed Abdel_Fadeel	- By the end of the course the students will be able to: Define the concept of the energy, and different basic concepts like properties, state, process, equilibrium, and cycles. -Identify the different between the ideal gases and the pure substance and understand the property relations relevant to engineering thermodynamics and how to deal with thermodynamic tables. -Identify the concept of energy and mass conservation and apply this concept on different applications
13	Energy conversion and utilization	Engineering	Dr.Ezzat Gad	**By the end of the course the students will be able to:** Demonstrate knowledge and

				understanding of electromechanical energy conversion principles for electromagnetic and electrostatic systems. - Understand the traction systems. - Recognize and analyze illumination and heating systems. - Analyze and understand essential industrial drives aspects. -The student shall attain the above mentioned objectives efficiently under controlled guidance and supervision. -To recognize the concepts and basics of electric power transmission and distribution theory.
14	Heat and mass transfer	Engineering	Dr. Mahmuod Hasan	By the end of the course the students will be able to: - Demonstrate knowledge of heat transfer definitions and terminology, including heat flux, thermal conductivity, and heat transfer coefficients. - Demonstrate knowledge of conduction and the equivalent resistance formula, convective and use of the overall heat transfer coefficient, radiant heat transfer, including black bodies, gray bodies and emissivity. - Demonstrate knowledge of heat exchangers, including the different types and how they operate, application. - Demonstrate knowledge of mass transfer definition and compare it with convenient heat transfer. - Apply this knowledge on various engineering application. - Share ideas and work in a team in an efficient and effective manner under controlled supervision or independently.

15	Renewable energy resources industrial	Engineering	Dr. Salama Abdel-Hady	By the end of the course the students will be able to: Identity different renewable energy, resources for power production such as wind, Solar, and non-conventional by hydro-power. Recognize natural sources of wind and solar ? energies in Egypt. Practice the operation and Design of Horizontal and Vertical Axis wind Turbines. Practice the Operation and Design of Solar flat plate collectors, concentrator systems, photovoltaic systems and other solar applications. Practice the operation of non-conventional hydro Power Systems Such as wave Energy and Tidal Energy. Recognize other renewable energy technologies such as Biomass, Ocean Thermal Energy …etc.
16	Pollution	Engineering	Dr. Mohamed Fathi	By the end of the course the students will be able to know: definition of pollution- Sources of pollution - Types of pollution and their effect on lumen health. Methods of measurement - methods of pollutant reduction.
17	Social Science rural and urban	Social Work	Dr. Mohamed Nagdy	Study the traditionally associated with the study of social structure and conflict rural areas although topical areas such as food and agriculture or natural resource access transcend traditional rural spatial boundaries
18	Introduction to Social Welfare	Social Work	Dr Mohamed Gaber Abbas	Study the social welfare function as t rank social states (alternative complete descriptions of the society) as less desirable, more desirable, or

				indifferent for every possible pair of social states. Inputs of the function include any variables considered to affect the economic welfare of a society. In using welfare measures of persons in the society as inputs, the social welfare function is individualistic in form. One use of a social welfare function is to represent prospective patterns of collective choice as to alternative social states.
19	Community health	Social Work	Dr Modather Seleem	This course is an introduction to the theory and practice of public and community health. The influence of public health professionals on the past, present and future health status of society through the examination of critical health issues will be described. Programming models, theories and policy development are included
20	Introduction to Social planning	Social Work	Dr. Kawther Kenawy	Speaking of this decision for the basis of and methods entrances and planning mechanisms for social programs and social services and is also interested in general political social.
21	Social work in one of the developed fields	Social Work	Dr Ali Dandarawy	This course deals with social service in the field of environment and sustainable development and to support community-based organizations working in the field of environment.
22	Populations and Environmental Studies	Social Work	Dr. Mohamded Abdel-Razik Dr. Mohamed Sayed	This course focuses on both sides, the first dimension of the population is interested in different societies, and the second deals with the concepts of environmental and environmental problems in the community

23	Environmental studies	Education	Dr Saied Sadeek	Knowledge of environmental concepts such as the environment and environmental pollution study the main features of the program to protect the environment. Identify the role of education in the face of environmental problems. Compare between the environment and environmental education.
24	Principles of Psychology	Education	Dr Adel Abaady	Study different types of psychology such as Environmental Psychology and the environmental factors that affect human health.
25	Adult education and environment Work	Education	Dr Abde Hay Mohamed Ali	This course aims to give a general idea about the importance of adult education and literacy as a requirement necessary for the development of society, especially in the current era, which is characterized as the era of knowledge it is true that there will be individuals in the community do not know how to read and write. In addition the environmental problems that affect individuals

Faculty Web Page:

Course Description/Overview

The present course is intended to provide students with the key concepts about the remote sensing, collection of data, sensing devices, evaluation of the collected data, applications of remote sensing techniques in geological purposes, image data processing, image rectification processing, image display and enhancement processing, edge enhancement processing, digital mosaics processing, contrast stretching processing, color composition, principle component analysis (PCA), decorrelation stretch , aerial photography, (elements, airphoto interpretation (instrumentation and procedures), principles of landform identification and evaluation, applications of aerial photographs in geology), earth resources satellites, multispectral scanners, digital image processing, applications of remote sensing and geographic information systems in geology.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of applications of remote sensing techniques in geological purposes; b) to train learners in geographic information systems and remote sensing as applied to geological exploration c) and help learners to

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the types of remote sensing.
2. Explain the principles and process of remote sensing.
3- Discuss the different remote sensing systems.
4- Differentiate between the active and passive sensors.
5- Explore the remote sensing platforms.

Course Resources

Course Website(s)

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Concept of remote sensing.
3		Sensor on the ground, in the air and in the space
4		Elements of climate.
5		Types of remote sensing
6		Applications of remote sensing techniques in geological purposes.

Renewable Energy

KNOWLEDGE (Concepts, theories, processes)	SKILLS (Tools, methodologies, dynamics)	ATTRIBUTES (Innate abilities)	CLIMASP CORE COMPETENCES

Course Description/Overview

The present course is intended to raise the students' awareness of renewable energy resources. It introduces them to the benefits of using clean energy resources. It does so through tackling the following aspects: 1) traditional and renewable energy resources; 2) impact of energy consumption on environment; 3); clean energy resources and climate change; 4) availability of solar and wind energy in Egypt; and 5) energy and future global climate change. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on renewable energy resources. They are invited to discuss impacts of energy resources on environment at local, national and international scales. In short, the course provides an appropriate chance for the students to get the minimum knowledge of the advantages and disadvantages of renewable energy resources.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of the renewable energy resources; b) to raise the learners' awareness of the need to explore renewable energy resources in order to achieve the goals of community development; c) help learners use traditional and electronic tools to identify the risks of the petroleum and natural gas limitations in Egypt; and d) to highlight the importance of renewable energy resources as clean and safe resources to the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

62. Explain the impacts of traditional energy resources on environment.
63. Compare and contrast the advantages and disadvantages of renewable energy resources with the advantages and disadvantages of traditional energy resources.
64. Identify the basic principles of renewable energy technologies.
65. Question the relation between sustainable development and the use of renewable energy resources.
66. Discuss the different types of renewable energy resources.

67. Anticipate possible future environmental change and identify possible development consequences.
68. Appreciate the positive impacts of utilizing renewable energy resources on the environment.
69. Explain the relationship between poverty, environment, climate change, and the insufficient supply of energy.
70. Use the different tools and equipments of renewable energy resources .

Course Website(s)

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Energy Resources and Supply.
3		Renewable energies and clean technologies.
4		Solar Energy, solar cells, solar thermal heating systems, and electricity generation.
5		Tidal and Hydro as renewable energy resources.
6		Renewable Energy Integration and Energy Efficiency in the Built Environment
7		Research Design Methods.

Scientific Culture

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Teachers have the potential to be what Giroux and McLaren described as transformative intellectuals who combine scholarly reflection and practice in the service of educating students to be thoughtful, active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the challenges resulting from climate change. . It does so through tackling the following logically sequenced six issues: 1) Weather and climate; 2) Climate change and livelihoods; 3) Gender-sensitive response to climate change; 4) Climate change communication; 5) Fairness and climate change justice; and 6) Future climate change scenarios. Issues 3-6 are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of climate changes at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the consequences of climate changes – at local, national and international scales - in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for a sustainable future for all; and c) use traditional and electronic resources as well as social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

46. Become familiar with the basic terminology and core concepts of climate change adaptation planning.
47. Identify the most likely impacts of local climatic hazards.
48. Articulating what good climate resilient development actually look like.
49. Compare local problems with problems elsewhere and to gain adaptation ideas from this comparison.

50. Comprehend the opportunities for planners and the social, economic and ecological risks of climate change.
51. Understand historical community reactions to and coping strategies for climatic hazards.
52. Contribute to the debate on global environmental change and societal adaptation strategies; to become an informed citizen and decision maker.
53. Demonstrate capacities for self-reflection and self-evaluation as integral aspects of the adaptive learning cycle.
54. Questioning business as usual can threaten our ideals, values, beliefs, business strategies and technical understanding and is not necessarily what everyone wants to hear.
55. Draw on active teaching and learning approaches to empower learner, young people and civic engagement.
56. Anticipate possible future environmental change and identify possible development consequences.
57. Appreciate the importance and practical characteristics of adaptive approaches.
58. Demonstrate knowledge and understanding of relationship between poverty, environment, climate change, economics and social issues.
59. Relate climate change and sustainability policy to a range of curricular areas in formal, non formal and informal education.

13-15		Future climate change scenarios

Course Modules

Course	Scientifc Culture
Module 1	**Climate Change : Environmental Impacts**
Key Concepts	Climate Change, Environment
Overview	The term environment may be vague for many students, Some of them my be concerned with the physical environment around them. They might ignore my cultural components of environment which are responsible for shaping mans attitudes, and in turn, influence our behaviour. Such behaviour might aggregate or alleviate the environmental challenges. Mans behaviour may be affected by climate change. So, his reaction toward the environment is almost disastrous!! Issues addressed in this module include: definition of environment, components of environment: physical and cultural; basic differences between weather and climate; and impacts of local climatic hazards.
Aim	The aim of this module is to turn students able to discourse on basic concepts related to environment and the impact of climate change.
Learning Outcomes	At the end of this module learners will be able to: 4. Become familiar with the basic terminology and core concepts of climate change adaptation planning. 5. Identify the most likely impacts of local climatic hazards. 6. Articulating what good climate resilient development actually look like.
Units	Unit 1.1: Environment: Physical and Cultural Unit 1.2: Man VS Environment Unit 1.3: Weather and Climate
Readings	• Climate Change: Key Concepts. **http://www.careclimatechange.org/tk/cba/en/cba_**basics/key_concepts.html • The Intergovernmental Panel on Climate Change (IPCC) is a body set up to

	provide scientific, technical and socio-economic information in a policy-relevant but policy neutral way to decision makers. • IPCC, 2007. *Climate Change 2007: Impacts, Adaptation and Vulnerability. Contribution of Working Group II to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, Annex I.*, M.L. Parry, O.F. Canziani, J.P. Palutikof, P.J. van der Linden and C.E. Hanson, Eds., Cambridge University Press, Cambridge, UK, 976pp. • Intergovernmental Panel on Climate Change (IPCC) Working Group 2, 2001. *Third Assessment Report, Annex B: Glossary of Terms.* • NASA - What's the Difference Between Weather and Climate? http://www. nasa.gov/mission_ pages/noaan/climate/climate_weather.html#. VAv8Mfl_vdM February 1, 2005 • Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986**

Activity	**Overview** Assignment 1.1: Reflecting Upon environmental issues 1. To what extent is responsible for environmental problems? (3-4 paragraphs) 2. What can we do to alleviate environmental problems? 3. draw a table of comparison to show the main differences between climate and weather. Assignment 1.2: Investigate local environmental problems to: - Make a list of most serious environmental problems - Interview a sample of citizens to identify their awareness of such problems. Access and explore the following report to identify and summarize its main ideas with regard the management of the environmental impacts of Climate Change: World Bank 2009. Convenient Solutions to an Inconvenient Truth: Ecosystem-based Approaches to Climate Change. Environment Department, World Bank.
Module 2	Climate Change and Livelihoods: Problems and Solutions
Key Concepts	Climate change , livelihoods (man, plant, animals)

Overview	The world is highly susceptible to a number of natural hazards droughts including, floods and hurricanes. Increasing in frequency and ferocity as a result of changing climate systems, these disasters are placing increased stress on inhabitants and severely impairing economic growth as they batter climate vulnerable sectors like tourism and agriculture upon which the region is financially reliant.In order to avoid risks and damage and to strengthen human resilience to natural disasters, governments need to be prepared. However, in developing countries, the ability of governments to help is often very limited. The impacts of loss and damage associated with natural disasters can set back development by increasing the incidence and severity of poverty. Poverty and vulnerability are fundamentally intertwined: the poor have fewer resources to cope with climate risk and thus their resource base is further diminished with every extreme weather event, deepening their poverty. This module is intended to raise the students awareness towards local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas for the management of such problems.
Aim	The overriding aim of this module is to identify local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas from this comparison.
Learning Outcomes	At the end of this module learners will be able to compare local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas from this comparison.
Units	Unit 2.1: Climate change and livelihoods Unit 2.2: Climate change and livelihoods (man, plant, animals)
Readings	• Task Force on Climate Change, Vulnerable Communities and Adaptation (IUCN, SEI and IISD), 2003. Livelihoods and Climate Change. Combining Disaster Risk Reduction, Natural Resource Management and Climate Change adaptation in a new approach to the reduction of vulnerability and poverty. 	• Scoones, Ian (2005): The Sustainable Rural Livelihoods: A Framework for Analysis. Institute for Development Studies, University of Sussex. England. **http://www.sarpn.org.za/www.careclimatechange.org/files/adaptation/d0001493/P1833-Sustainable-rural-livelihoods_IDS-paper72.pdf**. • *Livelihoods and Climate Change* ***http://www.iisd.org/ecp/es/resilience/*** *climate.asp* • Livelihoods and Climate Change Project Snapshot (PDF - 438 kb), http://www.iisd.org/ecp/es/resilience/climate.asp • Livelihoods and Climate Change: Combining disaster risk reduction, natural resource management and climate change adaptation in a new approach to the reduction of vulnerability and poverty (PDF - 1.6 mb), http://www.iisd.org/ecp/es/resilience/climate.asp
Activity	**Overview**
	Design poster showing local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas for the management of such problems.
Module 3	**Gender-Sensitive Response to Climate Change**
Key Concepts	Gender-Sensitive
Overview	A gender-sensitive response does not mean having a set of disaggregated data showing that climate change has differential impacts on women and men. In fact, it is obvious. So more than that, it requires an understanding of the nature of existing inequalities between women and men, their consequences, and then coming up with strategies to nullify them. However, due to their social status men may have greater access to vital information on climate change mitigation or adaptation strategies, or women are too busy with caring and other domestic responsibilities so they lack this information. Therefore, lack of information and lack of opportunity to voice their concerns about adaptation and mitigation strategies could jeopardize their safety when climate change events strike.

	To counter this situation, strategies need to be planned so that women receive as much information on climatic events and conditions as men do. Women are also more likely than men to be absent from decision-making, right from home, to community, to national, to international levels for two reasons. One, their opinion is not given importance and two, they don't have time or confidence or opportunity to share. Therefore, whatever the reasons are they are simply marginalized; and the same is true for elderly and children. The net result is that they remain more vulnerable than men. Thus, if effective adaptation strategies have to be chalked out for them they must be drawn out to participate in the climate change discussions which in turn, means challenging the traditional assumptions about their capabilities and redefining their gender equation. For centuries, women have passed on their skills in water management, forest management and the management of biodiversity, among others. Through these experiences, women have acquired valuable knowledge that will allow them to contribute positively to the identification of appropriate adaptation and mitigation techniques, if only they are given the opportunity. The present module is concerned with: Male/Female awareness of climate change consequences; as well as their role in the management of climate change consequences.
Aim	This module encourages the students to the debate on global environmental change and societal adaptation
Learning Outcomes	At the end of this module learners will be able to: • Contribute to the debate on global environmental change and societal adaptation strategies; to become an informed citizen and decision maker. • Demonstrate capacities for self-reflection and self-evaluation as integral aspects of the adaptive learning cycle.
Units	Unit 3.1: Gender-sensitive response to climate change

	Unit 3.2: Male/Female: awareness of climate change consequences Unit 3.3: Male/Female: how to alleviate climate change consequences
Readings	• Gender and Climate Change Adaptation: Tools for Community-level Action in Nigeria, http://africanclimate.net/en/node/8979 • Intergovernmental Panel on Climate Change (IPCC) Working Group 2, 2001. *Third Assessment Report, Annex B: Glossary of Terms.* • IPCC, 2007: *Climate Change 2007: Impacts, Adaptation and Vulnerability. Contribution of Working Group II to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, Annex I.*, M.L. Parry, O.F. Canziani, J.P. Palutikof, P.J. van der Linden and C.E. Hanson, Eds., Cambridge University Press, Cambridge, UK, 976pp.
Activity	**Overview**
	Assignment 1: Propose a strategy to: 3- Raise the awareness of both Male and Female citizen towards the climate change consequences in your local environment 4- how to involve both Male and Female citizen in the management of climate change consequences in your local environment
Module 4	**Climate Change Communication**
Key Concepts	social, economic and ecological risks of climate change; civic engagement

Overview	The rapid development of multimedia and hypermedia technologies has provided new avenues for merging images, sound, movies and animation together with texts. These can serve as effective tools for communicating information and data related to climate change concepts, causes and consequences. Climate change is the result of human actions and choices. Limiting climate change – and protecting people and ecosystems to the degree possible from unavoidable changes in the climate – will require significant public engagement in the issue so that difficult decisions can be made by members of the public and policy makers. So, the need emerges for unbiased social science research that will facilitate such public engagement. In other words, students should be trained on how to use social science research methods – experiments, surveys, in-depth interviews and other methods – to find ways of effectively engaging the public and policy makers in the problem, and in considering and enacting solutions. Social science research has played important roles in many social change campaigns over the past several decades, including reducing smoking and littering, and increasing seat belt use and recycling. So, they can conduct unbiased public engagement research - and help government agencies, non-profit organizations, and companies apply the results of this research - so that collectively, we can stabilize our planet's life sustaining climate.
Aim	The overriding aim of this module is encourage the students explore and use appropriate tools to communicate social, economic and ecological risks of climate change.
Learning Outcomes	At the end of this module learners will be able to: - Comprehend the opportunities for planners and the social, economic and ecological risks of climate change. - Understand historical community reactions to and coping strategies for climatic hazards. - Questioning business as usual can threaten our ideals, values, beliefs,

	business strategies and technical understanding and is not necessarily what everyone wants to hear. - Draw on active teaching and learning approaches to empower learner, young people and civic engagement.
Units	Unit 3.1: Climate Change Communication (Concepts) Unit 3.2: Climate Change Communication (tools: design) Unit 3.3: Climate Change Communication (tools: implementation/analysis)
Readings	• Adapted from: UNISDR, 2009. Terminology: Basic terms of disaster risk reduction and IISD et al, 2007. Community-based Risk Screening – Adaptation and Livelihoods (CRiSTAL) User's Manual, Version 3.0. • UNISDR, 2009. Terminology: Basic terms of disaster risk reduction. Department for International Development, UK (DFID). 2001. *Sustainable Livelihoods Guidance Sheet*. Available at **http://www.nssd.net/pdf/sectiont.pdf**.
Activity	**Overview**
	Assignment: Students are invited to work in groups to: - Design appropriate tools to communicate social, economic and ecological risks of climate change. - Write a report on the obtained results of communicating social, economic and ecological risks of climate change. - Orally present the outcomes of the above report
Module 5	Climate Change: Justice and Future Scenarios
Key Concepts	climate change fairness, justice; future scenarios.
Overview	This module is about climate change scenarios. Socioeconomic scenarios are used by analysts to make projections of future greenhouse gas (GHG) emissions and to assess future vulnerability to climate change. Producing scenarios requires estimates of future population levels, economic activity, the structure of governance, social values, and patterns of

	technological change. Economic and energy modelling (such as via the World3 or the POLES models) can be used to analyse and quantify the effects. These scenarios can be thought of as stories of possible futures. They allow the description of factors that are difficult to quantify, such as governance, social structures, and institutions. However, researcher claim a considerable variety among scenarios, ranging from variants of sustainable development, to the collapse of social, economic, and environmental systems.
Aim	The overriding aim of this module is to equip students with the capacity to actualise issues such as fairness and climate change justice; future climate change scenarios.
Learning Outcomes	At the end of this module learners will be able to contribute to group discussion with regard: • possible future environmental change and identify possible development consequences. • the importance and practical characteristics of adaptive approaches. • The relationship between poverty, environment, climate change, economics and social issues. • climate change and sustainability policy and a range of curricular areas in formal, non formal and informal education.
Units	Unit 5.1: Fairness and climate change justice Unit 5.2: Future climate change scenarios

Course Description/Overview

The present course is intended to raise the students' awareness of soil . The course concentrates on the techniques employed in the analysis of the physical, hydrological, chemical, and biological properties of soils as well as those processes which control the development of the soil. It introduces students to the fundamentals of soil pollution with a background on historical perspective on soil pollution and a commentary on current soil quality policies and standards. It does so through tackling the following aspects: 1) natural sources of soil pollution, 2) anthropogenic sources of soil pollution, 3) airborne particulate matter, 5) negative impacts, 6) global warming, 7) soil pollution act, 8) atmospheric stability, 9) thermal invasion, 10) modelling of soil pollution and control devices. That is they are asked to read and summarize articles on soil pollution and its treatment. They are invited to discuss impacts of soil pollution on environment at local, national and international scales.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of soil pollution; b) to raise awareness of the learners about effects of soil pollution on climate; c) help learners use traditional and electronic tools to identify the risks the different types of soil pollutants; and d) to identify risks of soil pollution.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

22. Discuss the sources of domestic, agricultural and industrial wastes and pollutants.
23. Identify the problems arising at pollution sites.
24. Devise solutions to the soil pollution problems.
25. Design soil treatment and water treatment process systems, among environmental processes.
26. Anticipate possible future environmental change and identify possible development consequences.

27. Estimate health impact of changes in soil pollution
28. Identify the different types of soil pollutants.

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		History of air pollution;
2		Current policies, standards and objectives;
3		Sources of air pollution;
4		Effects of major air pollutants;
5		Monitoring of emissions and air pollutants in ambient air;
6		Modelling and control of emission from road transport;
7		Modelling and control of emission from industrial sources;
8		Chemistry and dispersion of air pollution in atmosphere;
9		Air pollution modelling approaches;
10		Commercial air quality models (ADMS, USEPA models;
11		Indoor air pollution;
12		Personal exposure to air pollution

Course Description/Overview

The present course is intended to provide students with the key concepts about the methods and principles of environmental assessment of the impacts of activities and pollutants (predicting dispersion and ecological distribution of pollutants during discharge and after emission) with the introduction of the basics of project formulation, relationships between organisms and their environment and managing human, air and soil resources, A course which will familiarize students with a wide range of laboratory and held methods directly applicable to the study of environmental problems.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of methods and principles of environmental assessment of the impacts of activities and pollutants; b) to raise awareness of the learners about the need for predicting dispersion and ecological distribution of pollutants during discharge and after emission; c) and help learners to acquire the basics of project formulation, relationships between organisms and their environment and managing human, air and soil resources and d) give the basic understanding of a wide range of laboratory and held methods directly applicable to the study of environmental problems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Identify methods and principles of environmental assessment of the impacts of activities and pollutants.

2-Explain the dispersion and ecological distribution of pollutants during discharge and after emission.

3- Discuss the basics of project formulation, relationships between organisms and their environment and managing human, air and soil resources.

4- Explore the influence of economic activities on surrounding environment.

5- Summarize a wide range of laboratory and held methods directly applicable to the study of environmental problems.

Course Description/Overview

History was quite impracticable, not only because of the enormous compression that would be necessary, but because the plan of the original did not lend itself to such treatment. The story of technological development was at every epoch closely related to the historical background. This course aims at being as much a technological history as a history of technology, and in pursuing this course we believe ourselves to be following
an important modern trend.

Course Learning Objectives

Know the engineering history in different fields. Know the energy and different sources of it. Know different fields and different programs of engineering Know about the engineer jobs in different pogroms. Understand the engineering job ethics

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Demonstrate knowledge of role of engineering in development and establishment of civilization.
2- Demonstrate knowledge and understanding of engineering history in ancient time, middle ages and modern time.
3- Demonstrate knowledge of different engineering fields.
4- Demonstrate knowledge of different engineering programs.
5- Demonstrate knowledge and understanding of technology transfer, environmental, inventions and engineering ethics.
6- Understand the role of engineering in development and establishment of civilization.
7- Identify technology transfer, environmental & inventions and engineering ethics

8- Assess engineering history in ancient, middle and modern time.
9- Assess resources in engineering history
10- Deal with engineering history at various times
11- Analyze methods and tools used in engineering history and engineering ethics

Course Resources

1- Chaaban, M. A., "History of Engineering and technology", Elslam Press, 1998

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	22/9/2013	Role of engineering in development
2	29/7	Establishment of civilization.
3	6/10	Engineering history in ancient time and middle ages.

4	13/10	Engineering history in modern time.
5	20/10	Engineering fields.
6	27/10	Engineering programs.
7	3/11	Technology transfer,
8	10/11	Midyear exam
9	17/11	Inventions
10	24/11	Environmental,
11	1/12	Engineering ethics
12	8/12	Resources in engineering history
13	15/12	Methods and tools used in engineering history
14	22/12	Final Exam

Module 1	**Engineering Development and Civilization**
Key Concepts	Civilization, history
Overview	History was quite impracticable, not only because of the enormous compression that would be necessary, but because the plan of the original did not lend itself to such treatment. The story of technological development was at every epoch closely related to the historical background.
Aim	The overriding aim of this module is to equip students with the engineering history at different ages.
Learning Outcomes	At the end of this module learners will be able to: 1- Demonstrate knowledge of role of engineering in development and establishment of civilization.

	2- Demonstrate knowledge and understanding of engineering history in ancient time, middle ages and modern time.
Units	• Unit 1.1: Role of engineering in development • Unit 1.2: Establishment of civilization • Unit 1.3: Engineering history in ancient time and middle ages • Unit 1.4: Engineering history in modern time.
Readings	1- Chaaban, M. A., "History of Engineering and technology", Elslam Press, 1998
Activity	**Overview**
	Assignment : Using the WWW search for different civilization and its famous pictures. Assignment : Prepare a research proposal
Module 2	**Engineering Programs**
Key Concepts	Engineering Fields, Engineering programs
Overview	Because of the development of engineering, there are many fields are presented. Different engineering programs are described which leads to different jobs.
Aim	The overriding aim of this module is to equip students with the engineering fields, programs and jobs
Learning Outcomes	At the end of this module learners will be able to: 1- Know different fields and different programs of engineering 2- Know about the engineer jobs in different pogroms.
Units	• Unit 2.1: Engineering programs • Unit 2.2: Engineering fields • Unit 2.3: Engineering jobs
Readings	2- Singer, C. Holmyard, E. J. and Hill, A. R., History of Technology, Oxford

	university press, London, 1975
Activity	**Overview**
	Assignment : Using the WWW search for different programs, fields and jobs Assignment : Prepare a research proposal
Module 3	**Technology transfer**
Key Concepts	Technology, inventions
Overview	The aims at being as much a technological history as a history of technology transfer, and in pursuing this course we believe ourselves to be following an important modern trend.
Aim	The overriding aim of this module is to equip students with the how is the technology transferred during centuries and the greatest inventions.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify technology transfer, 2- Know about the inventions.
Units	• Unit 3.1: Technology transfer, • Unit 3.2: Engineering fields • Unit 3.3: Inventions
Readings	2- Singer, C. Holmyard, E. J. and Hill, A. R., History of Technology, Oxford university press, London, 1975
Activity	**Overview**
	Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 4	**Technology transfer**
Key Concepts	Technology, inventions

Overview	The aims at being as much a technological history as a history of technology transfer, and in pursuing this course we believe ourselves to be following an important modern trend.
Aim	The overriding aim of this module is to equip students with the how is the technology transferred during centuries and the greatest inventions.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify technology transfer, 2- Know about the inventions.
Units	• Unit 4.1: Technology transfer, • Unit 4.2: Engineering fields • Unit 4.3: Inventions
Readings	2- Singer, C. Holmyard, E. J. and Hill, A. R., History of Technology, Oxford university press, London, 1975
Activity	**Overview** Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 5	**Engineering ethics**
Key Concepts	Environment, ethics
Overview	There is a strong relation between technology and the environment and ethics.
Aim	The overriding aim of this module is to equip students with the relation between invention and ethics.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify technology transfer, environmental & inventions and engineering ethics 2- Demonstrate knowledge and understanding of technology transfer, environmental, inventions and engineering ethics.

Units	• Unit 5.1: Environmental, • Unit 5.2: Engineering ethics • Unit 5.3: Methods and tools used in engineering history
Readings	2- Singer, C. Holmyard, E. J. and Hill, A. R., History of Technology, Oxford university press, London, 1975

Course Identification

Course Coder: UNC321
Level: 300
Course Name: Project management
Course Location: Faculty of Energy Engineering
Class Times: Wednesday 10.00 - 12.00
Prerequisites: NA
Faculty Web Page: http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The project management is a process. It is an activity of planning, organizing, motivating, and controlling resources. It uses the procedures and protocols to achieve specific goals. A project is designed to produce a product or service. The management requires the development of distinct technical skills and management strategies.

Course Learning Objectives

Know the definitions used in project management. The project life cycle, Project stages, Relationships and responsibilities of the different project parties, Execution phase responsibilities, Productivity, Quality management. - Human Influences of projects: Upgrading, Development, Economic factors, Social factors, Cultural factors, Aesthetic factors, Hygienic and psychological factors. Types of projects: Urban planning projects (residential projects, tourism projects, commercial projects, public buildings…etc.). Infrastructure projects

(electricity plants, water supply and sewage networks, road networks, railroad networks, reservoirs, dams…etc.). Different Industrial projects (textile factories, steel Industries, cement factories, carpet factories, ceramic factories, food factories, electrical appliances, car industries…etc.). Environmental impact of projects: Negative and positive impacts (direct and indirect). The assessment of projects- both nationally and internationally- in order to avoid the negative consequences of projects on the environment. The approved rates and criteria for the compatibility of projects with environmental topics.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Define the definitions used in project management.

2- Understand the project life cycle

3- Understand the project stages, relationships and responsibilities.

4- Analyze execution phase responsibilities, productivity, quality management.

5- Discuss the hhuman influences of projects: Upgrading,

6- Identify the types of projects.

7- Analyse the environmental impact of projects

8- Apply the approved rates and criteria for the compatibility of projects with environmental topics.

12	18/5	The assessment of projects
13	25/5	The approved rates and criteria for the compatibility of projects with environmental topics
14	1/6	Final Exam

Module 1	**Definitions**
Key Concepts	Project, Management
Overview	The project management is a process. It is an activity of planning, organizing, motivating, and controlling resources.
Aim	The overriding aim of this module is to equip students know the definitions used in project management
Learning Outcomes	1- Define the definitions used in project management. 2- Understand the project life cycle
Units	• Unit 1.1: definitions used in project management • Unit 1.2: Relationships and responsibilities of the different project parties • Unit 1.3: The project life cycle and project stages
Readings	1- Gray, R. and Larson, K., Project Management: The Managerial Process, McGraw Hill, Irwin, New York, NY, 2002.
Activity	**Overview**

	Assignment : Using the WWW search for different definitions Assignment : Prepare a research proposal
Module 2	**Productivity and Quality**
Key Concepts	Productivity, Quality
Overview	A project is designed to produce a product or service with quality management
Aim	The overriding aim of this module is to equip students with the project stages.
Learning Outcomes	At the end of this module learners will be able to: 1- Understand the project stages, relationships and responsibilities. 2- Analyze execution phase responsibilities, productivity, quality management.
Units	• Unit 2.1: Execution phase responsibilities • Unit 2.2: Productivity • Unit 2.3: Quality management
Readings	Harris, R. and McCaffer, D., Modern Construction Management, Black Well Science, London, U.K., 2002.
Activity	**Overview**
	Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 3	**Human Influences of Projects**
Key Concepts	Human, Projects
Overview	Human influences of projects such as upgrading, development, economic

	factors, social factors, cultural factors, aesthetic factors, Hygienic and psychological factors are the aim.
Aim	The overriding aim of this module is to equip students with human influences of projects
Learning Outcomes	At the end of this module learners will be able to: 1- Discuss the hhuman influences of projects: Upgrading, 2- Identify the types of projects..
Units	• Unit 3.1: Types of projects and urban planning projects • Unit 3.2: Infrastructure projects and Industrial projects •
Readings	1- Gray, R. and Larson, K., Project Management: The Managerial Process, McGraw Hill, Irwin, New York, NY, 2002.
Activity	**Overview**
	Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 4	**Assessment of Projects**
Key Concepts	Assessment, Environmental
Overview	Environmental impact of projects: Negative and positive impacts (direct and indirect). The aim is the assessment of projects- both nationally and internationally- in order to avoid the negative consequences of projects on the environment.
Aim	The overriding aim of this module is to equip students with assessment of projects on the environment
Learning Outcomes	At the end of this module learners will be able to: 1- Analyse the environmental impact of projects
Units	• Unit 4.1:: Environmental impact of projects

	• Unit 4.2 Assessment of projects
Readings	2- Harris, R. and McCaffer, D., Modern Construction Management, Black Well Science, London, U.K., 2002.
Activity	**Overview** Assignment : Using the WWW search for different inventions. **Assignment : Prepare a research proposal**
Module 5	**Compatibility of Projects**
Key Concepts	Compatibility, environmental
Overview	The approved rates and criteria for the compatibility of projects with environmental topics.
Aim	The overriding aim of this module is to equip students to apply the compatibility with the environmental topics
Learning Outcomes	At the end of this module learners will be able to: 1- Apply the approved rates and criteria for the compatibility of projects with environmental topics.
Units	• Unit 5.1: Criteria for the compatibility of projects
Readings	2- Harris, R. and McCaffer, D., Modern Construction Management, Black Well Science, London, U.K., 2002.
Activity	**Overview** Assignment : Using the WWW search for different inventions. **Assignment : Prepare a research proposal**

CLIMASP COURSE SYLLABUS

Course Syllabus

Course Code: PCR123

Fundamentals of Thermodynamic

Aswan University, Faculty of Energy Engineering, Departments of Mechanical Power Station and High Voltage Networks,

Spring Semester, 2013-2014

Instructor Information

Instructor: Dr. Waleed Abdel-Fadeel
Location: Faculty of Energy Engineering
Telephone: Office – +20 3481234
Office Hours: Tuesday 11.00 - 14.00, Wednesday 11.00 – 14.00
E-mail: wfadeel@yahoo.com
Website:

Course Identification

Course Coder: PCR123
Level: 100
Course Name: Thermodynamic Fundamentals

Course Location:	Faculty of Energy Engineering
Class Times:	Thursday 9.00 - 11.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The subject of thermodynamics referred to as thermal science. It is of interest to students of all engineering branches, in fact to all mankind, as it deals with the most basic processes occurring in nature. The subject forms the basis for the study of a vast variety of devices such as refrigerators, air conditioners, automotive engines, aircrafts, locomotives, power plants, etc, the use of which is involved in the everyday life of almost every individual. Even the simple kitchen gadget of steam pressure cooker is designed on the basis of the principles of thermodynamics.

Course Learning Objectives

Demonstrate knowledge of basic thermodynamic concepts, ideal gases and pure substance, first low of thermodynamic on different systems. Apply the first law of thermodynamics on various engineering applications. Share ideas and work in a team in an efficient and effective manner under controlled supervision or independently.

Course Content Learning Outcomes

1- Define the concept of the energy.
2- Define the different basic concepts like properties, state, process, equilibrium, and cycles.
3- Identify the different between the ideal gases and the pure substance.
4- Understand the property relations relevant to engineering thermodynamics.
5- Understand how to deal with thermodynamic tables.
6- Identify the concept of energy and mass conservation.
7- Apply these concepts on different applications.
8- Analyse problems, conclude solutions and demonstrate creative thinking.
9- Work coherently and successfully as a part of a team in assignments.
10- Discuss results and defined his/her ideas.

Course Resources

1- Sonntag, R. E.; Borgnakke, C. and Van Wylen, G. J., Fundamentals of thermodynamics, John Wiley and Sons Inc., 1998.

2- Cengel, Y. A. and M. A., Thermodynamics: An Engineering Approach, WCB/McGraw Hill, 1998

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	16/2/2014	Basic concepts and definitions
2	23/2	System and control volume, Property and state

3	2/3	Processes and cycles
4	9/3	Work definition, Definition of heat transfer
5	16/3	Ideal gases, State equation, Specific heat at constant pressure and volume
6	23/3	Pure substances and phase equilibrium, Tables of thermodynamic properties
7	30/3	First law of thermodynamics, Internal energy and enthalpy
8	6/4	Midyear exam
9	27/4	First law for closed cycle
10	4/5	Closed and open systems: Steady flow and uniform state uniform flow
11	11/5	Application of first law of thermodynamics (reciprocating compressors)
12	18/5	Second law of thermodynamics
13	25/5	Vapour and gas cycles
14	1/6	Final Exam

Module 1	Basic concepts and definitions
Key Concepts	Property, state, Processes, cycles
Overview	The subject of thermodynamics referred to as thermal science. It is of interest to students of all engineering branches, in fact to all mankind, as it deals with the most basic processes occurring in nature.
Aim	The overriding aim of this module is to equip students with the basic concepts.
Learning Outcomes	At the end of this module learners will be able to: 1- Define the concept of the energy 2- Define the different basic concepts like properties, state, process, equilibrium, and cycles.
Units	• Unit 1.1: System and control volume, • Unit 1.2: Property and state • Unit 1.3: Processes and cycles
Readings	1- Sonntag, R. E.; Borgnakke, C. and Van Wylen, G. J., Fundamentals of thermodynamics, John Wiley and Sons Inc., 1998.
Activity	**Overview** Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 2	**Work and heat**
Key Concepts	Work, heat
Overview	The work and heat are a kind of energy.
Aim	The overriding aim of this module is to equip students with the meaning of

	heat and energy.
Learning Outcomes	At the end of this module learners will be able to: 1- Know the difference between heat and work 2- Identify the different between the ideal gases and the pure substance. 3- Understand the property relations relevant to engineering thermodynamics. 4- Understand how to deal with thermodynamic tables
Units	• Unit 2.1: definitions • Unit 2.2: Ideal gas • Unit 2.3: pure substances
Readings	2- Cengel, Y. A. and M. A., Thermodynamics: An Engineering Approach, WCB/McGraw Hill, 1998
Activity	**Overview**
	Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 3	**First law of thermodynamics**
Key Concepts	First law of thermodynamics
Overview	Apply the first law of thermodynamics on various engineering applications
Aim	The overriding aim of this module is to equip students with applications of the first law of thermodynamics.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify the concept of energy and mass conservation 2- Apply these concepts on different applications
Units	• Unit 3.1: Understand how to deal with thermodynamic tables. • Unit 3.2: Closed cycle and Open cycle • Unit 3.3: Applications

Readings	1- Sonntag, R. E.; Borgnakke, C. and Van Wylen, G. J., Fundamentals of thermodynamics, John Wiley and Sons Inc., 1998.
Activity	**Overview** Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 4	**Second law of thermodynamics**
Key Concepts	Second law of thermodynamics
Overview	The meaning of entropy and losses
Aim	The overriding aim of this module is to equip students with the meaning of entropy and kind of losses
Learning Outcomes	At the end of this module learners will be able to: 1- Identify the second law of thermodynamics 2- Identify the entropy and losses
Units	• Unit 4.1: Second law of thermodynamics • Unit 4.2: Entropy
Readings	1- Sonntag, R. E.; Borgnakke, C. and Van Wylen, G. J., Fundamentals of thermodynamics, John Wiley and Sons Inc., 1998.
Activity	**Overview** Assignment : Using the WWW search. **Assignment : Prepare a research proposal**
Module 5	**Vapour and gas cycles**
Key Concepts	Vapor, gas, cycles
Overview	Producing and consuming energy depends on cycles
Aim	The overriding aim of this module is to equip students with the different cycles.
Learning Outcomes	At the end of this module learners will be able to:

	1- Identify vapour cycles 2- Identify gas cycles
Units	• Unit 5.1: Vapour cycles • Unit 5.2: Gas cycles
Readings	2- Cengel, Y. A. and M. A., Thermodynamics: An Engineering Approach, WCB/McGraw Hill, 1998
Activity	**Overview**
	Assignment : Using the WWW search for **Assignment : Prepare a research proposal**

Course Name:	Energy conversion and utilization
Course Location:	Faculty of Energy Engineering
Class Times:	Monday 9.00 - 12.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The purpose of this course is to critically examine the technology of energy systems that will be acceptable in a world faced with global warming, local pollution, and declining supplies of oil. The focus is on renewable energy sources (wind, solar, biomass), but other non-carbon emitting sources (nuclear) and reduced carbon sources (co-generative gas turbine plants, fuel cells) are also studied. Both the devices and the overall systems are analysed.

Course Learning Objectives

Introduction to principles, theories and processes of devices and systems that convert thermal, chemical, nuclear, and electromagnetic energy to electrical, mechanical and alternative chemical form. Energy conversion performance characteristics and sources of inefficiencies are explored for a variety of applications that include conventional fossil energy combustion based systems, nuclear, solar, wind, wave, biomass, thermoelectric, and geothermal energy systems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Demonstrate knowledge of energy conversion principles

2- Understand of energy conversion principles

3- Understand the traction systems.

4- Recognize illumination and heating systems

5- Analyze illumination and heating systems.

6- Analyze essential industrial of wind energy. .

7- Analyze essential industrial of biomass and geothermal energy.

8- Analyze essential industrial of ocean energy.

9- Recognize the concepts and basics of climate control and sustainability.

Course Resources

1- Energy Systems Engineering, F.M. Vanek, L.D Albright, and Largus Angenent, Second Edition, McGraw-Hill, Inc., 2012.
2- Energy Conversion, Edited by D.Y. Goswami and F.Kreith, CRC Press, 2008. 2. G.N. Tiwari and R.K. Mishra, Advanced Renewable Energy Sources, RSC Publishing, 2012.

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	16/2/2014	Introduction and scope of energy conversion. Outline of the course. Guidelines for how the material is approached. Motivations for studying future energy systems (e.g. pollution, climate change,

		energy security). Principles from engineering economics and systems engineering.
2	23/2	Overview of fossil fuel combustion and plants. Comparison of fuels (oil, natural gas and coal). Cycle analysis (Brayton, Rankine review; combined cycles, cogeneration).
3	2/3	Nuclear power: nuclear reaction physics, current reactor designs, Breeder reactors, nuclear fusion. Nuclear waste disposal.
4	9/3	Solar-thermal energy: solar radiation physics, solar radiation geometry.
5	16/3	Solar energy collection and conversion for heating systems. Concentrating solar thermal power. Stirling cycle
6	23/3	Photovoltaic technology. P-n junctions. Materials. Photovoltaic cells. Solar towers/heliostats.
7	30/3	Wind Energy: Wind energy formation and availability. Wind turbine design. Turbine capacity factor. Tip speed ratio, Betz limit. Blade element theory. Operating conditions (sitting, height, wind speed variation, sitting density). Land requirements. Economics of wind energy.
8	6/4	Midyear exam
9	27/4	Geothermal and Ocean Current Energy : Physics, resources and availabilities, energy conversion technologies.
10	4/5	Biomass and Waste to Energy : Potential of biomass energy. Thermal-chemical and bio-chemical conversion. Syngas and liquid fuel production. System efficiency and environmental impact.

11	11/5	Electro-chemical conversion: physics of conversion, types and systems of fuel cells
12	18/5	Thermoelectric conversion: physics of conversion. Materials and applications
13	25/5	Overview of Climate Control, CO2 Sequestration and Energy Sustainability.
14	1/6	Final Exam

Module 1	**scope of energy conversion**
Key Concepts	Energy, conversion
Overview	Introduction and scope of energy conversion. Outline of the course. Guidelines for how the material is approached. Motivations for studying future energy systems (e.g. pollution, climate change, energy security). Principles from engineering economics and systems engineering. Overview

	of fossil fuel combustion and plants. Comparison of fuels (oil, natural gas and coal). Cycle analysis (Brayton, Rankine review; combined cycles, cogeneration).
Aim	The overriding aim of this module is to equip students with the energy conversion and future energy system.
Learning Outcomes	At the end of this module learners will be able to: 1- Demonstrate knowledge of energy conversion principles 2- Understand of mechanical energy conversion principles
Units	• Unit 1.1: Introduction and scope of energy conversion. • Unit 1.2: Motivations for studying future energy systems • Unit 1.3: Principles from engineering economics and systems engineering. • Unit 1.4: fossil fuel combustion and plants • Unit 1.5: Cycle analysis.
Readings	1- Energy Systems Engineering, F.M. Vanek, L.D Albright, and Largus Angenent, Second Edition, McGraw-Hill, Inc., 2012.
Activity	**Overview**
	Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 2	**Nuclear power**
Key Concepts	Nuclear, power
Overview	Nuclear reaction physics are widely used. The nuclear fusion is very dangerous. Nuclear waste disposal is a big problem.
Aim	The overriding aim of this module is to equip students with the nuclear reaction; the nuclear fusion and the nuclear waste disposal.
Learning Outcomes	At the end of this module learners will be able to: 1- Understand the reaction systems.

	2- Know about the nuclear fusion and the nuclear waste disposal
Units	• Unit 2.1: nuclear reaction physics • Unit 2.2: current reactor designs • Unit 2.3: nuclear fusion • Unit 2.4: Nuclear waste disposal
Readings	1- Energy Systems Engineering, F.M. Vanek, L.D Albright, and Largus Angenent, Second Edition, McGraw-Hill, Inc., 2012.
Activity	**Overview**
	Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 3	**Solar energy**
Key Concepts	Solar, energy
Overview	Solar energy can be converted for heating systems. Solar energy is also can be converted directly into electricity by using Photovoltaic.
Aim	The overriding aim of this module is to equip students with the solar energy and its techniques for heating and electricity.
Learning Outcomes	At the end of this module learners will be able to: 1- Recognize illumination and heating systems 2- Know about the design of Photovoltaic.
Units	• Unit 3.1: solar radiation physics and geometry. • Unit 3.2: heating systems and Stirling cycle • Unit 3.3: Photovoltaic technology
Readings	1- Energy Systems Engineering, F.M. Vanek, L.D Albright, and Largus Angenent, Second Edition, McGraw-Hill, Inc., 2012.
Activity	**Overview**

	Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 4	**Wind and other Energies**
Key Concepts	Wind, biomass, geothermal, ocean
Overview	Wind energy draws a main source of renewable energy. There are other sources such as biomass, geothermal and ocean energies.
Aim	The overriding aim of this module is to equip students with the technology of the wind, biomass, geothermal and ocean energies.
Learning Outcomes	At the end of this module learners will be able to: 1- Understand the Technology of wind energy. 2- Recognize the other renewable energy.
Units	• Unit 4.1: Wind Energy • Unit 4.2: Geothermal • Unit 4.3: Ocean Current Energy • Unit 4.4: Biomass and Waste to Energy
Readings	2- Energy Conversion, Edited by D.Y. Goswami and F.Kreith, CRC Press, 2008. 2. G.N. Tiwari and R.K. Mishra, Advanced Renewable Energy Sources, RSC Publishing, 2012.
Activity	**Overview**
	Assignment : Using the WWW search. **Assignment : Prepare a research proposal**
Module 5	**Climate Control**
Key Concepts	Climate, chemical, Control, Sustainability
Overview	The technology of energy systems must be examined that will be acceptable in a world faced with global warming, local pollution.
Aim	The overriding aim of this module is to equip students with the climate

	control, CO2 Sequestration and Energy Sustainability
Learning Outcomes	At the end of this module learners will be able to: 1- Recognize the concepts and basics of climate control and sustainability.
Units	• Unit 5.1: Electro-chemical conversion • Unit 5.2: Climate Control • Unit 5.3: CO2 Sequestration • Unit 5.4: Energy Sustainability
Readings	2- Energy Conversion, Edited by D.Y. Goswami and F.Kreith, CRC Press, 2008. 2. G.N. Tiwari and R.K. Mishra, Advanced Renewable Energy Sources, RSC Publishing, 2012.

Course Identification

Course Coder:	ENP222
Level:	200
Course Name:	Energy conversion and utilization
Course Location:	Faculty of Energy Engineering
Class Times:	Thursday 9.00 - 12.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

Heat transfer is a subject taught the basic concepts and the simple technical applications of heat transfer. More extensive knowledge of the subject is expected of graduate engineers. The engineer should be familiar with the fundamentals of heat conduction, convective heat transfer and radiative transfer, as well as having a basic knowledge of mass transfer. However, it is important that the student acquires a broad understanding of the fundamentals and methods. Then it is sufficient to deepen this knowledge with selected examples and thereby improve problem solving skills.

Course Learning Objectives

Demonstrate knowledge of heat transfer definitions and terminology, including heat flux, thermal conductivity, and heat transfer coefficients. Demonstrate knowledge of conduction and the equivalent resistance formula, convective and use of the overall heat transfer coefficient, radiant heat transfer, including black bodies, gray bodies and emissivity. Demonstrate knowledge of heat exchangers, including the different types and how they operate, application. Demonstrate knowledge of mass transfer definition and compare it with convenient heat transfer. Apply this knowledge on various engineering application. Share ideas and work in a team in an efficient and effective manner under controlled supervision or independently.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Explain the difference between turbulent and laminar flow regimes and how to determine which regime exists for a given flow.
2- Use correlations to calculate the convection heat transfer for flows over flat plates, cylinders, and sphere.
3- Determine the heat transfer coefficient and heat transfer rate using correlations for flow in cylindrical pipes.
4- Explain the difference between natural convection and forced convection.
5- Describe the relationship between radiation surface properties and radiation incident on a surface.
6- Determine the heat transfer from a grey surface given emissivity and the surface temperature.
7- Analyse the Heat transfer problems.
8- Conclude solutions and demonstrate creative thinking.
9- Deal with different used tables and charts.
10- Use appropriate fluid measurement lab. equipment.
11- Perform experiments in the lab within proper safety and ethical framework.
12- Write reports in accordance with the standard scientific guidelines.
13- Present reports, discuss results and defined his/her ideas.
14- Work coherently and successfully as a part of a team in assignments.

Course Resources

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	16/2/2014	Conduction equation and its application for steady state in simple and compound walls
2	23/2	Conduction equation and its application for steady state in simple and compound cylindrical and spherical surfaces

3	2/3	Study of the critical radius of insulation, Extended surfaces (fins) their efficiency charts.
4	9/3	Transient conduction
5	16/3	Introduction to convection heat transfer
6	23/3	Convection with internal flow
7	30/3	Convection with external flow
8	6/4	Midyear exam
9	27/4	Parameters affecting convection.
10	4/5	Relations for free convection and forced convection
11	11/5	Fundamentals of radiation heat transfer
12	18/5	Heat exchanger
13	25/5	Introduction to mass transfer
14	1/6	Final Exam

Module 1	**Conduction**
Key Concepts	Conduction, steady
Overview	The engineer should be familiar with the fundamentals of heat conduction. Demonstrate knowledge of heat transfer definitions and terminology, including heat flux, thermal conductivity,
Aim	The overriding aim of this module is to equip students with the fundamentals of heat conduction.
Learning Outcomes	At the end of this module learners will be able to: 1- Understand the steady state in simple and compound walls. 2- Study the conduction equation and its application
Units	• Unit 1.1: steady state in simple and compound walls • 1.2: steady state in simple and compound cylindrical and spherical

	surfaces • Unit 1.3: Extended surfaces (fins) • Unit 1.4: Transient conduction
Readings	1- Bird, R. B.; Steward, W. E. and Lishtbast, E. N., Transport Phenomena, John Wiley and Sons Inc., 1960.
Activity	**Overview**
	Assignment : Using the WWW search. Assignment : Prepare a research proposal
Module 2	**convection**
Key Concepts	Convection, internal flow, external flow, free, forced
Overview	The engineer should be familiar with the fundamentals of heat convection. Demonstrate knowledge of heat transfer coefficient and different types of convections.
Aim	The overriding aim of this module is to equip students with free and forced convection of the external and internal flows
Learning Outcomes	At the end of this module learners will be able to: 1- Explain the difference between turbulent and laminar flow regimes and how to determine which regime exists for a given flow. 2- Use correlations to calculate the convection heat transfer for flows over flat plates, cylinders, and sphere. 3- Explain the difference between natural convection and forced convection.
Units	• Unit 2.1: Introduction to convection heat transfer • Unit 2.2: Convection with internal flow • Unit 2.3: Convection with external flow • Unit 2.4 Parameters affecting convection.

	• Unit 2.5 free and forced convection
Readings	1- Bird, R. B.; Steward, W. E. and Lishtbast, E. N., Transport Phenomena, John Wiley and Sons Inc., 1960.
Activity	**Overview**
	Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 3	**radiation**
Key Concepts	Radiation, black body, gray
Overview	The engineer should be familiar with the fundamentals of heat radiation. Demonstrate knowledge of different surfaces and black body
Aim	The overriding aim of this module is to equip students with the how is the Fundamentals of radiation heat transfer.
Learning Outcomes	At the end of this module learners will be able to: 1- Describe the relationship between radiation surface properties and radiation incident on a surface. 2- Determine the heat transfer from a grey surface given emissivity and the surface temperature. 3- Analyse the Heat transfer problems.
Units	• Unit 3.1: Fundamentals of radiation heat transfer
Readings	2- Incroperal David, P. Devitt, Introduction to Heat Transfer, John Wiley and Sons, 1990.
Activity	**Overview**
	Assignment : Using the WWW search **Assignment : Prepare a research proposal** **Perform experiments in the lab**

Module 4	**Heat exchanger**
Key Concepts	Heat exchanger
Overview	Heat exchanger is one of the most important applications of heat transfer.
Aim	The overriding aim of this module is to equip students with the how is the technology of heat exchangers.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify the types of heat exchangers
Units	• Unit 4.1: Heat exchanger
Readings	3- Holman, J. P., Heat Transfer, McGraw Hill Book Co., 1990.
Activity	**Overview**
	Assignment : Using the WWW search. **Assignment : Prepare a research proposal** **Perform experiments in the lab**
Module 5	**mass transfer**
Key Concepts	mass transfer
Overview	There are many application in technology using the concept of mass transfer.
Aim	The overriding aim of this module is to equip students with the concept of mass transfer.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify the concept of mass transfer and its technology.
Units	• Unit 5.1: mass transfer
Readings	4- Geankoplis, C. J., Transport Processes and unit operations, Prentice Hall Int., 1993.
Activity	**Overview**
	Assignment : Using the WWW search

	Assignment : Prepare a research proposal **Perform experiments in the lab**

CLIMASP COURSE SYLLABUS

Course Syllabus

Course Code: ENX31x

Renewable Energy Resources *(Elective Course)*

Aswan University, Faculty of Energy Engineering, Departments of High Voltage Networks,

Fall Semester, 2013-2014

Instructor Information

Instructor: Prof. Dr. Salama Abdel-Hady

Location: Faculty of Energy Engineering

Telephone: Office – +20 3481234

Office Hours: Monday 12.00 - 14.00, Thursday 10.00 – 14.00

E-mail: salama_abdelhady@hotmail.com

Website:

Course Identification

Course Coder:	ENX31x
Level:	300
Course Name:	Renewable Energy Resources (Engineering Elective Course 1)
Course Location:	Faculty of Energy Engineering
Class Times:	Monday 9.00 - 12.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The origin and continuation of humankind is based on renewable energy such as solar and wind. The most basic processes supporting life on earth, such as photosynthesis and the rain cycle, are driven by solar and wind energy. From the very beginning of its history humankind realized that a good use of solar and wind energy is in humankind's benefit. Despite this, only recently, during the last 40 years, has solar and wind energy been har-nessed with specialized equipment and used as an alternative source of energy,

Course Learning Objectives

Identity different renewable energy, resources for power production such as wind, Solar, and non-conventional by hydro-power. Recognize natural sources of wind and solar ؟ energies in Egypt. Practice the operation and Design of Horizontal and Vertical Axis wind Turbines. Practice the Operation and Design of Solar flat plate collectors, concentrator systems, photovoltaic systems and other solar applications. Practice the operation of non-conventional hydro Power Systems Such as wave Energy and Tidal Energy. Recognize other renewable energy technologies such as Biomass, Ocean Thermal Energy …etc.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Define the renewable energy
2- Study the causes and the power of wind energy
3- Study of measuring equipment for wind speed and direction.

3- Analysis of wind energy data: Energy and frequency curves.
4- Analysis wind turbine theory and aerofoil theory.
5- Study of forces acting on the wind turbine and study the turbine performance.
6- Study of solar thermal energy: Its intensity in outer space and the calculation of the solar intensity on earth.
7- Study of solar angles, Shades and the equation of time.
8- Study of the solar collector and its components.

Course Resources

1- Duffie and Beckman, Solar Engineering of Thermal Processes, John Wiley, 1980.

Course Website(s)

Required Course Texts and Materials

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments/attendance/participation	20%
Midyear Exam	20%
Final Exam	60%
Total Points	**100**

Course Policies

Late Assignments

It is essential that final written exam and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

The students are expected to come to all classes. You cannot pass the class under any circumstances if you miss more than 25% of all classes. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	22/9/2013	Introduction to renewable energy
2	29/7	Causes and the power of wind energy

3	6/10	Measuring equipment for wind speed and direction
4	13/10	Wind energy and frequency curves
5	20/10	Aerofoil theory.
6	27/10	Wind turbine theory
7	3/11	Forces acting on the wind turbine and study the turbine performance
8	10/11	Midyear exam
9	17/11	Introduction to solar thermal energy
10	24/11	Intensity in outer space and the calculation of the solar intensity on earth
11	1/12	Solar angles, Shades and the equation of time.
12	8/12	Components of solar collector
13	15/12	Design of solar collector
14	22/12	Final Exam

Module 1	**Introduction to renewable energy**
Key Concepts	Renewable, energy
Overview	The origin and continuation of humankind is based on renewable energy such as solar and wind. The most basic processes supporting life on earth, such as photosynthesis and the rain cycle, are driven by solar and wind energy. From the very beginning of its history humankind realized that a good use of solar and wind energy is in humankind's benefit. Despite this, only recently, during the last 40 years, has solar and wind energy been harnessed with specialized equipment and used as an alternative source of energy.
Aim	The overriding aim of this module is to equip students with the main sources of renewable energy.
Learning Outcomes	At the end of this module learners will be able to: 1- Define the renewable energy
Units	• Unit 1.1: Introduction to renewable energy
Readings	1- Duffie and Beckman, Solar Engineering of Thermal Processes, John Wiley, 1980.
Activity	**Overview** Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 2	**Wind energy**

Key Concepts	Wind, energy
Overview	The power produces from the wind turbines is the most important sources of te renewable energy.
Aim	The overriding aim of this module is to equip students with the technology of wind turbines.
Learning Outcomes	At the end of this module learners will be able to: 1- Study the causes and the power of wind energy 2- Study of measuring equipment for wind speed and direction. 3- Analysis of wind energy data: Energy and frequency curves. 4- Analysis wind turbine theory and aerofoil theory. 5- Study of forces acting on the wind turbine and study the turbine performance.
Units	• Unit 2.1: Causes and the power of wind energy • Unit 2.2: Measuring equipment for wind speed • Unit 2.3: frequency curves • Unit 2.4: Aerofoil theory. • Unit 2.5: Wind turbine theory • Forces and performances of wind turbine
Readings	1- Duffie and Beckman, Solar Engineering of Thermal Processes, John Wiley, 1980.
Activity	**Overview**
	Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 3	**solar thermal energy**
Key Concepts	Solar, thermal, energy
Overview	The power produces from the solar energy due to heat working fluid by

	using different method of technology.
Aim	The overriding aim of this module is to equip students with the technology of solar thermal energy.
Learning Outcomes	At the end of this module learners will be able to: 1- Study of solar thermal energy: Its intensity in outer space and the calculation of the solar intensity on earth. 2- Study of solar angles, Shades and the equation of time. 3- Study of the solar collector and its components.
Units	• Unit 3.1: solar intensity on earth • Unit 3.2: solar angles and the equation of time. • Unit 3.3: solar collectors
Readings	1- Duffie and Beckman, Solar Engineering of Thermal Processes, John Wiley, 1980.
Activity	**Overview**
	Assignment : Using the WWW search **Assignment : Prepare a research proposal**

Course Description/Overview

This course covers the practices and technologies that are applied to the prevention of air pollution, and to the cleaning and control of industrial air emissions. It provides a bridge for today's environmental manager by focusing on an integrated approach to managing air pollution problems within industrial operations.

Course Learning Objectives

Know the: definition of pollution - Sources of pollution - Types of pollution and their effect on lumen health. Methods of measurement - methods of pollutant reduction.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Define the environment.
2- Define the pollution.
3- Identify the sources of pollution.
4- Identify the types of pollution.
5- Discuss their effect on lumen health.
6- Identify the methods of measurement.
7- Apply the methods of pollutant reduction.

Course Resources

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	16/2/2014	Environment

2	23/2	Primary and secondary pollution
3	2/3	Sources of pollution
4	9/3	Types of pollution.
5	16/3	Air pollution regulation
6	23/3	Toxic pollutants
7	30/3	Radioactive pollutants
8	6/4	Midyear exam
9	27/4	Indoor pollutants
10	4/5	Ventilation and air quality control
11	11/5	Methods of measurement
12	18/5	Effect on lumen health
13	25/5	Pollutant reduction.
14	1/6	Final Exam

Module 1	**Environment**
Key Concepts	Environment, : Primary , secondary pollution
Overview	The concept of environment are widely used, therefore definition of it are most important.
Aim	The overriding aim of this module is to equip students with the meaning of environment and pollution.
Learning Outcomes	At the end of this module learners will be able to: 1- Define the environment.

	2- Define the pollution. 3- Identify the sources of pollution
Units	• Unit 1.1: Environment • Unit 1.2: Primary and secondary pollution • Unit 1.3: Sources of pollution
Readings	1- Nicholas P. Cheremisinoff, HANDBOOK OF AIR POLLUTION PREVENTION AND CONTROL, Elsevier Science (USA), 2002. http://lwf.ncdc.noaa.gov/oa/climate/gases.html#cd http://lwf.ncdc.noaa.gov/oa/climate/gases.html#m
Activity	**Overview**
	Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 2	**Types of pollution.**
Key Concepts	Air pollution , Toxic, Radioactive, Indoor
Overview	There different types of pollution such as air, toxic, radioactive and indoor pollutants.
Aim	The overriding aim of this module is to equip students with the Types of pollution.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify the types of pollution.
Units	• Unit 2.1: Air pollution regulation • Unit 2.2: Toxic pollutants • Unit 2.3: Radioactive pollutants • Unit 2.4: Indoor pollutants
Readings	1- Nicholas P. Cheremisinoff, HANDBOOK OF AIR POLLUTION PREVENTION AND CONTROL, Elsevier Science (USA), 2002.

	http://lwf.ncdc.noaa.gov/oa/climate/gases.html#n2o http://www.gsf.de/eurotrac
Activity	**Overview**
	Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 3	**Methods of measurement**
Key Concepts	Measurement instrument, pollution
Overview	There are different methods to measure the different types of pollution.
Aim	The overriding aim of this module is to equip students with the how is the pollutions measured.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify the methods of measurement 2- Discuss their effect on lumen health.
Units	• Unit 3.1: Methods of measurement • Unit 3.2: Effect on lumen health
Readings	1- Nicholas P. Cheremisinoff, HANDBOOK OF AIR POLLUTION PREVENTION AND CONTROL, Elsevier Science (USA), 2002. http://www.epa.gov/air/airtrends/reports.html http://www.epa.gov/air/airtrends/aqtrnd03/
Activity	**Overview**
	Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 4	**Pollutant reduction.**
Key Concepts	Pollutant, reduction.

Overview	To reduce the pollutions, there are several methods must be followed.
Aim	The overriding aim of this module is to equip students with the method using to reduce the pollutions.
Learning Outcomes	At the end of this module learners will be able to: 1- Apply the methods of pollutant reduction.
Units	• Unit 4.1: Pollutant reduction.
Readings	2- Boubel et al. (1994) Fundamentals of Air Pollution, 3rd Edition. Academic Press. http://www.epa.gov/oar/caa/contents.html http://www.epa.gov/air/basic.html
Activity	**Overview**
	Assignment : Using the WWW search **Assignment : Prepare a research proposal**

Course Number:AQA121

University of Aswan, Faculty of Science, Department of Mathematics,
Summer Semester, 2013-2014

Instructor Information

Instructor: Dr. Adel A. El-Faheem
Office Location: Aswan University Campus
Telephone: Office – +20 3481533
Office Hours: Sunday 10.00 – 13.00
E-mail: elfaheem@aswu.edu.eg
Website:

Course Identification

Course Number: AQA121
Course Name: Statistical Biology and Experimental Design
Course Location: University Campus
Class Times: Sunday 10.00 – 13.00
Prerequisites: Introduction to Probability and Statistics
Faculty Web Page:

Course Description/Overview

This course is an introduction to statistics, experimental design and statistical analysis for addressing problems in biology. Statistics includes those techniques and tools used for the collection, display, and analysis of data for the purpose of making decisions or constructing mathematical models. Thus, we will explore the theoretical properties of statistical inference methods, and we will apply these methods to many sets of real data from the surrounding environment and climate change and its impact on fisheries statistics. The course begins with methods for collecting and summarizing data and analyzing and studying the measures of central tendency and measures of dispersion. The course then introduces probability theory as a background for understanding inferential statistics and Design of Experiments. Methods are next presented for drawing

inferences from research samples to populations from which the samples were drawn. The course covers basic statistical tests: analysis of variance, and Latin square - block design - the design of the cluster - the analysis of covariance.

Course Learning Objectives

The main goals of this course are practical:
1) to help you learn and practice basic experimental design, statistical methods, and tools for analyzing data,
2) to help you better critically interpret the primary biological literature. We work as much as possible with real biological problems and data sets related with environment and climate change,
3) to apply statistical methods learned to help solve interesting and realistic problems across a variety of fields.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. To learn basic techniques for collecting and summarizing data and analyzing and studying the measures of central tendency and measures of dispersion.
2. To appreciate the importance of how data are produced.
3. To understand the mathematical theory behind common methods of statistical inference, such as analysis of variance and the analysis of covariance .
4. To apply statistical methods learned to help solve interesting and realistic problems across a variety of fields.
5. To gain facility in analysis of variance, and Latin square - block design - the design of the cluster - the analysis of covariance.

Course Resources

Course Website(s)

Required Course Texts and Materials

Optional Course Texts and Materials

1- Snedecor, G. W. and W. G. Cochran (1969). Statistical Methods 6th ed. Iowa State Univ., Press, Ames.

2- Steel, R. G. D. and J. H. Torrie (1980). Principles and procedures of Statistical: A biometrical Approach 2nd Ed. New Yourk U.S.A.

Assignments and Grading Scheme

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments/attendance/participation	15 degrees
Midyear Exam	15 degrees
Applied Part	10 degrees
An oral exam	10 degrees
Final Exam	50 degrees
Total Points	100

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than 25% of classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 15% of the grade.

Dissability

N.A.

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	16/3/2014	**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2	23/3	Methods for collecting and summarizing data
3	30/3	Analyzing and studying the measures of central tendency.
4	13/4	Measures of dispersion.
5	27/4	Introduces probability theory as a background for

		understanding inferential statistics
6	4/5	Understanding inferential statistics and testing the significant.
7	11/5	Introduction to Design of Experiments
8	18/5	Analysis of variance.
9	25/5	Latin square - block design - the design of the cluster -
10	1/6	Design sectors
11	8/6	Design Cluster
12	15/6	the analysis of covariance

Course	Statistical Biology and Experimental Design
Module 1	Collecting Data
Key Concepts	Types of Data, Information, Collecting Data.
Overview	Data Collection is an important aspect of any type of research study. Inaccurate data collection can impact the results of a study and ultimately lead to invalid results.
Aim	The aim of this module is to give students an idea about Data, and its types. Collecting the Data and put it in tables.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different types of Data • Discuss how to put Data in Graphs and Tables
Units	Unit 1.1 Discrete Data

	Unit 1.2: Continuous Data Unit 1.3: Colleting Data Unit 1.4: Tabulation and Graphing the Data
Readings	http://www.stat.ncsu.edu/info/srms/survpamphlet.html http://www.worldbank.org/poverty/impact/methods/datacoll.
Activity	**Overview**
Module 2	Central Tendency
Key Concepts	Mean, Median, Mode
Overview	• A measure of central tendency is a measure that tells us where the middle of a bunch of data lies. • The three most common measures of central tendency are the mean, the median, and the mode.

Aim	The overriding aim of this module is to Enhances understandings of the Mean: Mean is the most common measure of central tendency. It is simply the sum of the numbers divided by the number of numbers in a set of data. This is also known as average. Median: Median is the number present in the middle when the numbers in a set of data are arranged in ascending or descending order. If the number of numbers in a data set is even, then the median is the mean of the two middle numbers. Mode: Mode is the value that occurs most frequently in a set of data.
Learning Outcomes	• At the end of this module learners will be able to: • Identify examples of Mean, Median, Mode • Understand calculating the central tendency measurements
Units	Unit 2.1: The arithmetic Mean. Unit 2.2: The Median. Unit 2.3: The Mode
Readings	http://www.icoachmath.com/math_dictionary/measures_of_central_tendency.html

	http://www.businessdictionary.com/definition/measures-of-central-tendency.html http://www.kenbenoit.net/courses/iqrm/IQRM_Week3_CentralTendency.pdf
Activity	**Overview**
	Find the mean, median, mode, and range for the following list of values of Data
Module 3	Measures of dispersion
Key Concepts	Rang, variance, standard deviation
Overview	In statistics, statistical dispersion (also called statistical variability or variation) is variability or spread in a variable or a probability distribution. Common examples of measures of statistical dispersion are the variance, standard deviation and interquartile range. Dispersion is contrasted with location or central tendency, and together they are the most used properties of distributions.
Aim	This module aims at measure of statistical dispersion for a real number that is zero if all the data are identical, and increases as the data becomes more diverse. It cannot be less than zero. Most measures of dispersion have the same scale as the quantity being measured. In other words, if the

	measurements have units, such as metres or seconds, the measure of dispersion has the same units
Learning Outcomes	At the end of this module learners will be able to: Identify examples of Mean, Median, Mode Understand calculating the central tendency measurements
Units	Unit 3.1 Standard deviation, Range Unit 3.2: Interquartile range Unit 3.3: Mean difference Median absolute deviation
Readings	http://www.regentsprep.org/Regents/math/algtrig/ATS1/Dispersion.htm http://web.uct.ac.za/depts/stats/BioInformaticsResources/Rayner/Rayner150/chapter6.pdf
Module 4	Probability
Key Concepts	Random Variables, Conditional Probability and Expectation

Overview	We use probability to describe uncertain events. When you accidentally drop a slice of bread, you don't know if it's going to fall with the buttered side facing upwards or downwards. When your favorite sports team plays a game, you don't know whether they will win or not. When the weatherman says that there is a 40% chance of rain tomorrow, you may or may not end up getting wet. Uncertainty presents itself to some degree in every event that occurs around us and in every decision that we make.
Aim	We will see in this Module all of these uncertainties can be described using the rules of probability theory and that we can make definite conclusions about uncertain processes. We'll use three examples of uncertain processes to help you understand the meanings of the different words used in probability theory: tossing a coin, rolling dice, and a soccer match.
Learning Outcomes	At the end of this module learners will be able to: • Demonstrate knowledge on the concept of probability • Plan, develop and assess uncertainties can be described using the rules of probability theory
Units	Unit 3.1: Basic Concepts Unit 3.2: Random Variables

	Unit 3.3: Expectation Unit 3.4: Conditional Probability and Expectation
Readings	http://m.everythingmaths.co.za/grade-10/10-probability/10-probability-01.cnxmlplus http://m.everythingmaths.co.za/grade-10/10-probability/10-probability-01.cnxmlplus
Activity	**Overview**
	Assignment : **Prepare a research proposal for Bayes' Theorem** What is Probability?
Module 5	**Inferential Statistics**
Key Concepts	Production processes, techniques
Overview	We have seen that descriptive statistics provide information about our immediate group of data. For example, we could calculate the mean and standard deviation of the exam marks for the 100

	students and this could provide valuable information about this group of 100 students. Any group of data like this, which includes all the data you are interested in, is called a **population**. A population can be small or large, as long as it includes all the data you are interested in. For example, if you were only interested in the exam marks of 100 students, the 100 students would represent your population. Descriptive statistics are applied to populations, and the properties of populations, like the mean or standard deviation, are called **parameters** as they represent the whole population (i.e., everybody you are interested in).
Aim	With inferential statistics, you are trying to reach conclusions that extend beyond the immediate data alone. For instance, we use inferential statistics to try to infer from the sample data what the population might think. Or, we use inferential statistics to make judgments of the probability that an observed difference between groups is a dependable one or one that might have happened by chance in this study. Thus, we use inferential statistics to make inferences from our data to more general conditions; we use descriptive statistics simply to describe what's going on in our data.
Learning Outcomes	At the end of this module learners will be able to: • Estimating the parameter for population. • Work with others in groups

	• Solving problems using statistical inference theory • Use inferential statistics to make inferences from our data to more general conditions
Units	Unit 5.1: Understanding inferential statistics and testing the significant. Unit 5.2: Introduction to Design of Experiments Unit 5.3: Analysis of variance, the analysis of covariance Unit 5.4: Latin square - block design - the design of the cluster
Readings	https://statistics.laerd.com/statistical-guides/descriptive-inferential-statistics.php http://www.mathcs.duq.edu/~packer/Courses/Psy624/Inferential.pdf

Course Name: Environmental Geology
Course Location: University Campus
Class Times: 2:00 – 3:00 pm, Wednesday
Faculty Web Page: http://sci.aswu.edu.eg

Course Description:

Environmental geology is a science which objectively studies geologic information and applies it to contemporary environmental problems such as pollution, waste management, resource extraction, natural hazards, and human health. An environmental geologist might evaluate the risk and damage potential from natural hazards such as floods, landslides, volcanoes, or earthquakes. The environmental changes on local to global scales can be placed into an earth systems science perspective through examining the evolution and structure of our planet's components, and how these components naturally interact. This course is designed to introduce students to the relationship between humans and our Earth. It focuses on environmental and geosciences subjects that facilitate greater awareness of the interactions between the different Earth's components. The course discusses the geologic processes that shape the surface of the Earth, and how these processes affect and are affected by human activity. Moreover, the relationships between the lithosphere, hydrosphere, and atmosphere will be discussed. Particular attentions are given to the subjects of soil, mineralogy,

biogeochemical cycles, climate change, and pollution by human activities. The scientific methods that allow studying, prediction, and mitigation of environmental problems will be discussed.

Course Learning Objectives:
The course introduces students to our natural environment and the human interactions and everyday problems with our environment and global community from a geological perspective. Topics to be covered will include; earth materials and structure, environmental hazards such as floods, volcanoes and earthquakes, pollution of the environment, waste disposal, natural resources, and energy sources and their exploitation. The overarching goals of this course are to:

- Provide the fundamental concepts of environmental geology, and the interactions between the Earth systems and human activities.
- Increase awareness of environmental issues and how they affect society.
- Raise awareness of the natural hazards associated with common geologic processes including volcanoes, earthquakes, tsunamis, and floods.
- Gain an understanding of the physical processes that operate in and on earth.
- Understand the interactions between humans and these geological processes.
- Introduce the environmental challenges such as climate change, the global water quality and supply, and the scale of these challenges
- Summarize the pollutants and harms that are created from exploitation of ores, minerals and energy resources.
- Process and interpret the environmental data to solve environmental problems.

Course Content Learning Outcomes
Upon successful completion of this course, students will be able to:

1. Discuss the fundamental concepts of environmental geology, the earth system and the different environmental cycles, and the interactions between the Earth systems and human activities.

2. Understand the geologic processes and associated natural hazards, the pollutants and harms, created from ore and energy resources exploitation.
3. Understand the interactions between humans and the geological processes.
4. Summarize the environmental challenges such as climate change, the global water quality and supply.
5. Process and interpret the environmental data and apply scientific methods to solve environmental problems.

Required Course Texts and Materials:
Reference textbook for this course are:
1) Principles of Environmental Geochemistry by G. Nelson Eby, Brooks/Cole, 2004; 2) Environmental Geology, 8th edition, by Edward A. Keller Prentice Hall, 2000.
3) The Geology of Egypt, by Said, R., Ed. (1990).
In addition, selected publications in the fields relevant to the topics will be reviews and discussed extensively.

Assignments and Grading Scheme

Grading System
0 to 150 (where 90 is the least pass mark)

Grading Policy

Assignments	20%
Exams	70%
Class attendance/participation	10%
Total Points	**100**

Course Schedule

Week	Date	Topics
1		Discussion of syllabus, assignments, and course requirements.
2		Environmental geology: Fundamental concepts and definitions.
3		Earth structure and systems.
4		Geologic cycle and processes
5		Soil formation, classification and profile
6		Mass wasting processes
7		Volcanism: tectonic setting and types
8		Volcanic hazards, volcanoes and climate
9		Earthquake process, magnitude and intensity
10		Hazards and effects of earthquakes
11		Hazards associated with Floods and torrents
12		Hazards associated with ore and energy resources exploitation.
13		Wastes management
14		The environmental challenges (climate change, the global water quality and supply).

Course	Environmental Geology
Module 1	**Introduction**
Key Concepts	Environmental geology: Fundamental concepts and definitions
Overview	Environmental geology is the use of geologic information to help us solve conflicts in land use, to minimize environmental degradation, and to maximize the beneficial results of using our natural and modified

	environments. This module discusses the basic concepts and principles of environmental geology, and defines the commonly used terms and issues. The module provides general introduction to Environmental Geology, environmental ethics, environmental Crisis and fundamental concepts of the environmental sciences
Aim	The overriding aim of this module is to turn students able to discourse on basic concepts and principles of environmental geology, definitions of commonly used terms and issues, and fundamental concepts that apply to all environmental sciences.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different terms, concepts and principles of environmental geology. • Summarize the environmental ethics and crisis
Units	Unit 1.1: Introduction to Environmental Geology. Unit 1.2: Environmental Ethics. Unit 1.2: Environmental Crisis. Unit 1.4: Fundamental Concepts of the Environmental Sciences.
Readings	Environmental Geology, Lundgren, L. W., 1999 Environmental Geology, 8th edition, Keller E. A., 2000
Activity	What environmental geology means? Discuss the basic concepts of environmental geology? Write brief notes on environmental ethics and crisis?
Module 2	**Geologic cycles and processes**
Key Concepts	Plate tectonics, rock cycle, water cycle, surficial process
Overview	This module focuses on the geologic cycle including tectonic, hydrologic, rock, and biogeochemical sub-cycles that influence each other and may produce natural hazards and processes important to environmental geology such as landslides, earthquakes, volcanic activity, flooding,

	groundwater flow, and weather. Next, the module spotlights on the three rock families and their properties, such as a compressive strength and response to stress and strain that are essential to evaluating natural hazards.
Aim	The overriding aim of this module is to enhance student understandings about the geologic cycle, rock properties and surfacial process.
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the geologic sub-cycles • Understand the surficial processes that produce natural hazards.
Units	Unit 2.1: Geologic Cycle Unit 2.2: Hydrologic Cycle Unit 2.3: Biogeochemical Cycle Unit 2.4: Physical Properties of Rocks Unit 2.5: Surficial Processes
Readings	Environmental Geology, Lundgren, L. W., 1999 Environmental Geology, 8th edition, Keller E. A., 2000
Activity	Where do volcanoes and earthquakes occur? What is the percent of fresh water on earth? How much carbon dioxide enters the Earth's atmosphere each day? What is carbon dioxide's residence time in the atmosphere? Define the three types of stress? What are the physical earth processes might cause each, and what strain would result? What are the differences between elastic and plastic deformations?
Module 3	**Soils**
Key Concepts	Soil formation, soil profile, soil physical properties
Overview	The module focuses on soils--how they are formed and classified, their texture and structure, how liquids move through them, and their engineering properties. The module concludes the effects of land use activities on soil which results in erosion, pollution, and desertification.

Aim	The overriding aim of this module is to turn students able to understand the principle factor controlling soil formation, and to evaluate the physical properties of soils as engineering materials.
Learning Outcomes	At the end of this module students will be able to: • Reveal knowledge on the soil formation factors • Identify the different soil horizons and soil profile • Determinate the physical and engineering properties of soils
Units	Unit 3.1: Soil formation and classification Unit 3.2: Soil horizons and soil profile Unit 3.3: Physical properties of soils
Readings	Environmental Geology, 8th edition, Keller E. A., 2000
Activity	What are the main factors controlling soil formation? What are the criteria that used to make soil classification? Define the most common soil horizons and their characteristics? What are the physical parameters you use to evaluate soils for engineering purposes?
Module 4	**Slope Failure and Mass Wasting Processes**
Key Concepts	Slope Profiles, Slope Stability, Types of Mass Wasting, The Human Impact of Landslides, Subsidence
Overview	Slope failure, also referred to as mass wasting, is the down-slope movement of rock debris and soil in response to gravitational stresses. This module focuses on the types of mass wasting classified based on the type of down-slope movement. The types of movement, falls, slides, and flows are covered in this module. In addition, another type of ground failure and subsidence are covered.
Aim	The overriding aim of this module is to turn students able to discourse on major types of mass wasting and their causes.
Learning	At the end of this module learners will be able to:

Outcomes	• Identify the slope stability and types of down-slope movement. • Understand the different mass wasting processes. • Summarize the driving and resisting forces. • Discuss the effects of water and earth materials on slope failure.
Units	Unit 4.1: Slopes and slope profiles Unit 4.2: Mass wasting processes Unit 4.3: Types of down-slope movement Unit 4.4: Slope stability, driving and resisting forces Unit 4.5: Water and ground material effects on pattern of slope failure
Readings	Environmental Geology, 8th edition, Keller E. A., 2000
Activity	List the common mass wasting processes and types of slope failure? Write brief notes on slope stability, driving and resisting forces? Summarize effects of water and earth materials on slope failure pattern? What are the conditions causing the slope failure?
Module 5	**Volcanism and Earthquakes**
Key Concepts	Major Types of Volcanoes, Volcanic Hazards, Effects of Volcanoes, Earthquake Process, Magnitude and Intensity Earthquakes, Effects of Earthquakes.
Overview	Volcanoes differ greatly in style of eruption and associated hazards. Moreover, earthquakes are probably the most frightening naturally occurring hazard encountered. This module discusses the types of volcanoes and earthquake process, effects of volcanoes and earthquakes, and their associated hazards. It includes the following major topics: tectonic setting and types of volcanoes, volcanic hazards, predicting volcanic activity, volcanoes and climate, types of faults and earthquake process, detecting, locating and measuring earthquakes.
Aim	The overriding aim of this module is to turn students able to discourse on major types of volcanoes and earthquake process, their primary and secondary effects, and the associated hazards.

Learning Outcomes	At the end of this module learners will be able to: • Understand tectonic setting of volcanoes. • Identify the common types of volcanoes. • Summarize the effects and hazards of volcanoes. • Understand the earthquake process, their magnitude and intensity • Summarize the effects and hazards of earthquakes
Units	Unit 5.1: Volcanoes: tectonic setting and types. Unit 5.2: Volcanic hazards and predicting volcanic activity. Unit 5.3: Volcanoes and climate. Unit 5.4: Types of faults and earthquake process. Unit 5.5: Magnitude, intensity and effects of earthquakes
Readings	Environmental Geology, 8th edition, Keller E. A., 2000
Activity	What are the common types of volcanoes? List and briefly describe the primary and secondary environmental effects of volcanic eruptions? Discuss the relationship between the volcanic activity and climate? List and briefly describe the primary and secondary environmental effects of earthquakes?

Course Description/Overview

The present course is intended to raise the students' awareness. It introduces students to the fundamentals of air pollution with a background on historical perspective on air pollution and a commentary on current air quality policies and standards It focuses on understanding the atmospheric phenomena and the destruction of natural balance, including noise pollution, inevitably brought about by human activities, It provides an overview of the history of air pollution, air pollutants, effect of air pollution on climate, air quality management, and indoor air pollution. It does so through tackling the following aspects: 1) natural sources of air pollution; 2) anthropogenic sources of air pollution; 3) airborne particulate matter; 4) size distribution of atmospheric aerosols; 5) negative impacts; 6) global warming; 7) air pollution act; 8) atmospheric stability; 9) thermal invasion; 10) modelling of air pollution and control devices. That is they are asked to read and summarize articles on air pollution and its sources. They are invited to discuss effect of air pollution on climate at local, national and international scales. In short, the course provides an appropriate chance for the students to get the minimum knowledge of major air pollutants; their sources and their effects (environmental, economic and health) and how emissions are estimated from road traffic and industrial sources.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of air pollution; b) to raise awareness of the learners about effects of air pollution on climate; c) help learners use traditional and electronic tools to identify the risks the different types of air pollutants; and d) to highlight the importance of renewable energy resources as clean and safe resources to the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

98. Discuss the effects of air pollution on vegetation, soils, fresh water, and buildings.
99. Identify the characteristics of air pollution, relevant regulations, and control technologies.
100. Identify the different types of air pollutants.
101. Anticipate possible future environmental change and identify possible development consequences.

102. Estimate air pollution concentrations as a function of emission, meteorology, topography and the built environment for a combination of road and industrial sources.
103. Disseminate emission and air quality results to a wider audience.
104. Estimate health impact of changes in air pollution

Required Course Texts and Materials

Hands-out prepared by the instructor for the

- Environmental pollution and control , Ann Arbor, 1982.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Description/Overview

This course examines the dynamics of the biosphere through the study of the natural state of ecosystems. Emphasis is on the explanation of the relationships between organisms and their environment and on managing human and water resources. The application of physics to the study of the atmosphere attempts to model Earth's atmosphere and the atmospheres of the other planets using fluid flow equations, chemical models, radiation balancing, and energy transfer processes in the atmosphere (as well as how these tie into other systems such as the oceans). In order to model weather systems, atmospheric physicists employ elements of scattering theory, wave propagation models, cloud physics, statistical mechanics and spatial statistics which are highly mathematical and related to physics. It has close links to meteorology and climatology and also covers the design and construction of instruments for studying the atmosphere and the interpretation of the data they provide, including remote sensing instruments.

Course Learning Objectives

The overreaching goals of this course are: a) to examines of the dynamics of the biosphere through the study of the natural state of ecosystems; b) to provide the basic knowledge of environmental and resources studies; c) to raise awareness of the learners about the need to examine the relationships between organisms and their environment and managing human and water resources.; d) to model Earth's atmosphere and the atmospheres of the other planets using fluid flow equations, chemical models, radiation balancing, and energy transfer processes in the atmosphere (as well as how these tie into other systems such as the oceans).; e) to employ elements of scattering theory, wave propagation models, cloud physics, statistical mechanics and spatial statistics which are highly mathematical and related to physics.; f) to examine the links to meteorology and climatology; g) and also covers the design and construction of instruments for studying the atmosphere and the interpretation of the data they provide, including remote sensing instruments.

Course Objectives Learning Outcomes

Upon successful completion of this course, students will be able to:

25. Describe the biosphere through the study of the natural state of ecosystems, the relationships between organisms and their environment and managing human and water resources.
26. Explain the relationships between organisms and their environment and managing human and water resources.
27. Question the relationships between Earth's atmosphere and the atmospheres of the other planets using fluid flow equations, chemical models, radiation balancing, and energy transfer processes in the atmosphere (as well as how these tie into other systems such as the oceans).
28. Anticipate possible future environmental changes and possible development consequences.
29. Understand scattering theory, wave propagation models, cloud physics, statistical mechanics and spatial statistics which are highly mathematical and related to physics
30. Demonstrate the knowledge and understanding of the links of atmospheric physics to meteorology and climatology.
31. Use the different tools and equipments to collect data needed for studying the atmosphere and atmospheric changes,
32. Anticipate the effect of atmosphere on climate change.

Course Description/Overview

This course provides an interdisciplinary survey of environmental and resources studies, examining its physical, chemical, biological, political and economic dimensions. Emphasis will be on concepts and methods that can be applied to the analysis and understanding of a range of specific environmental problems. A survey of environmental systems, human interactions with them and the use of distinctive areas on Earth are introduced. Emphasis is on environmental concepts, problems, and research methods in Egypt. This course examines the dynamics of the biosphere through the study of the natural state of ecosystems. Emphasis is on the explanation of the relationships between organisms and their environment and on managing human and water resources. In short, the course provides an appropriate chance for the students to get the minimum knowledge of safe environment.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of environmental and resources studies; b) to raise awareness of the learners about the need to examine physical, chemical, biological, political and economic dimensions of environment; c) emphasize on concepts and methods that can be applied to the analysis and understanding of a range of specific environmental problems; d) help learners to conduct survey of environmental systems, human interactions with them and the use of distinctive areas on Earth; e) use traditional and electronic tools to identify the risks of the degradation of environment; and f) to highlight the importance of the biosphere through the study of the natural state of ecosystems.

Course Objectives Learning Outcomes

Upon successful completion of this course, students will be able to:

70. Discuss the basic terminology and core concepts of environmental sciences.
71. Identify the physical, chemical, biological, political and economic dimensions of environment.
72. Conduct survey of environmental systems, human interactions with them and the use of distinctive areas on Earth.

73. Identify the risks of the degradation of environment.
74. Question the relation between sustainable development and clean environment.
75. Anticipate possible future environmental change and possible development consequences.
76. Appreciate the positive impacts of reasonable use of environmental resources.
77. Demonstrate knowledge and understanding of relationship between poverty and unsafe environment.
78. Use the different tools and equipments to conduct survey of environmental systems, human interactions with them and the use of distinctive areas on Earth.
79. Appreciate the importance of the biosphere through the study of the natural state of ecosystems.

Populations and Environmental Studies 7. Environmental studies 8. Principles of Psychology 9. Adult education and environment Work		1-Fish adaptation and climatic change 2-Paleoecology 3- Economic Geology 4- Flora of Egypt 5-Plant community 6-Plant Ecology 7- Ecology and Physiology of Algae 8- Environmental Geology

		9- Statistical Biology and Experimental Design 10- History of Engineering and Energy 11- Project management 12- Fundamentals of Thermodynamic 13-Energy conversion and utilization 14-Heat transfer 15-Renewable energy resources 16-Pollution

Description of the Environmental Psychology Course

List of cognitive concepts

Basic	Psychological	Skills	Knowledge

competencies	Traits		
Explains the causes of environmental pollution	Balances between psychological bases and entrances to the interpretation of the relationship between behavior and environment	Uses the Correlation Method	Clarifies the concept of the environment
Uses the Internet and global networks in search for programs of the most important environmental education	Concludes the goals of environmental Education	Displays the causal relationship within the framework of the experimental method	Defines the concept of environmental psychology
Acquires skills of individual's positive personal behavior	Mentions examples of types of pollution in the environment	Masters methods of collecting information and data about the phenomenon studied	States the concept of environmental education
Collects reports and information about people's responses to environmental	Suggests a roadmap for Environmental Action to try to limit environmental	Builds projective tests and measurements	Mentions the concept of environmental education

conditions	pollution		
Communicates with peers to complete assigned work.	Mentions evidence on the existence of pollution in the surroundings	Masters writing self-reports	Explains the concept of perception
Tackles self-dependence in writing research on the role of community in the reduction of environmental pollution	Concludes the negative impact on health, resulting from water pollution	Identifies the causes that lead to the occurrence or non-occurrence of a phenomenon in the context of the Descriptive Method	Enumerates the concept of environmental perception
Acquires skills of positive behavior towards the environment	Discusses ways of changing psychological attitudes toward environment	Plans to explain how difficult it is to apply the scientific method and experimental control	Clarifies principles of learning
Draws a comprehensive blueprint for the most important types of environmental	Proposes new methods to help parents raise children properly	Criticize the conduct of laboratory experiments in environmental psychology	Mentions the theoretical bases of the interpretation of the relationship between the environment and

pollution that resulted in climatic changes in the world			behavior

* Definition of the course:
- Course No.:
- Course Title: Environmental Psychology
- Place:
- Timing of the lectures:
- Prerequisite:
- College Website:

*** Brief description of the course: (about 15 lines)**

The course of environmental psychology includes the following:
Chapter one: includes definition of environmental psychology, its topics, scientific methods, and the necessity that led to its emergence. Chapter two depends on developing positive behavior towards the environment and all fields in which we can improve human behavior regarding environmental issues. This means a paramount necessity for the existence of the so-called environmental instruction and environmental education in addition to causes that led to the failure of all environmental educational programs in Arab societies. The proof of this is the suffering of the environment around us from many problems, including problems of pollution, wastes, water and energy saving. In chapter three, we can recognize the psychology of environment, study its psychological and health effects on human society, and know the sources and causes of environmental pollution. Chapter four deals with ways to cure problems of the environment through the role the community and university play in the development and improvement of environment in the fight against pollution. Chapter five contains presentation of the theoretical foundations and introductions that constitute the relationship between the environment and human behavior, the formation of environmental perception and factors that affect this perception, environmental trends, and the role of the principles of learning in their composition and how they are measured.

*** Learning outcomes included in the Content; derived from the list of concepts:**

- Mention the theoretical foundations for the interpretation of the relationship between the environment and behavior.
- Explain the causes of environmental pollution.
- Acquire the skills of positive behavior towards the environment.
- Draw a comprehensive blueprint for the most serious types of pollution in the environment, which resulted in climatic changes in the world.
- Discuss ways of changing psychological attitudes toward environment.

*** Assignments and methods of Assessment:**

- Assessment will be graded on a scale of zero to 10 marks, and the degree of success starts at 50% or 60%
- Assessment Policy

Assignments	80
Tests	----
Attendance and participation	20
Total	100

*** Policies adopted in teaching the course:**

- Delays in the delivery of assignments?!
- Methods or **(policies)** of classroom management:
- Dealing with learners with disabilities:

*** Timetable of lectures (lessons):**

Week	Date	Subject
One & Two		Environmental Psychology: definition, theme and methods
Three & Four		The development of positive behavior towards the environment
Five & Six		Psychology of the environment, and its health and psychological effects
Seven & Eight		Ways to solve environmental problems
Nine & Ten		Theoretical bases that explain the relationship between environment and behavioral - environmental perception
Eleven & Twelve		Environmental attitudes

Thirteen & fourteen		Suggested activities

*** Guiding model for course modules**

Module I: Environmental Psychology: definition, themes, and methods

- The basic concepts of the module: concept of the environment - concept of environmental psychology
- A brief description of the Module: definition of the environment and its types, topics of environmental psychology and necessity that led to its emergence, curricula used in it, and what characterizes it
- Module goal: is to identify the environment and its types, and environmental psychology as a science that should be studied
- Learning Outcomes: It is expected that the student will be, after the completion of the lesson, able to:

(A) state the concept of environmental psychology.
(B) discuss the necessity that led to the emergence of environmental psychology.
(C) clarify the curricula used in the study of environmental psychology with no errors.

*** Activities**

1. Visiting the Association and the Council of Environmental Protection, and attempting to execute their objectives
2. Designing or developing a program for environmental awareness
3 Picking pictures out of newspapers and magazines, and analyzing their content, then comparing among them in terms of their expected impact
4. Coming up with the concept of each of these four words: information - fact - law - theory
5. Choosing one of the theories of psychology, and the stages of concluding it.
6. Student presents: what s/he feels, and how s/he behaves when s/he faces one of the situations mentioned in the introductions assigned for the interpretation of the relationship between environment and behavior, for his/her peers.

7. A student presents one of the situations in which s/he feels adapted, and the ones in which s/he lacks his/her ability, and compares between the causes of each feeling.
8 What is the relationship among the following processes: sensation, attention, perception?
9 In one situation, different individuals develop different perceptions. Explain via environmental situations you have experienced?
10 Students' choice of two environmentally different residential areas and recording the reaction of the population at the time of the processes of repair in their streets for a relatively long period; perspective of the student to express his/her opinion is to be taken into account.
11. Posing an open-ended question on at least ten members whether they are aware of the dangers threatening the environment in which they are present
12 Making a comparison between the four different definitions of psychological attitude, using a number of references
13. The attitude of student may change towards an a particular environmental or social issue, and then s/he identifies the factors that were behind the change.
14. Concluding the relationship between programs that some candidates present and voters' attitudes in certain areas.
15. Thinking in a certain way to get to know the attitudes of population of the local environment towards a large project will lead to a comprehensive environmental change.

Course Description/Overview

Anthropology is interested in studying human, like other human sciences, which are closely linked to the humanitarian community in which they exist, they reflect its core values prevailing in it, and then help the community improvement and development, the study of environmental and climatic changes has become one of the social sciences and humanities concerns, which including the Anthropology, some of the recent trends in environmental studies, anthropological have been occurred , and these trends study the human adaptive with global environmental changes and developing solutions to many of the environmental problems, and this course shows the nature of the relationship between Anthropology and climate change as the results for man's behavior towards his environment, the course has been divided into five sections: the first section entitled "what is Anthropology," this section deals with the concept of Anthropology, and its objectives, and scope, and its relations to other sciences, the second section entitled "environmental Education", and deals with the concept of environmental education, its goals, and the process of environmental awareness, the third section titled "global climate changes, current and future," it deals with the most important global climate changes, and then the fourth section entitled "The harms of climate changes," it deals with harms of climatic changes and their impact on human health and the physical and natural environment, and finally the fifth section entitled "Mechanisms of the development of environmental awareness among members of the community" by clarifying the role of formal and informal educational institutions in achieving and reduce environmental harms from climate changes.

Course Learning Objectives

The overarching goals of this course are:

1- Identify the communities cultures and behaviors towards climate changes.

2 Monitor the most important risks of climate changes on the environment and humans.

3 Raise the level of community awareness towards the dangers and harms of climate changes.

4 providing a critical study of the individuals behaviors to various climatic changes.
5. Activating the role of formal and informal educational institutions, in achieving and reduce environmental harms from climate change.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

7. Define the concept of Anthropology and its most important fields and objectives.
8. Clarify the relationship between Anthropology and other sciences.
9. Comparison between the fields of anthropological studies.
10. Show the awareness of global climate changes.
11. Benefit from the programs of educational institutions in modifying the behavior of individuals towards the environment.
12. Develop proposals for how to deal with global climate changes.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	40%
Exams	40%
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		The concept of Anthropology- inception - objectives - fields
3		Relationship between Anthropology and other scienc
4		The concept of environmental education and its goals
5		The Current and Future Global Climate Changes
6		The Harms of Climate Changes on the Natural Environment
7		The Harms of Climate Changes on the physical

		environment
8		The Harms of Climate Changes on human health
9		The role of formal educational institutions in raising awareness of the climate changes harms and reduce it.
10		The role of informal educational institutions in raising awareness of the climate changes harms and reduce it.
11		The role of technology in reducing the harms of climate changes
12		Activation of social networking sites to modify some of the behaviors that cause climate changes through action or animated videos and other.

APENDIX II: The CLIMASP Course Modules Template Example

Course	Environmental Education Anthropology
Module 1	Curriculum: What is Anthropology
Key Concepts	Anthropology and its goals , fields and types
Overview	This Module appears Introduction to Anthropology and its importance in the study of the cultural history of human society, and the most important areas that concerned and its relationship to other sciences.
Aim	The main objective of this Module to know the nature of science Anthropology and its relationship to human behaviors, which is the main reason for the occurrence of climatic changes.
Learning Outcomes	At the end of this module learners will be able to: Identify the concept and the nature of Anthropology. Compare between the different areas of anthropology. Clarify the relationship of Anthropology and other sciences.
Units	Unit 1.1 Anthropology (concept, objectives and fields) Unit 1.2: The Relationship between Anthropology and ot sciences.
Readings	Fulya Damla Kentli (2009). Comparison of hidden curriculum theories. European Journal of Educational Studies 1 (2) 83-88. Grundy, S. (1987) *Curriculum: Product or Praxis*, Lewes: Falmer

	Aristotle (1976) *The Nicomachean Ethics* ('Ethics'), Harmondsworth: Penguin. Chapter 3: Curriculum Theory. http://www.sagepub.com/upm-data/6042_Chapter_3_Glatthorn_(Sage)_I_Proof_2.pdf Watson, D. (2001). Pedagogy before technology: Re-thinking the relationship between ICT and teaching. Education and Information Technologies 6:4, 251–266
Activity	Writing an essay about the role of Anthropology in studying the human culture throughout the ages.
Module 2	Environmental Education
Key Concepts	Environmental Education- population
Overview	This Module appears the nature of environmental education and its most important fields, and objectives, and how to use technology in the preservation of the environment.
Aim	The objective of this Module is knowing the concept of environmental education and its objectives, and to clarify the impact of population activities on the environment, as well as to provide students with some practices associated with environmental

	education, and how to use technology to preserve them.
Learning Outcomes	• At the end of this module learners will be able to: • Define the concept of environmental education and goals. • Knowing the global efforts towards the preservation of the environment. • Optimize the use of technology to solve environmental problems. • Diagnosis of the current situation of environmental pollution.
Units	Unit 2.1: Environmental Education (concept - targets). Unit 2.2: The role of technology in preserving the environment. Unit 2.3: The global efforts to preserve the environment
Readings	Magdy Aziz Ibrahim: environmental education in the curricula of public education, the Anglo-Egyptian Library, Cairo, 2001.
Activity	**Overview**
	1-View documentary film about how to recycle waste. 2-Implementation workshops on how to recycle waste 3-Conducting field research on the most important aspects of environmental pollution in the local community. 4-Implementation of a forestation campaigns for the local community to reduce air pollution.

Module 3	Climate changes
Key Concepts	Climate changes
Overview	This Module appears the nature of climate changes and the most important forms and causes, and the role of human behavior in its occurrence.
Aim	This module aims at knowing the forms of climate changes and its most important reasons, and the most important international practices relating to the policies of adaptation to climate changes and mitigation.
Learning Outcomes	At the end of this module learners will be able to: • Identify the causes of climate changes. • Compare the best international practices on adaptation to climate changes and mitigation.
Units	Unit 3.1: Climate change: forms and causes Unit 3.2: The International practices to adapt to climate change and reduce its impact.
Readings	Abdul Wahab Bin Rajab Hashim bin Sadiq: Environmental Crimes and ways of confrontation, the Center for Studies and Research, Naif Arab University for Security Sciences, Riyadh,

	2006.
Activity	Make Atlas illustrates the most important of climate changes forms, its causes and the most affected areas by them.
Module 4	The harms of climate changes
Key Concepts	harms of climate changes
Overview	This Module appears the harms of climate changes on the physical and natural environment and human health, and revenge on the countries' economies and food security.
Aim	The overriding aim of this module is to study the impact of climate changes on human and natural and physical environment.
Learning Outcomes	At the end of this module learners will be able to: • Identify the harms of climate changes. • Educate communities with the climate changes effects
Units	Unit 3.1: The Harm of climate change on human health. Unit 3.2: The Harm of climate change on physical environment Unit 3.3: The Harm of climate change on natural environment
Readings	4- Ahmed Midhat Islam: the problem of environmental pollution era, wrote a series of monthly issued by the National Council for Culture, Arts and Letters, the world of knowledge, Kuwait, 1990. 5- Rachid Salmi: the impact of environmental pollution in

	economic development in Algeria, Ph.D. thesis, Faculty of Economic Sciences of management, University of Algiers 2006. 6- Mohamed Mahmoud Sergani: liability for environmental damage, a comparative study between international law and Islamic law, Umm Al-Qura University Journal of Educational Sciences, social, humanitarian, first edition, Volume XIII, presses Umm Al Qura University, Mecca, in January 2001
Activity	**Overview**
	Make field research on the most important harms of climate changes in the community.
Module 5	Mechanisms for the development of environmental awareness among members of the community
Key Concepts	environmental awareness
Overview	This Module appears the mechanisms development of environmental awareness to members of the community and reduce harms of the climate changes through activating the role of formal educational institutions (schools and universities) and informal (family - the media - civil society

	organizations).
Aim	The overriding aim of this module is to raise the level of environmental awareness among students is to help them adapt to climate change and the reduction of increasing severity.
Learning Outcomes	At the end of this module learners will be able to: • Define the role of formal and informal educational institutions, in developing the environmental awareness among members of the community. • practice patterns behaviors aimed at adapting to climate change and work on mitigation
Units	Unit 5.1: - The role of formal educational institutions in limiting the harms of climate changes. Unit 5.2: The role of informal educational institutions in limiting the harms of climate changes.
Readings	Najib Saab: the environment in the Arab media, the first Arab Media Forum for Environment and Sustainable Development, Cairo, 2006.
Activity	**Overview**
	Designing educational videos shows the harms of climate changes and how to deal with it.

	Designing Videos emphasizes the rejection of wrong behaviors that cause climate change.

Course Description/Overview

This course introduces environmental processes and the influence of human activities upon them. Topics include environmental sustainability, ecology and evolution, population growth, natural resources, and a focus on current environmental problems from scientific, social, political, and economic perspectives. Upon completion, students should be able to demonstrate an understanding of environmental interrelationships and of contemporary environmental issues. This course has been approved to satisfy the Comprehensive Articulation Agreement general education core requirement in natural sciences/mathematics.

Course Learning Objectives

The overarching goals of this course are: a) to provide a a broad base of ecosystems biology, environmental microbiology, pollution monitoring, ecotoxicology and environmental biochemistry; b) to raise awareness of the learners about the important aspects of ecosystems and biodiversity, evolution, animal and plant physiology, environmental microbiology and molecular and cellular biology; c) and help learners Prepare for a careers in such field as environmental protection, research, consultancy and ecosystems management.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1) Discuss current environmental issues with an understanding of the basic ecological concepts involved.
2) Use an interdisciplinary approach to analyze environmental issues/problems; show
knowledge of the interplay between the ecological, political, social, cultural and economic aspects of environmental problems.
3) Develop a worldview related to an understanding of current environmental issues and how global problems affect us locally.

4) Demonstrate an understanding of core ecological principles, and define scientific principles and concepts as related to environmental studies and sustainability.
5) Participate in basic field ecology research and experiments according to the scientific method.

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Teachers have the potential to be what Giroux and McLaren described as transformative intellectuals who combine scholarly reflection and practice in the service of educating students to be thoughtful, active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the environmental challenges resulting from climate change. It does so through tackling the following logically sequenced seven issues: 1) Environmental awareness; 2)Environmental ethics; 3) Biodiversity and climate change; 4) Climate change adaptation; 5) Urbanization's role in climate change; 6) Water resources and climate change Social learning processes; and 7) Water management and recycling. Issues 5-7 are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is, they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of water resources at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the negative environmental consequences of climate changes – at local, national and international scales - in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for the management of critical environmental issues; and c) use traditional and electronic resources as well as social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

- Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community.
- Analyse methods of ensuring local participation in climate change adaptation.
- Analyze the effects of climate change from both male and female perspectives
- Compare and contrast the impacts of major climatic hazards on livelihoods of the community.
- Comprehend the significance of the climate change problem locally and globally.
- Describe the relationship between human activities and climate change.
- Demonstrate an understanding of the natural carbon cycle.
- Explore solutions to problems that cause climate change.
- Identify ways to reduce the school's carbon footprint.
- Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in.
- Investigate the causes of climate change.
- Propose solutions to climate change issues.
- Understand how human actions are contributing to global environmental change. Course Resources

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Environmental awareness
3		Environmental ethics
4		Biodiversity and climate change
5		Climate change adaptation
6		Urbanization's role in climate change
7		Water resources and climate change Social learning processes (FORUM 1)
8		Water resources and climate change Social learning processes (FORUM 2)
9		Water resources and climate change Social learning processes (FORUM 3)
10-15		Water management and recycling (concepts, feasibility and consequences, techniques, national and international models)

Course Modules

Course	Environmental Sciences
Module 1	Environment: Ethics and Awareness
Key Concepts	Environmental awareness, Environmental ethics
Overview	Environmental awareness is to understand the fragility of our environment and the importance of its protection. Promoting environmental awareness is an easy way to become an environmental steward and participate in creating a brighter future for our children. To define environmental awareness we must first understand the environmentalist movement. Environmentalism is an ideology that evokes the necessity and responsibility of humans to respect, protect, and preserve the natural world from its anthropogenic (caused by humans) afflictions. Environmental awareness is an integral part of the movement's success. By teaching our students, friends and family that the physical environment is fragile and indispensable. Students need to start fixing the problems that threaten it. Environmental ethics, on the other hand, is the part of environmental philosophy which considers extending the traditional boundaries of ethics from solely including humans to including the non-human world. It exerts influence on a large range of disciplines including environmental law, environmental sociology, ecotheology, ecological economics, ecology and geography. There are many ethical decisions that human beings make with respect to the environment. Throughout this module, students are invited to share and exchange ideas about issues related to : clear cut forests for the sake of human consumption, propagation of species, gasoline powered vehicles, etc.
Aim	The overriding aim of this module is to turn students able to discourse how human actions are contributing to global environmental change.
Learning Outcomes	At the end of this module learners will be able to: • Collect, interpret and present information about strategies to confront

	climate change to a variety of audiences, including other students, parents and the local community. • understand how human actions are contributing to global environmental change.
Units	Unit 1.1: Environmental awareness Unit 1.2: Environmental ethics
Readings	• Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986** • **Paul Pojman** Environmental Ethics: Readings in Theory and Application Paperback – January 1, 2007 • Oxford Dictionary of Philosophy: environmental ethics, **http://www. answers**. com/topic/environmental-ethics
Activity	**Overview** Assignment 1.1: Reflecting Upon the following issues: • clear cut forests for the sake of human consumption. • propagating our species, and life itself. • make gasoline powered vehicles. • environmental obligations needed to keep for future generations. • the extinction of a species for the convenience of humanity. • Methods for best use and conserve of the space environment to secure and expand life.
Module 2	Biodiversity and Climate Change
Key Concepts	Biodiversity, Climate, Climate Change
Overview	In the atmosphere, gases such as water vapour, carbon dioxide, ozone, and methane act like the glass roof of a greenhouse by trapping heat and warming the planet. These gases are called greenhouse gases. The natural levels of these

	gases are being supplemented by emissions resulting from human activities, such as the burning of fossil fuels, farming activities and land-use changes. As a result, the Earth's surface and lower atmosphere are warming, and this rise in temperature is accompanied by many other changes. Rising levels of greenhouse gases are already changing the climate. These changes are affecting the entire world, from low-lying islands in the tropics to the vast polar regions. Also, Climate change affects biodiversity. It becomes one of the most significant drivers of biodiversity loss by the end of the century. It is already forcing biodiversity to adapt either through shifting habitat, changing life cycles, or the development of new physical traits. In this module, students need to realize that, conserving natural terrestrial, freshwater and marine ecosystems and restoring degraded ecosystems (including their genetic and species diversity) is essential for human well-being. Biodiversity can support efforts to reduce the negative effects of climate change. Conserved or restored habitats can remove carbon dioxide from the atmosphere, thus helping to address climate change by storing carbon (for example,reducing emissions from deforestation and forest degradation). Moreover, conserving in-tact ecosystems, such as mangroves, for example, can help reduce the disastrous impacts of climate change such as flooding and storm surges.
Aim	The overriding aim of this module is to realize the interrelationship between biodiversity and climate change
Learning Outcomes	Students will be able to: • Analyse methods of ensuring local participation in climate change adaptation. • Analyze the effects of climate change from both male and female perspectives
Units	Unit 2.1: Biodiversity, Climate, Unit 2.2: Climate Change

	Unit 2.3: Climate Change Adaptation
Readings	Shah, Anup. "Biodiversity." *Global Issues*. 19 Jan. 2014. Web. 10 Sep. 2014. <http://www.globalissues.org/issue/169/biodiversity>. • Doucet, C. (2007) *Urban Meltdown: Cities, Climate Change and Politics as Usual*, New Society Publishers, Gabriola Island BC. • Dow, K. and Downing, T. (2006) *The Atlas of Climate Change: Mapping the World's Greatest Challenge*, University of California Press, Berkeley. • Flannery, T. (2005) *The Weather Makers: How Man is Changing the Climate and What It Means for Life on Earth*, Atlantic Monthly Press NY. • Hansen, J. (2010) *Storms of My Grandchildren: The Truth about the Coming Climate Catastrophe and Our Last Chance to Save Humanity*, Bloomsbury, New York. • Henson, R. (2008) *The Gough Guide to Climate Change: The Symptoms, The Science, The Solutions*, Rough Guides, London.
Activity	**Overview**
	Work in group to: - Collect information on biodiversity in your local environment. - Collect evidence on the effects of climate change on biodiversity in your local environment during the last fifty years. - Propose a strategy to protect biodiversity in your local environment.
Module 3	**Urbanization and Climate Change**
Key Concepts	Urbanization
Overview	This Module deals with the implications of population growth and urbanization for climate change in terms of the contribution of urban populations (and centres) to human induced climate change. It emphasizes how it is not the growth in (urban or rural) population but the growth in consumption that drives

	the growth in greenhouse gas emissions and that a significant proportion of the world's urban (and rural) population have consumption levels that are so low that they contribute little or nothing to such emissions. In this module students discuss how in the much-needed planning for global emissions reduction, provisions must be made to allow low-income low-consumption households with greenhouse gas emissions below the 'fair-share' level to increase their consumption.
Aim	This module aims at examining the relationship between urbanization and climate change.
Learning Outcomes	At the end of this module learners will be able to: • Describe the relationship between human activities and climate change. • Demonstrate an understanding of the natural carbon cycle.
Units	Unit 3.1: Urbanization *Unit 3.2: Urbanization a Mixed Blessing* Unit 3.3: Urbanization and Climate Change
Readings	• David Satterthwaite The implications of population growth and urbanization for climate change, Paper presented at Expert-Group Meeting on Population Dynamics and Climate Change, UNFPA and IIED In Collaboration with UN-HABITAT and the Population Division, UN/DESA 24 to 25 June 2009 • Holper, P. and Torok, S. (2008) *Climate Change: What You Can do about It at Work, at Home, at School*, Pan Macmillan,Sydney. • Hulme, M. (2009) *Why We Disagree About Climate Change: Understanding Controversy, Inaction and Opportunity*, Cambridge University Press, Cambridge. • Johansen, B. (2006) *Global Warming in the Twenty-First Century*, Praeger Publishers, Westport CT.

	• Moser, S. and Dilling, L. (eds) (2007) *Creating a Climate for Change: Communicating Climate Change and Facilitating Social Change*, Cambridge University Press, Cambridge.
Activity	**Overview**
	Assignment : Prepare a lecture either of following themes 7. Urbanization: cons and pros 8. Urbanization and Carbon Cycle
Module 4	Water Resources and Climate Change
Key Concepts	Water resources management, Social learning processes
Overview	Water resources are important to both society and ecosystems. We depend on a reliable, clean supply of drinking water to sustain our health. We also need water for agriculture, energy production, navigation, recreation, and manufacturing. Many of these uses put pressure on water resources, stresses that are likely to be exacerbated by climate change. In many areas, climate change is likely to increasewater demand while shrinking water supplies. This shifting balance would challenge water managers to simultaneously meet the needs of growing communities, sensitive ecosystems, farmers, ranchers, energy producers, and manufacturers. In this module need to realize that in some areas, water shortages will be less of a problem than increases in runoff, flooding, or sea level rise. These effects can reduce the quality of water and can damage the infrastructure that we use to transport and deliver water.
Aim	The overriding aim of this module is realize the interrelationship between water resources management and climate change
Learning Outcomes	At the end of this module learners will be able to: • Compare and contrast the impacts of major climatic hazards on livelihoods of the community. • Comprehend the significance of the climate change problem locally and

	globally. • Explore solutions to problems that cause climate change.
Units	Unit 4.1: Water Resources and Climate Change Unit 4.2: Climate change Social learning processes
Readings	• CCSP (2008). *The Effects of Climate Change on Agriculture, Land Resources, Water Resources, and Biodiversity in the United States* . A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Backlund, P., A. Janetos, D. Schimel, J. Hatfield, K. Boote, P. Fay, L. Hahn, C. Randerson, W. Schlesinger, D. Lettenmaier, D. Major, L. Poff, S. Running, L. Hansen, D. Inouye, B.P. Kelly, L Meyerson, B. Peterson, and R. Shaw. U.S. Environmental Protection Agency, Washington, DC, USA. • Kundzewicz, Z.W., L.J. Mata, N.W. Arnell, P. Döll, P. Kabat, B. Jiménez, K.A. Miller, T. Oki, Z. Sen, and I.A. Shiklomanov (2007). Freshwater resources and their management. In: *Climate Change 2007: Impacts, Adaptation and Vulnerability* . EXIT Disclaimer *Contribution of Working Group II to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change* [Parry, M.L., O.F. Canziani, J.P. Palutikof, P.J. van der Linden and C.E. Hanson (eds.)]. Cambridge University Press, Cambridge, United Kingdom. • CCSP (2009). *Coastal Sensitivity to Sea-Level Rise: A Focus on the Mid-Atlantic Region* . A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Titus, J.G. (Coordinating Lead Author), Anderson, K.E., Cahoon, D.R., Gesch, D.B., Gill, S.K., Gutierrez, B.T., Thieler, E.R., Williams, S.J. (Lead Authors).

	U.S. Environmental Protection Agency, Washington, DC, USA. • CCSP (2008). *Preliminary Review of Adaptation Options for Climate-Sensitive Ecosystems and Resources* . A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Julius, S.H., J.M. West (eds.), J.S. Baron, B. Griffith, L.A. Joyce, P. Kareiva, B.D. Keller, M.A. Palmer, C.H. Peterson, and J.M. Scott (authors). U.S. Environmental Protection Agency, Washington, DC, USA.
Activity	**Overview**
	• **Assignment**: plan a seminar on major climatic hazards on livelihoods of the community comparing the problems of water shortages and those of water increases
Module 5	**Water Management and Recycling**
Key Concepts	Water management and recycling processes, techniques
Overview	Water cycle is a delicate balance of precipitation, evaporation, and all of the steps in between. Warmer temperatures increase the rate of evaporation of water into the atmosphere, in effect increasing the atmosphere's capacity to "hold" water. Increased evaporation may dry out some areas and fall as excess precipitation on other areas. Changes in the amount of rain falling during storms provide evidence that the water cycle is already changing. Rising temperatures cause snow to begin melting earlier in the year. This alters the timing of stream flow in rivers that have their sources in mountainous areas. As temperatures rise, people and animals need more water to maintain their health and thrive. Many important economic activities, like producing energy at power plants, raising livestock, and growing food crops, also require water. The amount of water available for these activities may be reduced as Earth warms, and if competition for water resources increases.
Aim	The overriding aim of this module is to equip students with the capacity to debate on water management and recycling processes, techniques and feasibility>

Learning Outcomes	At the end of this module learners will be able to: • Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in. • Investigate the causes of climate change. • Propose solutions to climate change issues.
Units	Unit 5.1: Water management (concepts; national and international models) Unit 5.2: Water recycling techniques feasibility and consequences
Readings	• United Nations Development Programme (2007) *Fighting Climate Change: Human Solidarity in a Divided World: Human Development Report 2007-2008*, Palgrave Macmillan, Basingstoke, UK. • *Layperson's Guide to Water Recycling and Reuse*, published in 1992 by the Water Education Foundation, Sacramento, California. • Video, entitled *Water from Water: Recycling*, produced in 1995 by National Water Research Institute, Fountain Valley, California. • Research On Recycled Water is done by EPA through the Office of Research and Development. • Water Recycling and Reuse: The Environmental Benefits http://www.epa.gov/region9/water/recycling/
Activity	**Overview** **Students are to plan and implement three-sessions workshop on the following themes:** • Water management (concepts; national and international models) • Water recycling techniques feasibility and consequences

Course Description/Overview

The present course provides students with an overview of ideas and themes in development with a particular emphasis on what it means to understand it in terms of geography. It seeks to help students understand both the geographical causes and consequences of varying development. Studies compare More Economically Developed Countries (MEDCs) with Less Economically Developed Countries (LEDCs). Within development geography, sustainable development is also studied in an attempt to understand how to meet the needs of the present without compromising the needs of future generations to meet their own needs. In addition, it explores that 'thinking geographically' about development involves understanding how the meaning of places and regions are socially constructed, and how theoretical and conceptual frameworks about development have been debated. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on geography of development.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the thematic fields within the human geography of developing countries– at local, national and international scales; b) raise awareness of the role of the learners to reflect critically the major theories of development and underdevelopment; and c) use traditional and electronic resources as well as social networking technologies as tools to identify geographical causes and consequences of varying development.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

16. Critically assess the role of governments, international agencies, private actors and NGO's with regard to poverty and development.

17. Critically examine the central concepts underlying development theory and relate them to wider issues of how local societies conceive their long-term sustainability and well-being.
18. Identify how debates and concepts in the field of development geography are being translated in development policies and practice.
19. Discuss certain thematic fields within the human geography of developing countries.
20. Explain the major theories of development and underdevelopment.

Course Description/Overview

The present course is intended to provide students with the key concepts about the geography and climate, the important elements of climate and how they are measured and recorded and handled statistically. It also illustrates the importance of the gaseous envelope of the planet and the threats it faces and how protect it. It familiarizes student elements of the climate and the factors affecting it and its geographical distribution and the skillful representation of the elements of the climate on the maps using the suitable symbols. Students are asked to read and summarize articles on elements of the climate. In short, the course provides an appropriate chance for the students to get the minimum knowledge of the climate processes and elements.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of geography of climate ; b) to raise awareness of the learners about elements of the climate and the factors affecting it; c) and help learners use traditional and electronic tools to identify the the elements of the climate on the maps using the suitable symbols.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the geographic distributions of climate processes such as temperature, precipitation, and weather.
2. Explain the processes that determine global climate patterns.
3. Interpret weather maps and data.
4. Analyze the causes and explain the implications of global warming.
5- Identify the elements of the climate and the factors affecting it.
7- Identify the elements of the climate on the maps using the suitable symbols.
8- Discuss the concepts of atmospheric disturbances, hurricanes, and how they occur and geographically spread.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Description:

Adult education and environment work is a science, which aims to give a general idea about the importance of adult education and literacy as a requirement necessary for the development of society, especially in the current era, which is characterized as the era of knowledge. Adult environmental education can play an important role in sensitizing and mobilizing communities and decision-makers towards sustained environmental action. Environment, health, population, nutrition and food security are intricately linked to one another in sustaining development. Each is a complex issue. Caring for the environment by controlling pollution , preventing soil erosion and prudently managing natural resources has a direct impact on the population's health, nutrition and wellbeing which, in turn, have implications for population growth and the availability of food. These issues are part of the wider quest for sustainable development, which cannot be attained without a strong emphasis in education on family issues, the reproductive life cycle and population issues such as ageing, migration, urbanization, and intergenerational and family relations.

Course Learning Objectives:

- ***Knowledge of the concept of the environment and its relationship to humans and Adult.***
- ***The impact of Adult education on environment work .***
- ***Concludes the effect of environment work functions, and the performance of mental tasks .***
- ***Determine the relationship of Adult education and environment work.***
- ***Concludes the optimal form of the environment work and how to deal with it.***

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. ***Congestion and its impact on behavior and associated pressures.***
2. ***Adult education and environment work and the resulting affect the physiological functions, and perform mental tasks and psychological aspects.***
3. ***Adult education and environment work in terms of their relationship with the various functions on the human.***
4. ***Identify environmental problems of society.***
5. ***Learn practical ways to solve the environmental problems of society.***
6. ***Dealing good with the components of the environment.***

Course Description/Overview

Planners often have the challenge of serving the "public". How can a planner best serve a public which has diverse needs and values based on age, gender, ethnicity and cultural background? In addition, how do planners trained in land use planning account for and address social issues such as homelessness, housing affordability, environmental racism and the increased privatization of space? While social planning was an important and central focus of the urban planning discipline in the 1970's, today it is barely mentioned or studied within academia or at the local and regional level. Yet, social issues and challenges are just as prevalent today. Our urban communities continue to face the challenging issues of homelessness, affordable housing, and environmental justice. In addition, our populous has become more diverse spanning a wide variety of cultures and backgrounds, each bringing a distinctive set of perspectives and needs. Social planning is the practice of identifying and addressing the needs of various segments of the population to ensure that all have an equal opportunity to both change their environment and benefit from it. The purpose of this course is to analyze social planning theory and practice at the local, regional and national level. This course will also entail a contemporary study of social issues and problems

commonly encountered in an urban environment and how they're integrated into and addressed through the practice of land use planning. Included subjects of discussion and analysis
shall include: planning theory, planning for age (young and elderly), gender, race, and plan implementation.

Course Learning Objectives

The overarching goals of this course are: a) to Incorporate the knowledge of different planning theories and paradigms in approaching the urban planning process, be able to identify how the plan-making (comprehensive planning) process accounts for differences in society; b) Identify different segments of the population differentiated by race, age, and gender and their distinctive needs and concerns with respect to living and working in the urban environment.; c) Evaluate development plans and general plans with a critical eye to identify how they have accounted for the distinctive needs of different segments of the public, distinguished by age, race, and gender ;d) Prepare development plans and general plans incorporating a plan making process that accounts for and incorporates the needs of different segments of the population ;e) Find resources to develop solutions to social issues or problems, and an aptitude to plan an appropriate solution with tangible results ;f) Find resources to develop solutions to the issues and problems of climate change.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Incorporate the knowledge of different planning theories and paradigms in approaching the urban planning process, be able to identify how the plan-making (comprehensive planning) process accounts for differences in society.
2. Identify different segments of the population differentiated by race, age, and gender and their distinctive needs and concerns with respect to living and working in the urban environment.
3. Evaluate development plans and general plans with a critical eye to identify how they have accounted for the distinctive needs of different segments of the public, distinguished by age, race, and gender.
4. Prepare development plans and general plans incorporating a plan making process that accounts for and incorporates the needs of different segments of the population.
5. Find resources to develop solutions to social issues or problems, and an aptitude to plan an

Prerequisites:	accepted in the first year in social work faculty

Faculty Web Page: http://sworks.aswu.edu.eg/Arabic/Pages/default.aspx

Course Description/Overview

This course surveys the history of social welfare , services, and the relation between social work and social welfare.It explores current social welfare issues in the context of their history and the underlying rationale and values that support different approaches. The course considers implicit and explicit values of societal responses to human needs. From an examination of selected topics in social welfare, the course considers social, economic, ethical, religious, and/or personal values as they affect and are affected by social welfare. The first section addresses the basics of social welfare such as concepts, goals, philosophy, principles, functions, directions, fields . The second section discusses the social welfare in the great civilizations such as ancient Egypt, grace, roman. The third section focuses on social welfare in religious specially in the Islam. The fourth section discusses the social welfare around the world. The five section addresses social welfare in the Egyptian society , The sex section addresses the relation between social work and social welfare, The seven section discusses the social welfare under the climate change, which changed in the programs and services.

Course Learning Objectives

The overarching goals of this course are: a) to provide a description of the historical basis for the current social welfare system, including the history and role of the social work profession; b) Discuss the strengths and limitations of the current social welfare system in terms of the functions of the provision of basic needs, protection of the vulnerable, prevention, promotion, treatment, rehabilitation, protection of society, and provision of social control; c) raise awareness of the major fields of social welfare service provision from a multicultural perspective, including but not limited to income security, health and mental health services, child welfare, educational practices, services to the elderly, and corrections ;d) analyze current debates, trends, and ethical issues in each specific field of service presented in the course including the implications for social welfare practice and promoting social policies in the field of climate change.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Discuss the various basics of social welfare such as concepts, goals, philosophy, principles, functions, directions, fields .

2. make great knowledge about social welfare in the great civilizations such as ancient Egypt, grace, roman, and in the religious specially in the Islam. social welfare around the world.social welfare in the Egyptian society.
3. Discuss the relation between social work and social welfare,
4. Demonstrate awareness and ability to work in the social welfare under the climate change .

Course Description/Overview

Environment is the framework in which they live rights and gets him on the elements of his life, food, clothing, medicine, shelter and exercise their relationships with peers, and in light of this sense, the environment is not just the natural elements (water, air, soil, minerals, plants, animals and energy sources) but they are also the balance of material resources and social available at some time, and somewhere to satisfy human needs and aspirations, and this we will address this decision (environmental studies and population) through the following sections: the first section addresses the definition of the environment and its characteristics, the second section deals with identifying the relationship between man and the environment and environmental problems and ways to address those problems , and Your first category III deals with the study of environmental pollutants and how to combat these pollutants and the fourth section addresses the role of social Work and tread different in the face of environmental problems, and the fifth section deals with the study of population and demographic characteristics of the population as well as to identify the problems of population and ways to address them, in addition to the study of the various factors that affect the environment The population in the light of climate change in order to achieve sustainable development and contribute to the achievement of stability within the different communities.

Course Learning Objectives

The overarching goals of this course are:

1 - Development of awareness of the importance the study of environmental problems and work to find the appropriate solutions in the light of environmental standards, which would contribute to the stability and sustainable development and cope with various changes.

2 - Improve the relationship between man and the environment surrounding it through the best investment of resources and facilities available, including not affect the natural environment and to achieve development and maintains the ecological balance and environmental components.

3 - Development of awareness of the importance of studying the problems of population and work on investment of human resources in order to achieve stability and contribute to the development of communities under various changes and scientific progress.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the characteristics of the environment and natural components and the mutual influence between living and non-living .
2. Discuss the relationship between man and the environment and the impact of human environmental factors.
3. Identify the various environmental problems and how to address them and work to achieve ecological balance between man and the environment surrounding it.
4. Identify the types of environmental pollutants and its impact on human life and the ways to combat these pollutants. Develop a lesson plan that integrates the produced digital artefact.
5. Identify the demographics of the community and address the problems of the mechanics of the population increase.
6. Discuss methods of investment of human resources to achieve growth and sustainable development.
7. Display some videos related to environmental problems and population.
8. Recognize the contribution of social work in the face of environmental problems and population and to help achieve stability within communities

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave

early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Website:

Course Identification

Course Number:

Course Name: Rural and Urban Sociology

Course Location: University Campus

Class Times: Thursday 9:30pm – 12:30am

Prerequisites: accepted in the first year in social work faculty

Faculty Web Page: http://sworks.aswu.edu.eg/Arabic/Pages/default.aspx

Course Description/Overview

The course aims to help students understand the rich diversity in rural society, with an emphasis on the interdependencies between urban and rural contexts. Current issues and social problems experienced by rural populations and how sociology is used to understand and address issues affecting rural communities are explored.

This course explores social life along the rural-urban continuum. We will examine differences and similarities in social behaviour, organization and ecology. An overview of social science perspectives pertaining to the interaction between human behaviour, social organization, and various dimensions of both natural and "built" environments will be provided. Upon developing a sociological understanding of rural, we will consider topical issues that often transcend the rural-urban continuum. In examining these and other related issues, Students completing the course should leave with an enhanced awareness of how humans interface with their environments, and why planned development efforts need to consider that interface in order to maximize the degree of congruence between environmental conditions and the needs and preferences of humans who live and work in those environments.

The first section addresses the concept of Sociology. The second section discusses the definitions of Rural and Urban Sociology. The third section focuses on historical background of Rural and Urban Sociology. The fourth section discusses the theories of Rural and Urban Sociology. The five section addresses scientific schools in Rural and Urban Sociology, The sex section addresses the how to work with Rural and Urban society , The seven section discusses the role of Rural and Urban Sociology in the facing the challenges of climate change.

Course Learning Objectives

The overarching goals of this course are: a) to provide a description of terminology and concepts used in the study of urban and rural sociology, including the Define concepts such as society/ civilization/ city/ suburb/ rural; b) Review the theoretical foundation of humans living in cities and villages; c) Discuss the failure of centrally planned totalitarian cities and villages ;d) Examine the social life in urban and rural spaces and the influence of the urban environment on human behaviour; e) Discuss city-living issues such as corrupt zoning, gerrymandering, red-lining, urban redevelopment, eminent domain for roads and highways, urban redevelopment, price fixing for rents and groceries, war against youth, over policing, under policing, climate change. etc

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. As a result of taking this course, students will have gained a social science understanding of rural and urban issues.
2. Students will be able to demonstrate critical thinking through oral and written formats, assess the complexity of rural and urban issues.
3. Students will be able to apply sociological theories and methodologies to the study of rural and urban issues.

Class Times:	Wednesday 9:30pm – 12:30am
Prerequisites:	accepted in the first year in social work faculty
Faculty Web Page:	http://sworks.aswu.edu.eg/Arabic/Pages/default.aspx

Course Description/Overview

This course covers the Social Work in the field of environment and sustainable development and to support community-based organizations working in the field of environment. And is aimed at addressing environmental issues and changes thereto affect the stability and hinder the growth, progress and sustainable development as the focus of this course to support community-based organizations working in the field of environmental protection and spread awareness among members of the community and support of volunteerism, which would contribute to the improvement of the environment and to achieve stability and desired progress and deals with this scheduled the following sections: the concept of Social Work in the field of environmental protection, the goals of Social Work in the field of environmental protection, Social Work posts in achieving social development, contributions to civil society organizations in the field of environmental protection. This course also addresses the issues of climate change and its impact on the albino and how to contribute to the growth of environmental commensurate with the requirements of climate change and sustainable development.

Course Learning Objectives

The overarching goals of this course are:

1 - Development of environmental awareness as one of the areas developed in the Social Work and determines the appropriate methods to protect the environment from multiple problems.

2 - Increasing the information associated with the protection of the environment and ways to optimize the investment environment of resources in order to achieve stability and sustainable development and caring members of society.

3 - To identify the contribution of civil society organizations in the field of environmental protection and the mechanisms to support those organizations to contribute to the achievement of stability and social development

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

11. The acquisition of information related to the field of protection of the environment and how to preserve the environment of the different climate changes.

12. To identify the organizations working in the field of environmental protection and the mechanics of working through those organizations to protect the environment.
13. To identify the contribution of social service in the field of environmental protection as one of the areas developed in the Social Work.
14. Identify the goals of Social Work in the field of environmental protection.
15. Identify mechanisms to support organizations working in the field of environmental protection and to stabilize the environment and sustainable development.
16. Determine the plans, programs and strategies appropriate to the development environment commensurate with the climate change and achieving environmental stability
17. A showcase of some of the experiences in the field of environmental protection and how to employ them in proportion to the different climate changes

Class Times: Sunday 9.00 - 11.00
Prerequisites: NA
Faculty Web Page: http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

History was quite impracticable, not only because of the enormous compression that would be necessary, but because the plan of the original did not lend itself to such treatment. The story of technological development was at every epoch closely related to the historical background. This course aims at being as much a technological history as a history of technology, and in pursuing this course we believe ourselves to be following an important modern trend.

Course Learning Objectives

Know the engineering history in different fields. Know the energy and different sources of it. Know different fields and different programs of engineering Know about the engineer jobs in different pogroms. Understand the engineering job ethics

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Demonstrate knowledge of role of engineering in development and establishment of civilization.
2- Demonstrate knowledge and understanding of engineering history in ancient time, middle ages and modern time.
3- Demonstrate knowledge of different engineering fields.
4- Demonstrate knowledge of different engineering programs.
5- Demonstrate knowledge and understanding of technology transfer, environmental, inventions and engineering ethics.
6- Understand the role of engineering in development and establishment of civilization.
7- Identify technology transfer, environmental & inventions and engineering ethics
8- Assess engineering history in ancient, middle and modern time.
9- Assess resources in engineering history
10- Deal with engineering history at various times
11- Demonstrate knowledge of the engineering ethics and ethical obligations about climate change effects.
12- Understand the historical technologies to face the climatic hazards

Course Resources

Course Location: Faculty of Energy Engineering
Class Times: Wednesday 10.00 - 12.00
Prerequisites: NA
Faculty Web Page: http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The project management is a process. It is an activity of planning, organizing, motivating, and controlling resources. It uses the procedures and protocols to achieve specific goals. A project is designed to produce a product or service. The management requires the development of distinct technical skills and management strategies.

Course Learning Objectives

Know the definitions used in project management. The project life cycle, Project stages, Relationships and responsibilities of the different project parties, Execution phase responsibilities, Productivity, Quality management. - Human Influences of projects: Upgrading, Development, Economic factors, Social factors, Cultural factors, Aesthetic factors, Hygienic and psychological factors. Types of projects: Urban planning projects (residential projects, tourism projects, commercial projects, public buildings…etc.). Infrastructure projects (electricity plants, water supply and sewage networks, road networks, railroad networks, reservoirs, dams…etc.). Different Industrial projects (textile factories, steel Industries, cement factories, carpet factories, ceramic factories, food factories, electrical appliances, car industries…etc.). Environmental impact of projects: Negative and positive impacts (direct and indirect). The assessment of projects-

both nationally and internationally- in order to avoid the negative consequences of projects on the environment. The approved rates and criteria for the compatibility of projects with environmental topics.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:
1- Define the definitions used in project management.
2- Understand the project life cycle
3- Understand the project stages, relationships and responsibilities.
4- Analyze execution phase responsibilities, productivity, and quality management.
5- Discuss the hhuman influences of projects: Upgrading,
6- Identify the types of projects.
7- Analyse the environmental impact of projects
8- Apply the approved rates and criteria for the compatibility of projects with environmental topics.

Course Name:	Thermodynamic Fundamentals
Course Location:	Faculty of Energy Engineering
Class Times:	Thursday 9.00 - 11.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The subject of thermodynamics referred to as thermal science. It is of interest to students of all engineering branches, in fact to all mankind, as it deals with the most basic processes occurring in nature. The subject forms the basis for the study of a vast variety of devices such as refrigerators, air conditioners, automotive engines, aircrafts, locomotives, power plants, etc, the use of which is involved in the everyday life of almost every individual. Even the simple kitchen gadget of steam pressure cooker is designed on the basis of the principles of thermodynamics.

Course Learning Objectives

Demonstrate knowledge of basic thermodynamic concepts, ideal gases and pure substance, first low of thermodynamic on different systems. Apply the first law of thermodynamics on various engineering applications. Share ideas and work in a team in an efficient and effective manner under controlled supervision or independently.

Course Content Learning Outcomes

1- Understand the links between sustainability, carbon and climate change.
2- Define the concept of the energy.

2- Define the different basic concepts like properties, state, process, equilibrium, and cycles.
3- Develop students' understanding of the natural carbon cycle.
4- Identify the different between the ideal gases and the pure substance.
5- Understand the property relations relevant to engineering thermodynamics.
6- Understand how to deal with thermodynamic tables.
7- Identify the concept of work and heat.
8- Understand the first law of thermodynamics, internal energy and enthalpy and Steady state steady flow.
9- Apply the first law of thermodynamics.
10- Understand the ssecond law of thermodynamics.
11- Understand the vapour and gas cycles

Course Resources

1- Sonntag, R. E.; Borgnakke, C. and Van Wylen, G. J., Fundamentals of thermodynamics, John Wiley and Sons Inc., 1998.
2- Cengel, Y. A. and M. A., Thermodynamics: An Engineering Approach, WCB/McGraw Hill, 1998

Assignments and Grading Scheme

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades can be based on the following:

Assignments/attendance/participation	20%
Midyear Exam	20%
Final Exam	60%
Total Points	**100**

Course Policies

Late Assignments

It is essential that final written exam and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

The students are expected to come to all classes. You cannot pass the class under any circumstances if you miss more than 25% of all classes. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

NA

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	16/2/2014	Basic concepts and definitions, the links between sustainability, carbon and climate change.
2	23/2	System and control volume, Property and state
3	2/3	Processes and cycles, natural carbon cycle.
4	9/3	Work definition, Definition of heat transfer
5	16/3	Ideal gases, State equation, Specific heat at constant pressure and volume
6	23/3	Pure substances and phase equilibrium, Tables of thermodynamic properties
7	30/3	First law of thermodynamics, Internal energy and enthalpy
8	6/4	Midyear exam
9	27/4	First law for closed cycle
10	4/5	Closed and open systems: Steady flow and uniform state uniform flow
11	11/5	Application of first law of thermodynamics (reciprocating compressors)
12	18/5	Second law of thermodynamics
13	25/5	Vapour and gas cycles
14	1/6	Final Exam

Course Name: Energy conversion and utilization
Course Location: Faculty of Energy Engineering
Class Times: Monday 9.00 - 12.00

Prerequisites: NA

Faculty Web Page: http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The purpose of this course is to critically examine the technology of energy systems that will be acceptable in a world faced with global warming, local pollution, and declining supplies of oil. The focus is on renewable energy sources (wind, solar, biomass), but other non-carbon emitting sources (nuclear) and reduced carbon sources (co-generative gas turbine plants, fuel cells) are also studied. Both the devices and the overall systems are analysed.

Course Learning Objectives

Introduction to principles, theories and processes of devices and systems that convert thermal, chemical, nuclear, and electromagnetic energy to electrical, mechanical and alternative chemical form. Energy conversion performance characteristics and sources of inefficiencies are explored for a variety of applications that include conventional fossil energy combustion based systems, nuclear, solar, wind, wave, biomass, thermoelectric, and geothermal energy systems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Demonstrate knowledge of energy conversion.
2- Study the future energy systems (e.g. pollution, climate change, energy security).
3- Compare between fuels and cycle analysis.
4- Understand the nuclear reaction physics and reactor designs.
5- Discuss the nuclear waste disposal.
6- Understand the solar-thermal energy.
7- Apply the conversion for heating systems.
8- Identify the photovoltaic technology.
9- Identify the wind energy.
10- Identify the geothermal and ocean current Energy.
11- Identify the biomass and waste to energy.
12- Apply the electro-chemical conversion.

13- Apply the thermoelectric conversion.
14- Know the climate Control, CO2 Sequestration and Energy Sustainability.

Course Resources

1- Energy Systems Engineering, F.M. Vanek, L.D Albright, and Largus Angenent, Second Edition, McGraw-Hill, Inc., 2012.
2- Energy Conversion, Edited by D.Y. Goswami and F.Kreith, CRC Press, 2008. 2. G.N. Tiwari and R.K. Mishra, Advanced Renewable Energy Sources, RSC Publishing, 2012.

Course Identification

Course Coder: ENP222

Level:	200
Course Name:	Energy conversion and utilization
Course Location:	Faculty of Energy Engineering
Class Times:	Thursday 9.00 - 12.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

Heat transfer is a subject taught the basic concepts and the simple technical applications of heat transfer. More extensive knowledge of the subject is expected of graduate engineers. The engineer should be familiar with the fundamentals of heat conduction, convective heat transfer and radiative transfer, as well as having a basic knowledge of mass transfer. However, it is important that the student acquires a broad understanding of the fundamentals and methods. Then it is sufficient to deepen this knowledge with selected examples and thereby improve problem solving skills.

Course Learning Objectives

Demonstrate knowledge of heat transfer definitions and terminology, including heat flux, thermal conductivity, and heat transfer coefficients. Demonstrate knowledge of conduction and the equivalent resistance formula, convective and use of the overall heat transfer coefficient, radiant heat transfer, including black bodies, gray bodies and emissivity. Demonstrate knowledge of heat exchangers, including the different types and how they operate, application. Demonstrate knowledge of mass transfer definition and compare it with convenient heat transfer. Apply this knowledge on various engineering application. Share ideas and work in a team in an efficient and effective manner under controlled supervision or independently.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Describe the development of global warming.
2- Explain the difference between turbulent and laminar flow regimes and how to determine which regime exists for a given flow.
3- Use correlations to calculate the convection heat transfer for flows over flat plates, cylinders, and sphere.

4- Determine the heat transfer coefficient and heat transfer rate using correlations for flow in cylindrical pipes.
5- Explain the difference between natural convection and forced convection.
6- Describe the relationship between radiation surface properties and radiation incident on a surface.
7- Determine the heat transfer from a grey surface given emissivity and the surface temperature.
8- Analyse the Heat transfer problems.
9- Deal with different used tables and charts.

Course Coder:	ENX31x
Level:	300
Course Name:	Renewable Energy Resources (Engineering Elective Course 1)
Course Location:	Faculty of Energy Engineering
Class Times:	Monday 9.00 - 12.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The origin and continuation of humankind is based on renewable energy such as solar and wind. The most basic processes supporting life on earth, such as photosynthesis and the rain cycle, are driven by solar and wind energy. From the very beginning of its history humankind realized that a good use of solar and wind energy is in humankind's benefit. Despite this, only recently, during the last 40 years, has solar and wind energy been har-nessed with specialized equipment and used as an alternative source of energy,

Course Learning Objectives

Identity different renewable energy, resources for power production such as wind, Solar, and non-conventional by hydro-power. Recognize natural sources of wind and solar ؟ energies in Egypt. Practice the operation and Design of Horizontal and Vertical Axis wind Turbines. Practice the Operation and Design of Solar flat plate collectors, concentrator systems, photovoltaic systems and other solar applications. Practice the operation of non-conventional hydro Power Systems Such as wave Energy and Tidal Energy. Recognize other renewable energy technologies such as Biomass, Ocean Thermal Energy …etc.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Identify the future energy systems and energy Sustainability.
2- Define the renewable energy
3- Study the causes and the power of wind energy
4- Study of measuring equipment for wind speed and direction.
5- Analysis of wind energy data: Energy and frequency curves.
6- Analysis wind turbine theory and aerofoil theory.
7- Study of forces acting on the wind turbine and study the turbine performance.
6- Study of solar thermal energy: Its intensity in outer space and the calculation of the solar intensity on earth.
9- Study of solar angles, Shades and the equation of time.
10- Study of the solar collector and its components.

Course Resources

1- Duffie and Beckman, Solar Engineering of Thermal Processes, John Wiley, 1980.

Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

This course covers the practices and technologies that are applied to the prevention of air pollution, and to the cleaning and control of industrial air emissions. It provides a bridge for today's environmental manager by focusing on an integrated approach to managing air pollution problems within industrial operations.

Course Learning Objectives

Know the: definition of pollution - Sources of pollution - Types of pollution and their effect on lumen health. Methods of measurement - methods of pollutant reduction.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:
1- Define the environment and climate change.
2- Define the pollution.
3- Identify the sources of pollution.
4- Identify the types of pollution.
5- Discuss their effect on lumen health.
6- Identify the methods of measurement.
7- Apply the methods of pollutant reduction.

Course Resources

1- Nicholas P. Cheremisinoff, HANDBOOK OF AIR POLLUTION PREVENTION AND CONTROL, Elsevier Science (USA), 2002.
2- Boubel et al. (1994) Fundamentals of Air Pollution, 3rd Edition. Academic Press.

Course Identification

Course Number: AQA121
Course Name: Statistical Biology and Experimental Design
Course Location: University Campus
Class Times: Sunday 10.00 – 13.00
Prerequisites: Introduction to Probability and Statistics
Faculty Web Page:

Course Description/Overview

This course is an introduction to statistics, experimental design and statistical analysis for addressing problems in biology. Statistics includes those techniques and tools used for the collection, display, and analysis of data for the purpose of making decisions or constructing mathematical models. Thus, we will explore the theoretical properties of statistical inference methods, and we will apply these methods to many sets of real data from the surrounding environment and climate change and its impact on fisheries statistics. The course begins with methods for collecting and summarizing data and analyzing and studying the measures of central tendency and measures of dispersion. The course then introduces probability theory as a background for understanding inferential statistics and Design of Experiments. Methods are next presented for drawing inferences from research samples to populations from which the samples were drawn. The course covers basic statistical tests: analysis of variance, and Latin square - block design - the design of the cluster - the analysis of covariance.

Course Learning Objectives

The main goals of this course are practical:
1) to help you learn and practice basic experimental design, statistical methods, and tools for analyzing data,
2) to help you better critically interpret the primary biological literature. We work as much as possible with real biological problems and data sets related with environment and climate change,
3) to apply statistical methods learned to help solve interesting and realistic problems across a variety of fields.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. To learn basic techniques for collecting and summarizing data and analyzing and studying the measures of central tendency and measures of dispersion.
2. To appreciate the importance of how data are produced.

3. To understand the mathematical theory behind common methods of statistical inference, such as analysis of variance and the analysis of covariance .
4. To apply statistical methods learned to help solve interesting and realistic problems across a variety of fields.
5. To gain facility in analysis of variance, and Latin square - block design - the design of the cluster - the analysis of covariance.

Course Identification

Course Number: **332 Bot.**
Course Name: **Ecology and Physiology of Algae**

Course Location: Aswan University campus
Class Times: Monday, 9 - 12 am
Prerequisites: General Botany - Phycology
Faculty Web Page:

Course Description/Overview

This course focuses on the studying of the relationships between algae in different habitats and their environment. Algae occupied different niche habitats in aquatic ecosystems. They live as phytoplankton or may be associated to various natural or artificial substrates and live as attached forms (phycoperiphyton). On the other hand, terrestrial algae may occupy different non-aquatic habitats and can live as soil algae, lichenized or rhizospheric forms. Generally, algae in different habitats are influenced by various abiotic and biotic factors prevailed in their environments. Alterations that may take place in the environmental conditions can influence the development and distribution of algae in their environments. Algae in aquatic ecosystems are regarded as the base of food web and have a pivotal role in influencing other aquatic biota in such habitats.

Course Learning Objectives

The main objective of the ecology of algae is to understand the concept of environmental conditions as well as the alterations that may take place in these conditions and the extent to which these conditions can influence the various communities of algae. For instance, studying of the ecology of phytoplankton and attached algae in aquatic habitats and of soil algae in terrestrial habitats.

Course Content Learning Outcomes

Upon successful completion of this course, students should be able to: demonstrate and understand the concept of the ecology of algae. In addition, students would be able to determine the role of algae in the ecosystem. Furthermore, the

students would be able to use the knowledge of algae and their habitats for environmental impact assessment. Besides, the students would be able to identify the algae of economic value and others that may be harmful.

Total Points	**100%**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)

1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Introduction to the ecology of algae.
3		Distribution of algae.
4		General outlook on phytoplankton
5		Sampling, preservation, qualitative and quantitative determinat of phytoplankton.
6		Factors influencing the distribution of phytoplankton.
7		Factors influencing the distribution of phytoplankton.
8		Limiting factors for phytoplankton development and distribution.
9		Man- made effects on phytoplankton.
10		Eutrophication, water blooms and harmful algae.
11		Eutrophication, water blooms and harmful algae.
12		General outlook of the attached algae.
13		Studying of attached algae and the factors influencing their development.
14		General outlook of soil algae.
15		Sampling and studying the factors influencing the growth and distribution of soil algae.

Course Identification

Course Number: **GEO 410**
Course Name: Economic Geology
Course Location: University Campus
Class Times: 2:00 – 3:00 pm, Sunday
Faculty Web Page: http://sci.aswu.edu.eg

Course Description:

Resources formed by geological processes are commonly called mineral resources and the branch of geology which concerned with the study of these resources is called Economic geology. This course provides an introduction to the geologic and economic factors that result in the development of commercial concentrations of mineral resources. Emphasis will be placed on the descriptive geology and origin of economic mineral concentrations within the context of their overall geologic settings. The geologic and economic nature of metallic and industrial mineral commodities in both "hard rock" and "soft rock" geologic environments will be discussed. Related topics

to be discussed include importance of mineral resources to the global economy, mineral exploration and evaluation, mineral extraction and processing, and environmental impacts result from mining and mineral extraction.

Course Learning Objectives:
The course looks at the origin and occurrence of economic natural resources including metallic ore deposits and industrial minerals. The course aims to provide students with a knowledge and understanding of the origin and distribution of mineral resources, the geologic factors that have led to ore deposit formation, and the geologic conditions that control the environmentally responsible development. Also, students should comprehend the wide variety of ore-forming processes, and have developed skills in interpreting ore deposits and exploration techniques.

Course Content Learning Outcomes
Upon successful completion of this course, students will be able to:

1. Demonstrate knowledge of the variety of ore-forming processes and discuss the key geological processes responsible for ore deposit formation.
2. Identify common rock types and minerals found in and around ore deposits.
3. Describe the essential geological setting of the main ore deposit types that provide the majority of the metals required by human society.
4. Understand the genesis of mineral deposits and their relationship to plate tectonics in time and space.
5. Describe the ore deposit classification and distribution in Egyptian deserts.
6. Be conversant with the environmental impacts of mining processes.

Required Course Texts and Materials:
Reference textbook for this course are:
1) An introduction to ore geology, Evans (1987)
2) Ore deposit geology and its influence on mineral exploration, Edwards and Atkinson (1986)

In addition, selected publications in the fields relevant to the topics will be reviews and discussed extensively.

Assignments and Grading Scheme

Grading System

Course Identification

Course Number: **GEO 434**
Course Name: Environmental Geology
Course Location: University Campus
Class Times: 2:00 – 3:00 pm, Wednesday
Faculty Web Page: http://sci.aswu.edu.eg

Course Description:
Environmental geology is a science which objectively studies geologic information and applies it to contemporary environmental problems such as pollution, waste management, resource extraction, natural hazards, and human health. An environmental geologist might evaluate the risk and damage potential from natural hazards such as floods, landslides, volcanoes, or earthquakes. The environmental changes on local to global scales can be placed into an earth systems science perspective through examining the evolution and structure of our planet's components, and how these components naturally interact. This course is designed to introduce students to the relationship between humans and our Earth. It focuses on environmental and geosciences subjects that facilitate greater awareness of the interactions between the different Earth's components. The course discusses the geologic processes that shape the surface of the Earth, and how these processes affect and are affected by human activity. Moreover, the relationships between the lithosphere, hydrosphere, and atmosphere will be discussed. Particular attentions are given to the subjects of soil, mineralogy, biogeochemical cycles, climate change, and pollution by human activities. The scientific methods that allow studying, prediction, and mitigation of environmental problems will be discussed.

Course Learning Objectives:
The course introduces students to our natural environment and the human interactions and everyday problems with our environment and global community from a geological perspective. Topics to be covered will include; earth materials and structure, environmental hazards such as floods, volcanoes and earthquakes, pollution of the environment, waste disposal, natural resources, and energy sources and their exploitation. The overarching goals of this course are to:

- Provide the fundamental concepts of environmental geology, and the interactions between the Earth systems and human activities.

- Increase awareness of environmental issues and how they affect society.
- Raise awareness of the natural hazards associated with common geologic processes including volcanoes, earthquakes, tsunamis, and floods.
- Gain an understanding of the physical processes that operate in and on earth.
- Understand the interactions between humans and these geological processes.
- Introduce the environmental challenges such as climate change, the global water quality and supply, and the scale of these challenges
- Summarize the pollutants and harms that are created from exploitation of ores, minerals and energy resources.
- Process and interpret the environmental data to solve environmental problems.

Course Content Learning Outcomes
Upon successful completion of this course, students will be able to:

18. Discuss the fundamental concepts of environmental geology, the earth system and the different environmental cycles, and the interactions between the Earth systems and human activities.
19. Understand the geologic processes and associated natural hazards, the pollutants and harms, created from ore and energy resources exploitation.
20. Understand the interactions between humans and the geological processes.
21. Summarize the environmental challenges such as climate change, the global water quality and supply.
22. Process and interpret the environmental data and apply scientific methods to solve environmental problems.

Required Course Texts and Materials:
Reference textbook for this course are:
1) Principles of Environmental Geochemistry by G. Nelson Eby, Brooks/Cole, 2004; 2) Environmental Geology, 8th edition, by Edward A. Keller Prentice Hall, 2000.
3) The Geology of Egypt, by Said, R., Ed. (1990).
In addition, selected publications in the fields relevant to the topics will be reviews and discussed extensively.

Course Schedule

Week	Date	Topics
1		Discussion of syllabus, assignments, and course requirements.
2		Environmental geology: Fundamental concepts and definitions.
3		Earth structure and systems.
4		Geologic cycle and processes
5		Soil formation, classification and profile
6		Mass wasting processes

7		Volcanism: tectonic setting and types
8		Volcanic hazards, volcanoes and climate
9		Earthquake process, magnitude and intensity
10		Hazards and effects of earthquakes
11		Hazards associated with Floods and torrents
12		Hazards associated with ore and energy resources exploitation.
13		Wastes management
14		The environmental challenges (climate change, the global water quality and supply).

Course	Environmental Geology
Module 1	**Introduction**
Key Concepts	Environmental geology: Fundamental concepts and definitions
Overview	Environmental geology is the use of geologic information to help us solve conflicts in land use, to minimize environmental degradation, and to maximize the beneficial results of using our natural and modified environments. This module discusses the basic concepts and principles of environmental geology, and defines the commonly used terms and issues. The module provides general introduction to Environmental Geology, environmental ethics, environmental Crisis and fundamental concepts of the environmental sciences
Aim	The overriding aim of this module is to turn students able to discourse on basic concepts and principles of environmental geology, definitions of commonly used terms and issues, and fundamental concepts that apply to all environmental sciences.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different terms, concepts and principles of environmental geology. • Summarize the environmental ethics and crisis

Units	Unit 1.1: Introduction to Environmental Geology. Unit 1.2: Environmental Ethics. Unit 1.2: Environmental Crisis. Unit 1.4: Fundamental Concepts of the Environmental Sciences.
Readings	Environmental Geology, Lundgren, L. W., 1999 Environmental Geology, 8th edition, Keller E. A., 2000
Activity	What environmental geology means? Discuss the basic concepts of environmental geology? Write brief notes on environmental ethics and crisis?
Module 2	**Geologic cycles and processes**
Key Concepts	Plate tectonics, rock cycle, water cycle, surficial process
Overview	This module focuses on the geologic cycle including tectonic, hydrologic, rock, and biogeochemical sub-cycles that influence each other and may produce natural hazards and processes important to environmental geology such as landslides, earthquakes, volcanic activity, flooding, groundwater flow, and weather. Next, the module spotlights on the three rock families and their properties, such as a compressive strength and response to stress and strain that are essential to evaluating natural hazards.
Aim	The overriding aim of this module is to enhance student understandings about the geologic cycle, rock properties and surfacial process.
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the geologic sub-cycles • Understand the surficial processes that produce natural hazards.
Units	Unit 2.1: Geologic Cycle Unit 2.2: Hydrologic Cycle Unit 2.3: Biogeochemical Cycle Unit 2.4: Physical Properties of Rocks

	Unit 2.5: Surficial Processes
Readings	Environmental Geology, Lundgren, L. W., 1999 Environmental Geology, 8th edition, Keller E. A., 2000
Activity	Where do volcanoes and earthquakes occur? What is the percent of fresh water on earth? How much carbon dioxide enters the Earth's atmosphere each day? What is carbon dioxide's residence time in the atmosphere? Define the three types of stress? What are the physical earth processes might cause each, and what strain would result? What are the differences between elastic and plastic deformations?
Module 3	**Soils**
Key Concepts	Soil formation, soil profile, soil physical properties
Overview	The module focuses on soils--how they are formed and classified, their texture and structure, how liquids move through them, and their engineering properties. The module concludes the effects of land use activities on soil which results in erosion, pollution, and desertification.
Aim	The overriding aim of this module is to turn students able to understand the principle factor controlling soil formation, and to evaluate the physical properties of soils as engineering materials.
Learning Outcomes	At the end of this module students will be able to: • Reveal knowledge on the soil formation factors • Identify the different soil horizons and soil profile • Determinate the physical and engineering properties of soils
Units	Unit 3.1: Soil formation and classification Unit 3.2: Soil horizons and soil profile Unit 3.3: Physical properties of soils
Readings	Environmental Geology, 8th edition, Keller E. A., 2000

Activity	What are the main factors controlling soil formation? What are the criteria that used to make soil classification? Define the most common soil horizons and their characteristics? What are the physical parameters you use to evaluate soils for engineering purposes?
Module 4	**Slope Failure and Mass Wasting Processes**
Key Concepts	Slope Profiles, Slope Stability, Types of Mass Wasting, The Human Impact of Landslides, Subsidence
Overview	Slope failure, also referred to as mass wasting, is the down-slope movement of rock debris and soil in response to gravitational stresses. This module focuses on the types of mass wasting classified based on the type of down-slope movement. The types of movement, falls, slides, and flows are covered in this module. In addition, another type of ground failure and subsidence are covered.
Aim	The overriding aim of this module is to turn students able to discourse on major types of mass wasting and their causes.
Learning Outcomes	At the end of this module learners will be able to: • Identify the slope stability and types of down-slope movement. • Understand the different mass wasting processes. • Summarize the driving and resisting forces. • Discuss the effects of water and earth materials on slope failure.
Units	Unit 4.1: Slopes and slope profiles Unit 4.2: Mass wasting processes Unit 4.3: Types of down-slope movement Unit 4.4: Slope stability, driving and resisting forces Unit 4.5: Water and ground material effects on pattern of slope failure
Readings	Environmental Geology, 8th edition, Keller E. A., 2000

Activity	List the common mass wasting processes and types of slope failure? Write brief notes on slope stability, driving and resisting forces? Summarize effects of water and earth materials on slope failure pattern? What are the conditions causing the slope failure?
Module 5	**Volcanism and Earthquakes**
Key Concepts	Major Types of Volcanoes, Volcanic Hazards, Effects of Volcanoes, Earthquake Process, Magnitude and Intensity Earthquakes, Effects of Earthquakes.
Overview	Volcanoes differ greatly in style of eruption and associated hazards. Moreover, earthquakes are probably the most frightening naturally occurring hazard encountered. This module discusses the types of volcanoes and earthquake process, effects of volcanoes and earthquakes, and their associated hazards. It includes the following major topics: tectonic setting and types of volcanoes, volcanic hazards, predicting volcanic activity, volcanoes and climate, types of faults and earthquake process, detecting, locating and measuring earthquakes.
Aim	The overriding aim of this module is to turn students able to discourse on major types of volcanoes and earthquake process, their primary and secondary effects, and the associated hazards.
Learning Outcomes	At the end of this module learners will be able to: • Understand tectonic setting of volcanoes. • Identify the common types of volcanoes. • Summarize the effects and hazards of volcanoes. • Understand the earthquake process, their magnitude and intensity • Summarize the effects and hazards of earthquakes
Units	Unit 5.1: Volcanoes: tectonic setting and types. Unit 5.2: Volcanic hazards and predicting volcanic activity. Unit 5.3: Volcanoes and climate.

	Unit 5.4: Types of faults and earthquake process. Unit 5.5: Magnitude, intensity and effects of earthquakes
Readings	Environmental Geology, 8th edition, Keller E. A., 2000
Activity	What are the common types of volcanoes? List and briefly describe the primary and secondary environmental effects of volcanic eruptions? Discuss the relationship between the volcanic activity and climate? List and briefly describe the primary and secondary environmental effects of earthquakes?

Course Identification

Course Number: **ENV 114**
Course Name: **Fish Adaptation and Climatic Changes**
Course Location: University of Aswan
Class Times:
Prerequisites:
Faculty Web Page:

Course Description/Overview

The pressure exerted due to global warming and climatic change on aquatic habitats or fish stock of inland water systems should be considered for better sustainable development of these resources. This course deals with the identification of global warming as well as climatic changes and describes the main bases and scientific principles of the climatic changes and their influences on the fresh- and marine water habitats particularly on fisheries and fish production. Also, the course pays an attention of the main sources for global warming and possibilities for mitigation of such effects.

Course Learning Objectives

The main objective of fish adaptation and climatic change is to understand the concept of mitigation of the climatic change effects on fisheries of different aquatic ecosystems and to fisheries for better exploitation of water resources and integrated management of fisheries and fish resources.

Course Content Learning Outcomes

Upon successful completion of this course, students should be able to: demonstrate and understand how fish resources and fisheries are influenced due to global warming and climatic change. In addition, students would be able to deal with sustainability of water, fish resources and fisheries.

Course Resources:

Prerequisites: General Botany – Plant taxonomy
Faculty Web Page:

Course Description/Overview

This course focuses on the floristic composition and distribution in Egypt. The distribution of Egyptian flora includes main regions namely; The Nile valley, eastern and western deserts, oases of the western desert, Mediterranean coasts, Red sea coast, Sinai.

Course Learning Objectives

The main objective of this course is to understand the concept of the Egyptian flora, their distribution in the different types of habitats. In addition, the course pays an attention on analysis of the phytosociological behaviour and size structure of the important and predominant plants.

Course Content Learning Outcomes

Upon successful completion of this course, students should be able to: demonstrate and understand the concept of the flora of Egypt. In addition, students would be able to differentiate between the floristic compositions of the different ecosystems in Egypt. Furthermore, the students would be able to use keys and manuals to identify the natural vegetation of different Egyptian habitats. Besides, the students would be able to recognize the plants of economic and medicinal values.

Course Identification

Course Number: **GEO 427**
Course Name: Paleoecology and Biostratigraphy
Course Location: University Campus
Class Times: 12:00 – 1:00 pm, Monday
Faculty Web Page: http://sci.aswu.edu.eg

Course Description:
During the course, the students are introduced to different aspects of paleoecology and biostratigraphy. This course introduces students to the relationships of fossil organisms to one another and to their physical environment,. This course will introduce past environments, discuss common proxies for studying paleoecology, and examine ecological principles as applied to the past. The course will provide a foundation for starting and performing research in the field of paleoecology, paleoclimatology, and climate change studies.

Course Learning Objectives:

The course provides an insight into the broader aspects of the biostratigrapy and chronostratigraphy, as their application expects into the fields of paleoceanography, and paleobiology and the usage of different age dating methodologies and techniques. It provides basic background information for understanding paleoecology and discusses the major concepts and themes of paleoecology, and methods of paleoecological analysis. It also provides state-of-art summaries of different marine environments and paleocologic niches.

Course Content Learning Outcomes
Upon successful completion of this course, students will be able to:

1. Understand the fundamental concepts in paleoecology.
2. Understand how both spatial and temporal scale and variability influences study of the past.
3. Have a working knowledge of how to "do" paleoecology and the strengths and weaknesses of paleoecological data.
4. List multiple definitions of the niches and demonstrate common methods to infer the niches through time.
5. Discuss how spatial and temporal scale influence ecological properties of populations, species, communities, and ecosystems.
6. constructing range charts and zonal schems for any given time interval using the index fossils provided.
7. Get knowledge about the age dating methods using the biostigraphic and radioactive techniques.
8. Get knowledge about paleoecologic and paleoenvironmenal interpretations.
9. Develop critical thinking and communication skills.

Course Resources:

1. Plankton Stratigraphy. Edited by Bolli et al. (1985). Cambridge university press, volume 1, Chapters 10 & 11 .
2. International stratigraphic guide. (1976).
3. Paleoceanography. Richard. A. Davis (1972) .

4. Periodicals, Web Sites, … etc
   - Biostratigraphy Journal.
   - Palaeogeorapy, palaeoclimatology, Palaeoecology Journal.
   - Earth and planetary science website.

Course Identification

Course Number:	
Course Name:	**Plant Ecology**
Course Location:	University of Aswan
Class Times:	Wednesday 8:30pm – 11:30am
Prerequisites:	ICT literacy

Faculty Web Page: http://www.Sci.uoc.gr

Course Description/Overview

Ecology is studying the interactions and interrelationships among organisms and their environment, such as the interactions organisms have with each other and with their abiotic environment. Topics of interest to ecologists include the diversity, distribution, amount (biomass), number (population) of organisms, as well as competition between them within and among ecosystems. Ecosystems are composed of dynamically interacting parts including organisms, the communities they make up, and the non-living components of their environment. As a basic science, ecology informs us about the processes governing the patterns we observe in nature. From an applied perspective, it is critical that we understand ecology as it provides insights and solutions to many of the environmental issues we are confronted with in our daily lives. In this course we will focus specifically on the ecology of plants.

Course Learning Objectives

The main objective of ecology is to understand the dynamics of our surroundings and to take proper measures to conserve it if and when required. However, the main objective of ecology is to study:

1. The inter-relationship between organisms in population and communities.

2. The structural adaptations and functional adjustments of organisms to their physical environment.

3. The behaviour of organisms 'under natural conditions.

5. The biological productivity of nature and its relationship with mankind.

6. Temporal changes in the occurrence, abundance and activities of organisms.

7. Conservation and management of natural resources and pollution.

Course Content Learning Outcomes

Upon successful completion of this course, students should be able to: demonstrate an understanding of how biotic and abiotic factors affect the abundance and distribution of plants in natural communities. Most importantly, you should leave this course better able to**:**

1) Describe how organisms' interactions with their environment and other organisms give rise to patterns in their abundance and distribution.
2) Demonstrate knowledge of the important ecological principles that operate at the levels of the individual organism, the population, the community, and the ecosystem.
3) Synthesize information across levels of ecological organization.
4) Critically evaluate work published in both the primary literature and popular press.
5)) Observe patterns and ask interesting ecological questions.
6) Analyze and interpret data generated from ecological experiments.
7) Communicate your findings in both written and oral format to your peers, and the larger scientific community.
8) Apply ecological principles to current environmental challenges and conservation concerns.

Assignments and Grading Scheme

Grading Policy

Grades can be based on the following: (Example)

Assignments	20%
Exams	60%
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	15/2/2012	**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2	22/2	Introduction to plant Ecology
3	29/2	Abiotic factors,
4	7/3	Light and temperature relations
5	14/3	Temperature, humidity, wind Light and Photosynthesis
6	21/3	Global patterns of vegetation
7	28/3	Plant adaptations to the environment
8	4/4	Water and soil relations
9	25/4	Nutrient acquisition
10	2/5	Growth and reproduction
11	9/5	Population structure and growth
12	16/5	Ecology of pollination and seed dispersal

13	23/5	Life history strategies
14	30/5	Positive interactions
15		Negative interactions
16		General review

APENDIX I

Course Syllabus
Course Number: 432.bot
Plant community
Aswan University, Faculty of Science, Department of Botany,
2013-2014
Instructor Information
Instructor: Prof.Dr. Mohamed Gabr Sheded
Office Location: University Campus
Telephone: Office +20 97480450 (3270)
Office Hours: Tuesday 10- 12
E-mail: msgaber1960@Yahoo.co
Website:
Course Identification
Course Number: **432.bot**

Course Name: **Plant community**
Course Location: University Campus
Class Times: Tuesday 10- 12
Prerequisites:
Faculty Web Page: http://www.aswu.sci.edu.eg

Course Description/Overview

Plant community deals with the distribution of natural vegetation in relation to different environmental conditions. What the course offers is a good introduction to the area of economic importance of plants such as the medicinal values of the natural vegetation covers. This course addresses the role of natural vegetation in the human life. In addition, it focuses on providing the students with knowledge on the climate and the alterations that may take place in the community structure due to the climatic change. Also, it discusses the importance of the natural vegetation in global biodiversity. Furthermore, the knowledge and skills provided to the students by studying this course are regarded as important information for climate change mitigation.

Course Learning Objectives

To provide a critical approach in the context of the environmental sciences for sustainability; b) to raise the abilities of learners in preparing for a sustainable future for decision makers. and c) to enable learners to identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:
Discuss; the various aspects of the floristic composition in different regions.
Connect environmental sciences with the science of flora and plant community for sustainability.Apply principals of climate on the plant cover distribution.

Required Course Texts and Materials

Hands-out prepared by the instructor for the class
Text books: Plant community and Plant ecology

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

Grading Policy

Grades can be based on the following: (Example)

Final written exam	60%
Practical Exam.	30%
Class attendance/participation	10%
Total Points	**100**

Course Identification

Course Number: ***312 T.R***

Course Name: ***Adult education and environment work***

Course Location: ***Faulty of Education, Class Building***

Class Times: ***10:00 – 12:00 pm, Saturday***

Faculty Web Page: *http://edu.aswu.edu.eg*

Course Description:

Adult education and environment work is a science, which aims to give a general idea about the importance of adult education and literacy as a requirement necessary for the development of society, especially in the current era, which is characterized as the era of knowledge. Adult environmental education can play an important role in sensitizing and mobilizing communities and decision-makers towards sustained environmental action. Environment, health, population, nutrition and food security are intricately linked to one another in sustaining development. Each is a complex issue. Caring for the environment by controlling pollution , preventing soil erosion and prudently managing natural resources has a direct impact on the population's health, nutrition and wellbeing which, in turn, have implications for population growth and the availability of food. These issues are part of the wider quest for sustainable development, which cannot be attained without a strong emphasis in education on family issues, the reproductive life cycle and population issues such as ageing, migration, urbanization, and intergenerational and family relations.

Course Learning Objectives:

- ***Knowledge of the concept of the environment and its relationship to humans and Adult.***
- ***The impact of Adult education on environment work .***
- ***Concludes the effect of environment work functions, and the performance of mental tasks .***

- ***Determine the relationship of Adult education and environment work.***
- ***Concludes the optimal form of the environment work and how to deal with it.***

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

7. ***Congestion and its impact on behavior and associated pressures.***
8. ***Adult education and environment work and the resulting affect the physiological functions, and perform mental tasks and psychological aspects.***
9. ***Adult education and environment work in terms of their relationship with the various functions on the human.***
10. ***Identify environmental problems of society.***
11. ***Learn practical ways to solve the environmental problems of society.***
12. ***Dealing good with the components of the environment.***

Required Course Texts and Materials:

Course Identification

Course Number: **En. St. (1) 117 T.R.**
Course Name: Environmental Studies
Course Location: Aswan Faculty of Education (Classes Building)
Class Times: 12:00 – 2:00 pm, Sunday
Faculty Web Page: http://edu.aswu.edu.eg

Course Description:

environmental framework poses bio frame humans so it is preserved and maintenance of the most important foundations of a healthy life, and there are reports and studies warn of mass destruction awaits human because of the effects of the environment and climate has appeared many of the climatic changes that should be taken into account when teaching our students the skills to deal well with the environment supports the professional development of the most important: global warming, ozone, earthquakes, forest fires, hurricanes.

The course offers good introduction to the field of climate change and sustainable development is divided into six parts, the first concept of the environment, and the second environmental pollution concept and types, and the third climate change in terms of the definition, types and effects of economic, social and environmental, and the fourth deals with the environmental dimension of climate change, and the fifth is facing sustainable development and its role in the face of climate change, and the sixth is trying to provide possible solutions to address climate change, allowing refine and develop the skills of sustainable professional development.

Course Learning Objectives:

The course introduces students to our natural environment and the human interactions and everyday problems with our environment and global community from a environmental perspective. The overarching goals of this course are:

)a) To provide a critical approach to Sustainable Development supported new ways to cope with climate change.

)b) Increase awareness of the dangers of environmental pollution, climate change and access to citizen's rights and roles and responsibilities towards the future.

)c) Use of technology in order to reach the causes of climate change, describing it and stand on the terms of their occurrence.

)d) use of environmental resources and tools in the low-cost access to the optimum relationship between climate change and sustainable development.

(e) Provide explanatory entrance to the fields of education and environmental goals and environmental conservation diverse.

Course Content Learning Outcomes

Upon successful completion of this course, Students will be able to:

)a) Discusses the diverse knowledge for sustainable development in the face of the risks of climate change in order to survive and preserve the environment.

)b) linking Theories the environment with the causes of environmental pollution.

)c) Explain climate change in light of the diverse knowledge related to the objectives of environmental education and its fields.

)d) produce of a digital video clip for no more than 15 minutes to describe the diverse climatic changes.

)e) The use of social networking sites (Facebook and Twitter) to increase the awareness of community members climate change and the role of sustainable development in the face.

)f) Develop a scenario for a workshop with members of the local community where industrial products incorporate technology for environmental risks.

(g) Design brochures explain the possible solutions to overcome the risks resulting from potential climate changes in the community.

Course Schedule

Week	Date	Topics
1		Discussion of syllabus, assignments, and course requirements.
2		Environmental studies: Fundamental concepts and definitions.
3		environment and climate
4		concept of the environment

5		environmental pollution concept and types
6		climate change in terms of the definition, types and effects of economic, social and environmental
7		environmental dimension of climate change and professional development.

Course	**Environmental Geology**
Module 1	**Introduction**
Key Concepts	Environmental studies: Fundamental concepts and definitions
Overview	Environmental studies is the use of environmental information to help

	us solve conflicts in bio use, to minimize environmental problems, and to maximize the beneficial results of using our natural and modified environments. This module discusses the basic concepts and principles of environmental studies, and defines the commonly used terms and issues. The module provides general introduction to Environmental studies, environmental ethics, environmental Crisis and fundamental concepts of the environmental sciences
Aim	The overriding aim of this module is to turn students able to discourse on basic concepts and principles of environmental studies, definitions of commonly used terms and issues, and fundamental concepts that apply to all environmental sciences.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different terms, concepts and principles of environmental studies. • Summarize the environmental ethics and crisis
Units	Unit 1.1: Introduction to Environmental studies. Unit 1.2: Environmental Ethics. Unit 1.2: Environmental Crisis. Unit 1.4: Fundamental Concepts of the Environmental Sciences.
Readings	Ecology: Concepts and Applications by Manuel Molles (Jan 13, 2012), Lundgren, L. W., 1999 Principles of Environmental Science: Inquiry and Applications by William Cunningham and Mary Cunningham (Dec 13, 2012)
Activity	What environmental studies means? Discuss the basic concepts of environmental studies? Write brief notes on environmental ethics and crisis?
Module 2	Environment and Climate
Key Concepts	Environment, Climate.

Overview	This module focuses on the Climate, Environment and relationship between them. The Module concentrates on the meaning of pollution and the types of them including air, water, noise, and ethics.
Aim	The overriding aim of this module is to enhance student understandings about the Environment, Climate, the relationship between them, and the types of poulltion.
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the Environment and Climate • Understand the process of pollution. • Recall the types of pollution.
Units	Unit 2.1: Environment. Unit 2.2: Climate. Unit 2.3: the relationship between Environment and Climate Unit 2.4: pollution: The meaning and the types.
Readings	Essential Environment: The Science behind the Stories (4th Edition) by Jay H. Withgott and Matthew Laposata (Sep 22, 2011) Environmental Science: Toward a Sustainable Future (12th Edition) by Richard T. Wright and Dorothy T. Boorse (Jan 18, 2013) Environment by Peter H. Raven, David M. Hassenzahl and Linda R. Berg (Dec 17, 2012) The Environment and You by Norman Christensen (Jan 7, 2012)
Activity	Where do volcanoes and earthquakes occur? What is the percent of fresh water on earth? How much carbon dioxide enters the Earth's atmosphere each day? What is carbon dioxide's residence time in the atmosphere? Define the three types of stress? What are the physical earth processes might cause each, and what strain would result? What are the differences between elastic and plastic deformations?
Module 3	Climate change in terms of the definition, types and effects of economic,

	social and environmental
Key Concepts	Climate change, and effects of economic, social and environmental
Overview	The module focuses on the meaning and causes of climate change --how they are formed and classified. The economic, social and environmental effects of climate change will be discussed.
Aim	The overriding aim of this module is to turn students able to understand the climate change in the light of environmental meaning and classify this pollutions (effects of economic, social and environmental).
Learning Outcomes	At the end of this module students will be able to: • Reveal knowledge on the climate • Identify the different between climate and environment. • Determinate the physical and engineering properties of soils
Units	Unit 3.1: Climate change Unit 3.2: The relationship between climate and environment Unit 3.3: Pollution.
Readings	Living in the Environment by G. Tyler Miller and Scott Spoolman (Jan 1, 2014) Understanding Environmental Pollution by Marquita K. Hill (May 24, 2010) Pollution by Marquita K. Hill (May 24, 2010) Air Pollution and Global Warming: History, Science, and Solutions by Professor Mark Z. Jacobson (Apr 23, 2012)
Activity	What are the main factors controlling climate? What are the criteria that used to classify pollutions? Define The economic, social and environmental effects of climate change?
Module 4	**Climate Change and Professional Development**

Key Concepts	Climate, Climate Change, and Professional Development.
Overview	The Next Generation Science Standards (NGSS) are the first set of U.S national science standards to explicitly include the topic of global climate change. With this new emphasis on climate change in K 12 science education 12-science education ,geosciences educators will likely play a central role in shaping a nation of citizens capable of understanding and making informed decisions about global climate change.
Aim	The overriding aim of this module is to turn students able to discourse on major types of climate change and the meaning of professional development.
Learning Outcomes	At the end of this module learners will be able to: • Identify the climate change and types of climate change. • Determine the concept of professional development. • Understand the types of professional development. • Discuss the effects of climate change and professional development.
Units	Unit 4.1: climate change. Unit 4.2: The types of climate change. Unit 4.3: The professional development. Unit 4.4: The relationship between climate change and professional development.
Readings	Experiences of Climate Change Adaptation in Africa (Climate Change Management) by Walter Leal Filho (Aug 8, 2011). Climate Change and Sustainable Development: New Challenges for Poverty Reduction by M. A. Mohamed Salih (Jul 2009)

Activity	List the common climate change and types climate change? Write brief notes on professional development? Summarize the relationship between climate change and professional development?

Course Description:
Environmental psychology is a science, which objectively studies the environment and what is shrouded in pollution, destruction and aggression or hit it from neglect, tampering, corruption, and subsequent farmland green of desertification and doom or dredging of soil and abuse it. So the damage which has become attached to the physical environment. Social man of the times became threatening to his health and even his life and the lives of all wildlife species. Man spends his hand on the aspects of his life and other objects and even destroys the physical environment itself, rather than working to beautify and improve good investment. As well as hit the environment as well as pollution and congestion and resulting pollution to the violation occurs in the ozone layer and the spread of diseases and epidemics, behavior of rights does not affect the environment only but also affect the composition and construction and development and in his character and his health and his illness and inclinations and abilities, intelligence and beliefs and ideas and concerns, and cares first part of the definition of and concept of Environmental of Psychology, and the second part The surrounding environment. The third part deals with psychological effects of pollution; Finally, Fourth part Environmental problems and solutions behavioral.

Course Learning Objectives:
- Knowledge of the concept of the environment and its relationship to humans and the interaction between them
- The impact of congestion on human behavior .
- Concludes the effect of noise on physiological functions, and the performance of mental tasks .
- Determine the relationship of light and weather, temperature and air pollution on various human functions.
- Concludes the optimal form of the environment and how to deal with it.

Course Content Learning Outcomes
Upon successful completion of this course, students will be able to:

13. Congestion and its impact on behavior and associated pressures.
14. Noise and noise pollution and the resulting affect the physiological functions, and perform mental tasks and psychological aspects.
15. Light, weather, temperature and air pollution in terms of their relationship with the various functions on the human.

16. Identify environmental problems of society.
17. Learn practical ways to solve the environmental problems of society.
18. Dealing good with the components of the environment.

Required Course Texts and Materials:

Week	Date	Topics

1		Discussion of syllabus, assignments, and course requirements.
2		Knowledge of the concept of the environment and its relationship to humans and the interaction between them
3		The surrounding environment
4		The psychology of pollution.
5		Psychological effects of pollution.
6		Ways to deal with environmental problems.

Course	**Environmental Psychology**
Module 1	**Introduction**
Key Concepts	The concept of the environment and its relationship to humans and the interaction between them.
Overview	Environment word commonly used significance associated pattern of relationship between them and her employer, we say: AGRO environment, and the industrial environment, the environment and health, the environment and social and cultural environment, and political..., This means that the relationship of human activities related to these areas ...
Aim	The overriding aim of this module is to turn students able to discourse on basic concepts and principles of environmental psychology, definitions of commonly used terms and issues, and fundamental concepts that apply to all environmental of psychology.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different terms, concepts and principles of environmental psychology. • Summarize the environmental ethics and crisis
Units	Unit 1.1: Introduction to Environmental psychology. Unit 1.2 Components and elements of the environment. Unit 1.2: Man and role in the environment.
Readings	- Abdel Fattah Dwedar (2010) Environmental Psychology. Alexandria: House new knowledge. - Abdul Rahman Mohammed Essawi (1997): in environmental psychology. Alexandria: plant knowledge

Activity	What environmental psychology means? Discuss the basic concepts of environmental psychology?
Module 2	Surrounding Environment
Key Concepts	human behavior, positive behavior, popular participation
Overview	Strain influence of the surrounding environment. Specific features of the surrounding environment Response to the surrounding environment.
Aim	The overriding aim of this module is to enhance student understandings about the concept of burden on the environment as well as the climate, altitude, temperature, light, color and noise.
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the human behavior towards the environment
Units	Unit 2.1: surrounding environment. Unit 2.2: human behavior.
Readings	- Kazem Mikdadi, environmental education, www.ao-academy.org - Abdul Rahman Mohammed Essawi (1997): in environmental psychology. Alexandria: plant knowledge.
Activity	What are the components of the surrounding environment?
Module 3	Environmental Pollution
Key Concepts	Environmental Pollution, Physical environment
Overview	Environmental factors Cause, such as the various pollutants and natural disasters such as storms, earthquakes and other, in many of the negative effects on human behavior. It is so noise pollution or noise.
Aim	The overriding aim of this module is to turn students able to understand the types of environmental pollution, and the impact of environmental pollution on human.
Learning Outcomes	At the end of this module students will be able to: • Know the types of environmental pollution . • Knowledge of the impact of environmental pollution on human • Physical environment and work performance.
Units	Unit 3.1: Environmental pollution Unit 3.2: The impact of environmental pollution on human Unit 3.3: Physical environment

Readings	- Abdel Fattah Dwedar (2010) Environmental Psychology. Alexandria: House new knowledge. - Abdul Rahman Mohammed Essawi (1997): in environmental psychology. Alexandria: plant knowledge
Activity	What are the main factors of environmental pollution? What are the impact of environmental pollution on human? Define the Physical environment?
Module 4	**Environmental problems and solutions behavioral**
Key Concepts	Environmental problems, solutions behavioral
Overview	Slope failure, also referred to as mass wasting, is the down-slope movement of rock debris and soil in response to gravitational stresses. This module focuses on the types of mass wasting classified based on the type of down-slope movement. The types of movement, falls, slides, and flows are covered in this module. In addition, another type of ground failure and subsidence are covered.
Aim	The main objective of this unit is to transform the view of students toward the environment.
Learning Outcomes	At the end of this module learners will be able to: • Environmental technology and behavioral problems. • Environmental problems associated with health. • Resource problem. • Individual differences in environmental care and reaction.
Units	Unit 4.1: Environmental and behavioral problems Unit 4.2: Ways to deal with environmental problems.
Readings	McAndrew, F. T. (1992) Environmental Psychology. - Abdel Fattah Dwedar (2010) Environmental Psychology. Alexandria: House new knowledge.
Activity	What are Environmental problems associated with health? Define the Environmental technology?

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Description/Overview

Planners often have the challenge of serving the "public". How can a planner best serve a public which has diverse needs and values based on age, gender, ethnicity and cultural background? In addition, how do planners trained in land use planning account for and address social issues such as homelessness, housing affordability, environmental racism and the increased privatization of space? While social planning was an important and central focus of the urban planning discipline in the 1970's, today it is barely mentioned or studied within academia or at the local and regional level. Yet, social issues and challenges are just as prevalent today. Our urban communities continue to face the challenging issues of homelessness, affordable housing, and environmental justice. In addition, our populous has become more diverse spanning a wide variety of cultures and backgrounds, each bringing a distinctive set of perspectives and needs. Social planning is the practice of identifying and addressing the needs of various segments of the population to ensure that all have an equal opportunity to both change their environment and benefit from it. The purpose of this course is to analyze social planning theory

and practice at the local, regional and national level. This course will also entail a contemporary study of social issues and problems commonly encountered in an urban environment and how they're integrated into and addressed through the practice of land use planning. Included subjects of discussion and analysis
shall include: planning theory, planning for age (young and elderly), gender, race, and plan implementation.

Course Learning Objectives

The overarching goals of this course are: a) to Incorporate the knowledge of different planning theories and paradigms in approaching the urban planning process, be able to identify how the plan-making (comprehensive planning) process accounts for differences in society; b) Identify different segments of the population differentiated by race, age, and gender and their distinctive needs and concerns with respect to living and working in the urban environment.; c) Evaluate development plans and general plans with a critical eye to identify how they have accounted for the distinctive needs of different segments of the public, distinguished by age, race, and gender ;d) Prepare development plans and general plans incorporating a plan making process that accounts for and incorporates the needs of different segments of the population ;e) Find resources to develop solutions to social issues or problems, and an aptitude to plan an appropriate solution with tangible results ;f) Find resources to develop solutions to the issues and problems of climate change.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Incorporate the knowledge of different planning theories and paradigms in approaching the urban planning process, be able to identify how the plan-making (comprehensive planning) process accounts for differences in society.
2. Identify different segments of the population differentiated by race, age, and gender and their distinctive needs and concerns with respect to living and working in the urban environment.
3. Evaluate development plans and general plans with a critical eye to identify how they have accounted for the distinctive needs of different segments of the public, distinguished by age, race, and gender.
4. Prepare development plans and general plans incorporating a plan making process that accounts for and incorporates the needs of different segments of the population.

5. Find resources to develop solutions to social issues or problems, and an aptitude to plan an

Course Description/Overview

The course aims to help students understand the rich diversity in rural society, with an emphasis on the interdependencies between urban and rural contexts. Current issues and social problems experienced by rural populations and how sociology is used to understand and address issues affecting rural communities are explored.

This course explores social life along the rural-urban continuum. We will examine differences and similarities in social behaviour, organization and ecology. An overview of social science perspectives pertaining to the interaction between human behaviour, social organization, and various dimensions of both natural and "built" environments will be provided. Upon developing a sociological understanding of rural, we will consider topical issues that often transcend the rural-urban continuum. In examining these and other related issues, Students completing the course should leave with an enhanced awareness of how humans interface with their environments, and why planned development efforts need to consider that interface in order to maximize the degree of congruence between environmental conditions and the needs and preferences of humans who live and work in those environments.

The first section addresses the concept of Sociology. The second section discusses the definitions of Rural and Urban Sociology. The third section focuses on historical background of Rural and Urban Sociology. The fourth section discusses the theories of Rural and Urban Sociology. The five section addresses scientific schools in Rural and Urban Sociology, The sex section addresses the how to work with Rural and Urban society , The seven section discusses the role of Rural and Urban Sociology in the facing the challenges of climate change.

Course Learning Objectives

The overarching goals of this course are: a) to provide a description of terminology and concepts used in the study of urban and rural sociology, including the Define concepts such as society/ civilization/ city/ suburb/ rural; b) Review the theoretical foundation of humans living in cities and villages; c) Discuss the failure of centrally planned totalitarian cities and villages ;d) Examine the social life in urban and rural spaces and the influence of the urban environment on human behaviour; e) Discuss city-living issues such as corrupt zoning, gerrymandering, red-lining, urban redevelopment, eminent domain for roads and highways, urban redevelopment, price fixing for rents and groceries, war against youth, over policing, under policing, climate change. etc

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. As a result of taking this course, students will have gained a social science understanding of rural and urban issues.
2. Students will be able to demonstrate critical thinking through oral and written formats, assess the complexity of rural and urban issues.
3. Students will be able to apply sociological theories and methodologies to the study of rural and urban issues.

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Identification

Course Number:
Course Name: Social work in one of the developed fields (environment)
Course Location: University Campus

Class Times:	Wednesday 9:30pm – 12:30am
Prerequisites:	accepted in the first year in social work faculty
Faculty Web Page:	http://sworks.aswu.edu.eg/Arabic/Pages/default.aspx

Course Description/Overview

This course covers the Social Work in the field of environment and sustainable development and to support community-based organizations working in the field of environment. And is aimed at addressing environmental issues and changes thereto affect the stability and hinder the growth, progress and sustainable development as the focus of this course to support community-based organizations working in the field of environmental protection and spread awareness among members of the community and support of volunteerism, which would contribute to the improvement of the environment and to achieve stability and desired progress and deals with this scheduled the following sections: the concept of Social Work in the field of environmental protection, the goals of Social Work in the field of environmental protection, Social Work posts in achieving social development, contributions to civil society organizations in the field of environmental protection. This course also addresses the issues of climate change and its impact on the albino and how to contribute to the growth of environmental commensurate with the requirements of climate change and sustainable development.

Course Learning Objectives

The overarching goals of this course are:

1 - Development of environmental awareness as one of the areas developed in the Social Work and determines the appropriate methods to protect the environment from multiple problems.

2 - Increasing the information associated with the protection of the environment and ways to optimize the investment environment of resources in order to achieve stability and sustainable development and caring members of society.

3 - To identify the contribution of civil society organizations in the field of environmental protection and the mechanisms to support those organizations to contribute to the achievement of stability and social development

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

28. The acquisition of information related to the field of protection of the environment and how to preserve the environment of the different climate changes.

29. To identify the organizations working in the field of environmental protection and the mechanics of working through those organizations to protect the environment.
30. To identify the contribution of social service in the field of environmental protection as one of the areas developed in the Social Work.
31. Identify the goals of Social Work in the field of environmental protection.
32. Identify mechanisms to support organizations working in the field of environmental protection and to stabilize the environment and sustainable development.
33. Determine the plans, programs and strategies appropriate to the development environment commensurate with the climate change and achieving environmental stability
34. A showcase of some of the experiences in the field of environmental protection and how to employ them in proportion to the different climate changes

Course Identification

Course Coder: UNC012
Level: 000
Course Name: Engineering and Energy History
Course Location: Faculty of Energy Engineering
Class Times: Sunday 9.00 - 11.00
Prerequisites: NA
Faculty Web Page: http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

History was quite impracticable, not only because of the enormous compression that would be necessary, but because the plan of the original did not lend itself to such treatment. The story of technological development was at every epoch closely related to the historical background. This course aims at being as much a technological history as a history of technology, and in pursuing this course we believe ourselves to be following an important modern trend.

Course Learning Objectives

Know the engineering history in different fields. Know the energy and different sources of it. Know different fields and different programs of engineering Know about the engineer jobs in different pogroms. Understand the engineering job ethics

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Demonstrate knowledge of role of engineering in development and establishment of civilization.

2- Demonstrate knowledge and understanding of engineering history in ancient time, middle ages and modern time.

3- Demonstrate knowledge of different engineering fields.

4- Demonstrate knowledge of different engineering programs.

5- Demonstrate knowledge and understanding of technology transfer, environmental, inventions and engineering ethics.

6- Understand the role of engineering in development and establishment of civilization.

7- Identify technology transfer, environmental & inventions and engineering ethics

8- Assess engineering history in ancient, middle and modern time.

9- Assess resources in engineering history

10- Deal with engineering history at various times

11- Demonstrate knowledge of the engineering ethics and ethical obligations about climate change effects.

12- Understand the historical technologies to face the climatic hazards

Course Resources

1- Chaaban, M. A., "History of Engineering and technology", Elslam Press, 1998

Course Identification

Course Coder: UNC321
Level: 300
Course Name: Project management
Course Location: Faculty of Energy Engineering
Class Times: Wednesday 10.00 - 12.00
Prerequisites: NA
Faculty Web Page: http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The project management is a process. It is an activity of planning, organizing, motivating, and controlling resources. It uses the procedures and protocols to achieve specific goals. A project is designed to produce a product or service. The management requires the development of distinct technical skills and management strategies.

Course Learning Objectives

Know the definitions used in project management. The project life cycle, Project stages, Relationships and responsibilities of the different project parties, Execution phase responsibilities, Productivity, Quality management. - Human Influences of projects: Upgrading, Development, Economic factors, Social factors, Cultural factors, Aesthetic factors, Hygienic and psychological factors. Types of projects: Urban planning projects (residential projects, tourism projects, commercial projects, public buildings…etc.). Infrastructure projects (electricity plants, water supply and sewage networks, road networks, railroad networks, reservoirs, dams…etc.). Different Industrial projects (textile factories, steel Industries, cement factories, carpet factories, ceramic factories, food factories, electrical appliances, car industries…etc.). Environmental impact of projects: Negative and positive impacts (direct and indirect). The assessment of projects-

both nationally and internationally- in order to avoid the negative consequences of projects on the environment. The approved rates and criteria for the compatibility of projects with environmental topics.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:
1- Define the definitions used in project management.
2- Understand the project life cycle
3- Understand the project stages, relationships and responsibilities.
4- Analyze execution phase responsibilities, productivity, and quality management.
5- Discuss the hhuman influences of projects: Upgrading,
6- Identify the types of projects.
7- Analyse the environmental impact of projects
8- Apply the approved rates and criteria for the compatibility of projects with environmental topics.

Course Identification

Course Coder: PCR123
Level: 100
Course Name: Thermodynamic Fundamentals
Course Location: Faculty of Energy Engineering
Class Times: Thursday 9.00 - 11.00
Prerequisites: NA
Faculty Web Page: http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The subject of thermodynamics referred to as thermal science. It is of interest to students of all engineering branches, in fact to all mankind, as it deals with the most basic processes occurring in nature. The subject forms the basis for the study of a vast variety of devices such as refrigerators, air conditioners, automotive engines, aircrafts, locomotives, power plants, etc, the use of which is involved in the everyday life of almost every individual. Even the simple kitchen gadget of steam pressure cooker is designed on the basis of the principles of thermodynamics.

Course Learning Objectives

Demonstrate knowledge of basic thermodynamic concepts, ideal gases and pure substance, first low of thermodynamic on different systems. Apply the first law of thermodynamics on various engineering applications. Share ideas and work in a team in an efficient and effective manner under controlled supervision or independently.

Course Content Learning Outcomes

1- Understand the links between sustainability, carbon and climate change.
2- Define the concept of the energy.
2- Define the different basic concepts like properties, state, process, equilibrium, and cycles.
3- Develop students' understanding of the natural carbon cycle.
4- Identify the different between the ideal gases and the pure substance.
5- Understand the property relations relevant to engineering thermodynamics.
6- Understand how to deal with thermodynamic tables.
7- Identify the concept of work and heat.
8- Understand the first law of thermodynamics, internal energy and enthalpy and Steady state steady flow.
9- Apply the first law of thermodynamics.
10- Understand the ssecond law of thermodynamics.
11- Understand the vapour and gas cycles

Course Identification

Course Coder: ENN223
Level: 200
Course Name: Energy conversion and utilization
Course Location: Faculty of Energy Engineering
Class Times: Monday 9.00 - 12.00
Prerequisites: NA
Faculty Web Page: http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The purpose of this course is to critically examine the technology of energy systems that will be acceptable in a world faced with global warming, local pollution, and declining supplies of oil. The focus is on renewable energy sources (wind, solar, biomass), but other non-

carbon emitting sources (nuclear) and reduced carbon sources (co-generative gas turbine plants, fuel cells) are also studied. Both the devices and the overall systems are analysed.

Course Learning Objectives

Introduction to principles, theories and processes of devices and systems that convert thermal, chemical, nuclear, and electromagnetic energy to electrical, mechanical and alternative chemical form. Energy conversion performance characteristics and sources of inefficiencies are explored for a variety of applications that include conventional fossil energy combustion based systems, nuclear, solar, wind, wave, biomass, thermoelectric, and geothermal energy systems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:
1- Demonstrate knowledge of energy conversion.
2- Study the future energy systems (e.g. pollution, climate change, energy security).
3- Compare between fuels and cycle analysis.
4- Understand the nuclear reaction physics and reactor designs.
5- Discuss the nuclear waste disposal.
6- Understand the solar-thermal energy.
7- Apply the conversion for heating systems.
8- Identify the photovoltaic technology.
9- Identify the wind energy.
10- Identify the geothermal and ocean current Energy.
11- Identify the biomass and waste to energy.
12- Apply the electro-chemical conversion.
13- Apply the thermoelectric conversion.
14- Know the climate Control, CO2 Sequestration and Energy Sustainability.

Course Resources

1- Energy Systems Engineering, F.M. Vanek, L.D Albright, and Largus Angenent, Second Edition, McGraw-Hill, Inc., 2012.

2- Energy Conversion, Edited by D.Y. Goswami and F.Kreith, CRC Press, 2008. 2. G.N. Tiwari and R.K. Mishra, Advanced Renewable Energy Sources, RSC Publishing, 2012.

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	16/2/2014	Introduction and scope of energy conversion. Motivations for studying future energy systems (e.g. pollution, climate change, energy security).
2	23/2	Overview of fossil fuel combustion and plants. Comparison of fuels (oil, natural gas and coal). Cycle analysis (Brayton, Rankine ,combined cycles, cogeneration).
3	2/3	Nuclear power: nuclear reaction physics, current reactor designs, Breeder reactors, nuclear fusion. Nuclear waste disposal.
4	9/3	Solar-thermal energy: radiation physics, radiation geometry.
5	16/3	Solar energy collection and conversion for heating systems. Concentrating solar thermal power. Stirling cycle
6	23/3	Photovoltaic technology. P-n junctions. Materials. Photovoltaic cells. Solar towers/heliostats.
7	30/3	Wind Energy: formation and availability. Wind turbine design. Turbine capacity factor. Tip speed ratio, Betz limit. Blade

		element theory. Operating conditions (sitting, height, wind speed variation, sitting density). Land requirements. Economics of wind energy.
8	6/4	Midyear exam
9	27/4	Geothermal and Ocean Current Energy : Physics, resources and availabilities, energy conversion technologies.
10	4/5	Biomass and Waste to Energy : Potential of biomass energy. Thermal-chemical and bio-chemical conversion. Syngas and liquid fuel production. System efficiency and environmental impact.
11	11/5	Electro-chemical conversion: physics of conversion, types and systems of fuel cells
12	18/5	Thermoelectric conversion: physics of conversion. Materials and applications
13	25/5	Overview of Climate Control, CO2 Sequestration and Energy Sustainability.
14	1/6	Final Exam

Heat Transfer

Aswan University, Faculty of Energy Engineering, Departments of High Voltage Networks,

Spring Semester, 2013-2014

Instructor Information

Instructor:	Dr. Mahmuod Hasan
Location:	Faculty of Energy Engineering
Telephone:	Office – +20 3481234
Office Hours:	Thursday 12.00 - 14.00, sunday 10.00 – 14.00
E-mail:	aswan1500@yahoo.com
Website:	

Course Identification

Course Coder:	ENP222
Level:	200
Course Name:	Energy conversion and utilization
Course Location:	Faculty of Energy Engineering
Class Times:	Thursday 9.00 - 12.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

Heat transfer is a subject taught the basic concepts and the simple technical applications of heat transfer. More extensive knowledge of the subject is expected of graduate engineers. The engineer should be familiar with the fundamentals of heat conduction, convective heat transfer and radiative transfer, as well as having a basic knowledge of mass transfer. However, it is important that the student acquires a broad understanding of the fundamentals and methods. Then it is sufficient to deepen this knowledge with selected examples and thereby improve problem solving skills.

Course Learning Objectives

Demonstrate knowledge of heat transfer definitions and terminology, including heat flux, thermal conductivity, and heat transfer coefficients. Demonstrate knowledge of conduction and the equivalent resistance formula, convective and use of the overall heat transfer coefficient, radiant heat transfer, including black bodies, gray bodies and emissivity. Demonstrate knowledge of heat exchangers, including the different types and how they operate, application. Demonstrate knowledge of mass transfer definition and compare it with convenient heat transfer. Apply this knowledge on various engineering application. Share ideas and work in a team in an efficient and effective manner under controlled supervision or independently.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Describe the development of global warming.
2- Explain the difference between turbulent and laminar flow regimes and how to determine which regime exists for a given flow.
3- Use correlations to calculate the convection heat transfer for flows over flat plates, cylinders, and sphere.
4- Determine the heat transfer coefficient and heat transfer rate using correlations for flow in cylindrical pipes.
5- Explain the difference between natural convection and forced convection.
6- Describe the relationship between radiation surface properties and radiation incident on a surface.
7- Determine the heat transfer from a grey surface given emissivity and the surface temperature.
8- Analyse the Heat transfer problems.
9- Deal with different used tables and charts.

Course Resources

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades can be based on the following:

Assignments/attendance/participation	20%
Midyear Exam	20%
Final Exam	60%
Total Points	**100**

Course Policies

Late Assignments

It is essential that final written exam and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

The students are expected to come to all classes. You cannot pass the class under any circumstances if you miss more than 25% of all classes. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

NA

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	16/2/2014	Introduction to heat transfer and development of global warming.
2	23/2	Conduction equation and its application for steady state in simple and compound walls
3	2/3	Conduction equation and its application for steady state in simple and compound cylindrical and spherical surfaces
4	9/3	Study of the critical radius of insulation, Extended surfaces (fins) and their efficiency charts.
5	16/3	Transient conduction
6	23/3	Introduction to convection heat transfer

7	30/3	Convection with internal flow and external flow.
8	6/4	Midyear exam
9	27/4	Parameters affecting convection.
10	4/5	Relations for free convection and forced convection
11	11/5	Fundamentals of radiation heat transfer
12	18/5	Heat exchanger
13	25/5	Introduction to mass transfer
14	1/6	Final Exam

Course Identification

Course Coder:	ENX31x
Level:	300
Course Name:	Renewable Energy Resources (Engineering Elective Course 1)
Course Location:	Faculty of Energy Engineering
Class Times:	Monday 9.00 - 12.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The origin and continuation of humankind is based on renewable energy such as solar and wind. The most basic processes supporting life on earth, such as photosynthesis and the rain cycle, are driven by solar and wind energy. From the very beginning of its history humankind realized that a good use of solar and wind energy is in humankind's benefit. Despite this, only recently, during the last 40 years, has solar and wind energy been har-nessed with specialized equipment and used as an alternative source of energy,

Course Learning Objectives

Identity different renewable energy, resources for power production such as wind, Solar, and non-conventional by hydro-power. Recognize natural sources of wind and solar ؟ energies in Egypt. Practice the operation and Design of Horizontal and Vertical Axis wind Turbines. Practice the Operation and Design of Solar flat plate collectors, concentrator systems, photovoltaic systems and other solar applications. Practice the operation of non-conventional hydro Power Systems Such as wave Energy and Tidal Energy. Recognize other renewable energy technologies such as Biomass, Ocean Thermal Energy …etc.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Identify the future energy systems and energy Sustainability.

2- Define the renewable energy
3- Study the causes and the power of wind energy
4- Study of measuring equipment for wind speed and direction.
5- Analysis of wind energy data: Energy and frequency curves.
6- Analysis wind turbine theory and aerofoil theory.
7- Study of forces acting on the wind turbine and study the turbine performance.
6- Study of solar thermal energy: Its intensity in outer space and the calculation of the solar intensity on earth.
9- Study of solar angles, Shades and the equation of time.
10- Study of the solar collector and its components.

Course Resources

1- Duffie and Beckman, Solar Engineering of Thermal Processes, John Wiley, 1980.

Course Description/Overview

This course covers the practices and technologies that are applied to the prevention of air pollution, and to the cleaning and control of industrial air emissions. It provides a bridge for today's environmental manager by focusing on an integrated approach to managing air pollution problems within industrial operations.

Course Learning Objectives

Know the: definition of pollution - Sources of pollution - Types of pollution and their effect on lumen health. Methods of measurement - methods of pollutant reduction.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:
1- Define the environment and climate change.
2- Define the pollution.
3- Identify the sources of pollution.
4- Identify the types of pollution.
5- Discuss their effect on lumen health.
6- Identify the methods of measurement.
7- Apply the methods of pollutant reduction.

Course Resources

Course Identification

Course Number: AQA121
Course Name: Statistical Biology and Experimental Design
Course Location: University Campus
Class Times: Sunday 10.00 – 13.00
Prerequisites: Introduction to Probability and Statistics
Faculty Web Page:

Course Description/Overview

This course is an introduction to statistics, experimental design and statistical analysis for addressing problems in biology. Statistics includes those techniques and tools used for the collection, display, and analysis of data for the purpose of making decisions or constructing mathematical models. Thus, we will explore the theoretical properties of statistical inference methods, and we will apply these methods to many sets of real data from the surrounding environment and climate change and its impact on fisheries statistics. The course begins with methods for collecting and summarizing data and analyzing and studying the measures of central tendency and measures of dispersion. The course then introduces probability theory as a background for understanding inferential statistics and Design of Experiments. Methods are next presented for drawing

inferences from research samples to populations from which the samples were drawn. The course covers basic statistical tests: analysis of variance, and Latin square - block design - the design of the cluster - the analysis of covariance.

Course Learning Objectives

The main goals of this course are practical:
1) to help you learn and practice basic experimental design, statistical methods, and tools for analyzing data,
2) to help you better critically interpret the primary biological literature. We work as much as possible with real biological problems and data sets related with environment and climate change,
3) to apply statistical methods learned to help solve interesting and realistic problems across a variety of fields.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. To learn basic techniques for collecting and summarizing data and analyzing and studying the measures of central tendency and measures of dispersion.
2. To appreciate the importance of how data are produced.
3. To understand the mathematical theory behind common methods of statistical inference, such as analysis of variance and the analysis of covariance .
4. To apply statistical methods learned to help solve interesting and realistic problems across a variety of fields.
5. To gain facility in analysis of variance, and Latin square - block design - the design of the cluster - the analysis of covariance.

Course Identification

Course Number: **332 Bot.**
Course Name: **Ecology and Physiology of Algae**

Course Location: Aswan University campus
Class Times: Monday, 9 - 12 am
Prerequisites: General Botany - Phycology
Faculty Web Page:

Course Description/Overview

This course focuses on the studying of the relationships between algae in different habitats and their environment. Algae occupied different niche habitats in aquatic ecosystems. They live as phytoplankton or may be associated to various natural or artificial substrates and live as attached forms (phycoperiphyton). On the other hand, terrestrial algae may occupy different non-aquatic habitats and can live as soil algae, lichenized or rhizospheric forms. Generally, algae in different habitats are influenced by various abiotic and biotic factors prevailed in their environments. Alterations that may take place in the environmental conditions can influence the development and distribution of algae in their environments. Algae in aquatic ecosystems are regarded as the base of food web and have a pivotal role in influencing other aquatic biota in such habitats.

Course Learning Objectives

The main objective of the ecology of algae is to understand the concept of environmental conditions as well as the alterations that may take place in these conditions and the extent to which these conditions can influence the various communities of algae. For instance, studying of the ecology of phytoplankton and attached algae in aquatic habitats and of soil algae in terrestrial habitats.

Course Content Learning Outcomes

Upon successful completion of this course, students should be able to: demonstrate and understand the concept of the ecology of algae. In addition, students would be able to determine the role of algae in the ecosystem. Furthermore, the

students would be able to use the knowledge of algae and their habitats for environmental impact assessment. Besides, the students would be able to identify the algae of economic value and others that may be harmful.

Course Resources:

Course Identification

Course Number: **GEO 410**
Course Name: Economic Geology
Course Location: University Campus
Class Times: 2:00 – 3:00 pm, Sunday
Faculty Web Page: http://sci.aswu.edu.eg

Course Description:

Resources formed by geological processes are commonly called mineral resources and the branch of geology which concerned with the study of these resources is called Economic geology. This course provides an introduction to the geologic and economic factors that result in the development of commercial concentrations of mineral resources. Emphasis will be placed on the descriptive geology and origin of economic mineral concentrations within the context of their overall geologic settings. The geologic and economic nature of metallic and industrial mineral commodities in both "hard rock" and "soft rock" geologic environments will be discussed. Related topics to be discussed include importance of mineral resources to the global economy, mineral exploration and evaluation, mineral extraction and processing, and environmental impacts result from mining and mineral extraction.

Course Learning Objectives:
The course looks at the origin and occurrence of economic natural resources including metallic ore deposits and industrial minerals. The course aims to provide students with a knowledge and understanding of the origin and distribution of mineral resources, the geologic factors that have led to ore deposit formation, and the geologic conditions that control the environmentally responsible development. Also, students should comprehend the wide variety of ore-forming processes, and have developed skills in interpreting ore deposits and exploration techniques.

Course Content Learning Outcomes
Upon successful completion of this course, students will be able to:

7. Demonstrate knowledge of the variety of ore-forming processes and discuss the key geological processes responsible for ore deposit formation.
8. Identify common rock types and minerals found in and around ore deposits.
9. Describe the essential geological setting of the main ore deposit types that provide the majority of the metals required by human society.
10. Understand the genesis of mineral deposits and their relationship to plate tectonics in time and space.
11. Describe the ore deposit classification and distribution in Egyptian deserts.
12. Be conversant with the environmental impacts of mining processes.

Required Course Texts and Materials:
Reference textbook for this course are:

3) An introduction to ore geology, Evans (1987)
4) Ore deposit geology and its influence on mineral exploration, Edwards and Atkinson (1986)

In addition, selected publications in the fields relevant to the topics will be reviews and discussed extensively.

Course Identification

Course Number: **GEO 434**
Course Name: Environmental Geology
Course Location: University Campus
Class Times: 2:00 – 3:00 pm, Wednesday

Faculty Web Page: http://sci.aswu.edu.eg

Course Description:
Environmental geology is a science which objectively studies geologic information and applies it to contemporary environmental problems such as pollution, waste management, resource extraction, natural hazards, and human health. An environmental geologist might evaluate the risk and damage potential from natural hazards such as floods, landslides, volcanoes, or earthquakes. The environmental changes on local to global scales can be placed into an earth systems science perspective through examining the evolution and structure of our planet's components, and how these components naturally interact. This course is designed to introduce students to the relationship between humans and our Earth. It focuses on environmental and geosciences subjects that facilitate greater awareness of the interactions between the different Earth's components. The course discusses the geologic processes that shape the surface of the Earth, and how these processes affect and are affected by human activity. Moreover, the relationships between the lithosphere, hydrosphere, and atmosphere will be discussed. Particular attentions are given to the subjects of soil, mineralogy, biogeochemical cycles, climate change, and pollution by human activities. The scientific methods that allow studying, prediction, and mitigation of environmental problems will be discussed.

Course Learning Objectives:
The course introduces students to our natural environment and the human interactions and everyday problems with our environment and global community from a geological perspective. Topics to be covered will include; earth materials and structure, environmental hazards such as floods, volcanoes and earthquakes, pollution of the environment, waste disposal, natural resources, and energy sources and their exploitation. The overarching goals of this course are to:

- Provide the fundamental concepts of environmental geology, and the interactions between the Earth systems and human activities.
- Increase awareness of environmental issues and how they affect society.
- Raise awareness of the natural hazards associated with common geologic processes including volcanoes, earthquakes, tsunamis, and floods.
- Gain an understanding of the physical processes that operate in and on earth.

- Understand the interactions between humans and these geological processes.
- Introduce the environmental challenges such as climate change, the global water quality and supply, and the scale of these challenges
- Summarize the pollutants and harms that are created from exploitation of ores, minerals and energy resources.
- Process and interpret the environmental data to solve environmental problems.

Course Content Learning Outcomes
Upon successful completion of this course, students will be able to:

35. Discuss the fundamental concepts of environmental geology, the earth system and the different environmental cycles, and the interactions between the Earth systems and human activities.
36. Understand the geologic processes and associated natural hazards, the pollutants and harms, created from ore and energy resources exploitation.
37. Understand the interactions between humans and the geological processes.
38. Summarize the environmental challenges such as climate change, the global water quality and supply.
39. Process and interpret the environmental data and apply scientific methods to solve environmental problems.

Required Course Texts and Materials:
Reference textbook for this course are:
1) Principles of Environmental Geochemistry by G. Nelson Eby, Brooks/Cole, 2004; 2) Environmental Geology, 8th edition, by Edward A. Keller Prentice Hall, 2000.
3) The Geology of Egypt, by Said, R., Ed. (1990).
In addition, selected publications in the fields relevant to the topics will be reviews and discussed extensively.

Assignments and Grading Scheme

Grading System
0 to 150 (where 90 is the least pass mark)

Grading Policy

Assignments	20%
Exams	70%
Class attendance/participation	10%
Total Points	**100**

Course Schedule

Week	Date	Topics
1		Discussion of syllabus, assignments, and course requirements.
2		Environmental geology: Fundamental concepts and definitions.
3		Earth structure and systems.
4		Geologic cycle and processes
5		Soil formation, classification and profile
6		Mass wasting processes
7		Volcanism: tectonic setting and types
8		Volcanic hazards, volcanoes and climate
9		Earthquake process, magnitude and intensity

10		Hazards and effects of earthquakes
11		Hazards associated with Floods and torrents
12		Hazards associated with ore and energy resources exploitation.
13		Wastes management
14		The environmental challenges (climate change, the global water quality and supply).

Course	Environmental Geology
Module 1	**Introduction**
Key Concepts	Environmental geology: Fundamental concepts and definitions
Overview	Environmental geology is the use of geologic information to help us solve conflicts in land use, to minimize environmental degradation, and to maximize the beneficial results of using our natural and modified environments. This module discusses the basic concepts and principles of environmental geology, and defines the commonly used terms and issues. The module provides general introduction to Environmental Geology, environmental ethics, environmental Crisis and fundamental concepts of the environmental sciences
Aim	The overriding aim of this module is to turn students able to discourse on basic concepts and principles of environmental geology, definitions of commonly used terms and issues, and fundamental concepts that apply to all environmental sciences.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different terms, concepts and principles of environmental geology. • Summarize the environmental ethics and crisis
Units	Unit 1.1: Introduction to Environmental Geology. Unit 1.2: Environmental Ethics. Unit 1.2: Environmental Crisis. Unit 1.4: Fundamental Concepts of the Environmental Sciences.

Readings	Environmental Geology, Lundgren, L. W., 1999 Environmental Geology, 8th edition, Keller E. A., 2000
Activity	What environmental geology means? Discuss the basic concepts of environmental geology? Write brief notes on environmental ethics and crisis?
Module 2	**Geologic cycles and processes**
Key Concepts	Plate tectonics, rock cycle, water cycle, surficial process
Overview	This module focuses on the geologic cycle including tectonic, hydrologic, rock, and biogeochemical sub-cycles that influence each other and may produce natural hazards and processes important to environmental geology such as landslides, earthquakes, volcanic activity, flooding, groundwater flow, and weather. Next, the module spotlights on the three rock families and their properties, such as a compressive strength and response to stress and strain that are essential to evaluating natural hazards.
Aim	The overriding aim of this module is to enhance student understandings about the geologic cycle, rock properties and surfacial process.
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the geologic sub-cycles • Understand the surficial processes that produce natural hazards.
Units	Unit 2.1: Geologic Cycle Unit 2.2: Hydrologic Cycle Unit 2.3: Biogeochemical Cycle Unit 2.4: Physical Properties of Rocks Unit 2.5: Surficial Processes
Readings	Environmental Geology, Lundgren, L. W., 1999 Environmental Geology, 8th edition, Keller E. A., 2000

Activity	Where do volcanoes and earthquakes occur? What is the percent of fresh water on earth? How much carbon dioxide enters the Earth's atmosphere each day? What is carbon dioxide's residence time in the atmosphere? Define the three types of stress? What are the physical earth processes might cause each, and what strain would result? What are the differences between elastic and plastic deformations?
Module 3	**Soils**
Key Concepts	Soil formation, soil profile, soil physical properties
Overview	The module focuses on soils--how they are formed and classified, their texture and structure, how liquids move through them, and their engineering properties. The module concludes the effects of land use activities on soil which results in erosion, pollution, and desertification.
Aim	The overriding aim of this module is to turn students able to understand the principle factor controlling soil formation, and to evaluate the physical properties of soils as engineering materials.
Learning Outcomes	At the end of this module students will be able to: • Reveal knowledge on the soil formation factors • Identify the different soil horizons and soil profile • Determinate the physical and engineering properties of soils
Units	Unit 3.1: Soil formation and classification Unit 3.2: Soil horizons and soil profile Unit 3.3: Physical properties of soils
Readings	Environmental Geology, 8th edition, Keller E. A., 2000
Activity	What are the main factors controlling soil formation? What are the criteria that used to make soil classification? Define the most common soil horizons and their characteristics? What are the physical parameters you use to evaluate soils for

	engineering purposes?
Module 4	**Slope Failure and Mass Wasting Processes**
Key Concepts	Slope Profiles, Slope Stability, Types of Mass Wasting, The Human Impact of Landslides, Subsidence
Overview	Slope failure, also referred to as mass wasting, is the down-slope movement of rock debris and soil in response to gravitational stresses. This module focuses on the types of mass wasting classified based on the type of down-slope movement. The types of movement, falls, slides, and flows are covered in this module. In addition, another type of ground failure and subsidence are covered.
Aim	The overriding aim of this module is to turn students able to discourse on major types of mass wasting and their causes.
Learning Outcomes	At the end of this module learners will be able to: • Identify the slope stability and types of down-slope movement. • Understand the different mass wasting processes. • Summarize the driving and resisting forces. • Discuss the effects of water and earth materials on slope failure.
Units	Unit 4.1: Slopes and slope profiles Unit 4.2: Mass wasting processes Unit 4.3: Types of down-slope movement Unit 4.4: Slope stability, driving and resisting forces Unit 4.5: Water and ground material effects on pattern of slope failure
Readings	Environmental Geology, 8th edition, Keller E. A., 2000
Activity	List the common mass wasting processes and types of slope failure? Write brief notes on slope stability, driving and resisting forces? Summarize effects of water and earth materials on slope failure pattern? What are the conditions causing the slope failure?

Module 5	Volcanism and Earthquakes
Key Concepts	Major Types of Volcanoes, Volcanic Hazards, Effects of Volcanoes, Earthquake Process, Magnitude and Intensity Earthquakes, Effects of Earthquakes.
Overview	Volcanoes differ greatly in style of eruption and associated hazards. Moreover, earthquakes are probably the most frightening naturally occurring hazard encountered. This module discusses the types of volcanoes and earthquake process, effects of volcanoes and earthquakes, and their associated hazards. It includes the following major topics: tectonic setting and types of volcanoes, volcanic hazards, predicting volcanic activity, volcanoes and climate, types of faults and earthquake process, detecting, locating and measuring earthquakes.
Aim	The overriding aim of this module is to turn students able to discourse on major types of volcanoes and earthquake process, their primary and secondary effects, and the associated hazards.
Learning Outcomes	At the end of this module learners will be able to: • Understand tectonic setting of volcanoes. • Identify the common types of volcanoes. • Summarize the effects and hazards of volcanoes. • Understand the earthquake process, their magnitude and intensity • Summarize the effects and hazards of earthquakes
Units	Unit 5.1: Volcanoes: tectonic setting and types. Unit 5.2: Volcanic hazards and predicting volcanic activity. Unit 5.3: Volcanoes and climate. Unit 5.4: Types of faults and earthquake process. Unit 5.5: Magnitude, intensity and effects of earthquakes
Readings	Environmental Geology, 8th edition, Keller E. A., 2000

Activity	What are the common types of volcanoes? List and briefly describe the primary and secondary environmental effects of volcanic eruptions? Discuss the relationship between the volcanic activity and climate? List and briefly describe the primary and secondary environmental effects of earthquakes?

Course Identification

Course Coder: UNC012
Level: 000
Course Name: Engineering and Energy History
Course Location: Faculty of Energy Engineering
Class Times: Sunday 9.00 - 11.00
Prerequisites: NA
Faculty Web Page: http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

History was quite impracticable, not only because of the enormous compression that would be necessary, but because the plan of the original did not lend itself to such treatment. The story of technological development was at every epoch closely related to the historical background. This course aims at being as much a technological history as a history of technology, and in pursuing this course we believe ourselves to be following
an important modern trend.

Course Learning Objectives

Know the engineering history in different fields. Know the energy and different sources of it. Know different fields and different programs of engineering Know about the engineer jobs in different pogroms. Understand the engineering job ethics

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Demonstrate knowledge of role of engineering in development and establishment of civilization.
2- Demonstrate knowledge and understanding of engineering history in ancient time, middle ages and modern time.
3- Demonstrate knowledge of different engineering fields.
4- Demonstrate knowledge of different engineering programs.
5- Demonstrate knowledge and understanding of technology transfer, environmental, inventions and engineering ethics.
6- Understand the role of engineering in development and establishment of civilization.
7- Identify technology transfer, environmental & inventions and engineering ethics
8- Assess engineering history in ancient, middle and modern time.
9- Assess resources in engineering history
10- Deal with engineering history at various times
11- Analyze methods and tools used in engineering history and engineering ethics

Course Resources

1- Chaaban, M. A., "History of Engineering and technology", Elslam Press, 1998
2- Singer, C. Holmyard, E. J. and Hill, A. R., History of Technology, Oxford university press, London, 1975

Course Website(s)

Required Course Texts and Materials

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments/attendance/participation	20%
Midyear Exam	20%
Final Exam	60%
Total Points	**100**

Course Policies

Late Assignments

It is essential that final written exam and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

The students are expected to come to all classes. You cannot pass the class under any circumstances if you miss more than 25% of all classes. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

NA

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	22/9/2013	Role of engineering in development
2	29/7	Establishment of civilization.
3	6/10	Engineering history in ancient time and middle ages.
4	13/10	Engineering history in modern time.
5	20/10	Engineering fields.
6	27/10	Engineering programs.
7	3/11	Technology transfer,
8	10/11	Midyear exam
9	17/11	Inventions
10	24/11	Environmental,
11	1/12	Engineering ethics
12	8/12	Resources in engineering history
13	15/12	Methods and tools used in engineering history
14	22/12	Final Exam

Module 1	**Engineering Development and Civilization**
Key Concepts	Civilization, history
Overview	History was quite impracticable, not only because of the enormous compression that would be necessary, but because the plan of the original

	did not lend itself to such treatment. The story of technological development was at every epoch closely related to the historical background.
Aim	The overriding aim of this module is to equip students with the engineering history at different ages.
Learning Outcomes	At the end of this module learners will be able to: 1- Demonstrate knowledge of role of engineering in development and establishment of civilization. 2- Demonstrate knowledge and understanding of engineering history in ancient time, middle ages and modern time.
Units	• Unit 1.1: Role of engineering in development • Unit 1.2: Establishment of civilization • Unit 1.3: Engineering history in ancient time and middle ages • Unit 1.4: Engineering history in modern time.
Readings	1- Chaaban, M. A., "History of Engineering and technology", Elslam Press, 1998
Activity	**Overview**
	Assignment : Using the WWW search for different civilization and its famous pictures. Assignment : Prepare a research proposal
Module 2	**Engineering Programs**
Key Concepts	Engineering Fields, Engineering programs
Overview	Because of the development of engineering, there are many fields are presented. Different engineering programs are described which leads to different jobs.
Aim	The overriding aim of this module is to equip students with the

	engineering fields, programs and jobs
Learning Outcomes	At the end of this module learners will be able to: 1- Know different fields and different programs of engineering 2- Know about the engineer jobs in different pogroms.
Units	• Unit 2.1: Engineering programs • Unit 2.2: Engineering fields • Unit 2.3: Engineering jobs
Readings	2- Singer, C. Holmyard, E. J. and Hill, A. R., History of Technology, Oxford university press, London, 1975
Activity	**Overview** Assignment : Using the WWW search for different programs, fields and jobs Assignment : Prepare a research proposal
Module 3	**Technology transfer**
Key Concepts	Technology, inventions
Overview	The aims at being as much a technological history as a history of technology transfer, and in pursuing this course we believe ourselves to be following an important modern trend.
Aim	The overriding aim of this module is to equip students with the how is the technology transferred during centuries and the greatest inventions.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify technology transfer, 2- Know about the inventions.
Units	• Unit 3.1: Technology transfer, • Unit 3.2: Engineering fields • Unit 3.3: Inventions

Readings	2- Singer, C. Holmyard, E. J. and Hill, A. R., History of Technology, Oxford university press, London, 1975
Activity	**Overview**
	Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 4	**Technology transfer**
Key Concepts	Technology, inventions
Overview	The aims at being as much a technological history as a history of technology transfer, and in pursuing this course we believe ourselves to be following an important modern trend.
Aim	The overriding aim of this module is to equip students with the how is the technology transferred during centuries and the greatest inventions.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify technology transfer, 2- Know about the inventions.
Units	• Unit 4.1: Technology transfer, • Unit 4.2: Engineering fields • Unit 4.3: Inventions
Readings	2- Singer, C. Holmyard, E. J. and Hill, A. R., History of Technology, Oxford university press, London, 1975
Activity	**Overview**
	Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 5	**Engineering ethics**
Key Concepts	Environment, ethics
Overview	There is a strong relation between technology and the environment and

	ethics.
Aim	The overriding aim of this module is to equip students with the relation between invention and ethics.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify technology transfer, environmental & inventions and engineering ethics 2- Demonstrate knowledge and understanding of technology transfer, environmental, inventions and engineering ethics.
Units	• Unit 5.1: Environmental, • Unit 5.2: Engineering ethics • Unit 5.3: Methods and tools used in engineering history
Readings	2- Singer, C. Holmyard, E. J. and Hill, A. R., History of Technology, Oxford university press, London, 1975
Activity	**Overview** Assignment : Using the WWW search **Assignment : Prepare a research proposal**

Course Identification

Course Coder:	UNC321
Level:	300
Course Name:	Project management
Course Location:	Faculty of Energy Engineering
Class Times:	Wednesday 10.00 - 12.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The project management is a process. It is an activity of planning, organizing, motivating, and controlling resources. It uses the procedures and protocols to achieve specific goals. A project is designed to produce a product or service. The management requires the development of distinct technical skills and management strategies.

Course Learning Objectives

Know the definitions used in project management. The project life cycle, Project stages, Relationships and responsibilities of the different project parties, Execution phase responsibilities, Productivity, Quality management. - Human Influences of projects: Upgrading, Development, Economic factors, Social factors, Cultural factors, Aesthetic factors, Hygienic and psychological factors. Types of projects: Urban planning projects (residential projects, tourism projects, commercial projects, public buildings…etc.). Infrastructure projects (electricity plants, water supply and sewage networks, road networks, railroad networks, reservoirs, dams…etc.). Different Industrial projects (textile factories, steel Industries, cement factories, carpet factories, ceramic factories, food factories, electrical appliances, car industries…etc.). Environmental impact of projects: Negative and positive impacts (direct and indirect). The assessment of projects- both nationally and internationally- in order to avoid the negative consequences of projects on the environment. The approved rates and criteria for the compatibility of projects with environmental topics.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Define the definitions used in project management.

2- Understand the project life cycle

3- Understand the project stages, relationships and responsibilities.

4- Analyze execution phase responsibilities, productivity, quality management.

5- Discuss the hhuman influences of projects: Upgrading,

6- Identify the types of projects.

7- Analyse the environmental impact of projects

8- Apply the approved rates and criteria for the compatibility of projects with environmental topics.

Course Resources

1- Gray, R. and Larson, K., Project Management: The Managerial Process, McGraw Hill, Irwin, New York, NY, 2002.

2- Harris, R. and McCaffer, D., Modern Construction Management, Black Well Science, London, U.K., 2002.

14	1/6	Final Exam

Module 1	**Definitions**
Key Concepts	Project, Management
Overview	The project management is a process. It is an activity of planning, organizing, motivating, and controlling resources.
Aim	The overriding aim of this module is to equip students know the definitions used in project management
Learning Outcomes	1- Define the definitions used in project management. 2- Understand the project life cycle
Units	• Unit 1.1: definitions used in project management • Unit 1.2: Relationships and responsibilities of the different project parties • Unit 1.3: The project life cycle and project stages

Readings	1- Gray, R. and Larson, K., Project Management: The Managerial Process, McGraw Hill, Irwin, New York, NY, 2002.
Activity	**Overview** Assignment : Using the WWW search for different definitions Assignment : Prepare a research proposal
Module 2	**Productivity and Quality**
Key Concepts	Productivity, Quality
Overview	A project is designed to produce a product or service with quality management
Aim	The overriding aim of this module is to equip students with the project stages.
Learning Outcomes	At the end of this module learners will be able to: 1- Understand the project stages, relationships and responsibilities. 2- Analyze execution phase responsibilities, productivity, quality management.
Units	• Unit 2.1: Execution phase responsibilities • Unit 2.2: Productivity • Unit 2.3: Quality management
Readings	Harris, R. and McCaffer, D., Modern Construction Management, Black Well Science, London, U.K., 2002.
Activity	**Overview** Assignment : Using the WWW search Assignment : Prepare a research proposal

Module 3	**Human Influences of Projects**
Key Concepts	Human, Projects
Overview	Human influences of projects such as upgrading, development, economic factors, social factors, cultural factors, aesthetic factors, Hygienic and psychological factors are the aim.
Aim	The overriding aim of this module is to equip students with human influences of projects
Learning Outcomes	At the end of this module learners will be able to: 1- Discuss the hhuman influences of projects: Upgrading, 2- Identify the types of projects..
Units	• Unit 3.1: Types of projects and urban planning projects • Unit 3.2: Infrastructure projects and Industrial projects •
Readings	1- Gray, R. and Larson, K., Project Management: The Managerial Process, McGraw Hill, Irwin, New York, NY, 2002.
Activity	**Overview**
	Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 4	**Assessment of Projects**
Key Concepts	Assessment, Environmental
Overview	Environmental impact of projects: Negative and positive impacts (direct and indirect). The aim is the assessment of projects- both nationally and internationally- in order to avoid the negative consequences of projects on the environment.
Aim	The overriding aim of this module is to equip students with assessment of projects on the environment
Learning Outcomes	At the end of this module learners will be able to:

	1- Analyse the environmental impact of projects
Units	• Unit 4.1:: Environmental impact of projects • Unit 4.2 Assessment of projects
Readings	2- Harris, R. and McCaffer, D., Modern Construction Management, Black Well Science, London, U.K., 2002.
Activity	**Overview**
	Assignment : Using the WWW search for different inventions. **Assignment : Prepare a research proposal**
Module 5	**Compatibility of Projects**
Key Concepts	Compatibility, environmental
Overview	The approved rates and criteria for the compatibility of projects with environmental topics.
Aim	The overriding aim of this module is to equip students to apply the compatibility with the environmental topics
Learning Outcomes	At the end of this module learners will be able to: 1- Apply the approved rates and criteria for the compatibility of projects with environmental topics.
Units	• Unit 5.1: Criteria for the compatibility of projects
Readings	2- Harris, R. and McCaffer, D., Modern Construction Management, Black Well Science, London, U.K., 2002.

Course Identification

Course Coder:	PCR123
Level:	100
Course Name:	Thermodynamic Fundamentals
Course Location:	Faculty of Energy Engineering
Class Times:	Thursday 9.00 - 11.00
Prerequisites:	NA
Faculty Web Page:	http://energy.aswu.edu.eg/English/Pages/default.aspx

Course Description/Overview

The subject of thermodynamics referred to as thermal science. It is of interest to students of all engineering branches, in fact to all mankind, as it deals with the most basic processes occurring in nature. The subject forms the basis for the study of a vast variety of devices such as refrigerators, air conditioners, automotive engines, aircrafts, locomotives, power plants, etc, the use of which is involved in the everyday life of almost every individual. Even the simple kitchen gadget of steam pressure cooker is designed on the basis of the principles of thermodynamics.

Course Learning Objectives

Demonstrate knowledge of basic thermodynamic concepts, ideal gases and pure substance, first low of thermodynamic on different systems. Apply the first law of thermodynamics on various engineering applications. Share ideas and work in a team in an efficient and effective manner under controlled supervision or independently.

Course Content Learning Outcomes

1- Define the concept of the energy.
2- Define the different basic concepts like properties, state, process, equilibrium, and cycles.
3- Identify the different between the ideal gases and the pure substance.
4- Understand the property relations relevant to engineering thermodynamics.
5- Understand how to deal with thermodynamic tables.

6- Identify the concept of energy and mass conservation.
7- Apply these concepts on different applications.
8- Analyse problems, conclude solutions and demonstrate creative thinking.
9- Work coherently and successfully as a part of a team in assignments.
10- Discuss results and defined his/her ideas.

Course Resources

1- Sonntag, R. E.; Borgnakke, C. and Van Wylen, G. J., Fundamentals of thermodynamics, John Wiley and Sons Inc., 1998.

2- Cengel, Y. A. and M. A., Thermodynamics: An Engineering Approach, WCB/McGraw Hill, 1998

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	16/2/2014	Basic concepts and definitions
2	23/2	System and control volume, Property and state

3	2/3	Processes and cycles
4	9/3	Work definition, Definition of heat transfer
5	16/3	Ideal gases, State equation, Specific heat at constant pressure and volume
6	23/3	Pure substances and phase equilibrium, Tables of thermodynamic properties
7	30/3	First law of thermodynamics, Internal energy and enthalpy
8	6/4	Midyear exam
9	27/4	First law for closed cycle
10	4/5	Closed and open systems: Steady flow and uniform state uniform flow
11	11/5	Application of first law of thermodynamics (reciprocating compressors)
12	18/5	Second law of thermodynamics
13	25/5	Vapour and gas cycles
14	1/6	Final Exam

Module 1	Basic concepts and definitions
Key Concepts	Property, state, Processes, cycles
Overview	The subject of thermodynamics referred to as thermal science. It is of interest to students of all engineering branches, in fact to all mankind, as it deals with the most basic processes occurring in nature.
Aim	The overriding aim of this module is to equip students with the basic concepts.
Learning Outcomes	At the end of this module learners will be able to: 1- Define the concept of the energy 2- Define the different basic concepts like properties, state, process, equilibrium, and cycles.
Units	• Unit 1.1: System and control volume, • Unit 1.2: Property and state • Unit 1.3: Processes and cycles
Readings	1- Sonntag, R. E.; Borgnakke, C. and Van Wylen, G. J., Fundamentals of thermodynamics, John Wiley and Sons Inc., 1998.
Activity	**Overview** Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 2	**Work and heat**
Key Concepts	Work, heat
Overview	The work and heat are a kind of energy.
Aim	The overriding aim of this module is to equip students with the meaning of

	heat and energy.
Learning Outcomes	At the end of this module learners will be able to: 1- Know the difference between heat and work 2- Identify the different between the ideal gases and the pure substance. 3- Understand the property relations relevant to engineering thermodynamics. 4- Understand how to deal with thermodynamic tables
Units	• Unit 2.1: definitions • Unit 2.2: Ideal gas • Unit 2.3: pure substances
Readings	2- Cengel, Y. A. and M. A., Thermodynamics: An Engineering Approach, WCB/McGraw Hill, 1998
Activity	**Overview**
	Assignment : Using the WWW search Assignment : Prepare a research proposal
Module 3	**First law of thermodynamics**
Key Concepts	First law of thermodynamics
Overview	Apply the first law of thermodynamics on various engineering applications
Aim	The overriding aim of this module is to equip students with applications of the first law of thermodynamics.
Learning Outcomes	At the end of this module learners will be able to: 1- Identify the concept of energy and mass conservation 2- Apply these concepts on different applications
Units	• Unit 3.1: Understand how to deal with thermodynamic tables. • Unit 3.2: Closed cycle and Open cycle • Unit 3.3: Applications

Readings	1- Sonntag, R. E.; Borgnakke, C. and Van Wylen, G. J., Fundamentals of thermodynamics, John Wiley and Sons Inc., 1998.
Activity	**Overview** Assignment : Using the WWW search **Assignment : Prepare a research proposal**
Module 4	**Second law of thermodynamics**
Key Concepts	Second law of thermodynamics
Overview	The meaning of entropy and losses
Aim	The overriding aim of this module is to equip students with the meaning of entropy and kind of losses
Learning Outcomes	At the end of this module learners will be able to: 1- Identify the second law of thermodynamics 2- Identify the entropy and losses
Units	• Unit 4.1: Second law of thermodynamics • Unit 4.2: Entropy
Readings	1- Sonntag, R. E.; Borgnakke, C. and Van Wylen, G. J., Fundamentals of thermodynamics, John Wiley and Sons Inc., 1998.
Activity	**Overview** Assignment : Using the WWW search. **Assignment : Prepare a research proposal**
Module 5	**Vapour and gas cycles**
Key Concepts	Vapor, gas, cycles
Overview	Producing and consuming energy depends on cycles
Aim	The overriding aim of this module is to equip students with the different cycles.
Learning Outcomes	At the end of this module learners will be able to:

	1- Identify vapour cycles 2- Identify gas cycles
Units	• Unit 5.1: Vapour cycles • Unit 5.2: Gas cycles
Readings	2- Cengel, Y. A. and M. A., Thermodynamics: An Engineering Approach, WCB/McGraw Hill, 1998
Activity	**Overview**
	Assignment : Using the WWW search for **Assignment : Prepare a research proposal**

2110 Business Ethics

Heliopolis University for Sustainable Development

Introduction to Marketing www.hu.edu.eg

2013/2014

Course Description/Overview

This course responds to a need for students and businesses to understand the role of ethics within the business environment. The course aims to dispel the myth that only the dishonest and unscrupulous companies are those that succeed. Furthermore, the course explains to the students the importance of aligning the business's practices, vision, and mission with ethical practices. Furthermore, students will be required to think critically about the different circumstances surrounding ethical choices and will be taught how to deal with them. Finally, the students will be taught how not to trap themselves within a dilemma (or tri-lemma) and will be taught how to find creative

solutions to difficult ethical problems. Most of these aspects will be taught within the scope of climate change. Specific case will be given regarding the debate around climate change as well as around companies seeking to address this problem. Furthermore, students will be asked to find creative ways to align business's strategies (and profitability) with addressing climate change.

Course Learning Objectives

The overarching goals of this course are: a) to teach students about the concepts of ethics, virtue, and values; b) raise awareness of the importance of ethics in a business environment, and c) Use the concepts practically in enhancing the performance of the company and to help in development of the company and the surrounding community.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Discuss the underlying theories regarding ethics
2. Understand the different concepts of ethics and their underlying foundations
3. Understand how aligning ethics with the company's practices can help in its long term success and growth
4. Understand ethics from the standpoint of climate change and environmental harm
5. Realize the ethics of sustainable development
6. Incorporate ethical activates into an enterprise

7. Understand the challenges of global warming and the role ethics has to play in mitigating its impact

Course Resources

2013/2014

Course Description/Overview

This course responds to a contemporary need for increase social awareness of corporations to take place in order to address the burning needs of society. Through this course, students will be taught on the different aspects of CSR such as community building and outreach, human development, giving back to the surrounding community, being a good neighbor, reducing emissions and pollution, the benefits of CSR, and the marketing potential for a socially responsible company. Furthermore, the course focuses on the relationship between CSR and addressing Climate change on the micro and macro marketing scale.

Course Learning Objectives

The overarching goals of this course are: a) to provide an understanding of the concepts and theories behind CSR; b) raise awareness of the concepts of CSR and how they apply to real industries and situations, and c) Use the concepts practically to enhance the total value of the company and its brand through an improved perception among its customer base.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

8. Discuss the underlying theories regarding CSR

9. Differentiate between donating money and actual CSR practices
10. Understand how CSR can enhance the brand image of a company
11. Be able to communicate the CSR actions of an institution
12. Turn CSR into a full-fledged strategy of an institution
13. Apply the concepts in a practical situation
14. Understand the challenges of global warming and businesses role in facing the threat
15. Realize the potential for creating brand awareness and loyalty while adding value to your product through addressing climate change in company practices

2203 Developmental Economics ... ... Introduction to Integral Economics (2233) ...

Course Description/Overview

Participants of this course will get an overview on Co-evolutionary Economics and Conscious Economics as a basis for the subsequent course Development Economics II. This parts of the Eastern Economic Path of Developmental Economics is concerned with (1) the extent our society is economically grounded in its particular culture and how do within our society culture and economy co-evolve, and (2) the development of our economy as a means whereby the culture and consciousness of human being and consciousness of the human being and humanity is advanced.

Course Learning Objectives

16. To provide a broad knowledge base for a culturally based developmental economics

17. To compare and contrast communally based self-sufficiency with a culturally based developmental economy

18. To connect conscious evolution, micro enterprise-wise, with developmental economics, macro economicswise Course Content Learning Outcomes Upon successful completion

of this course, students will be able to:

- To be able to align culture with economics
- To distinguish between a local-global developmental, and a self- sufficient, local economy
- To be able to internalize development, individually and societally, psychologically and economically
- To position a developmental economy within a conventional economic context

Furthermore, students will gain the following transferable skills and other attributes:

- Internalize developmental principles and processes
- Build a developmental approach into your work and study processes
- Be able to link the local and traditional with the global and modern 2

- Internalize the connectedness between nature and culture

Learning and teaching strategies

- Lectures/seminars/group exercises – on building up a developmental orientation
- Drawing on the history and culture of your region, on the one hand, and on the applied arts, on the other, to cultivate a developmental orientation
- Practical projects focused on self, organizational and communal development
- Oral, visual and written presentation focused on patterns of connection, unfolding narratives, and an overall developmental approach to economics Course Resources Course Website(s) Required Course Texts and Materials

Course

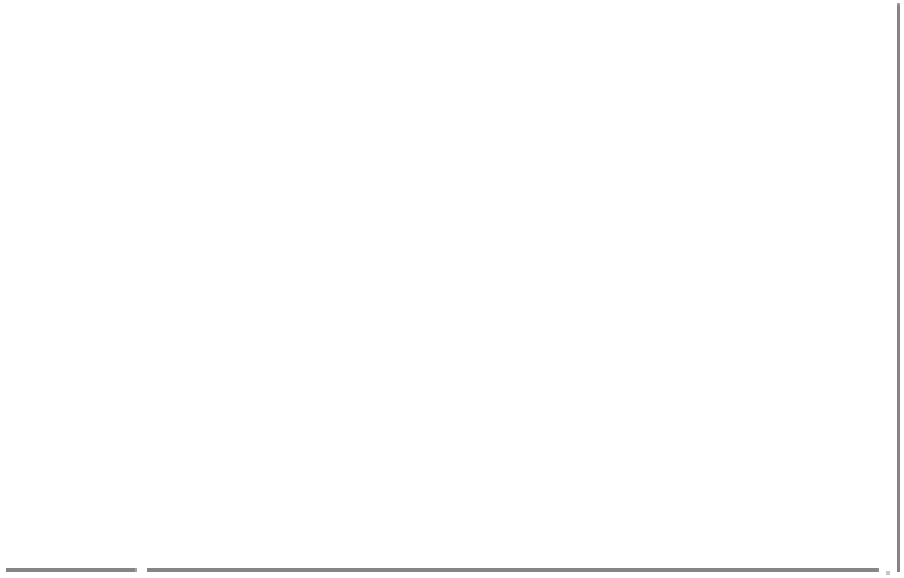
Developmental Economics

Key Concepts

- Provides the philosophical Foundation for the missing co- evolutionary Aspect

of an Integral Economy

- Sees the World as a Patchwork Quilt of loosely interconnected, co-evolving social and ecological Systems
- Transcends Individualism and Globalism



Overview

We now begin to release the eastern economic Gene-ius through what we term

‘developmental’ economics. Surprisingly perhaps for you, the reader, we ground the archetypal ‘east’ in the work of ‘western’ environmental economist Richard Norgaard from Berkeley, California, and particularly in his work on Development Betrayed : Toward a Co-evolutionary Re-visioning of Economics’. For what we have found, and indeed what has alarmed us, is that there are virtually no distinct economic voices – that is distinctly ‘eastern’ in nature and scope – coming from the geographical east, at least from a theoretical perspective. As the archetypal ‘east’ for us represents the spiritual and cultural dimensions of a society and has thereby a particular inclination towards holism, we have long been seeking to identify – in particular in the geographical east of our world, such as India, China or Japan – a culturally and spiritually grounded approach to macro economics, as opposed to micro enterprise, building on the ‘eastern’ notion of the evolution of consciousness. Perhaps because of the all-pervasive force of today’s mainstream economics, we have by and large failed to

7

	discover such an approach. With Norgaard though, we came across a formidable,

	holistic economic voice, focusing on what we term the 'developmental'. This is set in the context of the evolution of a particular society, rather than on 'development', which is arguably a 'western' imposition of modernization on any society.

	Assignment/Exam
Module 2	Consciousness, power and economics: an “eastern” developmental orientation
Key Concepts	• An ecosytemic and holistic Approach that applies Culture, Spirituality and Philosophy to Economics • Aiming to renew Individual, Organization and Society • Turning from Development to Transformation
Overview	We now turn to the late and great E.F. Schumacher, who, German by origin, drew intensely on eastern philosophies, in particular Buddhism, in his ‘economics as if people mattered’. His holistic orientation as an economist, able to link individual and societal evolution, cultural and economic development, knowledge and wisdom, agriculture and industry, the material and the immaterial, economic theory and

	practice, makes him an ideal ‘eastern’

8

	protagonist for an emergent developmental economy. Metaphysical reconstruction of economics via a higher level of consciousness is a keynote of Schumacher’s work, as well as for Argentinean former World Banker Mario Kamenetzky. Moreover, we conclude this chapter with the Sri Lankan movement ‘Sarvodaya’ (meaning: awakening for all) as a practical application of Schumacher’s approach to culture and consciousness. This movement, encompassing over 15.000 villages, links purposefully and successfully culturally rooted spiritual evolution with economic development, thereby being also a force for cultural reconciliation and nation building.

	Assignment/Exam

Module 3	Culture, politics and economics – the nature and scope of associative economics
Key Concepts	• Culture is seen as the rightful Place for Competition, to achieve personal Freedom and Liberation

9

	• □Economics, in Contrast, is about Fraternity • □Politics, or human Rights, is about Equality. • □Economics focusses on the real Needs of Society, and its organizing Form is the Association. • □Capital is regarded as Means of Self-expression, individual Evolution and Knowledge Creation.
Overview	With his Threefold Commonwealth, Rudolf Steiner offers a fundamental reinterpretation of a developmental economy and society, distinguishing three independent as well as interdependent (co-evolving) societal parts: economics,

	politics and culture, as opposed to Norgaard's two (economics and culture). He sees culture as the rightful place for competition, in order to achieve personal freedom and liberation. Economics, in contrast for Steiner, is about fraternity, and politics is about equality. In this combination, an individual strives to fully actualize his or her personal skills in the field of culture, which, in turn, informs his or her unique and knowledgeable contribution to economic life. The focus of economics, then, is on the real needs of society, and its organizing form is the association. Consequently capital is seen in a new light. As articulated by Steiner's followers Folkert Wilken and Christopher Houghton Budd, capital becomes a means of self- expression, individual evolution and knowledge creation. Wilken was among the first to recognize the intellectual, cultural, even spiritual dimension of capital and its rootedness in accumulative capacities of previous generations. Therefore, both, Associative Economics and the Capital Economy introduced in this chapter, can be regarded as suitable building blocks for a developmental economy, addressing most especially liberty (culture) and fraternity (economy) in such co-evolution.

...
Assignment/Exam

- □llustrates how an active Engagement with cultural Grounds on a micro-level provides a Basis for organizational Development and for social, political and economic Transformation

- □Shows how a Company practicing Co-evolution establishes harmonious Relations with its Customers, Suppliers and Competitors, as well as with the Government with which it deals, and the natural Environment.

Key Concepts

Overview

Japan's Canon demonstrates developmental economics on a microeconomic level. By building on the Japanese philosophy of 'Kyosei', which means co-existence or co-evolution, the Canon case illustrates how such an original eastern cultural impulse is realized in economic practice. We witness, substantiated by Japan's economic philosopher Kensei Hiwaki, how an active engagement with cultural grounds provides, on the one microeconomic hand, a basis for organizational development. On the other macroeconomic hand, the Canon case provides insights, on how an evolved, and culturally infused variation of mainstream macroeconomic theory is put into practice. We have chosen a case

	from Japan, as there is much to learn from a country that economically excelled in the 1970s and 1980s, and lost its way economically thereafter. The reasons for this are undoubtedly complex. From our integral perspective, however, we offer as one reason, that Japan, macroeconomically, submitted to the monocultural 'western' economic mainstream, with no space to continue to integrate its own cultural, more eastern, perspective. The case of Canon, even if culturally diluted in recent times, provides micro clues for macroeconomic co-evolution.

Introduction to Marketing www.hu.edu.eg

2013/2014

Course Description/Overview

This course responds to a contemporary and social need to better understand consumer demand for green products and the implications of this demand within the marketing system. The course helps students to clearly identify the growing demand by so-called “green” consumers for products, services and systems that support environmental and social sustainability, as well as changing patterns of consumer demand and changing propensities to pay for environmentally sustainable products and services. This course will help students to be prepared for work in a business environment where environmental and social sustainability are increasingly important and are expected

components of best practice business operations. Students will explore issues associated with product innovation and design, as well as appropriate pricing and promotion strategies for green products and services.

Course Learning Objectives

The overarching goals of this course are: a) to provide an understanding of the concepts and theories behind Green Marketing; b) raise awareness of the concepts of Green Marketing and its applications, and c) Use the concepts practically in enhancing the value of the products and services provided by a company.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

19. Discuss the underlying theories regarding Green Marketing
20. Differentiate between environmentally friendly practices and Green Marketing
21. Understand how “going green” can enhance the brand image of a company
22. Use social media to raise awareness for green practices of the company
23. Develop a green product portfolio
24. Apply the concepts in a practical situation
25. Understand the challenges of global warming and businesses role in facing the threat
26. Realize the potential for creating brand awareness and loyalty while adding value to your product through addressing climate change in company practices

Herbal Medicine

Course Location: Class Times: Prerequisites: Faculty Web Page: Course Description/Overview

University Campus Monday 8:30 – 12:30 - www.hu.edu.eg

The course describes the detailed preparation and formulation of phytopharmaceuticals. Requirements for quality control and standardization of herbal drugs, legal and professional framework for production, dispensing of herbal medicines also will be covered, critical appraisal of the overall process of developing a medicine from a botanical drug, sound understanding of the importance of pharmacovigilance of herbal

medicines and finally, physician and industrial perspectives in herbal medicine.

1

Course Learning Objectives

After completion of the course the student should have the knowledge and skills that enables her/ him to understand, describe and deal with herbal remedies for different diseases. They also should recognize the medicinal value of these herbs and their importance for a sustainable health and recognize, explain and connect the basic principles, concepts, theories, pertaining to the global climate change debate using appropriate scientific language.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

a- KnowledgeandUnderstanding: a_1- Be familiar with the history of herbal medicine.

a_2-Understand the concepts of natural products manufacture. a_3-Understand the mechanism of action of herbal drugs on human

systems. a_4-Identify risks associated with the use of herbal drugs

a_5- Understanding of the preparation and formulation of phytopharmaceuticals.

a_6- Understanding of the needs and requirements for quality control and standardization of herbal drugs.

b- IntellectualSkills b_1- design a herbal approach for prevention and treatment of certain

pathological conditions. b_2-Predict herb-drug interactions based on mechanism of action.

b_3-Design a pharmaceutical care plan for a person who wishes to use herbal preparations or nutritional supplements for s specific health problem.

c- ProfessionalandPracticalSkills c_1- Act as a specialist to the public and other members of the health

care team on proper use of herbal medicine. c_2- Help the public to select useful and safe herbal products c_3- Collect the therapeutic uses of medicines including adverse reactions, interaction of medicine and their significance in treatment.

2

General and Transferable Skills d_1- Assess critical thinking.

d_2- Estinate problem solving. d_3- Integraton different fields of knowledge. d_4- Approve raise team work. d_5- Design independent learning.

Course Resources Course Website(s) Required Course Texts and Materials Hands-out prepared by the instructor are uploaded on the portal for the students.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

GPA from 1 to 4 (where 2 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	10%
Written exams	35%
Class attendance/participation	20%
Oral exams	10%
Practical exam	25%
Total Points	100

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a practical course, which means that students are expected to come to ALL classes and laboratories. You cannot pass the class under any circumstances if you miss more than three classes or three labs. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by- case basis.

Course Content

Theoretical	Estimated number of hours
Preparation and formulation of phytopharmaceuticals	2
Needs and requirements for quality control and standardization of herbal drugs	2

Legal and professional framework for production and dispensing of herbal medicines	2

4

Overall process of developing a botanical drug into a medicine	2
Importance of pharmacovigilance of herbal medicines	2
Management of system disorders using herbal products	10
Herbal medicine: physician and industrial perspectives.	2
Total	24

2233 Introduction to Integral Economics ... ... no prerequisites ...

Course Description/Overview

Participants of this course will critically review existing dominant models of economic thinking and how these affect the planet's health and human well-being and survival. Integral Economics gives an overview on alternative past and present economic models that

integrate economics with the earth, with society and community, with life's processes and human's creativity. Integral economics is aiming to provide a framework for the needed paradigm shifts of our time.

Course Learning Objectives

34. • To compare and contrast diverse moral underpinnings to economics

35. • To gain insight into the relationship between culture, spirituality and economics

36. • To compare and contrast self-sufficiency, with developmental, social and sustainable (living) economics

37. • To recast the Middle-East generally, and Sekem-Heliopolis specifically, as an integrator in the above light, ultimately focused on sustainable development Course Content Learning Outcomes Upon successful completion of this course, students will be able to:

- • To become adept at re-viewing economics in a cultural context

- • □Developing powers of comparative analysis and, more especially, synthesis, in economics
- • □Becoming able to discern the evolutionary development of economics
- • □Relating such an evolutionary impulse to the art and science of development
- • □Appreciating the long and wide-ranging backdrop to sustainable development

Furthermore, students will gain the following transferable skills and other attributes:

- • □To adopt a cross-cultural orientation
- • □To be able to distinguish between more, and less, evolved orientations to economics 2
- • □To appreciate the need for regression, prior to progression, in economic analysis
- • □To recognize that development of economics is a cyclical as well as a linear process

- To become adept at comparative and cross-cultural economic theorizing

Learning and teaching strategies

- Lectures/seminars/ group exercises – to internalize comparative evolution of economics
- Partaking in the "art" of development – to experience and appreciate different economic models, through music and movement, dance and drama,
- Practical projects – on comparative economic systems
- Oral, visual and written presentation – encompassing different belief systems, and economic systems, with specific reference to Sekem

APENDIX II: The CLIMASP Course Modules Template Example

Modules Overview

Course	Introduction to Integral Economics
Module 1	The moral economic core
Key Concepts	...
Overview	In this module we center our Integral Economy in a moral economic core, which has its foundation in 'Religion and Humanity'. We take you then on a journey, beginning with Protestantism, as the original moral inspiration for today's economic mainstream. Thereafter, we acknowledge the urgent need to revitalize such a narrow moral economic core, and turn, in order to do so, to the rich diversity of faith based sources from all over the world; for an economy, to authentically renew itself, needs to build on, or build up, its own moral economic core. We, hence, travel around the Four Worlds, starting out with southern indigenous wisdom and move from there to

	various eastern moral cores, specifically Hinduism, Buddhism and Confucianism. Turning north, we review Catholicism in the light of e.g. so- called Distributivism, before we revisit the Christian West and its own Quaker and Protestant impulses for economic renewal. We end in the geographic center of the world with Islamic Economics. In the final analysis we conclude, that in order to renew economics from within we need to engage, interactively and co-creatively, with the full diversity of those faith based perspectives and humanistic orientations that underlie the moral economic core.

Assignment/Exam

Key Concepts

...

Overview

We start out on our journey towards an Integral Economy by identifying four different ‘economic paths’, lodged in four worlds – south, east, north and west – and a center. Each of these paths represents holographically a local economic part of the global whole.

In this module we focus on the Self-sufficient Economy of the natural and communal south.

This particular stream of economics has a southern humanistic orientation, related to individual and organizational ‘being’ and, in broad terms, nature and community. In sectoral terms, we locate here the environmental sector.

In other words: The southern economic path towards economic self-sufficiency is designed to bring the foundations of ‘nature and community’ back into the economic picture, thereby addressing communal and environmental decay.

We will uncover the connection to one, or usually more than one, central moral core, which has its foundation in religion and humanity. While the new integral economic map is based on the generic principles of living social systems, each economy needs to engage with it in its own particular way, serving to release its own genius. To do so, a so-called GENE process (Grounding-Emergence-

7

	Navigation-Effect) is introduced for each economic path, that enables an economy to gradually evolve towards an Integral one, thereby fully releasing its particular

	economic GENE-IUS. Overview: Southern Economic Gene-ius • MORAL ECONOMIC CORE: Centered in Moral Inspiration / Universal Truth. To what Extent are you economically driven by a southern Source of moral Inspiration (e.g. Ubuntu), which is at the same time enriched by a compelling universal Truth (e.g. Martin Buber's 'I and Thou')? • GROUNDING in ECONOMIC COMMONS: Individual to Community. To what Extent is your Economy grounded in its particular Nature and Community? • EMERGING in GRASSROOTS ECONOMICS: Universe to Pluriverse. To what Extent are your local economic Communities lodged in a Pluriverse of Diversity, naturally and culturally? • NAVIGATING in SUBSISTENCE ECONOMICS: Efficiency to Sufficiency. To what Extent is your Economy oriented towards Sufficiency, in Theory as well as in Practice, institutionally as well as practically, and thereby providing Subsistence for all its Members?

	• □EFFECTING in SOCIAL BUSINESS: Profits to Profiting Society. To what Extent is your Enterprise participating in building a Self-Sufficient Economy, and thereby contributing Locally to alleviate Poverty?

Overview

We start out on our journey towards an Integral Economy by identifying four different ‘economic paths’, lodged in four worlds – south, east, north and west – and a center. Each of

these paths represents holographically a local economic part of the global whole.

In this module we focus on the Developmental Economy of the cultural and spiritual east. This particular stream of economics has an eastern holistic orientation connects with individual and organizational ‘becoming’ and emphasizes, in general terms, culture, spirituality and consciousness. In sectoral terms, this is represented by the civic sector.

In other words: The eastern economic path towards developmental economics is building on the foundations of ‘culture and spirituality’, thereby promoting peaceful co-evolution of countries rather than ‘clashes of civilizations’.

We will uncover the connection to one, or usually more than one, central moral core, which has its foundation in religion and humanity. While the new integral economic map is based on the generic principles of living social systems, each economy needs to engage with it in its own particular way, serving to release its own genius. To do so, a so-called GENE process (Grounding-Emergence- Navigation-Effect) is introduced for each economic path, that enables an economy to gradually evolve towards an Integral one, thereby fully releasing its particular economic GENE-IUS.

9

	Overview: Eastern Economic Gene-ius • □MORAL ECONOMIC CORE: Centered in Moral Inspiration / Universal Truth. To what Extent are you economically driven by an eastern Source of moral Inspiration, which is at the same time enriched by a compelling universal Truth? • □GROUNDING in CO-EVOLUTIONARY ECONOMICS: Economic Development to Economic Mosaic. To what Extent is your Society economically grounded in its particular Culture and how do Culture and Economy co-evolve within your Society? • □EMERGING in CONSCIOUS ECONOMICS: Energy to Consciousness. To what Extent is the Development of your Economy a Means whereby the Culture and Consciousness of the Human Being and Humanity is enhanced? • □NAVIGATING in ASSOCIATIVE ECONOMICS: Competition to Association. To what Extent is the Economy of your Society focussing on 'Real Needs' and is organized around Association rather than Competition, building purposefully and

	interdependently on Culture, Politics and Economics? • □EFFECTING in DEVELOPMENTAL ENTERPRISE: Survival to Co- Evolution. To what Extent is your Community or Enterprise co-evolving with its multiple Stakeholders, thereby becoming an Agent for a Developmental Economy?

Overview

We start out on our journey towards an Integral Economy by identifying four different

‘economic paths’, lodged in four worlds – south, east, north and west – and a center. Each of these paths represents holographically a local economic part of the global whole.

In this module we focus on the Social Economy of the scientific and technological north. This particular stream of economics has a northern rationalistic orientation pertains to individual and organizational ‘knowing’, and focuses, in broad terms, on science and technology. In sectoral terms, the public sector is positioned here.

In other words: The northern economic path towards social economics is building on social and natural ‘science and technology’, thereby enabling a society open for continuous improvement, while simultaneously addressing social injustice.

We will uncover the connection to one, or usually more than one, central moral core, which has its foundation in religion and humanity. While the new integral economic map is based on the generic principles of living social systems, each economy needs to engage with it in its own particular way, serving to release its own genius. To do so, a so-called GENE process (Grounding-Emergence- Navigation-Effect) is introduced for each economic path, that enables an economy to gradually evolve towards an Integral one, thereby fully releasing its particular economic GENE-IUS.

Overview: Eastern Economic Gene-ius

11

	• □MORAL ECONOMIC CORE: Centered in Moral Inspiration / Universal Truth. To what Extent are you economically driven by a northern Source of moral Inspiration, which is at the same time enriched by a compelling universal Truth? • □GROUNDING in COMMON GOOD ECONOMICS: Economy to Society. To what Extent is your Society's Economy designed to bring about humane Communities and Enterprises? • □EMERGING in SOCIAL LEARNING AND THE NETWORK SOCIETY: Hierarchy to Network. To what Extent is your Society open for Learning, responding to the economic Opportunities but also to the social Challenges posed by a Network Society? • □NAVIGATING in OPEN ECONOMICS: Open Markets to Learning Society. To what extent does your Society promote Pluralism And exchange of Ideas, and is it

	open for continuous Improvement, through its social and economic Institutions? • □EFFECTING in COOPERATIVE ENTERPRISE: Enterprise to Democracy. To what Extent does your Community or Enterprise respond to continuous technological Change and social Challenges, in a cooperative and democratic Manner?

Introduction to Water Engineering

University Campus

- www.hu.edu.eg

Course Description/Overview

The course is an introduction to building materials, soil mechanics, engineering of water supply and sanitation, waste resources management, water management and quality. It also introduces water structures, groundwater engineering, hydraulic engineering, desalination and the Processes of water and waste water treatment. It highlights the impact of climate changes on water resources.

Course Learning Objectives:

Our student should gain the right understanding that How global warming impacts water. Water in its various forms is always on the move, in a complex process known as the water cycle. Global warming is already having a measurable effect on this cycle, altering the amount, distribution, timing, and quality of available water. Water users – from communities, to industries, to ecosystems – are in turn affected: their activities and functions depend, either directly or indirectly, on water.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

a- KnowledgeandUnderstanding:

1- Describe the engineering approach of water supply and sanitation 2- Discuss the waste resources management 3- Explain Water management and quality

b- IntellectualSkills

1- Rain versus snow can make a critical difference 2- Water quality affects people and ecosystems 3- The tide is rising.

4- Human activities are the main reason for the global warming.

c- ProfessionalandPracticalSkills

1-

d- General and Transferable Skills

1- Illustrate the environmental impact of water treatment. 2- Search for typical cases of study and working with others 3- Write technical reports

4- Independent learning; 5- Team working; 6- Presentation skills.

Course Resources

Course Website(s)

http://www.ucsusa.org/assets/documents/global_warming/National-Landmarks-at-Risk-Full- Report.pdf

Required Course Texts and Materials

Hands-out prepared by the instructor are uploaded on the portal for the students. 1- Engineering of water supply and sanitation 2- Waste resources management 3- Water management and quality

4- Water management and quality

We have the practical solution and technologies at hand to substantially reduce our

emissions, create a clean energy economy.

2- With climate change, the student should understand how water cycle will significantly

change.

3- Understand the concept that a warmer atmosphere can hold more water-roughly four

percent more water for every 1 Feh. Rise in temperature.

k.Pennington, January (2010) ,Introduction to Water Resources and Environmental Issues,. US Department of Agriculture, Stoneville. Cambridge University Press.

5- Structures needed for water usages Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

GPA from 1 to 4 (where 2 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	10%
Written exams	35%

Class attendance/participation	20%
Oral exams	10%
Practical exam	25%
Total Points	100

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a practical course, which means that students are expected to come to ALL classes and tutorials and Laboratories. You cannot pass the class under any circumstances if you miss more than three classes or three labs. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by

making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Lectures
1	30.09.2014	Perspectives on water and environmental issues
2	09.10.2014	The water environment of early civilizations
3	15.10.2014	The hydrologic cycle

4	22.10.2014	Water quality
5	29.10.2014	Watershed basics
6	05.11.2014	Groundwater
7	12.11.2014	Lake and Ponds
8	19.11.2014	Rivers and Stream
9	26.11.2014	Wetlands
10	03.12.2014	Dams and Reservoirs
11	10.12.2014	Drink water and Wastewater treatment
12	17.12.2014	Water allocation law
13	23.12.2014	Water conflict and problems
14	01.01.2015	Presentation on each source and its effect on Environment.

Course Teaching and Learning Methods:

1- All lectures are in electronic format using data show. 2- Tutorials are often in the form of example problems which are solved by students with the help of staff. 3- Labs and/or case study for more demonstration.

Course	Introduction to Water Engineering
Module 1	The Meaning of Ethics
Key Concepts	How global warming impacts water
Overview	When discuss with the students most of them will believe the main reason of the global warming is the moving cars exhausts. No one will realize how global warming will have significant consequences on the hydro cycle.
Aim	We must take immediate action to address global warming or these consequences will continue to intensify grow ever more costly, and increasingly affect the entire planet- including you, your family and community. And more the sea level rise is accelerating. Dangerous heat waves are becoming more common.
Learning outcomes	At the end of this module learners will be able to: 38. • Understand the crisis of fresh water we are going to face. 39. • Understand the different sours of water and how each source affect the environment.

Units	1.1: distribution of water on earth 1.2: the water and agriculture: the basis of civilization 1.2: The hydrologic cycle 2.1: Clean water as human rights 2.2: Water shed basics 2.3: Sources of water in Egypt.

Reading

k.Pennington, January (2010) ,Introduction to Water Resources and Environmental Issues,.

US Department of Agriculture, Stoneville. Cambridge University Press.

Activity

Think about :

Approximately two-thirds of the global population lives in regions that receive only one-fourth of the world's annual precipitation – a Tremendous disparity. What sorts of water management challenges does this create? What sorts of environmental challenges does this Population/precipitation imbalance create?

2321 Macro-Economics

Heliopolis University for Sustainable Development

- www.hu.edu.eg

2013/2014

Course Description/Overview

This course is designed to introduce students to the core concepts of Macro-Economics. Students learnt to view the economy in holistic terms and understand the impact of certain economic policies on growth, development, GDP, income inequality, etc... Throughout this course, students are exposed to the different ways that environmental damage impacts the economy as a whole, and internalize the way that all aspects of the economy are interconnected.

Course Learning Objectives

The overarching goals of this course are: a) to teach students about the concepts economy, GDP, and inflation b) raise awareness of the impacts of environmental and ecological harm on economic development, and c) Understand how this knowledge can be applied to real life situations and how it can impact the economic prosperity of a country.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

40. Discuss the underlying theories regarding Macro-Economics

41. Understand the different concepts of Macro-Economics and their underlying foundations

42. Understand how to calculate GDP, GNP, inflation, and other economic indicators

43. Realize how economic indicators impact the way governments and organizations act and react to the different environmental factors

44. To be able to calculate and see the negative impact of climate change in Macro- Economic terms

45. To be able to understand that environmental harm impacts the economic prosperity of a country, even if GDP is increased in the short term

Course Resources

Course Website(s) Required Course Texts and Materials Hands-out prepared by the instructor for the class Optional Course Texts and Materials

Grading Policy

Grades can be based on the following:

Assignments	10%
Quizzes	10%
Final Exam	40%
Mid-Term Exam	30%
Class participation	20%
Total Points	100 %

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Any submission that is less than a week late will get only half the marks; more than a week late and it will not be accepted

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class.

Dissability

2411 Integral Management www.hu.edu.eg

2013/2014

Course Description/Overview

This course is designed to teach students about the way natural resources are planned and managed in a practical context. Students are taught the methods used both on a micro and a macro level. The course teaches methods of calculating the present and future value of natural resources and the way that the conservation of said resources are calculated. Furthermore, students are taught about adding in the calculation of CO2 from fossil fuels and other carbon emitting resources in order to consider for the cost to the environment, the economy, and for cap-and-trade rules and regulations.

Course Learning Objectives

The overarching goals of this course are: a) to teach students about the concepts of how natural resources are calculated financially b) for the students realize the important of conserving natural resource, and c) for the

students to understand how calculations are made by world governments to make strategic decisions about discovering and consuming their natural resources.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

46. Discuss the underlying theories regarding the planning and valuing natural resources

47. Understand the different concepts of conserving natural resources and their pragmatic, financial imperative

48. Realize the importance of conserving natural resources

49. Realize how to calculate the overall cost of extracting and consuming finite natural resources

50. To be able to explain the cap-and-trade process and how it fits into a company’s and country’s method of calculating the cost effectiveness of extracting the resources

51. To be able to understand the environmental impact, and the role of conserving natural resources plays in mitigating and facing climate change

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Any submission that is less than a week late will get only half the marks; more than a week late and it will not be accepted

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by- case basis. Important Dates to Remember

Course Schedule

Week	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	Course Overview Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2	Introduction to resource planning and management
3	The different methods and calculations used for calculating the monetary value of natural resources
4	Calculating the future vs present value of natural resources
5	The impact of these calculations on governmental actions and on corporate decisions regarding natural resources
6	How conserving natural resources can be a way to prevent global warning

7	Sustainable development and its relationship with natural resources and its planning
8	Natural resources that contribute to global warming, and how this must been taken into account. Adding

	carbon footprints to the total cost of materials
9	Modern statistical techniques for measuring both the future and present cots of consuming natural resources as well as accounting for their carbon footprint
10	Programs designed for the planning, organizing and measuring of resource consumption
11	Alternatives to consuming natural resources, and sustainable alternatives towards new consumption
12	Recycling, reusing, reorienting, reforming, and recreating resources for a more sustainable future
13	Presentation of projects

CLIMAPS COURSE SYLLABUS TEMPLATE Pharmacognosy I

Course Number: PHG111 Heliopolis University, Faculty of Pharmacy and Drug Technology, Department of Pharmacognosy and Medicinal Plants Fall Semester, 2013-2014

PHG 111

Pharmacognosy I

Course Location: Class Times: Prerequisites: Faculty Web Page: Course Description/Overview

University Campus Wednesday 8:30 – 11:30 - www.hu.edu.eg

The course covers the medicinal leaves, flowers, barks, woods and their derived drugs: classification, morphology, histology, monographs, powdered drug identification, adulteration, chemical tests, active constituents, uses, and pharmaceutical preparations of leaves e.g. senna, belladonna, digitalis, and henna; flowers e.g. clove, pyrethrum, chamomile, and calendula; barks and woods e.g. cinchona, cinnamon, cassia, and pomegranate. Quassia, guaiacum, yellow sandal, and pine wood.

1

Course Learning Objectives

After completion of the course the student should have the knowledge and skills that enable her/ him to recognize and identify leave, flower, bark, and wood drugs in entire and powdered forms. They also should recognize the medicinal value of these drugs and their importance for a sustainable health and recognize, explain and connect the basic principles, concepts, theories, pertaining to the global climate change debate using appropriate scientific language.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

a- KnowledgeandUnderstanding:

a_1- recognize different key elements of leaves, flowers, barks, and wood. a_2- demonstrate the morphological and histological characters of drugs composed of leaves, flowers, barks, woods, and seeds their active constituents, medicinal uses, and chemical tests.

a_3- explain concepts of quality control of herbal drugs. b- IntellectualSkills

b_1- differentiate between genuine and adulterated drugs made of leaves, flowers, wood or bark. b2- transfer intellectual knowledge into practical application by identifying a real unknown powder plant at the lab.

b3- plan and conduct a research task. c- ProfessionalandPracticalSkills

c_1- be able to use microscope and chemical tests to identify drugs of leaves, flowers, bark and wood origin c_2- describe different morphological and histological features of leaves, flowers, bark, and wood either in entire or powder form.

d- General and Transferable Skills

d1- independent learning; d2- team working; d3- presentation skills; d4- basic IT literacy.

Course Resources

Course Website(s) Required Course Texts and Materials Hands-out prepared by the instructor are uploaded on the portal for the students.

2

1- Trease & Evans' Pharmacognosy,latestedition.

2- Anintroductiontoplantbiology.

3- Fundamentals of pharmacognosy and phytotherapy.

4- Encyclopaediaofherbsandtheiruses.

5- Thecompleteguidetoherbalmedicine.

6- Thehealingpowerofherbs.

7- TheABCclinicalguidetoherbs.

8- BritishandEgyptianPharmacopeia.

PHG 221

Phytochemistry I

Course Location: Class Times: Prerequisites: Faculty Web Page: Course Description/Overview

University Campus Monday 8:30 – 12:30 - www.hu.edu.eg

The course describes the fundamentals of phytochemistry and plant constituents: extraction, isolation, characterization and quantitative evaluation of plant constituents, applications of chromatography and spectroscopy in the analysis of natural products. Volatile oils: physical properties, methods of preparation, storage, quality control, and chemistry. Carbohydrates: monosaccharides, disaccharides, trisaccharides, tetrasaccharides, homopolysaccharides, heteropolysaccharides, biologically active carbohydrates, and sweeteners. Resins: resin combinations and other isoprenoids.

1

Course Learning Objectives

After completion of the course the student should have the knowledge and skills that enables her/ him to understand, describe and deal with the chemistry of volatile oil, resins, miscellaneous terpenoids, bitters and carbohydrates of the plant or animal origin and its related techniques. Also, the student should be aware with different chromatographic methods used for isolation and analysis of different plant constituents. They also should recognize the medicinal value of these compounds and their importance for a

sustainable health and recognize, explain and connect the basic principles, concepts, theories, pertaining to the global climate change debate using appropriate scientific language.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

a- KnowledgeandUnderstanding: a_1- Define the biogenetic origin of secondary metabolites.

a_2-List the different classes of biologically active compounds of natural origin and their distribution in nature.

a_3-Define the general methods of extraction, separation, purification, identification and analysis of active constituents of medicinal plants by different chromatographic methods.

a_4-Describe the chemical structure, physico-chemical properties, isolation, identification and therapeutic uses of volatile oils, resins, miscellaneous isoprenoids, bitters and carbohydrates.

b- IntellectualSkills b_1- Categorize the different types of secondary metabolites

b_2-Apply the basic methods for extraction, isolation, purification and identification of natural compounds.

b_3-Analyze natural compounds qualitatively and quantitatively. b_4-Distinguish the basic laboratory equipments safely and efficiently.

b_5-Integrate and link information across course components, including structure, chemical identification and separation of certain chemical groups of plant' constituents.

b_6-Formulate pharmaceutical science material and arguments clearly and correctly, in writing and orally to both specialist and lay audiences.

2

c- Professional and Practical Skills c_1- Design suitable methods for extraction and isolation of different

compounds. c_2- Construct analytical methods, principles, design, development, validation and application of good laboratory practice. c_3- Diagnose structural changes that modify the biological activity. c_4- Interpret purposively data derived from laboratory observations and measurements in terms of their significance and theory underlying them. c_5- Collect the therapeutic uses of medicines including adverse reactions, interaction of medicine and their significance in treatment.

General and Transferable Skills d_1- Assess critical thinking.

d_2- Estinate problem solving. d_3- Integraton different fields of knowledge. d_4- Approve raise team work. d_5- Design independent learning.

Course Resources Course Website(s) Required Course Texts and Materials Hands-out prepared by the instructor are uploaded on the portal for the students.

F11REP221

Renewable Energy Project

University Campus

USUS121 “Sustainable development and Environment” www.hu.edu.eg

Course Description/Overview

82. • Climate change is likely to both increase electricity demand for cooling in the summer and decrease electricity, natural gas, heating oil, and wood demand for heating in the winter. New infrastructure investments may be necessary to meet increased energy demand, especially peak demand during heat waves.

83. • Climate change could affect the amount of water available to produce electricity or extract fuel. In areas where water is already scarce, competition for water between energy production

and other uses could increase.

84. • □Sea level rise and more frequent intense storms could disrupt energy production and delivery by damaging electricity infrastructure, fuel delivery infrastructure and equipment, power plants, or storage facilities. Course Learning Objectives: The role of the renewable materials is very important to human beings especially to wind, tides and geothermal heat, which are naturally replenished. Non-renewable sources of energy, like coal, oil and natural gas, emit carbon dioxide, a

climate change because, renewable energy	utilizes natural resources such as sunlight,

greenhouse gas that is contributing to climate change. This is why we need to move to renewable sources.

Renewable energy technologies range from solar power, wind power, and hydroelectricity to biomass and biofuels for transportation.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

• Knowledge and Understanding: By the end of this course, the student should be able to:

1- Grasp the awareness of sustainable development.

2- About 13 percent of primary energy comes from renewables, with most of this coming from traditional biomass like wood-burning. Hydropower is the next largest source, providing 2-3%, and modern technologies like geothermal, wind, solar, and marine energy together produce less than 1% of total world energy demand. The technical potential for their use is very large, exceeding all other readily available sources.

3- Define the technology used in solar systems.

• Intellectual Skills 1- Energy use from fossil fuel is the dominant source of greenhouse gas emissions

2- If the production of all our energy from renewable sources tomorrow we would have very little problem with climate change.

3- the actual capacity of producing renewable energy in Egypt. 4- Human activities are the main reason for the global warming.

• Professional and Practical Skills By the end of this course, the student should be able to:

1- Suggest a solar energy system for specific application. 2- Estimate the cost of solar system application. 3- Simulate different types of solar systems. 4- Capability to estimate the cost of applying renewable energy for small community. 5- Well understand the meaning of hybrid systems for different kinds of renewable energies. 6- Capability of making project auditing and energy efficiency control.

• General and Transferable Skills 1- Working within a team work

2- Designing technical presentation 3- Writing a full technical report.

Course Resources

Renewable Energy Sources and Climate Change Mitigation, summary for policymakers and technical summary. Published for the Intergovernmental Panel on Climate Change,2011

Course Website(s)

http://www.answers.com/Q/What_is_the_role_of_renewable_energy_in_addressing_climate_ change

Required Course Texts and Materials

Hands-out prepared by the instructor are uploaded on the portal for the students. 1- Engineering solution for energy crisis in Egypt. 2- Regional Center for Renewable Energy and Energy Efficiency Newsletters. 3- Energy management in Egypt.

4- Egyptian Governmental tariff for renewable energy producers. 5- How to convert your traditional source of energy to renewable one.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

GPA from 1 to 4 (where 2 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	10%
Written exams	35%
Class attendance/participation	20%
Oral exams	10%
Practical exam	25%
Total Points	100

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a practical course, which means that students are expected to come to ALL classes and tutorials and Laboratories. You cannot pass the class under any circumstances if you miss more than three classes or three labs. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by- case basis.

Important Dates to Remember Course Schedule

Week	Date	Lectures
1	30.09.2014	Introduction to the sources of power
2	09.10.2014	Introduction to the traditional source of power
3	15.10.2014	How the traditional station works and its theories
4	22.10.2014	Source of renewable energy, technologies and markets
5	29.10.2014	Introduction to the Solar energy in Egypt
6	05.11.2014	How to convert your house to work with PV
7	12.11.2014	Different applications for the solar power
8	19.11.2014	Bioenergy source of renewable energy
9	26.11.2014	Geothermal source of Energy

10	03.12.2014	Hydropower and Ocean energy
11	10.12.2014	Wind Energy in Egypt.
12	17.12.2014	Renewable Energy in the Context of Sustainable Development
13	23.12.2014	Mitigation potentials and costs
14	01.01.2015	Presentation for course project.

Course Teaching and Learning Methods:

1- All lectures are in electronic format using data show. 2- Tutorials are often in the form of example problems which are solved by students with the help of staff. 3- Labs and/or case study for more demonstration.

Course	Business Ethics
Module 1	The sources of renewable energy

Key Concepts	The foundations, history and origins of ethics
Overview	There are multiple options for lowering GHG emissions from the energy system while still satisfying the global demand for energy services. Some of these possible options, such as energy conservation and efficiency, fossil fuel switching, RE, nuclear and carbon capture and storage (CCS) were assessed in the AR4. A comprehensive evaluation of any portfolio of mitigation options would involve an evaluation of their respective mitigation potential as well as their contribution to sustainable development and all associated risks and costs.
Aim	The aims of this course is to allow the students to think about the different sources of renewable energy could use in our culture. Understand the meaning of Egypt Atlas for wind and solar. Read in solar application and how to implement in real case.
Learning outcomes	At the end of this module learners will be able to: • • □Demand for energy and associated services, to meet social and economic development and improve human welfare and health, is increase. • • □Greenhouse gas emissions resulting from the traditional energy sources have contribute significantly to the historic increase in atmospheric GHG concentrations.
Units	1.1: What are the sources of energy? 1.2: how the traditional power station contribute in the GHG. 1.2: sources of renewable energy. 2.1: Solar thermal and electricity applications 2.2: fundamental for solar applications

	2.3 wind energy.
Reading	Renewable Energy Sources and Climate Change Mitigation, summary for policymakers and technical summary. Published for the Intergovernmental Panel on Climate Change,2011
Activity	Students projects for small solar applications.
Module 2	RetScreen Energy Efficiency Software.
Key Concepts	Clean Energy Project Analysis
Overview	Clean Energy Project Analysis: ReScreen Engineering and Cases: is an electronic textbook for professionals and university students. This chapter covers the analysis of potential photovoltaic projects using the RETScreen® International Clean Energy Project Analysis Software, including a technology background and a detailed description of the algorithms found in the RETScreen® Software. Many case studies are available on their website.
Aim	Significant growth in demand for PV systems is expected to occur in developing countries to help meet the basic electrical needs of the 2 billion people without access to conventional electricity grids. In addition to this demand for cost effective off-grid power systems, environmental and longer-term fuel supply concerns by governments and electric utilities are beginning to help accelerate the market for demonstration programs for PV systems connected to central electric grids in industrialized countries.

Learning outcomes	At the end of this module learners will be able to: • • □Read the similar case studies relative to our culture. • • □Know how to collect the data and use international inventory.
Units	3.1: Basic of Solar Energy 3.2: Tilted Irradiance Calculation 3.3:PV Array Model 4.1: On and Off Grid Model

	4.2: Water Pumping Model.
Reading	RetScreen Official Website: http://www.retscreen.net/ang/d_t_info.php
Activity	Use Egyptain data to apply one of the case studies.

2205 Self-Sufficiency Economics ... ... Introduction to Integral Economics (2233) ...

Description/Overview

Participants of this course Economic Commons and basis for the subsequent course Self-Sufficiency Economics II. This parts of the Southern Economic Path of Self-Sufficiency Economics is concerned with (1) the extent our economy is grounded in its particular nature and community, and (2) the way our local economic communities are lodged in diversity, naturally and culturally.

Course Learning Objectives

85. To provide a basic grounding in the economics of self-sufficiency, in theory and practice

86. To compare and contrast efficiency with sufficiency

87. To appreciate the basic nature and scope of subsistence economics Course Content Learning Outcomes Upon successful completion of this course, students will be able to:

- To be able to identify the grounds for self-sufficiency in the local community
- To distinguish between self-sufficiency and sustainable development
- To distinguish between the natural and communal elements of self sufficiency
- To position self-sufficiency within a conventional economic context Furthermore, students will gain the following transferable skills and other attributes:
- Gain acquire practical skills in becoming self-sufficient, together with others

- Become develop a sense of “sufficiency” in your lifestyle
- Stat to build a local economy from the ground up
- Internalize the connectedness between nature and community 2

Course

will get an overview on Grassroots Economics as a

Learning and teaching strategies

- Lectures/seminars/group exercises – on building a self sufficient micro-economy
- Drawing on the history and culture of your region to uncover subsistence economies
- Practical projects – to cast light on self sufficiency
- Oral, visual and written presentation – to illustrate the workings of the subsistence economy you have been building as a group Course Resources Course

APENDIX II: The CLIMASP Course Modules Template Example

Modules Overview

Course	Self-Sufficiency Economics
Module 1	The economics of the commons
Key Concepts	• Communal Call for Freedom • Overcoming the Subordination of our Lives under Value Practices of Capitalism • Lodged within the communal Commons as opposed to individual Preferences
Overview	With Massimo de Angelis we enter the southern world of 'nature and community' with a contemporary Italian political economist. De Angelis' work on The Beginning of History lodges economics in the commons. His communal call for freedom challenges us to overcome the subordination of our lives under the value practices of market capitalism. In the context of our Integral Economy, de Angelis' philosophy provides

	the theoretical basis for regrounding economics in community. Further, by reversing the neoclassical conception of the economy as independent from society, he builds on the 20th century economic anthropologist Karl Polanyi, who maintained that the economy is embedded in society. De Angelis's perspective is reinforced, at the end of the chapter, by a brief introduction to African Economic Humanism. The originator, Mfuniselwa Bhengu, a South African politician and social philosopher, lodges his equally communal economic approach in the African philosophy of Ubuntu: I am because you are.

Activity	Overview ...
	Assignment/Exam
Module 2	Grassroots economics and earth democracy
Key Concepts	• Renewed cultural Soil renews Economics

	• Provides philosophical and practical Insigths into an emergent multicultural local Movement • Challenges the global monocultural economic Establishment
Overview	Esteva's and Prakash's work on 'Grassroots Postmodernism' as well as Vandana Shiva's approach to Earth Democracy build on the philosophical grounds in which the Economic Commons is lodged. Together they provide accumulative insight into an emergent multicultural local so-called 'pluriverse', challenging the global monocultural economic establishment. By looking at economics from such a 'grassroots' perspective, we show not only how revisiting economics on a local level can lead to 'remaking the soil of cultures' (the subtitle of Esteva's and Prakash's book), they also particularly emphasize the importance of 'nature and community', now alongside cultural diversity in such an evolution. 'Nature and Community' is the southern reference point of an Integral

7

	Economy, encompassing, most strongly, the economic principles of sustenance and

	self-sufficiency.

Activity	Overview ...
	Assignment/Exam
Module 3	The nature and scope of subsistence economics
Key Concepts	• Economics in Harmony with Nature and Community • Priority of Use-Value-Production • Central Concern: Creation and Maintenance of communal Economy • Starting Point: Needs of Rural Woman from 'Global South'

Overview	With the work of Princen, Bennholdt-Thomsen and Mies, we continue to build up approaches whereby economies operate in harmony with nature and community. In doing so, we initially build on the work of Harvard educated Thomas Princen, transforming

8

	efficiency into sufficiency. Thereafter we turn to German eco- feminists, Veronika Bennholdt-Thomsen and Maria Mies, whose applied research and practical experiences in Southeast Asia informed their theory on subsistence economics. The strong theory basis of subsistence economics makes it an ideal example for southern navigation, offering conceptual guidance in building a self-sufficient economy. Bennholdt-Thomsen and Mies have been inspired by the case of Grameen in Bangladesh, which will bring these 'southern' economic perspectives to practical life.

Activity	Overview ...
	Assignment/Exam
Module 4	**Social business, self sufficiency and micro-finance**
Key Concepts	• □A World without Poverty: Poverty is not created by the Poor, but by the

	Socio- Economic Structures • Objective to create a level playing Field for Everybody; to give every Human Being a fair and equal Chance; to develop the Potential of everybody to the fullest
Overview	We are now turning to a prominent practical case for economic self-sufficiency, to Grameen in Bangladesh as a 'social business'. Altogether these serve to provide the grounding (commons), emergence (pluriverse/earth democracy), navigation (subsistence/sufficiency) and ultimate practical effect (social

9

	business) arising out of the southern world of nature and community.

2207 Social Economics ... ... Introduction to Integral Economics (2233) ...

Course Syllabus Social Economics

Maximilian Abouleish ... ... maximilian.abouleish@hu.edu.eg

Course Description/Overview

Participants of this course will get an overview on Common Good Economics and Network Economy as a basis for the subsequent course Social Economics II. This parts of the Northern Economic Path of Social Economics is concerned with (1) the extent our society's economy is designed to bring about humane communities and enterprises, and (2) to what extent our society is open for learning, responding to the economic opportunities but also to the social challenges posed by a network society.

Course Learning Objectives

88. To provide a critique of market based economic from a social economic perspective

89. To position the emerging knowledge economy in a social context

90. To understand the nature and scope of co-operative enterprise Course Content Learning Outcomes Upon successful completion of this course, students will be able to:

- To be able to align culture with economics
- To distinguish between a local-global developmental, and a self- sufficient, local economy
- To be able to internalize development, individually and societally, psychologically and economically
- To position a developmental economy within a conventional economic context

Furthermore, students will gain the following transferable skills and other attributes:

- Internalize developmental principles and processes
- Build a knowledge-creating approach into your work and study processes

- Be able to link a social orientation to a knowledge-based economy and enterprise 2

- Internalize the connectedness between nature, culture and knowledge work
- Internalize the connectedness between nature and culture Learning and teaching strategies

- Lectures/seminars/group exercises – on building up social-and- knowledge processes
- Drawing on the Islamic orientation toward knowledge, generally, and in information and communication technologies, specifically, to build up a knowledge based community
- Practical projects focused on social processes for knowledge creation
- Oral, visual and written presentation focused explicitly on the use of knowledge, in groups,

to build up mini knowledge based, social economies Course Resources Course Website(s) Required Course Texts and Materials

APENDIX II: The CLIMASP Course Modules Template Example

Modules Overview

Course	Social Economics
Module 1	Humanistic economics and the economics of the “common good”
Key Concepts	• Oriented towards helping shape economic Policy that is consistent with the integral Values of the Person and a humane Community • Core Questions: How to minimize social Problems or the social Waste of Unemployment, meaningless Work, chronic Poverty, congested Cities, foul Air, Decay of the Family, etc. • Main Objective: Humanizing the Society – Individual Capacity, in the Interest of Society, must be fully realized, as well as human Needs serving as the Basis for rightful Claims on the social Product
Overview	The northern economic path constituting the Social Economy aims to link, democratically, the social and the technological attributes of the knowledge-based

	economy. Thereby, we not only fundamentally alter the current overly technological pre-emphasis, but also serve to transcend mechanical economic thought via a social, humanistic orientation. We begin in this northern grounding chapter by revisiting an originally European social economic orientation. This focuses on economics as a means to bring about humane communities and enterprises. Looking then, in rational northern guise, for a new social structure for the economy, we follow a stream of social-economic consciousness over the last 150 years – from Sismondi to J.S. Mill, from Ruskin to Hobson, from Tawney to Schumacher. We thereby purposefully build on the historical social roots, which we had made visible in chapter 2,

6

which include the French Utopians, the Catholic Encyclicals and many other sources. We make this reconnection to these rich social grounds together with contemporary Americans Lutz and Lux, who conclude, that this very 'global' 21st century needs to counteract the

‘western’ individualistic creed. In the process, it will serve to bring about ‘social economics’.

Readings
Activity
Overview ...
Assignment/Exam

Key Concepts

- Overcoming Humankind's social Underdevelopment is likely to be the decisive Factor in the World's social and economic Evolution.

- With the Network Society, a new World is taking shape. The Rise of Informationalism poses major Challenges to the

7

	Economy’s social Dimension. It is intertwined with rising Inequality and social Exclusion throughout the World. • It is for People to free themselves, to construct their Practice on the Basis of their Experience, while using whatever Information or Analysis is available to them. Such

	social, economic and political Action is essential for the betterment of Society.
Overview	Recent times, with the social downsides of mainstream economics, have seen a strong 'reemergence of the social'. The global rise of civic society and the World Social Forum, for example, are significant expressions of this global phenomenon. One of the reasons for this emergence can be seen in a fundamentally changed and increasingly complex social and economic context which humankind is facing, captured, for example, in terms like Network Society and Information Economy, which we explore here with the help of Castells. We learn how this new context brings not only economic opportunities, but also massive problems through social inequality and injustice. Furthermore, and this is another interpretation of the 'social', humankind is called to bridge the gap between technological overdevelopment and social underdevelopment. We address this issue with the expertise of the Club of Rome, as well as with Beinhocker's approach to social technologies. Altogether it becomes evident, that a reconnection to the philosophical grounds of a social economy (as done in the previous chapter) is necessary in order to meet current day social challenges.

Activity	Overview ...

	Assignment/Exam
Module 3	Participative and innovative learning, individually, communally, economically
Key Concepts	• There is no real Conflict between being determined to resist global Inequality and Injustice and at the same Time Understanding and Facilitating the positive Contributions of globalized Economic, social and cultural Relations across the World. • In an Open Society, we must content ourselves with a Form of social Organization that accepts the Image of human Fallibility, falls short of Perfection but holds itself open to Improvement. This is the Concept of an Open Society – a Society open to Improvement. • The supreme Challenge of our Time is to establish a Set of fundamental Values that applies to a largely transactional, global Society.
Overview	The urgent need to address current day social challenges and to overcome humankind's social underdevelopment, as addressed in the previous chapter, requires

	an economic and societal framework, that is open for learning and continuous improvement. Amartya Sen and George Soros are among those eminent economic thinkers, who promote – in theory and in practice – an ‘open’ economy and society characterized by pluralism and receptivity, relevant for such continuous improvement. Both of them have a deep understanding of today’s complexity as well as of social philosophies of the past. While Soros is philosophically rooted primarily in Europe, with Karl Popper’s approach to an Open Society as his guiding star, Sen draws in addition, for example, on

9

	his own Indian heritage. Deliberately we juxtapose Sen and Soros in this chapter, illustrating the need to revisit the theoretical grounds on which a future economy is built from diverse ideological backgrounds, on an ongoing basis. Thereby, we argue, we continuously substantiate and practice ‘open economics’, economics in an open society. This is, for us, a suitable navigational framework for a social, knowledge-based economy.

Activity	Overview ...
	Assignment/Exam
Module 4	The making of Mondragon as a co-operative enterprise
Key Concepts	• The cooperative Enterprise distinguishes itself from the capitalist, simply in that the latter utilizes Capital in order to make People serve it, while the former uses it to make more gratifying and uplifting the Working Life of the People. • The Enterprise is seen as in a permanent Process of evolutionary Change: it must renew and revitalize itself at all Times due to the inevitable Consequences of the changing Technology and Economy of our World.

10

Overview	The case of the Basque Mondragon Cooperatives in Spain is a practical illustration of the northern Social Economy. With Mondragon we build on the prior grounds provided by the economics of the common good and show how the organization's founding father Arizmendi provided Mondragon, from the outset, with a strong social philosophy. Furthermore, Mondragon is an organizational articulation of Open Economics, firstly, because of its inbuilt democratic principles (one worker-one vote) and, secondly, by combining technological with social innovation. Such innovation is promoted through Mondragon's own university and research center. Thereby, the Mondragon Corporation today, whose original roots lay in education, has itself become an exemplar of learning and knowledge creation. In summary, combining good business with social justice, Mondragon is a visionary expression of a social, knowledge-based economy.

2201 Sustainable Economics ... ... Introduction to Integral Economics (2233) ...

جامعة هليوبوليس
Heliopolis University

Course Description/Overview

Participants of this course will get an overview on New Economics and Real Economics as a basis for the subsequent course Sustainable Economics II. This parts of the Western Economic Path of Sustainable Economics is concerned with (1) the extent economic activity

of our society is rooted in ecological principles that sustain life, and (2) the extent our economy is transforming itself from a paradigm of domination to partnership and from promotion of phantom wealth to real wealth.

Course Learning Objectives

91. To integrate self-sufficient, developmental, social and living economics

92. To position living economics as an evolution of market based, free enterprise-and-comparative advantage

93. To interconnect living economics and sustainable development Course Content Learning Outcomes Upon successful completion of this course, students will be able to:

    To realign economics with life

    To distinguish between “self made man”, and “living” principles of “self making”

    To be able to connect initiative taking with living enterprise

To position a living economy within conventional economics inclusive of international trade Furthermore, students will gain the following transferable skills and other attributes:

- Internalize principles and processes of spontaneity and improvisation
- Transfer powers of improvisation from the arts to enterprise
- To become enterprising in your own life and learning
- Internalize the connectedness between nature, culture, knowledge and enterprise 2

جامعة هليوبوليس
Heliopolis University

Learning and teaching strategies

- Lectures/seminars/group exercises – on becoming enterprising

- Drawing on the movement and dance, music and drama to develop powers of improvisation, spontaneity and risk-taking

- Practical projects focused on action research and learning

- Oral, visual and written presentation focused explicitly on enterprise, teamwork and the exercise of leadership Course Resources Course Website(s) Required Course Texts and Materials

- Anielski, M. (2009). Economics of Happiness. Gabriola Island: New Society Publications.

Optional Course Texts and Materials Course Policies Grading System Assignments and Grading Scheme This course is assessed through course and fieldwork, as well as formal assessment, with a

pre-emphasis on activity, enterprise and the achievement of results. Grading Policy
Grades can be based on the following: (Example) 3

Assignments and/or Presentation	25%

Exams (Mid-term and Final)	50%
Class attendance/participation	25%
Total Points	100

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once

the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify the professor before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 25% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

APENDIX II: The CLIMASP Course Modules Template Example

Modules Overview

Course	Sustainable Economics
Module 1	The new economic agenda to build sustainable development
Key Concepts	• □New Economics is rooted in the Recognition that Human Life and economic Activity are an interdependent Part of the wider ecological Principles that sustain Life on Earth and will either operate sustainably within those Processes or bring about their own Demise. • □New Economics includes a new Approach to Development: need oriented, endogenous (that stems from the Heart of each Society), self-reliant, ecologically sound and based on structural Transformation.
Overview	The Western economic path towards a Living Economy serves to renew the economic mainstream from within the 'west'. For over forty years there have been serious western economists, who have sought a radical shift from the conventional economic wisdom. Prominent mainly Anglo-Saxon (with significant exceptions) economic

	thinkers such as Hazel Henderson, Herman Daly, Manfred Max-Neef (Chilean), Susan George, James Robertson, Paul Ekins, and Johan Galtung (Norwegian) are among these voices. The main connecting themes for them are environmental sustainability and social justice. Jointly, they initiated a 'new economics', the focus of this chapter. Aspiring to establish a fundamental departure from the existing economic paradigm, such a new economics, for James Robertson, is meant to be Sane, Ecological and Humane (SHE). Altogether, SHE aims to be life supporting, a 'living economy, equally concerned with community life and natural life.

Activity	Overview ...
	Assignment/Exam

Module 2	Partnership as opposed to domination economics
Key Concepts	• Real Wealth Economics builds on a new economic Map that includes the following six Sectors: Household Economy, unpaid Community Economy, Market Economy, illegal Economy, Government Economy, and the Natural Economy • It is based on Partnership, not Domination; it is emphasizing the Main Street (Real Wealth) Economy, as opposed to the Wall Street (Phantom Wealth) Economy. • It is oriented towards the Transformation of Financial Markets, especially the Money Systems in Place; Conscious

7

———	Choice in Money Systems at all Levels – global, national, corporate, grass-roots etc. – is seen as one of the most powerful Leverage Points for a new Economy.
Overview	With Riane Eisler and David Korten from the US and Bernard Lietaer originally from Belgium, we are introducing three eminent economic thinkers based in America, who

	have contributed together to a fundamentally revised perspective on ‘wealth’. Building on a new economic ‘partnership’ map, initially provided by Eisler, Korten has subsequently formulated a new economic agenda, envisioning the transition from an economy focusing on phantom wealth to real wealth. A significant catalyst in such a transition, however, will be the revision of the current day financial and monetary systems. For this we turn to financier and former architect of the Euro, Bernhard Lietaer, whose innovative approach to finance and money seeks a balance between conventional and so-called complementary currencies. Altogether, this chapter is an illustration of a rich array of emergent thinking within the west, that pursues an integrative approach to economics: bridging tradition and modernity, the developing and the developed world, wo/man and nature, as well as masculine and feminine, material and immaterial aspects of the economy. These emergent approaches thereby take on from where ‘new economics’ leaves off, towards a ‘sane, humane and ecological’ economy.

Activity	Overview ...
	Assignment/Exam
Module 3	The economics of wellbeing
Key Concepts	• Focuses on Real Life Issues. In measuring real Wealth (genuine Wealth), not only monetary and worldly Possessions but also qualitative Attributes like Health (physical and mental), spiritual Well-Being, healthy Relationships, Love and Respect, and the Well-Being of Nature are included. Genuine Wealth is

	thereby grounded in what we value most about Life. • □A Genuine Wealth Indicator integrates and harmonizes five Categories of Wealth or Capital, which collectively contribute to the good Life and form the Basis for an Economy of Well- Being: Human Capital, Social Capital, Natural Capital, Built Capital and Financial Capital.
Overview	In this western navigational chapter we demonstrate through the work of Canada's 'well-being economist' Mark Anielski, how a new economic framework that focuses on generating and measuring real genuine wealth might look. Such genuine wealth does not only include monetary and worldly possessions, but qualitative attributes like physical and mental health, spiritual well- being, healthy relationships, love and respect, and the well-being of nature. By discussing core features of a Genuine Progress Indicator and illustrating various forms of its practical application, this chapter provides tangible means of navigation to steer a society beyond the conventional focus on Gross Domestic Product (GDP).

Activity	Overview ...

	Assignment/Exam
Module 4	Sustainable enterprise: the case of Interface Carpets in the U.S.
Key Concepts	• The Sustainable Enterprise is a restorative Enterprise, modeled after Nature (often inspired by Biomimicry); it puts back more than its take out from the Earth. A Strategy to achieve that is: reduce, reuse, reclaim, recycle and redesign. • Sustainability does not stop at the Organization. The final Front calls for the Redesign of Commerce itself. Finally, it engages, in caring for human and natural Capital (Earth) as much as it has traditionally cared for financial Capital. • Thereby social Equity and environmental Stewardship are given their natural Places alongside economic Progress.
Overview	With the concept of the Sustainable Enterprise and America's Interface, the world's largest modular carpet manufacturer, as a practical example of 'Living Economics', we come to the culmination of the western economic path. Interface, as the other cases

	we have introduced, is an exemplar of a microeconomic seed corn for a new macroeconomic paradigm. What makes cases like

10

	Interface highly relevant for our Integral Economics, is not only their innovative practice, but it is the unique demonstration of how a critical conceptual and philosophical revision of mainstream economic theory, has led to a new path breaking practice. In the case of Interface, by now a global icon of the sustainable enterprise, its commitment to redesigning the enterprise according to nature's principles, thereby not only restoring but also 'giving back' to the earth, makes it a formidable exemplar for a Living Economy.

Course Description/Overview

The present course is intended to raise the students' awareness. It introduces students to the fundamentals of air pollution with a background on historical perspective on air pollution and a commentary on current air quality policies and standards It focuses on understanding the atmospheric phenomena and the destruction of natural balance, including noise pollution, inevitably brought about by human activities, It provides an overview of the history of air pollution, air pollutants, effect of air pollution on climate, air quality management, and indoor air pollution. It does so through tackling the following aspects: 1) natural sources of air pollution; 2) anthropogenic sources of air pollution; 3) airborne particulate matter; 4) size distribution of atmospheric aerosols; 5) negative impacts; 6) global warming; 7) air pollution act; 8) atmospheric stability; 9) thermal invasion; 10) modelling of air pollution and control devices. That is they are asked to read and summarize articles on air pollution and its sources. They are invited to discuss effect of air pollution on climate at local, national and international scales. In short, the course provides an appropriate chance for the students to get the minimum knowledge of major air pollutants; their sources and their effects (environmental, economic and health) and how emissions are estimated from road traffic and industrial sources.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of air pollution; b) to raise awareness of the learners about effects of air pollution on climate; c) help learners use traditional and electronic tools to identify the risks the different types of air pollutants; and d) to highlight the importance of renewable energy resources as clean and safe resources to the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

112. Discuss the effects of air pollution on vegetation, soils, fresh water, and buildings.
113. Identify the characteristics of air pollution, relevant regulations, and control technologies.
114. Identify the different types of air pollutants.
115. Anticipate possible future environmental change and identify possible development consequences.

116. Estimate air pollution concentrations as a function of emission, meteorology, topography and the built environment for a combination of road and industrial sources.
117. Disseminate emission and air quality results to a wider audience.
118. Estimate health impact of changes in air pollution

Course Description/Overview

This course examines the dynamics of the biosphere through the study of the natural state of ecosystems. Emphasis is on the explanation of the relationships between organisms and their environment and on managing human and water resources. The application of physics to the study of the atmosphere attempts to model Earth's atmosphere and the atmospheres of the other planets using fluid flow equations, chemical models, radiation balancing, and energy transfer processes in the atmosphere (as well as how these tie into other systems such as the oceans). In order to model weather systems, atmospheric physicists employ elements of scattering theory, wave propagation models, cloud physics, statistical mechanics and spatial statistics which are highly mathematical and related to physics. It has close links to meteorology and climatology and also covers the design and construction of instruments for studying the atmosphere and the interpretation of the data they provide, including remote sensing instruments.

Course Learning Objectives

The overreaching goals of this course are: a) to examines of the dynamics of the biosphere through the study of the natural state of ecosystems; b) to provide the basic knowledge of environmental and resources studies; c) to raise awareness of the learners about the need to examine the relationships between organisms and their environment and managing human and water resources.; d) to model Earth's atmosphere and the atmospheres of the other planets using fluid flow equations, chemical models, radiation balancing, and energy transfer processes in the atmosphere (as well as how these tie into other systems such as the oceans).; e) to employ elements of scattering theory, wave propagation models, cloud physics, statistical mechanics and spatial statistics which are highly mathematical and related to physics.; f) to examine the links to meteorology and climatology; g) and also covers the design and construction of instruments for studying the atmosphere and the interpretation of the data they provide, including remote sensing instruments.

Course Objectives Learning Outcomes

Upon successful completion of this course, students will be able to:

41. Describe the biosphere through the study of the natural state of ecosystems, the relationships between organisms and their environment and managing human and water resources.
42. Explain the relationships between organisms and their environment and managing human and water resources.
43. Question the relationships between Earth's atmosphere and the atmospheres of the other planets using fluid flow equations, chemical models, radiation balancing, and energy transfer processes in the atmosphere (as well as how these tie into other systems such as the oceans).
44. Anticipate possible future environmental changes and possible development consequences.
45. Understand scattering theory, wave propagation models, cloud physics, statistical mechanics and spatial statistics which are highly mathematical and related to physics
46. Demonstrate the knowledge and understanding of the links of atmospheric physics to meteorology and climatology.
47. Use the different tools and equipments to collect data needed for studying the atmosphere and atmospheric changes,
48. Anticipate the effect of atmosphere on climate change.

Course Description/Overview

This course provides an interdisciplinary survey of environmental and resources studies, examining its physical, chemical, biological, political and economic dimensions. Emphasis will be on concepts and methods that can be applied to the analysis and understanding of a range of specific environmental problems. A survey of environmental systems, human interactions with them and the use of distinctive areas on Earth are introduced. Emphasis is on environmental concepts, problems, and research methods in Egypt. This course examines the dynamics of the biosphere through the study of the natural state of ecosystems. Emphasis is on the explanation of the relationships between organisms and their environment and on managing human and water resources. In short, the course provides an appropriate chance for the students to get the minimum knowledge of safe environment.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of environmental and resources studies; b) to raise awareness of the learners about the need to examine physical, chemical, biological, political and economic dimensions of environment; c) emphasize on concepts and methods that can be applied to the analysis and understanding of a range of specific environmental problems; d) help learners to conduct survey of environmental systems, human interactions with them and the use of distinctive areas on Earth; e) use traditional and electronic tools to identify the risks of the degradation of environment; and f) to highlight the importance of the biosphere through the study of the natural state of ecosystems.

Course Objectives Learning Outcomes

Upon successful completion of this course, students will be able to:

90. Discuss the basic terminology and core concepts of environmental sciences.
91. Identify the physical, chemical, biological, political and economic dimensions of environment.
92. Conduct survey of environmental systems, human interactions with them and the use of distinctive areas on Earth.
93. Identify the risks of the degradation of environment.
94. Question the relation between sustainable development and clean environment.
95. Anticipate possible future environmental change and possible development consequences.

96. Appreciate the positive impacts of reasonable use of environmental resources.
97. Demonstrate knowledge and understanding of relationship between poverty and unsafe environment.
98. Use the different tools and equipments to conduct survey of environmental systems, human interactions with them and the use of distinctive areas on Earth.
99. Appreciate the importance of the biosphere through the study of the natural state of ecosystems.

Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection

3		Renewable energies and clean technologies.
		Solar Energy, solar cells, solar thermal heating systems, and electricity generation.
		Tidal and Hydro as renewable energy resources.
		Renewable Energy Integration and Energy Efficiency in the Built Environment
		Research Design Methods.

Dear Prof.Vassilis

All greetings from Port Said University's CLIMASP Project Team, we hope you're fine.
Here's our Required Equipments which we approved to buy to the CLIMASP Lab.

Ser.	Item	Unit	Quantity
1	**Desktop Computer** Dell optoplex 9020 with i7 Ram 8GB, HARD 1TB, Monitor 18.5 inch	Number	12
2	**Laptop HP** Core I7, 8GB RAM , 1TB Hard Disk , 15 display	Number	3
3	**Switch Cisco** PART NO (SRW2024 P-K9-EU)	Number	1
4	**Access Point** AIR-SAP16021 –I-K9 802.11a/g/n standalone AP,Int Ant, I Rag Domaim	Number	1
5	**Color Printer** HP color GP 5225N printer (ce4711A)	Number	1
6	**Scanner** HP Scan jet 5590 Digital Flatbed scanner (L1910A)	Number	1

7	**Projector include cables and installation** In focus IN112 Projector	Number	1
8	**Video conference** Video conference scopia XT5000	Number	1

Best Regards.

Description of the Environmental Psychology Course

List of cognitive concepts

Basic competencies	Psychological Traits	Skills	Knowledge
Explains the causes of environmental pollution	Balances between psychological bases and entrances to the interpretation of the relationship between behavior and environment	Uses the Correlation Method	Clarifies the concept of the environment
Uses the Internet	Concludes the goals	Displays the causal	Defines the concept

and global networks in search for programs of the most important environmental education	of environmental Education	relationship within the framework of the experimental method	of environmental psychology
Acquires skills of individual's positive personal behavior	Mentions examples of types of pollution in the environment	Masters methods of collecting information and data about the phenomenon studied	States the concept of environmental education
Collects reports and information about people's responses to environmental conditions	Suggests a roadmap for Environmental Action to try to limit environmental pollution	Builds projective tests and measurements	Mentions the concept of environmental education
Communicates with peers to complete assigned work.	Mentions evidence on the existence of pollution in the surroundings	Masters writing self-reports	Explains the concept of perception
Tackles self-dependence in writing research on the role of	Concludes the negative impact on health, resulting from water	Identifies the causes that lead to the occurrence or non-occurrence of a	Enumerates the concept of environmental perception

community in the reduction of environmental pollution	pollution	phenomenon in the context of the Descriptive Method	
Acquires skills of positive behavior towards the environment	Discusses ways of changing psychological attitudes toward environment	Plans to explain how difficult it is to apply the scientific method and experimental control	Clarifies principles of learning
Draws a comprehensive blueprint for the most important types of environmental pollution that resulted in climatic changes in the world	Proposes new methods to help parents raise children properly	Criticize the conduct of laboratory experiments in environmental psychology	Mentions the theoretical bases of the interpretation of the relationship between the environment and behavior

*** Study Plan for the course:**

Course number: ……..
Course Name: Environmental Psychology
Semester: ……..

* Definition of the course:
- Course No.:
- Course Title: Environmental Psychology
- Place:
- Timing of the lectures:
- Prerequisite:
- College Website:

*** Brief description of the course: (about 15 lines)**

The course of environmental psychology includes the following:
Chapter one: includes definition of environmental psychology, its topics, scientific methods, and the necessity that led to its emergence. Chapter two depends on developing positive behavior towards the environment and all fields in which we can improve human behavior regarding environmental issues. This means a paramount necessity for the existence of the so-called environmental instruction and environmental education in addition to causes that led to the failure of all environmental educational programs in Arab societies. The proof of this is the suffering of the environment around us from many problems, including problems of pollution, wastes, water and energy saving. In chapter three, we can recognize the psychology of environment, study its psychological and health effects on human society, and know the sources and causes of environmental pollution. Chapter four deals with ways to cure problems of the environment through the role the

community and university play in the development and improvement of environment in the fight against pollution. Chapter five contains presentation of the theoretical foundations and introductions that constitute the relationship between the environment and human behavior, the formation of environmental perception and factors that affect this perception, environmental trends, and the role of the principles of learning in their composition and how they are measured.

*** Learning outcomes included in the Content; derived from the list of concepts:**

- Mention the theoretical foundations for the interpretation of the relationship between the environment and behavior.
- Explain the causes of environmental pollution.
- Acquire the skills of positive behavior towards the environment.
- Draw a comprehensive blueprint for the most serious types of pollution in the environment, which resulted in climatic changes in the world.
- Discuss ways of changing psychological attitudes toward environment.

*** Assignments and methods of Assessment:**

- Assessment will be graded on a scale of zero to 10 marks, and the degree of success starts at 50% or 60%
- Assessment Policy

Assignments	80
Tests	----
Attendance and participation	20
Total	100

*** Policies adopted in teaching the course:**

- Delays in the delivery of assignments?!
- Methods or **(policies)** of classroom management:
- Dealing with learners with disabilities:

*** Timetable of lectures (lessons):**

Week	Date	Subject
One & Two		Environmental Psychology: definition, theme and methods

Three & Four		The development of positive behavior towards the environment
Five & Six		Psychology of the environment, and its health and psychological effects
Seven & Eight		Ways to solve environmental problems
Nine & Ten		Theoretical bases that explain the relationship between environment and behavioral - environmental perception
Eleven & Twelve		Environmental attitudes
Thirteen & fourteen		Suggested activities

*** Guiding model for course modules**

Module I: Environmental Psychology: definition, themes, and methods

- The basic concepts of the module: concept of the environment - concept of environmental psychology
- A brief description of the Module: definition of the environment and its types, topics of environmental psychology and necessity that led to its emergence, curricula used in it, and what characterizes it
- Module goal: is to identify the environment and its types, and environmental psychology as a science that should be

studied

- Learning Outcomes: It is expected that the student will be, after the completion of the lesson, able to:

(A) state the concept of environmental psychology.
(B) discuss the necessity that led to the emergence of environmental psychology.
(C) clarify the curricula used in the study of environmental psychology with no errors.

*** Activities**

1. Visiting the Association and the Council of Environmental Protection, and attempting to execute their objectives
2. Designing or developing a program for environmental awareness
3 Picking pictures out of newspapers and magazines, and analyzing their content, then comparing among them in terms of their expected impact
4. Coming up with the concept of each of these four words: information - fact - law - theory
5. Choosing one of the theories of psychology, and the stages of concluding it.
6. Student presents: what s/he feels, and how s/he behaves when s/he faces one of the situations mentioned in the introductions assigned for the interpretation of the relationship between environment and behavior, for his/her peers.
7. A student presents one of the situations in which s/he feels adapted, and the ones in which s/he lacks his/her ability, and compares between the causes of each feeling.
8 What is the relationship among the following processes: sensation, attention, perception?
9 In one situation, different individuals develop different perceptions. Explain via environmental situations you have experienced?
10 Students' choice of two environmentally different residential areas and recording the reaction of the population at the time of the processes of repair in their streets for a relatively long period; perspective of the student to express his/her opinion is to be taken into account.
11. Posing an open-ended question on at least ten members whether they are aware of the dangers threatening the environment in which they are present

12 Making a comparison between the four different definitions of psychological attitude, using a number of references
13. The attitude of student may change towards an a particular environmental or social issue, and then s/he identifies the factors that were behind the change.
14. Concluding the relationship between programs that some candidates present and voters' attitudes in certain areas.
15. Thinking in a certain way to get to know the attitudes of population of the local environment towards a large project will lead to a comprehensive environmental change.

Course Description/Overview

The present course is intended to raise the students' awareness of energy consumption and environmental pollution. It presents a discussion of the scientific principles of energy and thermodynamics, and the current and future prospects for energy production, conversion, storage and transmission. It also discusses the availability of solar energy, wind energy, hydroelectric energy and nuclear energy. It introduces students to the benefits of using clean energy resources. It does so through tackling the following aspects: 1) environmental pollution energy resources; 2) impact of energy consumption on environment; 3); 4) clean energy resources and climate change; 5) air, thermal and nuclear pollution; and 6) energy consumption, current and future global climate change. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on renewable energy resources. They are invited to discuss impacts of energy resources on environment at local, national and international scales.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of energy production, conversion, storage and transmission; b) to raise awareness of the learners about the need to explore clean energy resources to achieve the goals of sustainable development; c) help learners use traditional and electronic tools to identify the risks of pollution a result of increasing consumption of petroleum and gas; and d) to highlight the importance of controlling energy resources consumption as clean and safe resources to the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

12. Discuss the basic terminology and core concepts of energy.
13. Identify the impacts of traditional energy resources on environment.
14. Compare the advantages and disadvantages of different energy resources.
15. Understand the basic principles of production, conversion, storage and transmission of energy.

16. Question the relation between sustainable development and the use of energy resources.
17. Identify the different types of pollution sources.
18. Anticipate possible future environmental change and identify possible development consequences.
19. Appreciate the positive impacts of utilizing renewable energy resources on the environment.
20. Demonstrate knowledge and understanding of relationship between poverty, environment, climate change, and the insufficient supply of energy.
21. Use the different tools and equipments of pollution measurements.
22. Recognize the availability of solar, wind, hydroelectric and nuclear energy resources in Egypt.

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Description/Overview

The present course aims to equip students to integrate an understanding of the environment with other academic fields and their personal life. It prepares students for meaningful lifetime engagement with the environmental challenges that are facing society. This course emphasizes active, interdisciplinary learning with the overall objective of instilling the necessary skills to conserve biodiversity and integrate the principles of sustainability with respect to management of complex environmental systems. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on environmental issues.

Course Learning Objectives

The overarching goals of this course are: a) to develop an awareness about environmental issues; b) to train students to locate and comprehend relationships between the natural, social and cultural environment; and c) nurture the curiosity and creativity of the student particularly in relation to the natural environment (including artifacts and people);

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

13. Develop an understanding based on observation and illustration, drawn from lived experiences and physical, biological, social and cultural aspects of life, rather than abstractions;

14. Create cognitive capacity and resourcefulness to make the child curious about social phenomena, starting with the family and moving on to wider spaces;

15. Engage the child in exploratory and hands-on activities to acquire basic cognitive and psychomotor skills through observation, classification, inference, etc.;

16. Critically address gender concerns and issues of marginalisation and oppression with values of equality and justice, and respect for human dignity and rights

Course Description/Overview

Anthropology is interested in studying human, like other human sciences, which are closely linked to the humanitarian community in which they exist, they reflect its core values prevailing in it, and then help the community improvement and development, the study of environmental and climatic changes has become one of the social sciences and humanities concerns, which including the Anthropology, some of the recent trends in environmental studies, anthropological have been occurred , and these trends study the human adaptive with global environmental changes and developing solutions to many of the environmental problems, and this course shows the nature of the relationship between Anthropology and climate change as the results for man's behavior towards his environment, the course has been divided into five sections: the first section entitled "what is Anthropology," this section deals with the concept of Anthropology, and its objectives, and scope, and its relations to other sciences, the second section entitled "environmental Education", and deals with the concept of environmental education, its goals, and the process of environmental awareness, the third section titled "global climate changes, current and future," it deals with the most important global climate changes, and then the fourth section entitled "The harms of climate changes," it deals with harms of climatic changes and their impact on human health and the physical and natural environment, and finally the fifth section entitled "Mechanisms of the development of environmental awareness

among members of the community" by clarifying the role of formal and informal educational institutions in achieving and reduce environmental harms from climate changes.

Course Learning Objectives

The overarching goals of this course are:
1- Identify the communities cultures and behaviors towards climate changes.
2 Monitor the most important risks of climate changes on the environment and humans.
3 Raise the level of community awareness towards the dangers and harms of climate changes.
4 providing a critical study of the individuals behaviors to various climatic changes.
5. Activating the role of formal and informal educational institutions, in achieving and reduce environmental harms from climate change.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

13. Define the concept of Anthropology and its most important fields and objectives.
14. Clarify the relationship between Anthropology and other sciences.
15. Comparison between the fields of anthropological studies.
16. Show the awareness of global climate changes.
17. Benefit from the programs of educational institutions in modifying the behavior of individuals towards the environment.
18. Develop proposals for how to deal with global climate changes.

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class

starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

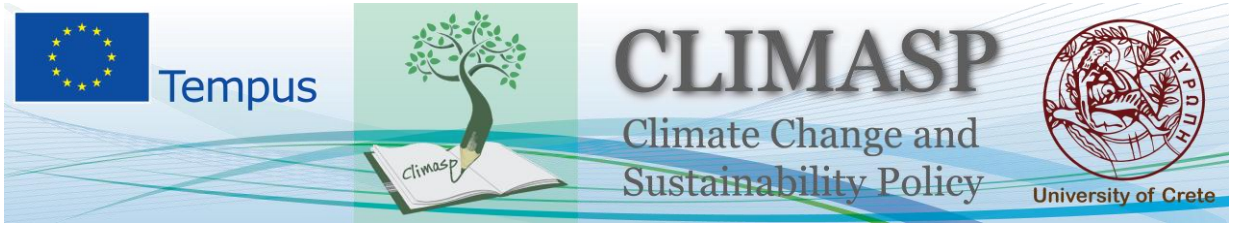
Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		The concept of Anthropology- inception - objectives - fields
3		Relationship between Anthropology and other scienc
4		The concept of environmental education and its goals

5		The Current and Future Global Climate Changes
6		The Harms of Climate Changes on the Natural Environment
7		The Harms of Climate Changes on the physical environment
8		The Harms of Climate Changes on human health
9		The role of formal educational institutions in raising awareness of the climate changes harms and reduce it.
10		The role of informal educational institutions in raising awareness of the climate changes harms and reduce it.
11		The role of technology in reducing the harms of climate changes
12		Activation of social networking sites to modify some of the behaviors that cause climate changes through action or animated videos and other.

APENDIX II: The CLIMASP Course Modules Template Example



Course	**Environmental Education Anthropology**
Module 1	Curriculum: What is Anthropology
Key Concepts	Anthropology and its goals , fields and types
Overview	This Module appears Introduction to Anthropology and its importance in the study of the cultural history of human society, and the most important areas that concerned and its relationship to other sciences.
Aim	The main objective of this Module to know the nature of science Anthropology and its relationship to human behaviors, which is the main reason for the occurrence of climatic changes.
Learning Outcomes	At the end of this module learners will be able to: Identify the concept and the nature of Anthropology.

	Compare between the different areas of anthropology. Clarify the relationship of Anthropology and other sciences.
Units	Unit 1.1 Anthropology (concept, objectives and fields) Unit 1.2: The Relationship between Anthropology and ot sciences.
Readings	Fulya Damla Kentli (2009). Comparison of hidden curriculum theories. European Journal of Educational Studies 1 (2) 83-88. Grundy, S. (1987) *Curriculum: Product or Praxis*, Lewes: Falmer Aristotle (1976) *The Nicomachean Ethics* ('Ethics'), Harmondsworth: Penguin. Chapter 3: Curriculum Theory. http://www.sagepub.com/upm-data/6042_Chapter_3_Glatthorn_(Sage)_I_Proof_2.pdf Watson, D. (2001). Pedagogy before technology: Re-thinking the relationship between ICT and teaching. Education and Information Technologies 6:4, 251–266
Activity	Writing an essay about the role of Anthropology in studying the human culture throughout the ages.
Module 2	Environmental Education

Key Concepts	Environmental Education- population
Overview	This Module appears the nature of environmental education and its most important fields, and objectives, and how to use technology in the preservation of the environment.
Aim	The objective of this Module is knowing the concept of environmental education and its objectives, and to clarify the impact of population activities on the environment, as well as to provide students with some practices associated with environmental education, and how to use technology to preserve them.
Learning Outcomes	• At the end of this module learners will be able to: • Define the concept of environmental education and goals. • Knowing the global efforts towards the preservation of the environment. • Optimize the use of technology to solve environmental problems. • Diagnosis of the current situation of environmental pollution.
Units	Unit 2.1: Environmental Education (concept - targets). Unit 2.2: The role of technology in preserving the environment. Unit 2.3: The global efforts to preserve the environment
Readings	Magdy Aziz Ibrahim: environmental education in the curricula of public education, the Anglo-Egyptian Library, Cairo, 2001.

Activity	**Overview**
	1-View documentary film about how to recycle waste. 2-Implementation workshops on how to recycle waste 3-Conducting field research on the most important aspects of environmental pollution in the local community. 4-Implementation of a forestation campaigns for the local community to reduce air pollution.
Module 3	Climate changes
Key Concepts	Climate changes
Overview	This Module appears the nature of climate changes and the most important forms and causes, and the role of human behavior in its occurrence.
Aim	This module aims at knowing the forms of climate changes and its most important reasons, and the most important international practices relating to the policies of adaptation to

	climate changes and mitigation.
Learning Outcomes	At the end of this module learners will be able to: • Identify the causes of climate changes. • Compare the best international practices on adaptation to climate changes and mitigation.
Units	Unit 3.1: Climate change: forms and causes Unit 3.2: The International practices to adapt to climate change and reduce its impact.
Readings	Abdul Wahab Bin Rajab Hashim bin Sadiq: Environmental Crimes and ways of confrontation, the Center for Studies and Research, Naif Arab University for Security Sciences, Riyadh, 2006.
Activity	Make Atlas illustrates the most important of climate changes forms, its causes and the most affected areas by them.
Module 4	The harms of climate changes
Key Concepts	harms of climate changes
Overview	This Module appears the harms of climate changes on the physical and natural environment and human health, and revenge on the countries' economies and food security.
Aim	The overriding aim of this module is to study the impact of climate changes on human and natural and physical environment.

Learning Outcomes	At the end of this module learners will be able to: • Identify the harms of climate changes. • Educate communities with the climate changes effects
Units	Unit 3.1: The Harm of climate change on human health. Unit 3.2: The Harm of climate change on physical environment Unit 3.3: The Harm of climate change on natural environment
Readings	7- Ahmed Midhat Islam: the problem of environmental pollution era, wrote a series of monthly issued by the National Council for Culture, Arts and Letters, the world of knowledge, Kuwait, 1990. 8- Rachid Salmi: the impact of environmental pollution in economic development in Algeria, Ph.D. thesis, Faculty of Economic Sciences of management, University of Algiers 2006. 9- Mohamed Mahmoud Sergani: liability for environmental damage, a comparative study between international law and Islamic law, Umm Al-Qura University Journal of Educational Sciences, social, humanitarian, first edition, Volume XIII, presses Umm Al Qura University, Mecca, in January 2001
Activity	**Overview**
	Make field research on the most important harms of climate changes

	in the community.
Module 5	Mechanisms for the development of environmental awareness among members of the community
Key Concepts	environmental awareness
Overview	This Module appears the mechanisms development of environmental awareness to members of the community and reduce harms of the climate changes through activating the role of formal educational institutions (schools and universities) and informal (family - the media - civil society organizations).
Aim	The overriding aim of this module is to raise the level of environmental awareness among students is to help them adapt to climate change and the reduction of increasing severity.
Learning Outcomes	At the end of this module learners will be able to: • Define the role of formal and informal educational institutions, in developing the environmental awareness among members of the community. • practice patterns behaviors aimed at adapting to climate change and work on mitigation
Units	Unit 5.1: - The role of formal educational institutions in limiting

	the harms of climate changes. Unit 5.2: The role of informal educational institutions in limiting the harms of climate changes.
Readings	Najib Saab: the environment in the Arab media, the first Arab Media Forum for Environment and Sustainable Development, Cairo, 2006.
Activity	**Overview**
	Designing educational videos shows the harms of climate changes and how to deal with it. Designing Videos emphasizes the rejection of wrong behaviors that cause climate change.

Environmental Microbiology

KNOWLEDGE (Concepts, theories, processes)	**SKILLS (Tools, methodologies, dynamics)**	**ATTRIBUTES (Innate abilities)**	**CLIMASP CORE COMPETENCES**
462. Environmental awareness 463. Climate change communication 464. Fairness and climate change justice 465. Future climate change scenarios 466. Technology and innovation 467. Climate change implications for integrated coastal planning 468. Risk assessment 469. Climate variability	633. Adaptive learning and self-reflection; 634. Awareness and advocacy raising 635. Communicating 636. Contextualising 637. Critical, systemic and futures thinking 638. Debating 639. Discourse 640. Futures thinking 641. Integrated assessment 642. Leadership 643. Local knowledge	725. Accountability 726. Confident 727. Decisive 728. Democratic 729. Empathy 730. Environmental justice 731. Openness to novelty and change 732. Optimism 733. Organised 734. Respect and care for the community 735. Respect for diversity	1) Discuss current environmental issues with an understanding of the basic ecological concepts involved. 2) Use an interdisciplinary approach to analyze environmental issues/problems; show knowledge of the interplay between the ecological, political, social, cultural and economic aspects of environmental problems. 3) Develop a worldview related to an understanding of current environmental issues and how global problems affect us locally. 4) Demonstrate an understanding of core ecological principles, and define scientific principles and concepts as related to environmental studies and sustainability.

470. Climate change communication 471. Climate change and health 472. Strategic planning and climate change 473. Role of international institutions 474. Climate change: Science, impacts & scenarios 475. Future climate change scenarios	644. Motivate and manage change 645. Networked learning 646. Prioritising 647. Problem solving 648. Course Description/Overview

This course introduces environmental processes and the influence of human activities upon them. Topics include environmental sustainability, ecology and evolution, population growth, natural resources, and a focus on current environmental problems from scientific, social, political, and economic perspectives. Upon completion, students should be able to demonstrate an understanding of environmental interrelationships and of contemporary environmental issues. This course has been approved to satisfy the Comprehensive Articulation Agreement general education core requirement in natural sciences/mathematics.

Course Learning Objectives

The overarching goals of this course are: a) to provide a a broad base of ecosystems biology, environmental microbiology, pollution monitoring, ecotoxicology and environmental biochemistry; b) to raise awareness of the learners about the important aspects of ecosystems and biodiversity, evolution, animal and plant physiology, environmental microbiology and molecular and cellular biology; c) and help learners Prepare for a careers in such field as environmental protection, research, consultancy and ecosystems management.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1) Discuss current environmental issues with an understanding of the basic ecological concepts involved.
2) Use an interdisciplinary approach to analyze environmental issues/problems; show
knowledge of the interplay between the ecological, political, social, cultural and economic aspects of environmental problems.
3) Develop a worldview related to an understanding of current environmental issues and how global problems affect us locally.

4) Demonstrate an understanding of core ecological principles, and define scientific principles and concepts as related to environmental studies and sustainability.
5) Participate in basic field ecology research and experiments according to the scientific method.

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Teachers have the potential to be what Giroux and McLaren described as transformative intellectuals who combine scholarly reflection and practice in the service of educating students to be thoughtful, active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the environmental challenges resulting from climate change. It does so through tackling the following logically sequenced seven issues: 1) Environmental awareness; 2)Environmental ethics; 3) Biodiversity and climate change; 4) Climate change adaptation; 5) Urbanization's role in climate change; 6) Water resources and climate change Social learning processes; and 7) Water management and recycling. Issues 5-7 are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is, they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of water resources at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the negative environmental consequences of climate changes – at local, national and international scales - in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for the management of critical environmental issues; and c) use traditional and electronic resources as well as social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

- Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community.
- Analyse methods of ensuring local participation in climate change adaptation.
- Analyze the effects of climate change from both male and female perspectives
- Compare and contrast the impacts of major climatic hazards on livelihoods of the community.
- Comprehend the significance of the climate change problem locally and globally.
- Describe the relationship between human activities and climate change.
- Demonstrate an understanding of the natural carbon cycle.
- Explore solutions to problems that cause climate change.
- Identify ways to reduce the school's carbon footprint.
- Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in.
- Investigate the causes of climate change.
- Propose solutions to climate change issues.
- Understand how human actions are contributing to global environmental change. Course Resources

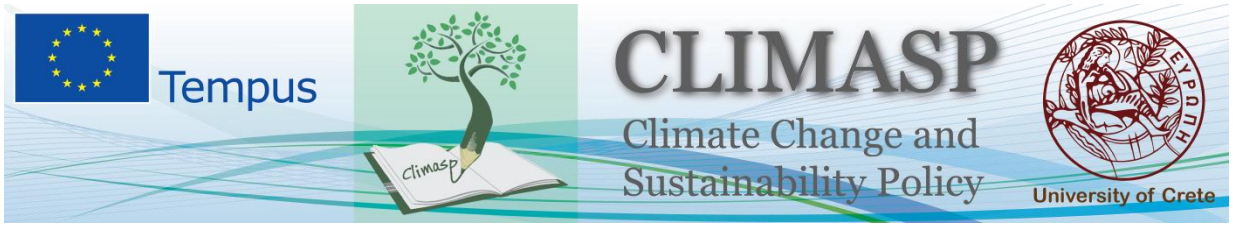
10-15		Water management and recycling (concepts, feasibility and consequences, techniques, national and international models)

Course Modules



Course	Environmental Sciences
Module 1	Environment: Ethics and Awareness
Key Concepts	Environmental awareness, Environmental ethics
Overview	Environmental awareness is to understand the fragility of our environment and the importance of its protection. Promoting environmental awareness is an easy way to become an environmental steward and participate in creating a brighter future for our children. To define environmental awareness we must first understand the environmentalist movement. Environmentalism is an ideology that evokes the necessity and responsibility of humans to respect, protect, and preserve the natural world from its anthropogenic (caused by humans) afflictions. Environmental awareness is an integral part of the movement's success. By teaching our students, friends and family that the physical environment is fragile and indispensable. Students need to start fixing the problems that threaten it. Environmental ethics, on the other hand, is the part of environmental philosophy which considers extending the traditional boundaries of ethics from solely including humans to including the non-human world. It exerts influence on a large range of disciplines including environmental law, environmental sociology, ecotheology, ecological economics, ecology and geography. There are many ethical decisions that human beings make with respect to the environment. Throughout this module, students are invited to share and

	exchange ideas about issues related to : clear cut forests for the sake of human consumption, propagation of species, gasoline powered vehicles, etc.
Aim	The overriding aim of this module is to turn students able to discourse how human actions are contributing to global environmental change.
Learning Outcomes	At the end of this module learners will be able to: • Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community. • understand how human actions are contributing to global environmental change.
Units	Unit 1.1: Environmental awareness Unit 1.2: Environmental ethics
Readings	• Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986** • **Paul Pojman** Environmental Ethics: Readings in Theory and Application Paperback – January 1, 2007 • Oxford Dictionary of Philosophy: environmental ethics, **http://www.answers**. com/topic/environmental-ethics
Activity	**Overview** Assignment 1.1: Reflecting Upon the following issues: • clear cut forests for the sake of human consumption. • propagating our species, and life itself. • make gasoline powered vehicles. • environmental obligations needed to keep for future generations. • the extinction of a species for the convenience of humanity. • Methods for best use and conserve of the space environment to secure and expand life.

Module 2	Biodiversity and Climate Change
Key Concepts	Biodiversity, Climate, Climate Change
Overview	In the atmosphere, gases such as water vapour, carbon dioxide, ozone, and methane act like the glass roof of a greenhouse by trapping heat and warming the planet. These gases are called greenhouse gases. The natural levels of these gases are being supplemented by emissions resulting from human activities, such as the burning of fossil fuels, farming activities and land-use changes. As a result, the Earth's surface and lower atmosphere are warming, and this rise in temperature is accompanied by many other changes. Rising levels of greenhouse gases are already changing the climate. These changes are affecting the entire world, from low-lying islands in the tropics to the vast polar regions. Also, Climate change affects biodiversity. It becomes one of the most significant drivers of biodiversity loss by the end of the century. It is already forcing biodiversity to adapt either through shifting habitat, changing life cycles, or the development of new physical traits. In this module, students need to realize that, conserving natural terrestrial, freshwater and marine ecosystems and restoring degraded ecosystems (including their genetic and species diversity) is essential for human well-being. Biodiversity can support efforts to reduce the negative effects of climate change. Conserved or restored habitats can remove carbon dioxide from the atmosphere, thus helping to address climate change by storing carbon (for example,reducing emissions from deforestation and forest degradation). Moreover, conserving in-tact ecosystems, such as mangroves, for example, can help reduce the disastrous impacts of climate change such as flooding and storm surges.
Aim	The overriding aim of this module is to realize the interrelationship between biodiversity and climate change
Learning Outcomes	Students will be able to:

	• Analyse methods of ensuring local participation in climate change adaptation. • Analyze the effects of climate change from both male and female perspectives
Units	Unit 2.1: Biodiversity, Climate, Unit 2.2: Climate Change Unit 2.3: Climate Change Adaptation
Readings	Shah, Anup. "Biodiversity." *Global Issues*. 19 Jan. 2014. Web. 10 Sep. 2014. <http://www.globalissues.org/issue/169/biodiversity>. • Doucet, C. (2008) *The Gough Guide to Climate Change: The Symptoms, The Science, The Solutions*, Rough Guides, London.
Activity	**Overview**
	Work in group to: - Collect information on biodiversity in your local environment. - Collect evidence on the effects of climate change on biodiversity in your local environment during the last fifty years. - Propose a strategy to protect biodiversity in your local environment.

Module 3	**Urbanization and Climate Change**
Key Concepts	Urbanization
Overview	This Module deals with the implications of population growth and urbanization for climate change in terms of the contribution of urban populations (and centres) to human induced climate change. It emphasizes how it is not the growth in (urban or rural) population but the growth in consumption that drives the growth in greenhouse gas emissions and that a significant proportion of the world's urban (and rural) population have consumption levels that are so low that they contribute little or nothing to such emissions. In this module students discuss how in the much-needed planning for global emissions reduction, provisions must be made to allow low-income low-consumption households with greenhouse gas emissions below the 'fair-share' level to increase their consumption.
Aim	This module aims at examining the relationship between urbanization and climate change.
Learning Outcomes	At the end of this module learners will be able to: • Describe the relationship between human activities and climate change. • Demonstrate an understanding of the natural carbon cycle.
Units	Unit 3.1: Urbanization *Unit 3.2: Urbanization a Mixed Blessing* Unit 3.3: Urbanization and Climate Change
Readings	• David Satterthwaite The implications of population growth and urbanization for climate change, Paper presented at Expert-Group Meeting on Population Dynamics and Climate Change, UNFPA and IIED In Collaboration with UN-HABITAT and the Population Division, UN/DESA 24 to 25 June 2009 • Holper, P. and Torok, S. (2008) *Climate Change: What You Can do about It at Work, at Home, at School*, Pan Macmillan,Sydney.

Activity	**Overview**
	Assignment : Prepare a lecture either of following themes 9. Urbanization: cons and pros 10. Urbanization and Carbon Cycle
Module 4	Water Resources and Climate Change
Key Concepts	Water resources management, Social learning processes
Overview	Water resources are important to both society and ecosystems. We depend on a reliable, clean supply of drinking water to sustain our health. We also need water for agriculture, energy production, navigation, recreation, and manufacturing. Many of these uses put pressure on water resources, stresses that are likely to be exacerbated by climate change. In many areas, climate change is likely to increasewater demand while shrinking water supplies. This shifting balance would challenge water managers to simultaneously meet the needs of growing communities, sensitive ecosystems, farmers, ranchers, energy producers, and manufacturers. In this module need to realize that in some areas, water shortages will be less of a problem than increases in runoff, flooding, or sea level rise. These effects can reduce the quality of water and can damage the infrastructure that we use to transport and deliver water.

Aim	The overriding aim of this module is realize the interrelationship between water resources management and climate change
Learning Outcomes	At the end of this module learners will be able to: • Compare and contrast the impacts of major climatic hazards on livelihoods of the community. • Comprehend the significance of the climate change problem locally and globally. • Explore solutions to problems that cause climate change.
Units	Unit 4.1: Water Resources and Climate Change Unit 4.2: Climate change Social learning processes
Readings	• CCSP (2008). *The Effects of Climate Change on Agriculture, Land Resources, Water Resources, and Biodiversity in the United States*. A Report by the U.S. Climate Change Science Program and the Subcommittee on Global Change Research. Backlund, P., A. Janetos, D. Schimel, J. Hatfield, K. Boote, P. Fay, L. Hahn, C. Izaurralde, B.A. Kimball, T. Mader, J. Morgan, D. Ort, W. Polley, A. Thomson, D. Wolfe, M. Ryan, S. Archer, R. Birdsey, C. Dahm, L. Heath, J. Hicke, D. Hollinger, T. Huxman, G. Okin, R. Oren, J. Activity	**Overview**
	• **Assignment**: plan a seminar on major climatic hazards on livelihoods of the community comparing the problems of water shortages and those of water increases
Module 5	**Water Management and Recycling**
Key Concepts	Water management and recycling processes, techniques
Overview	Water cycle is a delicate balance of precipitation, evaporation, and all of the steps in between. Warmer temperatures increase the rate of evaporation of water into the atmosphere, in effect increasing the atmosphere's capacity to "hold" water. Increased evaporation may dry out some areas and fall as excess precipitation on other areas. Changes in the amount of rain falling during storms provide evidence that the water cycle is already changing. Rising temperatures cause snow to begin melting earlier in the year. This alters the timing of stream flow in rivers that have their sources in mountainous areas. As temperatures rise, people and animals need more water to maintain their health and thrive. Many important economic activities, like producing energy at

	power plants, raising livestock, and growing food crops, also require water. The amount of water available for these activities may be reduced as Earth warms, and if competition for water resources increases.
Aim	The overriding aim of this module is to equip students with the capacity to debate on water management and recycling processes, techniques and feasibility>
Learning Outcomes	At the end of this module learners will be able to: • Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in. • Investigate the causes of climate change. • Propose solutions to climate change issues.
Units	Unit 5.1: Water management (concepts; national and international models) Unit 5.2: Water recycling techniques feasibility and consequences
Readings	• United Nations Development Programme (2007) *Fighting Climate Change: Human Solidarity in a Divided World: Human Development Report 2007-2008*, Palgrave Macmillan, Basingstoke, UK. • *Layperson's Guide to Water Recycling and Reuse*, published in 1992 by the Water Education Foundation, Sacramento, California. • Video, entitled *Water from Water: Recycling*, produced in 1995 by National Water Research Institute, Fountain Valley, California. • Research On Recycled Water is done by EPA through the Office of Research and Development. • Water Recycling and Reuse: The Environmental Benefits http://www.epa. gov/region9/water/recycling/
Activity	**Overview**

	Students are to plan and implement three-sessions workshop on the following themes: • Water management (concepts; national and international models) • Water recycling techniques feasibility and consequences

Environmental Sciences

KNOWLEDGE (Concepts, theories, processes)	**SKILLS (Tools, methodologies, dynamics)**	**ATTRIBUTES (Innate abilities)**	**CLIMASP CORE COMPETENCES**
44. Environmental awareness 45. Environmental ethics 46. Biodiversity and climate change 47. Climate change adaptation 48. Urbanization's role in climate change 49. Water resources and climate change Social learning processes 50. Water management and recycling	111. Adaptive learning and self-reflection; 112. Awareness and advocacy raising 113. Carbon literacy for procurement 114. Communicating 115. Contextualising 116. Critical, systemic and futures thinking 117. Debating 118. Discourse 119. Emergency psychology 120. Futures thinking 121. Global dynamics	111. Accountability 112. Confident 113. Decisive 114. Democratic 115. Empathy 116. Environmental justice 117. Gender-sensitive 118. Global mind-set/ consciousness 119. Interdependency 120. Needs vs. wants 121. Nonviolence & peace 122. Openness to	66. Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community. 67. Analyse methods of ensuring local participation in climate change adaptation. 68. Analyze the effects of climate change from both male and female perspectives 69. Compare and contrast the impacts of major climatic hazards on livelihoods of the community. 70. Comprehend the significance of the climate change problem locally and globally. 71. Describe the relationship between human activities and climate change. 72. Demonstrate an understanding of the natural carbon

	122. Integrated assessment 123. Leadership 124. Local knowledge 125. Mapping gender impacts 126. Motivate and manage change 127. Networked learning 128. Prioritising 129. Problem solving 130. Resolve ethical dilemmas 131. Scenario analysis and planning 132. Team management	novelty and change 123. Optimism 124. Organised 125. Respect and care for the community 126. Respect for diversity 127. Social cohesion 128. Social responsibility 129. Stewardship 130. Tolerance 131. Transparency 132. Virtue	cycle. 73. Explore solutions to problems that cause climate change. 74. Identify ways to reduce the school's carbon footprint. 75. Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in. 76. Investigate the causes of climate change. 77. Propose solutions to climate change issues. 78. Understand how human actions are contributing to global environmental change.

Course Syllabus

Course Number:

Environmental Sciences

University of Port Said, Faculty of Education, Department of Curricula and Methods of Teaching,

Fall Semester, 2013-2014

Instructor Information

Instructor: Dr Mahmoud Mohasseb

Office Location: Faculty of Education Campus

Telephone: Office –

Office Hours: Tuesday 14.30- 17.00, Wednsday 14.00 – 16.00

E-mail:

Website:

Course Identification

Course Number: **Γ0**

Course Name: **Environmental Sciences**

Course Location: University Campus

Class Times: Wednesday 8:30pm – 11:30am

Prerequisites:
Faculty Web Page:

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Teachers have the potential to be what Giroux and McLaren described as transformative intellectuals who combine scholarly reflection and practice in the service of educating students to be thoughtful, active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the environmental challenges resulting from climate change. It does so through tackling the following logically sequenced seven issues: 1) Environmental awareness; 2)Environmental ethics; 3) Biodiversity and climate change; 4) Climate change adaptation; 5) Urbanization's role in climate change; 6) Water resources and climate change Social learning processes; and 7) Water management and recycling. Issues 5-7 are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is, they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of water resources at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the negative environmental consequences of climate changes – at local, national and international scales - in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for the management of critical environmental issues; and c) use traditional and electronic resources as well as social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

- Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community.
- Analyse methods of ensuring local participation in climate change adaptation.
- Analyze the effects of climate change from both male and female perspectives
- Compare and contrast the impacts of major climatic hazards on livelihoods of the community.
- Comprehend the significance of the climate change problem locally and globally.
- Describe the relationship between human activities and climate change.
- Demonstrate an understanding of the natural carbon cycle.
- Explore solutions to problems that cause climate change.
- Identify ways to reduce the school's carbon footprint.
- Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in.
- Investigate the causes of climate change.
- Propose solutions to climate change issues.
- Understand how human actions are contributing to global environmental change. Course Resources

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

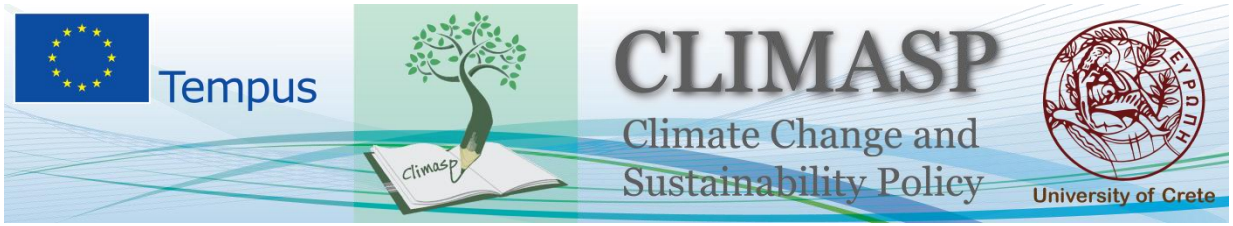
Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Environmental awareness
3		Environmental ethics
4		Biodiversity and climate change
5		Climate change adaptation
6		Urbanization's role in climate change
7		Water resources and climate change Social learning processes (FORUM 1)
8		Water resources and climate change Social learning processes (FORUM 2)
9		Water resources and climate change Social learning processes (FORUM 3)
10-15		Water management and recycling (concepts, feasibility and consequences, techniques, national and international models)

Course Modules



Course	Environmental Sciences
Module 1	Environment: Ethics and Awareness
Key Concepts	Environmental awareness, Environmental ethics
Overview	Environmental awareness is to understand the fragility of our environment and the importance of its protection. Promoting environmental awareness is an easy way to become an environmental steward and participate in creating a brighter future for our children. To define environmental awareness we must first understand the environmentalist movement. Environmentalism is an ideology that evokes the necessity and responsibility of humans to respect, protect, and preserve the natural world from its anthropogenic (caused by humans) afflictions. Environmental awareness is an integral part of the movement's success. By teaching our students, friends and family that the physical environment is fragile and indispensable. Students need to start fixing the problems that threaten it. Environmental ethics, on the other hand, is the part of environmental philosophy which considers extending the traditional boundaries of ethics from solely including humans to including the non-human world. It exerts influence on a large range of disciplines including environmental law, environmental sociology, ecotheology, ecological economics, ecology and geography. There are many ethical decisions that human beings make with respect to the environment. Throughout this module, students are invited to share and

	exchange ideas about issues related to : clear cut forests for the sake of human consumption, propagation of species, gasoline powered vehicles, etc.
Aim	The overriding aim of this module is to turn students able to discourse how human actions are contributing to global environmental change.
Learning Outcomes	At the end of this module learners will be able to: • Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community. • understand how human actions are contributing to global environmental change.
Units	Unit 1.1: Environmental awareness Unit 1.2: Environmental ethics
Readings	• Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986** • **Paul Pojman** Environmental Ethics: Readings in Theory and Application Paperback – January 1, 2007 • Oxford Dictionary of Philosophy: environmental ethics, **http://www.answers**. com/topic/environmental-ethics
Activity	**Overview** Assignment 1.1: Reflecting Upon the following issues: • clear cut forests for the sake of human consumption. • propagating our species, and life itself. • make gasoline powered vehicles. • environmental obligations needed to keep for future generations. • the extinction of a species for the convenience of humanity. • Methods for best use and conserve of the space environment to secure and expand life.

Module 2	Biodiversity and Climate Change
Key Concepts	Biodiversity, Climate, Climate Change
Overview	In the atmosphere, gases such as water vapour, carbon dioxide, ozone, and methane act like the glass roof of a greenhouse by trapping heat and warming the planet. These gases are called greenhouse gases. The natural levels of these gases are being supplemented by emissions resulting from human activities, such as the burning of fossil fuels, farming activities and land-use changes. As a result, the Earth's surface and lower atmosphere are warming, and this rise in temperature is accompanied by many other changes. Rising levels of greenhouse gases are already changing the climate. These changes are affecting the entire world, from low-lying islands in the tropics to the vast polar regions. Also, Climate change affects biodiversity. It becomes one of the most significant drivers of biodiversity loss by the end of the century. It is already forcing biodiversity to adapt either through shifting habitat, changing life cycles, or the development of new physical traits. In this module, students need to realize that, conserving natural terrestrial, freshwater and marine ecosystems and restoring degraded ecosystems (including their genetic and species diversity) is essential for human well-being. Biodiversity can support efforts to reduce the negative effects of climate change. Conserved or restored habitats can remove carbon dioxide from the atmosphere, thus helping to address climate change by storing carbon (for example,reducing emissions from deforestation and forest degradation). Moreover, conserving in-tact ecosystems, such as mangroves, for example, can help reduce the disastrous impacts of climate change such as flooding and storm surges.
Aim	The overriding aim of this module is to realize the interrelationship between biodiversity and climate change
Learning Outcomes	Students will be able to:

	• Analyse methods of ensuring local participation in climate change adaptation. • Analyze the effects of climate change from both male and female perspectives
Units	Unit 2.1: Biodiversity, Climate, Unit 2.2: Climate Change Unit 2.3: Climate Change Adaptation
Readings	Shah, Anup. "Biodiversity." *Global Issues*. 19 Jan. 2014. Web. 10 Sep. 2014. <http://www.globalissues.org/issue/169/biodiversity>. • Doucet, C. (2007) *Urban Meltdown: Cities, Climate Change and Politics as Usual*, New Society Publishers, Gabriola Island BC. • Dow, K. and Downing, T. (2006) *The Atlas of Climate Change: Mapping the World's Greatest Challenge*, University of California Press, Berkeley. • Flannery, T. (2005) *The Weather Makers: How Man is Changing the Climate and What It Means for Life on Earth*, Atlantic Monthly Press NY. • Hansen, J. (2010) *Storms of My Grandchildren: The Truth about the Coming Climate Catastrophe and Our Last Chance to Save Humanity*, Bloomsbury, New York. • Henson, R. (2008) *The Gough Guide to Climate Change: The Symptoms, The Science, The Solutions*, Rough Guides, London.
Activity	**Overview**
	Work in group to: - Collect information on biodiversity in your local environment. - Collect evidence on the effects of climate change on biodiversity in your local environment during the last fifty years. - Propose a strategy to protect biodiversity in your local environment.

Module 3	**Urbanization and Climate Change**
Key Concepts	Urbanization
Overview	This Module deals with the implications of population growth and urbanization for climate change in terms of the contribution of urban populations (and centres) to human induced climate change. It emphasizes how it is not the growth in (urban or rural) population but the growth in consumption that drives the growth in greenhouse gas emissions and that a significant proportion of the world's urban (and rural) population have consumption levels that are so low that they contribute little or nothing to such emissions. In this module students discuss how in the much-needed planning for global emissions reduction, provisions must be made to allow low-income low-consumption households with greenhouse gas emissions below the 'fair-share' level to increase their consumption.
Aim	This module aims at examining the relationship between urbanization and climate change.
Learning Outcomes	At the end of this module learners will be able to: • Describe the relationship between human activities and climate change. • Demonstrate an understanding of the natural carbon cycle.
Units	Unit 3.1: Urbanization *Unit 3.2: Urbanization a Mixed Blessing* Unit 3.3: Urbanization and Climate Change
Readings	• David Satterthwaite The implications of population growth and urbanization for climate change, Paper presented at Expert-Group Meeting on Population Dynamics and Climate Change, UNFPA and IIED In Collaboration with UN-HABITAT and the Population Division, UN/DESA 24 to 25 June 2009 • Holper, P. and Torok, S. (2008) *Climate Change: What You Can do about It at Work, at Home, at School*, Pan Macmillan,Sydney.

Activity	**Overview**
	Assignment : Prepare a lecture either of following themes 11. Urbanization: cons and pros 12. Urbanization and Carbon Cycle
Module 4	Water Resources and Climate Change
Key Concepts	Water resources management, Social learning processes
Overview	Water resources are important to both society and ecosystems. We depend on a reliable, clean supply of drinking water to sustain our health. We also need water for agriculture, energy production, navigation, recreation, and manufacturing. Many of these uses put pressure on water resources, stresses that are likely to be exacerbated by climate change. In many areas, climate change is likely to increasewater demand while shrinking water supplies. This shifting balance would challenge water managers to simultaneously meet the needs of growing communities, sensitive ecosystems, farmers, ranchers, energy producers, and manufacturers. In this module need to realize that in some areas, water shortages will be less of a problem than increases in runoff, flooding, or sea level rise. These effects can reduce the quality of water and can damage the infrastructure that we use to transport and deliver water.

Aim	The overriding aim of this module is realize the interrelationship between water resources management and climate change
Learning Outcomes	At the end of this module learners will be able to: • Compare and contrast the impacts of major climatic hazards on livelihoods of the community. • Comprehend the significance of the climate change problem locally and globally. • Explore solutions to problems that cause climate change.
Units	Unit 4.1: Water Resources and Climate Change Unit 4.2: Climate change Social learning processes

Activity	**Overview**
	• **Assignment**: plan a seminar on major climatic hazards on livelihoods of the community comparing the problems of water shortages and those of water increases
Module 5	**Water Management and Recycling**
Key Concepts	Water management and recycling processes, techniques
Overview	Water cycle is a delicate balance of precipitation, evaporation, and all of the steps in between. Warmer temperatures increase the rate of evaporation of water into the atmosphere, in effect increasing the atmosphere's capacity to "hold" water. Increased evaporation may dry out some areas and fall as excess precipitation on other areas. Changes in the amount of rain falling during storms provide evidence that the water cycle is already changing. Rising temperatures cause snow to begin melting earlier in the year. This alters the timing of stream flow in rivers that have their sources in mountainous areas. As temperatures rise, people and animals need more water to maintain their health and thrive. Many important economic activities, like producing energy at

	power plants, raising livestock, and growing food crops, also require water. The amount of water available for these activities may be reduced as Earth warms, and if competition for water resources increases.
Aim	The overriding aim of this module is to equip students with the capacity to debate on water management and recycling processes, techniques and feasibility>
Learning Outcomes	At the end of this module learners will be able to: • Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in. • Investigate the causes of climate change. • Propose solutions to climate change issues.
Units	Unit 5.1: Water management (concepts; national and international models) Unit 5.2: Water recycling techniques feasibility and consequences
Readings	• United Nations Development Programme (2007) *Fighting Climate Change: Human Solidarity in a Divided World: Human Development Report 2007-2008*, Palgrave Macmillan, Basingstoke, UK. • *Layperson's Guide to Water Recycling and Reuse*, published in 1992 by the Water Education Foundation, Sacramento, California. • Video, entitled *Water from Water: Recycling*, produced in 1995 by National Water Research Institute, Fountain Valley, California. • Research On Recycled Water is done by EPA through the Office of Research and Development. • Water Recycling and Reuse: The Environmental Benefits http://www.epa. gov/region9/water/recycling/
Activity	**Overview**

	Students are to plan and implement three-sessions workshop on the following themes: • Water management (concepts; national and international models) • Water recycling techniques feasibility and consequences

Course Description/Overview

The present course provides students with an overview of ideas and themes in development with a particular emphasis on what it means to understand it in terms of geography. It seeks to help students understand both the geographical causes and consequences of varying development. Studies compare More Economically Developed Countries (MEDCs) with Less Economically Developed Countries (LEDCs). Within development geography, sustainable development is also studied in an attempt to understand how to meet the needs of the present without compromising the needs of future generations to meet their own needs. In addition, it explores that 'thinking geographically' about development involves understanding how the meaning of places and regions are socially constructed, and how theoretical and conceptual frameworks about development have been debated. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on geography of development.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the thematic fields within the human geography of developing countries– at local, national and international scales; b) raise awareness of the role of the learners to reflect critically the major theories of development and underdevelopment; and c) use traditional and electronic resources as well as social networking technologies as tools to identify geographical causes and consequences of varying development.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

26. Critically assess the role of governments, international agencies, private actors and NGO's with regard to poverty and development.

27. Critically examine the central concepts underlying development theory and relate them to wider issues of how local societies conceive their long-term sustainability and well-being.
28. Identify how debates and concepts in the field of development geography are being translated in development policies and practice.
29. Discuss certain thematic fields within the human geography of developing countries.
30. Explain the major theories of development and underdevelopment.

Course Resources

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Description/Overview

The present course is intended to provide students with the key concepts about the geography and climate, the important elements of climate and how they are measured and recorded and handled statistically. It also illustrates the importance of the gaseous envelope of the planet and the threats it faces and how protect it. It familiarizes student elements of the climate and the factors affecting it and its geographical distribution and the skillful representation of the elements of the climate on the maps using the suitable symbols. Students are asked to read and summarize articles on elements of the climate. In short, the course provides an appropriate chance for the students to get the minimum knowledge of the climate processes and elements.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of geography of climate ; b) to raise awareness of the learners about elements of the climate and the factors affecting it; c) and help learners use traditional and electronic tools to identify the the elements of the climate on the maps using the suitable symbols.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the geographic distributions of climate processes such as temperature, precipitation, and weather.
2. Explain the processes that determine global climate patterns.
3. Interpret weather maps and data.
4. Analyze the causes and explain the implications of global warming.
5- Identify the elements of the climate and the factors affecting it.
7- Identify the elements of the climate on the maps using the suitable symbols.
8- Discuss the concepts of atmospheric disturbances, hurricanes, and how they occur and geographically spread.

Course Description/Overview

Though the political thought cared about the Human rights' issue since ever, this care has not reached the nowadays level but recently; only when the Human rights' issue has become an important issue on the international level during the last decade of the twentieth century. The Human rights' issue has been connected to what distinguish man as a man. This can start with ensuring the right of every child in life even before he is born. Then, his rights extend to his care all his life, as he has the right in security, assurance, education, accommodation, health besides his right in political participation and expressing his opinion.

This course is divided into five parts: the first is titled: The Essence of Human Rights. It deals with the concept of human rights, its importance, beginnings, and the human rights and the peoples' rights. The second part is titled: Judiciary and Human Rights. It tackles the role of judiciary in maintaining the human rights, and the types of human rights as well. The third part is: The Procedures of Human Rights. It deals with the procedures of Human Rights on the international, regional and national levels. The fourth is titled: Applications of Human Rights. This one discusses the applications in the fields of medicine, engineering, agriculture and science. The fifth is titled: The Islamic and International Declarations of Human Rights, a comparison between the Islamic and International Declarations of Human Rights.

Course Learning Objectives

The overarching goals of this course are:

15. Recognizing the concept of Human Rights and its importance
16. Defining the types of Human Rights
17. Recognizing the procedures of Human Rights, their beginnings and sources
18. Applying Human Rights' procedures in various fields
19. Discussing the restrictions on Human Rights

20. Learning about the historical development of Human Rights and Democracy
21. Determining the relation between Democracy and Human Rights

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

15. Recognize the Human Rights and their procedures
16. State the Civil, Political, Economic and Social Rights
17. Demonstrate the beginnings, sources and procedures of Human Rights
18. Explain some models of Human Rights' Applications on different levels
19. Analyze the Human Rights' procedures on the international, regional and national levels
20. Analyze the international charters of Human Rights
21. Differentiate between the Human Rights in both the Islamic and Western Civilizations

Course Resources

15. Fadl-ullah Muhammad Isma'eil: Human Rights between the Western Thought and the Islamic, Bustan Elma'refa, Alexandria, 2006.
16. Lotfy Mahmoud Abd El-Haleem: Human Rights Between the United Nations' Declarion and the Holy Qur'an, Dar Almisbah, Cairo, 1992.
17. Muhammad El-Ghazaly: Human Rights between the Islamic Instructions and the United Nations' Declaration, Dar Elkotob Elhaditha, Cairo, 1965.
18. Muhammad Abd El-Ma'boud Morsy and al.: Human Rights Suez Canal University, (University Requirement).
19. Muhammad Fathy Othman: Human Rights between the Islamic Law and the Western Legal Thought, Dar El-Shorouk, Beirut, 1982.

20. Muhammad No'man, Egypt and the Human Rights between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
21. Muhammad Salam Zanaty, Human Rights (Historical Introduction), 1992.

APENDIX II: The CLIMASP Course Modules Template Example

Course	
Module 1	
Key Concepts	The Essence of Human Rights
Overview	This module tackles the essence of Human Rights and its importance in establishing societies, the beginnings of Human Rights and the most important factors which paved the way for the Human Right Movement within the society.
Aim	The main objective is to identify the concept of Human Rights, its beginning, and the factors which affected it.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Clarify the Human Rights concept, and its importance. • Recognize the historical development of the concept. • Be exposed to the beginning and the sources of Human Rights
Units	• Human Rights: Concept and Importance • The Beginning and sources of Human Rights • Human Rights and Peoples' Rights

Readings	Muhammad Salam Zanaty, Human Rights (Historical Introducti 1992.
Activity	
	Writing an essay about the essence of Human Rights and its importance in establishing societies.
Module 2	
Key Concepts	Judiciary and Human Rights
Overview	This module deals with the role of justiciary in maintaining the Human Rights as every individual has the rights to have an effective legal tool in the national court specialized in the deeds violating the Human Rights given to individuals by judiciary or constitution. People are equal before judiciary, and therefore have equal protection without any discrimination by judiciary.

Aim	The main aim of this module is recognizing the role and importance of judiciary in maintaining Human Rights, and recognizing the rights given to humans.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Recognize the role of judiciary in maintaining Human Rights • Determine types of Human Rights • Discuss the restrictions on Human Rights
Units	5. The Role of judiciary in maintaining Human Rights 6. Human Rights' Types and Restrictions on them
Readings	Lotfy Mahmoud Abd El-Haleem: Human Rights Between the United Nations' Declarion and the Holy Qur'an, Dar Almisbah, Cairo, 1992
Activity	
	Preparing critical researches on some thoughts presented in the content
Module 3	
Key Concepts	Human Rights' Procedures
Overview	This module deals with the procedures necessary for applying the Human Rights within the society as these rights are integrated and no right overwhelms another. Besides, an individual's rights are not separated from the rights of the society. Therefore, procedures are imposed to apply the Human

	Rights.
Aim	The main goal of this module is recognizing the procedures necessary for applying the Human Rights whether on the international, regional or national levels.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Recognize the Procedures of Applying the Human Rights • Analyze the Human Rights' Procedures on the international, regional or national levels.
Units	7. Human Rights' Procedures on the international level. 8. Human Rights' Procedures on the regional level. 9. Human Rights' Procedures on the national level.
Readings	Muhammad No'man Galal, Egypt and the Human Rights between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
Activity	Using the Internet in holding a research on the Human Rights' Procedures on the International, Regional and National Levels
Module 4	
Key Concepts	Human Rights' Applications
Overview	This module focuses on how to apply the Human Rights in the field of medicine for maintaining the patient's rights on the physician, in medical treatment, and in sickness confidentiality.

	In the field of Engineering, the application is held by the syndicate commitment to the laborers' rights. In Agriculture, it is guaranteed by the protection of the new plant species, etc. In Science, Human Rights are applied via maintaining copyrights as well as other applications.
Aim	The main goal of this module is recognizing the most important Human Rights' Applications in different fields.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Identify the Human Rights' Applications in different fields. • Suggest procedures to apply the Human Rights' Applications in different fields.
Units	5. Human Rights' Applications in the fields of Medicine and Engineering 6. Human Rights' Applications in the fields of Agriculture and Science
Readings	Muhammad No'man Galal, Egypt and the Human Rights between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
Activity	
	Holding civil researches about how to apply Human Rights on different fields
Module 5	

Key Concepts	The Islamic and International Declarations of Human Rights
Overview	
Aim	To recognize human rights in both the Islamic and European Civilizations and to learn about the international charters of human rights
Learning Outcomes	By the end of this module, learners are expected to be able to: • Differentiate between human rights in both the Islamic and European Civilizations • Analyze the international charters of human rights
Units	7. The Islamic Declaration of Human Rights 8. The International Declaration of Human Rights 9. A comparison between the Islamic and International Declarations of Human Rights
Readings	Mohammad No'man Galal, Egypt and Human Rights between Truth and Slander (a documentary study), the Egyptian General Association for Books, Cairo, 1993.
Activity	
	Writing an essay that clarifies the most important principals in the Islamic and International Declarations of Human Rights

1		Human Rights, Concept and Importance
2		Beginnings and Sources of Human Rights
3		Human Rights and Peoples' Rights
4		The Role of judiciary in Maintaining Human Rights
5		Types of Human Rights and the Restrictions on them
6		Human Rights' Procedures on the International Level

7		Human Rights' Procedures on the Regional Level
8		Human Rights' Procedures on the National Level
9		Human Rights' Applications in the field of Engineering, Medicine, Agriculture and Science
10		The Islamic Declaration of Human Rights
11		The International Declaration of Human Rights
12		A Comparison Between The Islamic and International Declarations of Human Rights

APENDIX II: The CLIMASP Course Modules Template Example

Course	
Module 1	
Key Concepts	The Essence of Human Rights
Overview	This module tackles the essence of Human Rights and its importance in establishing societies, the beginnings of Human Rights and the most important factors which paved the way for the Human Right Movement within the society.
Aim	The main objective is to identify the concept of Human Rights, its beginning, and the factors which affected it.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Clarify the Human Rights concept, and its importance. • Recognize the historical development of the concept. • Be exposed to the beginning and the sources of Human Rights
Units	• Human Rights: Concept and Importance

	• The Beginning and sources of Human Rights • Human Rights and Peoples' Rights
Readings	Muhammad Salam Zanaty, Human Rights (Historical Introducti 1992.
Activity	
	Writing an essay about the essence of Human Rights and its importance in establishing societies.
Module 2	
Key Concepts	Judiciary and Human Rights
Overview	This module deals with the role of justiciary in maintaining the Human Rights as every individual has the rights to have an effective legal tool in the national court specialized in the deeds violating the Human Rights given to individuals by judiciary or constitution.

	People are equal before judiciary, and therefore have equal protection without any discrimination by judiciary.
Aim	The main aim of this module is recognizing the role and importance of judiciary in maintaining Human Rights, and recognizing the rights given to humans.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Recognize the role of judiciary in maintaining Human Rights • Determine types of Human Rights • Discuss the restrictions on Human Rights
Units	7. The Role of judiciary in maintaining Human Rights 8. Human Rights' Types and Restrictions on them
Readings	Lotfy Mahmoud Abd El-Haleem: Human Rights Between the United Nations' Declarion and the Holy Qur'an, Dar Almisbah, Cairo, 1992
Activity	
	Preparing critical researches on some thoughts presented in the content
Module 3	
Key Concepts	Human Rights' Procedures
Overview	This module deals with the procedures necessary for applying the Human Rights within the society as these rights are

	integrated and no right overwhelms another. Besides, an individual's rights are not separated from the rights of the society. Therefore, procedures are imposed to apply the Human Rights.
Aim	The main goal of this module is recognizing the procedures necessary for applying the Human Rights whether on the international, regional or national levels.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Recognize the Procedures of Applying the Human Rights • Analyze the Human Rights' Procedures on the international, regional or national levels.
Units	10. Human Rights' Procedures on the international level. 11. Human Rights' Procedures on the regional level. 12. Human Rights' Procedures on the national level.
Readings	Muhammad No'man Galal, Egypt and the Human Rights between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
Activity	Using the Internet in holding a research on the Human Rights' Procedures on the International, Regional and National Levels
Module 4	
Key	Human Rights' Applications

Concepts	
Overview	This module focuses on how to apply the Human Rights in the field of medicine for maintaining the patient's rights on the physician, in medical treatment, and in sickness confidentiality. In the field of Engineering, the application is held by the syndicate commitment to the laborers' rights. In Agriculture, it is guaranteed by the protection of the new plant species, etc. In Science, Human Rights are applied via maintaining copyrights as well as other applications.
Aim	The main goal of this module is recognizing the most important Human Rights' Applications in different fields.
Learning Outcomes	By the end of this module, learners are expected to be able to: • Identify the Human Rights' Applications in different fields. • Suggest procedures to apply the Human Rights' Applications in different fields.
Units	7. Human Rights' Applications in the fields of Medicine and Engineering 8. Human Rights' Applications in the fields of Agriculture and Science
Readings	Muhammad No'man Galal, Egypt and the Human Rights between Truth and Slander (A Documentary Study), The General Egyptian Book Association , Cairo, 1993
Activity	

	Holding civil researches about how to apply Human Rights on different fields
Module 5	
Key Concepts	The Islamic and International Declarations of Human Rights
Overview	
Aim	To recognize human rights in both the Islamic and European Civilizations and to learn about the international charters of human rights
Learning Outcomes	By the end of this module, learners are expected to be able to: • Differentiate between human rights in both the Islamic and European Civilizations • Analyze the international charters of human rights
Units	10. The Islamic Declaration of Human Rights 11. The International Declaration of Human Rights 12. A comparison between the Islamic and International Declarations of Human Rights
Readings	Mohammad No'man Galal, Egypt and Human Rights between Truth and Slander (a documentary study), the Egyptian General Association for Books, Cairo, 1993.
Activity	
	Writing an essay that clarifies the most important principals in the

	Islamic and International Declarations of Human Rights

Course Description/Overview

The present course is intended to provide students with the key concepts about physical and chemical properties of water, hydrogeochemical processes, influence of aquifer materials on groundwater quality, representations of results of chemical analyses, groundwater origin and genesis, water quality modelling, sources of groundwater pollution, municipal, agricultural, mining, industrial sources, water treatment, the distribution of biota, nutrients and contaminants in the aquatic environment. Topics will include the hydrologic cycle, the carbonate system and pH control, weathering and water chemistry, redox equilibria, and hydrologic transport.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of hydrogeochemical processes and influence of aquifer materials on groundwater quality; b) to raise awareness of the learners about the need for new sources of water needed for irrigation and drink; c) and help learners to acquire water quality modeling: and d) give the basic understanding of hydrologic cycle, carbonate system, weathering and hydrologic transport

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the physical and chemical properties of water.
2. Explain the groundwater origin and genesis, water quality modelling, sources of groundwater pollution,.
3- Discuss weathering and water chemistry.
4- Identify the elements of the climate on the maps using the suitable symbols.
5- Explore the influence of aquifer materials on groundwater quality.

Course Resources

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Water quality modeling.
3		Groundwater origin and genesis
4		Sources of groundwater pollution.
5		*Components and Characteristics* of the Earth's *Atmosphere*
6		Weathering and water chemistry.

Legislation and the laws of Environmental Management

Course Description/Overview

The present course is intended to provide students with practical and detailed examination of the enactment, enforcement and limitations of environmental law and policy. The course will 'provide a comprehensive overview of environmental law. It critically explores modes of decision-making in contemporary institutions with special emphasis on methods of evaluation in environmental management. Decision analysis, risk assessment and other techniques of 'scientific' decision/evaluation are studied using both theoretical and case-study approaches. The course focuses on perspectives, actors, institutions, and economic relationships as they relate to global environmental policy.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of environmental law; b) to raise awareness of the learners about the need for new methods of evaluation in environmental management; and c) provide students with a solid understanding of linkages between the global political system and the natural environment

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the issues arising from the impact of industrial and development policies on the natural environment.
2. Explain the limitations of environmental law.
3- Discuss perspectives, actors, institutions, and economic relationships as they relate to global environmental policy.
4- Identify the methods of evaluation in environmental management..
5- Explore the linkages between the global political system and the natural environment.

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Physician have the potential to be decision maker and practice in the service of educating patients to be active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the environmental challenges resulting from climate change. It does so through tackling the following logically sequence issues: 1) Environmental awareness; 2)Environmental ethics; 3) Biodiversity and climate change; 4) Climate change adaptation; 5) Urbanization's role in climate change; 6) Water resources and climate change Social learning processes; and 7) natural sources of pollution and man madepollutions 8) air pollution, noise pollution and human activity 9) effect of pollution on health Issues are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is, they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of water resources at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the negative environmental consequences of climate changes – at local, national and international scales -in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for the management of critical environmental issues; and c) use traditional and electronic resources as well as social networking technologies as tools tohelp the community, including children, identify risks and develop climate change adaptation strategies. d) to raise the awareness of the learner about the need to examine physical, chemical, biological, political and economic dimension of environment

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

- Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community.
- Discuss the basic terminology and core concepts of environment
- Identify the physical chemical biological political and economic dimension of environment
- Conduct survey of environmental system , human interaction
- Analyse methods of ensuring local participation in climate change adaptation.
- Analyze the effects of climate change from both male and female perspectives
- Compare and contrast the impacts of major climatic hazards on human beings and the community.
- Comprehend the significance of the climate change problem locally and globally.
- Describe the relationship between human activities and climate change.
- Describe the relationship between poverty and unsafe environment
- Demonstrate an understanding of the different types of pollutions and its impact on human health
- Explore solutions and mitigation process to problems that cause climate change.
- Identify ways to reduce the impact of climate changes
- Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in.
- Investigate the causes of climate change and pollution
- Propose solutions to climate change issues.
- Understand how human actions are contributing to global environmental change. Course Resources

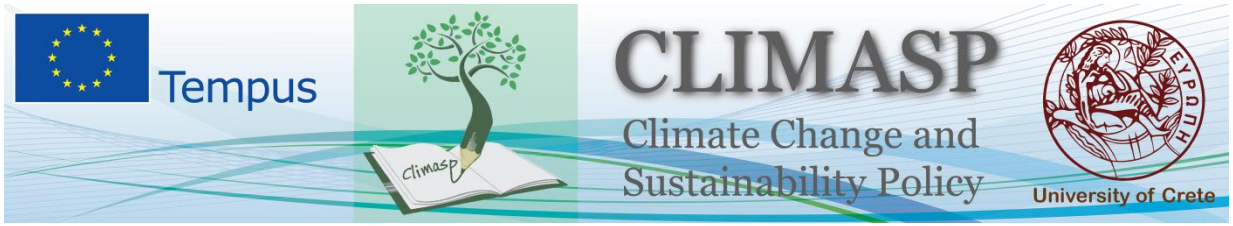
Course Modules



Course	Man and Environment
Module 1	Environment: Ethics and Awareness
Key Concepts	Environmental awareness, Environmental ethics
Overview	Environmental awareness is to understand the fragility of our environment and the importance of its protection. Promoting environmental awareness is an easy way to become an environmental steward and participate in creating a brighter future for our children.To define environmental awareness we must first understand the environmentalist movement. Environmentalism is an ideology that evokes the necessity and responsibility of humans to respect, protect, and preserve the natural world from its anthropogenic (caused by humans) afflictions. Environmental awareness is an integral part of the movement's success. By teaching our students, friends and family that the physical environment is fragile and indispensable. Students need to start fixing the problems that threaten it. Environmental ethics, on the other hand, is the part of environmental philosophy which considers extending the traditional boundaries of ethics from solely including humans to including the non-human world. It exerts influence on a large range of disciplines including environmental law, environmental sociology, ecotheology, ecological economics, ecology and geography. There are many ethical decisions that human beings make with respect to the

	environment. Throughout this module, students are invited to share and exchange ideas about issues related to :clear cut forests for the sake of human consumption, propagation of species, gasoline powered vehicles, etc.
Aim	The overriding aim of this module is to turn students able to discourse how human actions are contributing to global environmental change.
Learning Outcomes	At the end of this module learners will be able to: • Collect, interpret and present information about strategies to confront climate change to a variety of audiences, including other students, parents and the local community. • understand how human actions are contributing to global environmental change.
Units	Unit 1.1:Environmental awareness Unit 1.2: Environmental ethics
Readings	• Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986** • **Paul Pojman**Environmental Ethics: Readings in Theory and ApplicationPaperback – January 1, 2007 • Oxford Dictionary of Philosophy: environmental ethics, **http://www.answers**.com/topic/environmental-ethics
Activity	**Overview** Assignment 1.1: Reflecting Upon the following issues: • clear cut forests for the sake of human consumption. • propagating our species, and life itself. • make gasoline powered vehicles. • environmental obligations needed to keep for future generations. • the extinction of a species for the convenience of humanity. • Methods for best use and conserve of the space environment to secure and

	expand life.
Module 2	Biodiversity and Climate Change
Key Concepts	Biodiversity, Climate, Climate Change
Overview	In the atmosphere, gases such as water vapour, carbon dioxide, ozone, and methane act like the glass roof of a greenhouse by trapping heat and warming the planet. These gases are called greenhouse gases. The natural levels of these gases are being supplemented by emissions resulting from human activities, such as the burning of fossil fuels, farming activities and land-use changes. As a result, the Earth's surface and lower atmosphere are warming, and this rise in temperature is accompanied by many other changes. Rising levels of greenhouse gases are already changing the climate. These changes are affecting the entire world, from low-lying islands in the tropics to the vast polar regions. Also, Climate change affects biodiversity. It becomes one of the most significant drivers of biodiversity loss by the end of the century. It is already forcing biodiversity to adapt either through shifting habitat, changing life cycles, or the development of new physical traits. In this module, students need to realize that, conserving natural terrestrial, freshwater and marine ecosystems and restoring degraded ecosystems (including their genetic and species diversity) is essential for human well-being. Biodiversity can support efforts to reduce the negative effects of climate change. Conserved or restored habitats can remove carbon dioxide from the atmosphere, thus helping to address climate change by storing carbon (for example,reducing emissions from deforestation and forest degradation). Moreover, conserving in-tact ecosystems, such as mangroves, for example, can help reduce the disastrous impacts of climate change such as flooding and storm surges.
Aim	The overriding aim of this module is to realize the interrelationship between biodiversity and climate change

Learning Outcomes	Students will be able to: • Analyse methods of ensuring local participation in climate change adaptation. • Analyze the effects of climate change from both male and female perspectives
Units	Unit 2.1: Biodiversity, Climate, Unit 2.2: Climate Change Unit 2.3: Climate Change Adaptation
Readings	Shah, Anup. "Biodiversity." *Global Issues*. 19 Jan. 2014. Web. 10 Sep. 2014. <http://www.globalissues.org/issue/169/biodiversity>. • Doucet, C. (2008) *The Gough Guide to Climate Change: The Symptoms, The Science, The Solutions*, Rough Guides, London.
Activity	**Overview**
	Work in group to: - Collect information on biodiversity in your local environment. - Collect evidence on the effects of climate changeon biodiversity in your local environment during the last fifty years.

	- Propose a strategy to protect biodiversity in your local environment.
Module 3	**Urbanization and Climate Change**
KeyConcepts	Urbanization
Overview	This Module deals with the implications of population growth and urbanization for climate change in terms of the contribution of urban populations (and centres) to human induced climate change. It emphasizes how it is not the growth in (urban or rural) population but the growth in consumption that drives the growth in greenhouse gas emissions and that a significant proportion of the world's urban (and rural) population have consumption levels that are so low that they contribute little or nothing to such emissions. In this module students discuss how in the much-needed planning for global emissions reduction, provisions must be made to allow low-income low-consumption households with greenhouse gas emissions below the 'fair-share' level to increase their consumption.
Aim	This module aims at examining the relationship between urbanization and climate change.
Learning Outcomes	At the end of this module learners will be able to: • Describe the relationship between human activities and climate change. • Demonstrate an understanding of the natural carbon cycle.
Units	Unit 3.1: Urbanization *Unit 3.2: Urbanization a Mixed Blessing* Unit 3.3: Urbanization and Climate Change
Readings	• David Satterthwaite The implications of population growth and urbanization for climate change, Paper presented at Expert-Group Meeting on Population Dynamics and Climate Change, UNFPA and IIED In Collaboration with UN-HABITAT and the Population Division, UN/DESA 24 to 25 June 2009

Activity	**Overview**
	Assignment : Prepare a lecture either of following themes 13. Urbanization: cons and pros 14. Urbanization and Carbon Cycle
Module 4	Water Resources and Climate Change
Key Concepts	Water resources management, Social learning processes
Overview	Water resources are important to both society and ecosystems. We depend on a reliable, clean supply of drinking water to sustain our health. We also need water for agriculture, energy production, navigation, recreation, and manufacturing. Many of these uses put pressure on water resources, stresses that are likely to be exacerbated by climate change. In many areas, climate change is likely to increasewater demand while shrinking water supplies. This shifting balance would challenge water managers to simultaneously meet the needs of growing communities, sensitive ecosystems, farmers, ranchers, energy producers, and manufacturers. In this module need to realize that in some areas, water shortages will be less of

	a problem than increases in runoff, flooding, or sea level rise. These effects can reduce the quality of water and can damage the infrastructure that we use to transport and deliver water.
Aim	The overriding aim of this module is realize the interrelationship between water resources management and climate change
Learning Outcomes	At the end of this module learners will be able to: • Compare and contrast the impacts of major climatic hazards on livelihoods of the community. • Comprehend the significance of the climate change problem locally and globally. • Explore solutions to problems that cause climate change.
Units	Unit 4.1: Water Resources and Climate Change Unit 4.2: Climate change Social learning processes
Readings	• CCSP (2008). *The Effects of Climate Change on Agriculture, Land Resources, Water Resources, and Biodiversity in the United States* . Keller, M.A. Palmer, C.H. Peterson, and J.M. Scott (authors). U.S. Environmental Protection Agency, Washington, DC, USA.
Activity	**Overview**
	• **Assignment**:plan a seminar on major climatic hazards on livelihoods of the community comparingthe problems of water shortages and those of water increases
Module 5	**Water Management and Recycling**
Key Concepts	Water management and recyclingprocesses, techniques
Overview	Water cycle is a delicate balance of precipitation, evaporation, and all of the steps in between. Warmer temperatures increase the rate of evaporation of water into the atmosphere, in effect increasing the atmosphere's capacity to "hold" water.Increased evaporation may dry out some areas and fall as excess precipitation on other areas.Changes in the amount of rain falling during storms provide evidence that the water cycle is already changing. Rising temperatures cause snow to begin melting earlier in the year. This alters the timing of

	streamflow in rivers that have their sources in mountainous areas. As temperatures rise, people and animals need more water to maintain their health and thrive. Many important economic activities, like producing energy at power plants, raising livestock, and growing food crops, also require water. The amount of water available for these activities may be reduced as Earth warms, and if competition for water resources increases.
Aim	The overriding aim of this module is to equip students with the capacity to debate on water management and recycling processes, techniques and feasibility>
Learning Outcomes	At the end of this module learners will be able to: • Interpret information about impacts and vulnerabilities specific to the locality, region or sector students are expected to work in. • Investigate the causes of climate change. • Propose solutions to climate change issues.
Units	Unit 5.1: Water management (concepts; national and international models) Unit 5.2: Water recycling techniques feasibility and consequences
Readings	• United Nations Development Programme (2007) *Fighting Climate Change: Human Solidarity in a Divided World: Human Development Report 2007-2008*, Palgrave Macmillan, Basingstoke, UK. • *Layperson's Guide to Water Recycling and Reuse*, published in 1992 by the Water Education Foundation, Sacramento, California. • Video, entitled *Water from Water: Recycling*, produced in 1995 by National Water Research Institute, Fountain Valley, California. • Research On Recycled Water is done by EPA through the Office of Research and Development. • Water Recycling and Reuse: The Environmental Benefits http://www.epa.gov/region9/water/recycling/

Activity	Overview
	Students are to plan and implement three-sessions workshop on the following themes: • Water management (concepts; national and international models) • Water recycling techniques feasibility and consequences

Course Description/Overview

The present course is intended to provide students with the key concepts about the remote sensing, collection of data, sensing devices, evaluation of the collected data, applications of remote sensing techniques in geological purposes, image data processing, image rectification processing, image display and enhancement processing, edge enhancement processing, digital mosaics processing, contrast stretching processing, color composition, principle component analysis (PCA), decorrelation stretch , aerial photography, (elements, airphoto interpretation (instrumentation and procedures), principles of landform identification and evaluation, applications of aerial photographs in geology), earth resources satellites, multispectral scanners, digital image processing, applications of remote sensing and geographic information systems in geology.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of applications of remote sensing techniques in geological purposes; b) to train learners in geographic information systems and remote sensing as applied to geological exploration c) and help learners to

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the types of remote sensing.
2. Explain the principles and process of remote sensing.
3- Discuss the different remote sensing systems.
4- Differentiate between the active and passive sensors.
5- Explore the remote sensing platforms.

Course Resources

Course Website(s)

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Concept of remote sensing.
3		Sensor on the ground, in the air and in the space
4		Elements of climate.
5		Types of remote sensing
6		Applications of remote sensing techniques in geological purposes.

Renewable Energy

KNOWLEDGE (Concepts, theories, processes)	**SKILLS (Tools, methodologies, dynamics)**	**ATTRIBUTES (Innate abilities)**	**CLIMASP CORE COMPETENCES**

538. Environmental awareness 539. Renewable energy technologies 540. Energy efficiency behaviour 541. Technology and innovation 542. Climate change policy 543. Climate change adaptation 544. Course Description/Overview

The present course is intended to raise the students' awareness of renewable energy resources. It introduces them to the benefits of using clean energy resources. It does so through tackling the following aspects: 1) traditional and renewable energy resources; 2) impact of energy consumption on environment; 3); clean energy resources and climate change; 4) availability of solar and wind energy in Egypt; and 5) energy and future global climate change. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on renewable energy resources. They are invited to discuss impacts of energy resources on environment at local, national and international scales. In short, the course provides an appropriate chance for the students to get the minimum knowledge of the advantages and disadvantages of renewable energy resources.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of the renewable energy resources; b) to raise the learners' awareness of the need to explore renewable energy resources in order to achieve the goals of community development; c) help learners use traditional and electronic tools to identify the risks of the petroleum and natural gas limitations in Egypt; and d) to highlight the importance of renewable energy resources as clean and safe resources to the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

128. Explain the impacts of traditional energy resources on environment.
129. Compare and contrast the advantages and disadvantages of renewable energy resources with the advantages and disadvantages of traditional energy resources.
130. Identify the basic principles of renewable energy technologies.
131. Question the relation between sustainable development and the use of renewable energy resources.
132. Discuss the different types of renewable energy resources.

133. Anticipate possible future environmental change and identify possible development consequences.
134. Appreciate the positive impacts of utilizing renewable energy resources on the environment.
135. Explain the relationship between poverty, environment, climate change, and the insufficient supply of energy.
136. Use the different tools and equipments of renewable energy resources .

Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Teachers have the potential to be what Giroux and McLaren described as transformative intellectuals who combine scholarly reflection and practice in the service of educating students to be thoughtful, active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the challenges resulting from climate change. . It does so through tackling the following logically sequenced six issues: 1) Weather and climate; 2) Climate change and livelihoods; 3) Gender-sensitive response to climate change; 4) Climate change communication; 5) Fairness and climate change justice; and 6) Future climate change scenarios. Issues 3-6 are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of climate changes at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the consequences of climate changes – at local, national and international scales - in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for a sustainable future for all; and c) use traditional and electronic resources as well as social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

111. Become familiar with the basic terminology and core concepts of climate change adaptation planning.
112. Identify the most likely impacts of local climatic hazards.
113. Articulating what good climate resilient development actually look like.
114. Compare local problems with problems elsewhere and to gain adaptation ideas from this comparison.

115. Comprehend the opportunities for planners and the social, economic and ecological risks of climate change.
116. Understand historical community reactions to and coping strategies for climatic hazards.
117. Contribute to the debate on global environmental change and societal adaptation strategies; to become an informed citizen and decision maker.
118. Demonstrate capacities for self-reflection and self-evaluation as integral aspects of the adaptive learning cycle.
119. Questioning business as usual can threaten our ideals, values, beliefs, business strategies and technical understanding and is not necessarily what everyone wants to hear.
120. Draw on active teaching and learning approaches to empower learner, young people and civic engagement.
121. Anticipate possible future environmental change and identify possible development consequences.
122. Appreciate the importance and practical characteristics of adaptive approaches.
123. Demonstrate knowledge and understanding of relationship between poverty, environment, climate change, economics and social issues.
124. Relate climate change and sustainability policy to a range of curricular areas in formal, non formal and informal education.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave

early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

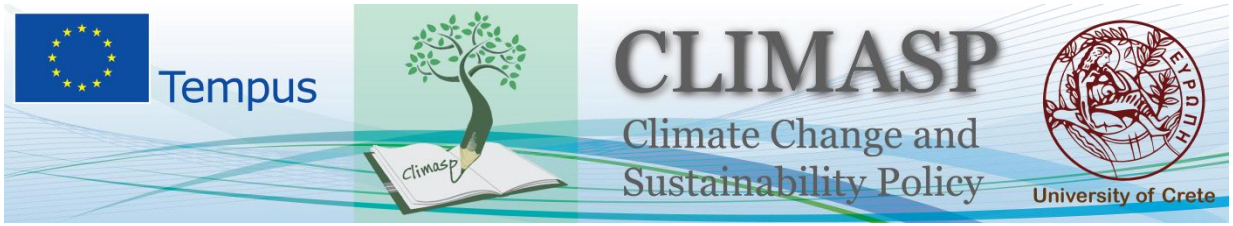
Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Environmental awareness
3		Weather and climate
4		Climate change and livelihoods
5		Climate change and livelihoods (man, plant, animals)
6		Gender-sensitive response to climate change
7		Male/Female: awareness of climate change consequences
8		Male/Female: roles to alleviate climate change consequences
9		Climate change communication (Concepts)

10		Climate change communication (tools: design)
11		Climate change communication (tools: implementation/analysis)
12		Fairness and climate change justice
13-15		Future climate change scenarios

Course Modules



Course	Scientifc Culture
Module 1	**Climate Change : Environmental Impacts**
Key Concepts	Climate Change, Environment
Overview	The term environment may be vague for many students, Some of them my be concerned with the physical environment around them. They might ignore my cultural components of environment which are responsible for shaping mans attitudes, and in turn, influence our behaviour. Such behaviour might aggregate or alleviate the environmental challenges. Mans behaviour may be affected by climate change. So, his reaction toward the environment is almost disastrous!! Issues addressed in this module include: definition of environment, components of environment: physical and cultural; basic differences between weather and climate; and impacts of local climatic hazards.
Aim	The aim of this module is to turn students able to discourse on basic concepts related to environment and the impact of climate change.
Learning Outcomes	At the end of this module learners will be able to: 7. Become familiar with the basic terminology and core concepts of climate change adaptation planning. 8. Identify the most likely impacts of local climatic hazards. 9. Articulating what good climate resilient development actually look like.
Units	Unit 1.1: Environment: Physical and Cultural

	Unit 1.2: Man VS Environment Unit 1.3: Weather and Climate
Readings	• Climate Change: Key Concepts. **http://www.careclimatechange.org/tk/cba/en/cba_**basics/key_concepts.html • The Intergovernmental Panel on Climate Change (IPCC) is a body set up to provide scientific, technical and socio-economic information in a policy-relevant but policy neutral way to decision makers. • IPCC, 2007. *Climate Change 2007: Impacts, Adaptation and Vulnerability. Contribution of Working Group II to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, Annex I.*, M.L. Parry, O.F. Canziani, J.P. Palutikof, P.J. van der Linden and C.E. Hanson, Eds., Cambridge University Press, Cambridge, UK, 976pp. • Intergovernmental Panel on Climate Change (IPCC) Working Group 2, 2001. *Third Assessment Report, Annex B: Glossary of Terms.* • NASA - What's the Difference Between Weather and Climate? http://www.nasa.gov/mission_ pages/noaan/climate/climate_weather.html#.VAv8Mfl_vdM February 1, 2005 • Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986**

Activity	**Overview** Assignment 1.1: Reflecting Upon environmental issues 1. To what extent is responsible for environmental problems? (3-4 paragraphs) 2. What can we do to alleviate environmental problems? 3. draw a table of comparison to show the main differences between climate and weather. Assignment 1.2: Investigate local environmental problems to: - Make a list of most serious environmental problems - Interview a sample of citizens to identify their awareness of such problems. Access and explore the following report to identify and summarize its main ideas with regard the management of the environmental impacts of Climate Change: World Bank 2009. Convenient Solutions to an Inconvenient Truth: Ecosystem-based Approaches to Climate Change. Environment Department, World Bank.
Module 2	Climate Change and Livelihoods: Problems and Solutions
Key Concepts	Climate change , livelihoods (man, plant, animals)

Overview	The world is highly susceptible to a number of natural hazards droughts including, floods and hurricanes. Increasing in frequency and ferocity as a result of changing climate systems, these disasters are placing increased stress on inhabitants and severely impairing economic growth as they batter climate vulnerable sectors like tourism and agriculture upon which the region is financially reliant.In order to avoid risks and damage and to strengthen human resilience to natural disasters, governments need to be prepared. However, in developing countries, the ability of governments to help is often very limited. The impacts of loss and damage associated with natural disasters can set back development by increasing the incidence and severity of poverty. Poverty and vulnerability are fundamentally intertwined: the poor have fewer resources to cope with climate risk and thus their resource base is further diminished with every extreme weather event, deepening their poverty. This module is intended to raise the students awareness towards local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas for the management of such problems.
Aim	The overriding aim of this module is to identify local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas from this comparison.
Learning Outcomes	At the end of this module learners will be able to compare local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas from this comparison.
Units	Unit 2.1: Climate change and livelihoods Unit 2.2: Climate change and livelihoods (man, plant, animals)
Readings	• Task Force on Climate Change, Vulnerable Communities and Adaptation (IUCN, SEI and IISD), 2003. Livelihoods and Climate Change. Combining Disaster Risk Reduction, Natural Resource Management and Climate Change adaptation in a new approach to the reduction of vulnerability and poverty. International Institute for Sustainable Development, Canada.

	• Scoones, Ian (2005): The Sustainable Rural Livelihoods: A Framework for Analysis. Institute for Development Studies, University of Sussex. England. **http://www.sarpn.org.za/www.careclimatechange.org/files/adaptation/d0001493/P1833-Sustainable-rural-livelihoods_IDS-paper72.pdf**. • *Livelihoods and Climate Change **http://www.iisd.org/ecp/es/resilience/** climate.asp* • Livelihoods and Climate Change Project Snapshot (PDF - 438 kb), http://www.iisd.org/ecp/es/resilience/climate.asp • Livelihoods and Climate Change: Combining disaster risk reduction, natural resource management and climate change adaptation in a new approach to the reduction of vulnerability and poverty (PDF - 1.6 mb), http://www.iisd.org/ecp/es/resilience/climate.asp
Activity	**Overview**
	Design poster showing local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas for the management of such problems.
Module 3	**Gender-Sensitive Response to Climate Change**
Key Concepts	Gender-Sensitive
Overview	A gender-sensitive response does not mean having a set of disaggregated data showing that climate change has differential impacts on women and men. In fact, it is obvious. So more than that, it requires an understanding of the nature of existing inequalities between women and men, their consequences, and then coming up with strategies to nullify them. However, due to their social status men may have greater access to vital information on climate change mitigation or adaptation strategies, or women are too busy with caring and other domestic responsibilities so they lack this information. Therefore, lack of information and lack of opportunity to voice their concerns about adaptation and mitigation strategies could jeopardize their safety when climate change events strike.

	To counter this situation, strategies need to be planned so that women receive as much information on climatic events and conditions as men do. Women are also more likely than men to be absent from decision-making, right from home, to community, to national, to international levels for two reasons. One, their opinion is not given importance and two, they don't have time or confidence or opportunity to share. Therefore, whatever the reasons are they are simply marginalized; and the same is true for elderly and children. The net result is that they remain more vulnerable than men. Thus, if effective adaptation strategies have to be chalked out for them they must be drawn out to participate in the climate change discussions which in turn, means challenging the traditional assumptions about their capabilities and redefining their gender equation. For centuries, women have passed on their skills in water management, forest management and the management of biodiversity, among others. Through these experiences, women have acquired valuable knowledge that will allow them to contribute positively to the identification of appropriate adaptation and mitigation techniques, if only they are given the opportunity. The present module is concerned with: Male/Female awareness of climate change consequences; as well as their role in the management of climate change consequences.
Aim	This module encourages the students to the debate on global environmental change and societal adaptation
Learning Outcomes	At the end of this module learners will be able to: • Contribute to the debate on global environmental change and societal adaptation strategies; to become an informed citizen and decision maker. • Demonstrate capacities for self-reflection and self-evaluation as integral aspects of the adaptive learning cycle.
Units	Unit 3.1: Gender-sensitive response to climate change

	Unit 3.2: Male/Female: awareness of climate change consequences Unit 3.3: Male/Female: how to alleviate climate change consequences
Readings	• Gender and Climate Change Adaptation: Tools for Community-level Action in Nigeria, http://africanclimate.net/en/node/8979 • Intergovernmental Panel on Climate Change (IPCC) Working Group 2, 2001. *Third Assessment Report, Annex B: Glossary of Terms.* • IPCC, 2007: *Climate Change 2007: Impacts, Adaptation and Vulnerability. Contribution of Working Group II to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, Annex I.*, M.L. Parry, O.F. Canziani, J.P. Palutikof, P.J. van der Linden and C.E. Hanson, Eds., Cambridge University Press, Cambridge, UK, 976pp.
Activity	**Overview**
	Assignment 1: Propose a strategy to: 5- Raise the awareness of both Male and Female citizen towards the climate change consequences in your local environment 6- how to involve both Male and Female citizen in the management of climate change consequences in your local environment
Module 4	**Climate Change Communication**
Key Concepts	social, economic and ecological risks of climate change; civic engagement

Overview	The rapid development of multimedia and hypermedia technologies has provided new avenues for merging images, sound, movies and animation together with texts. These can serve as effective tools for communicating information and data related to climate change concepts, causes and consequences. Climate change is the result of human actions and choices. Limiting climate change – and protecting people and ecosystems to the degree possible from unavoidable changes in the climate – will require significant public engagement in the issue so that difficult decisions can be made by members of the public and policy makers. So, the need emerges for unbiased social science research that will facilitate such public engagement. In other words, students should be trained on how to use social science research methods – experiments, surveys, in-depth interviews and other methods – to find ways of effectively engaging the public and policy makers in the problem, and in considering and enacting solutions. Social science research has played important roles in many social change campaigns over the past several decades, including reducing smoking and littering, and increasing seat belt use and recycling. So, they can conduct unbiased public engagement research - and help government agencies, non-profit organizations, and companies apply the results of this research - so that collectively, we can stabilize our planet's life sustaining climate.
Aim	The overriding aim of this module is encourage the students explore and use appropriate tools to communicate social, economic and ecological risks of climate change.
Learning Outcomes	At the end of this module learners will be able to: - Comprehend the opportunities for planners and the social, economic and ecological risks of climate change. - Understand historical community reactions to and coping strategies for climatic hazards. - Questioning business as usual can threaten our ideals, values, beliefs,

	business strategies and technical understanding and is not necessarily what everyone wants to hear. - Draw on active teaching and learning approaches to empower learner, young people and civic engagement.
Units	Unit 3.1: Climate Change Communication (Concepts) Unit 3.2: Climate Change Communication (tools: design) Unit 3.3: Climate Change Communication (tools: implementation/analysis)
Readings	• Adapted from: UNISDR, 2009. Terminology: Basic terms of disaster risk reduction and IISD et al, 2007. Community-based Risk Screening – Adaptation and Livelihoods (CRiSTAL) User's Manual, Version 3.0. • UNISDR, 2009. Terminology: Basic terms of disaster risk reduction. Department for International Development, UK (DFID). 2001. *Sustainable Livelihoods Guidance Sheet*. Available at **http://www.nssd.net/pdf/sectiont.pdf**.
Activity	**Overview**
	Assignment: Students are invited to work in groups to: - Design appropriate tools to communicate social, economic and ecological risks of climate change. - Write a report on the obtained results of communicating social, economic and ecological risks of climate change. - Orally present the outcomes of the above report
Module 5	Climate Change: Justice and Future Scenarios
Key Concepts	climate change fairness, justice; future scenarios.
Overview	This module is about climate change scenarios. Socioeconomic scenarios are used by analysts to make projections of future greenhouse gas (GHG) emissions and to assess future vulnerability to climate change. Producing scenarios requires estimates of future population levels, economic activity, the structure of governance, social values, and patterns of

	technological change. Economic and energy modelling (such as via the World3 or the POLES models) can be used to analyse and quantify the effects. These scenarios can be thought of as stories of possible futures. They allow the description of factors that are difficult to quantify, such as governance, social structures, and institutions. However, researcher claim a considerable variety among scenarios, ranging from variants of sustainable development, to the collapse of social, economic, and environmental systems.
Aim	The overriding aim of this module is to equip students with the capacity to actualise issues such as fairness and climate change justice; future climate change scenarios.
Learning Outcomes	At the end of this module learners will be able to contribute to group discussion with regard: • possible future environmental change and identify possible development consequences. • the importance and practical characteristics of adaptive approaches. • The relationship between poverty, environment, climate change, economics and social issues. • climate change and sustainability policy and a range of curricular areas in formal, non formal and informal education.
Units	Unit 5.1: Fairness and climate change justice Unit 5.2: Future climate change scenarios
Readings	• Steve Vanderheiden Climate Change, Fairness, and Equity in *Atmospheric Justice* Published in print June 2008|ISBN: 9780195334609 Published online May 2008 | e-ISBN: 9780199868759 | DOI: http://dx.doi .org/10.1093/acprof:oso/9780195334609.003.0002 http://oxfordindex.oup.com/ view/10.1093/ acprof:oso/9780195334609. 003.0002 • Carter, T.R. *et al*. Course Description/Overview

Education can be the catalyst for empowering students to become critical, reflective and active citizens. Teachers have the potential to be what Giroux and McLaren described as transformative intellectuals who combine scholarly reflection and practice in the service of educating students to be thoughtful, active citizens. The present course is intended to raise the students' environmental awareness. It introduces them to the challenges resulting from climate change. . It does so through tackling the following logically sequenced six issues: 1) Weather and climate; 2) Climate change and livelihoods; 3) Gender-sensitive response to climate change; 4) Climate change communication; 5) Fairness and climate change justice; and 6) Future climate change scenarios. Issues 3-6 are, however, deeply covered through active participation of the students. Students are encouraged to collect, analyse, report and discuss information and data both outside and inside the classroom. That is they are asked to read and summarize articles on climate changes. They are invited to discuss scenarios for the management of climate changes at local, national and international scales. In short, the course provides an appropriate chance for the students practice their role as future citizens.

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to the consequences of climate changes – at local, national and international scales - in the context of education for sustainability; b) raise awareness of the role of the learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for a sustainable future for all; and c) use traditional and electronic resources as well as social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

125. Become familiar with the basic terminology and core concepts of climate change adaptation planning.
126. Identify the most likely impacts of local climatic hazards.
127. Articulating what good climate resilient development actually look like.
128. Compare local problems with problems elsewhere and to gain adaptation ideas from this comparison.

129. Comprehend the opportunities for planners and the social, economic and ecological risks of climate change.
130. Understand historical community reactions to and coping strategies for climatic hazards.
131. Contribute to the debate on global environmental change and societal adaptation strategies; to become an informed citizen and decision maker.
132. Demonstrate capacities for self-reflection and self-evaluation as integral aspects of the adaptive learning cycle.
133. Questioning business as usual can threaten our ideals, values, beliefs, business strategies and technical understanding and is not necessarily what everyone wants to hear.
134. Draw on active teaching and learning approaches to empower learner, young people and civic engagement.
135. Anticipate possible future environmental change and identify possible development consequences.
136. Appreciate the importance and practical characteristics of adaptive approaches.
137. Demonstrate knowledge and understanding of relationship between poverty, environment, climate change, economics and social issues.
138. Relate climate change and sustainability policy to a range of curricular areas in formal, non formal and informal education.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave

early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

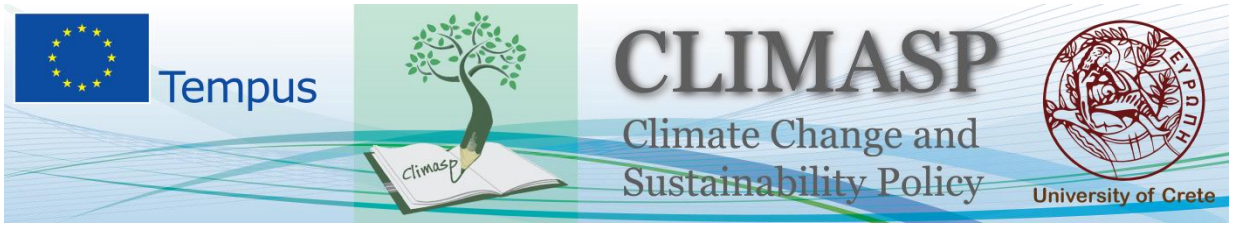
Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Environmental awareness
3		Weather and climate
4		Climate change and livelihoods
5		Climate change and livelihoods (man, plant, animals)
6		Gender-sensitive response to climate change
7		Male/Female: awareness of climate change consequences
8		Male/Female: roles to alleviate climate change consequences
9		Climate change communication (Concepts)

10		Climate change communication (tools: design)
11		Climate change communication (tools: implementation/analysis)
12		Fairness and climate change justice
13-15		Future climate change scenarios

Course Modules



Course	Scientifc Culture
Module 1	**Climate Change : Environmental Impacts**
Key Concepts	Climate Change, Environment
Overview	The term environment may be vague for many students, Some of them my be concerned with the physical environment around them. They might ignore my cultural components of environment which are responsible for shaping mans attitudes, and in turn, influence our behaviour. Such behaviour might aggregate or alleviate the environmental challenges. Mans behaviour may be affected by climate change. So, his reaction toward the environment is almost disastrous!! Issues addressed in this module include: definition of environment, components of environment: physical and cultural; basic differences between weather and climate; and impacts of local climatic hazards.
Aim	The aim of this module is to turn students able to discourse on basic concepts related to environment and the impact of climate change.
Learning Outcomes	At the end of this module learners will be able to: 10. Become familiar with the basic terminology and core concepts of climate change adaptation planning. 11. Identify the most likely impacts of local climatic hazards. 12. Articulating what good climate resilient development actually look like.
Units	Unit 1.1: Environment: Physical and Cultural

	Unit 1.2: Man VS Environment Unit 1.3: Weather and Climate
Readings	• Climate Change: Key Concepts. **http://www.careclimatechange.org/tk/cba/en/cba_**basics/key_concepts.html • The Intergovernmental Panel on Climate Change (IPCC) is a body set up to provide scientific, technical and socio-economic information in a policy-relevant but policy neutral way to decision makers. • IPCC, 2007. *Climate Change 2007: Impacts, Adaptation and Vulnerability. Contribution of Working Group II to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, Annex I.*, M.L. Parry, O.F. Canziani, J.P. Palutikof, P.J. van der Linden and C.E. Hanson, Eds., Cambridge University Press, Cambridge, UK, 976pp. • Intergovernmental Panel on Climate Change (IPCC) Working Group 2, 2001. *Third Assessment Report, Annex B: Glossary of Terms.* • NASA - What's the Difference Between Weather and Climate? http://www.nasa.gov/mission_ pages/noaan/climate/climate_weather.html#.VAv8Mfl_vdM February 1, 2005 • Geoff M Dodson: How to Promote Environmental Awareness Submitted On June 25, 2012 **http://ezinearticles.com/?How-to-Promote-Environmental-Awareness&id=7141986**

Activity	**Overview** Assignment 1.1: Reflecting Upon environmental issues 1. To what extent is responsible for environmental problems? (3-4 paragraphs) 2. What can we do to alleviate environmental problems? 3. draw a table of comparison to show the main differences between climate and weather. Assignment 1.2: Investigate local environmental problems to: - Make a list of most serious environmental problems - Interview a sample of citizens to identify their awareness of such problems. Access and explore the following report to identify and summarize its main ideas with regard the management of the environmental impacts of Climate Change: World Bank 2009. Convenient Solutions to an Inconvenient Truth: Ecosystem-based Approaches to Climate Change. Environment Department, World Bank.
Module 2	Climate Change and Livelihoods: Problems and Solutions
Key Concepts	Climate change , livelihoods (man, plant, animals)

Overview	The world is highly susceptible to a number of natural hazards droughts including, floods and hurricanes. Increasing in frequency and ferocity as a result of changing climate systems, these disasters are placing increased stress on inhabitants and severely impairing economic growth as they batter climate vulnerable sectors like tourism and agriculture upon which the region is financially reliant.In order to avoid risks and damage and to strengthen human resilience to natural disasters, governments need to be prepared. However, in developing countries, the ability of governments to help is often very limited. The impacts of loss and damage associated with natural disasters can set back development by increasing the incidence and severity of poverty. Poverty and vulnerability are fundamentally intertwined: the poor have fewer resources to cope with climate risk and thus their resource base is further diminished with every extreme weather event, deepening their poverty. This module is intended to raise the students awareness towards local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas for the management of such problems.
Aim	The overriding aim of this module is to identify local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas from this comparison.
Learning Outcomes	At the end of this module learners will be able to compare local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas from this comparison.
Units	Unit 2.1: Climate change and livelihoods Unit 2.2: Climate change and livelihoods (man, plant, animals)
Readings	• Task Force on Climate Change, Vulnerable Communities and Adaptation (IUCN, SEI and IISD), 2003. Livelihoods and Climate Change. Combining Disaster Risk Reduction, Natural Resource Management and Climate Change adaptation in a new approach to the reduction of vulnerability and poverty. 	• Scoones, Ian (2005): The Sustainable Rural Livelihoods: A Framework for Analysis. Institute for Development Studies, University of Sussex. England. **http://www.sarpn.org.za/www.careclimatechange.org/files/adaptation/d0001493/P1833-Sustainable-rural-livelihoods_IDS-paper72.pdf**. • *Livelihoods and Climate Change **http://www.iisd.org/ecp/es/resilience/** climate.asp* • Livelihoods and Climate Change Project Snapshot (PDF - 438 kb), http://www.iisd.org/ecp/es/resilience/climate.asp • Livelihoods and Climate Change: Combining disaster risk reduction, natural resource management and climate change adaptation in a new approach to the reduction of vulnerability and poverty (PDF - 1.6 mb), http://www.iisd.org/ecp/es/resilience/climate.asp
Activity	**Overview**
	Design poster showing local climate change and livelihoods problems with similar problems elsewhere and to gain adaptation ideas for the management of such problems.
Module 3	**Gender-Sensitive Response to Climate Change**
Key Concepts	Gender-Sensitive
Overview	A gender-sensitive response does not mean having a set of disaggregated data showing that climate change has differential impacts on women and men. In fact, it is obvious. So more than that, it requires an understanding of the nature of existing inequalities between women and men, their consequences, and then coming up with strategies to nullify them. However, due to their social status men may have greater access to vital information on climate change mitigation or adaptation strategies, or women are too busy with caring and other domestic responsibilities so they lack this information. Therefore, lack of information and lack of opportunity to voice their concerns about adaptation and mitigation strategies could jeopardize their safety when climate change events strike.

	To counter this situation, strategies need to be planned so that women receive as much information on climatic events and conditions as men do. Women are also more likely than men to be absent from decision-making, right from home, to community, to national, to international levels for two reasons. One, their opinion is not given importance and two, they don't have time or confidence or opportunity to share. Therefore, whatever the reasons are they are simply marginalized; and the same is true for elderly and children. The net result is that they remain more vulnerable than men. Thus, if effective adaptation strategies have to be chalked out for them they must be drawn out to participate in the climate change discussions which in turn, means challenging the traditional assumptions about their capabilities and redefining their gender equation. For centuries, women have passed on their skills in water management, forest management and the management of biodiversity, among others. Through these experiences, women have acquired valuable knowledge that will allow them to contribute positively to the identification of appropriate adaptation and mitigation techniques, if only they are given the opportunity. The present module is concerned with: Male/Female awareness of climate change consequences; as well as their role in the management of climate change consequences.
Aim	This module encourages the students to the debate on global environmental change and societal adaptation
Learning Outcomes	At the end of this module learners will be able to: • Contribute to the debate on global environmental change and societal adaptation strategies; to become an informed citizen and decision maker. • Demonstrate capacities for self-reflection and self-evaluation as integral aspects of the adaptive learning cycle.
Units	Unit 3.1: Gender-sensitive response to climate change

	Unit 3.2: Male/Female: awareness of climate change consequences Unit 3.3: Male/Female: how to alleviate climate change consequences
Readings	• Gender and Climate Change Adaptation: Tools for Community-level Action in Nigeria, http://africanclimate.net/en/node/8979 • Intergovernmental Panel on Climate Change (IPCC) Working Group 2, 2001. *Third Assessment Report, Annex B: Glossary of Terms.* • IPCC, 2007: *Climate Change 2007: Impacts, Adaptation and Vulnerability. Contribution of Working Group II to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, Annex I.*, M.L. Parry, O.F. Canziani, J.P. Palutikof, P.J. van der Linden and C.E. Hanson, Eds., Cambridge University Press, Cambridge, UK, 976pp.
Activity	**Overview**
	Assignment 1: Propose a strategy to: 7- Raise the awareness of both Male and Female citizen towards the climate change consequences in your local environment 8- how to involve both Male and Female citizen in the management of climate change consequences in your local environment
Module 4	**Climate Change Communication**
Key Concepts	social, economic and ecological risks of climate change; civic engagement

Overview	The rapid development of multimedia and hypermedia technologies has provided new avenues for merging images, sound, movies and animation together with texts. These can serve as effective tools for communicating information and data related to climate change concepts, causes and consequences. Climate change is the result of human actions and choices. Limiting climate change – and protecting people and ecosystems to the degree possible from unavoidable changes in the climate – will require significant public engagement in the issue so that difficult decisions can be made by members of the public and policy makers. So, the need emerges for unbiased social science research that will facilitate such public engagement. In other words, students should be trained on how to use social science research methods – experiments, surveys, in-depth interviews and other methods – to find ways of effectively engaging the public and policy makers in the problem, and in considering and enacting solutions. Social science research has played important roles in many social change campaigns over the past several decades, including reducing smoking and littering, and increasing seat belt use and recycling. So, they can conduct unbiased public engagement research - and help government agencies, non-profit organizations, and companies apply the results of this research - so that collectively, we can stabilize our planet's life sustaining climate.
Aim	The overriding aim of this module is encourage the students explore and use appropriate tools to communicate social, economic and ecological risks of climate change.
Learning Outcomes	At the end of this module learners will be able to: - Comprehend the opportunities for planners and the social, economic and ecological risks of climate change. - Understand historical community reactions to and coping strategies for climatic hazards. - Questioning business as usual can threaten our ideals, values, beliefs,

	business strategies and technical understanding and is not necessarily what everyone wants to hear. - Draw on active teaching and learning approaches to empower learner, young people and civic engagement.
Units	Unit 3.1: Climate Change Communication (Concepts) Unit 3.2: Climate Change Communication (tools: design) Unit 3.3: Climate Change Communication (tools: implementation/analysis)
Readings	• Adapted from: UNISDR, 2009. Terminology: Basic terms of disaster risk reduction and IISD et al, 2007. Community-based Risk Screening – Adaptation and Livelihoods (CRiSTAL) User's Manual, Version 3.0. • UNISDR, 2009. Terminology: Basic terms of disaster risk reduction. Department for International Development, UK (DFID). 2001. *Sustainable Livelihoods Guidance Sheet*. Available at **http://www.nssd.net/pdf/sectiont.pdf**.
Activity	**Overview**
	Assignment: Students are invited to work in groups to: - Design appropriate tools to communicate social, economic and ecological risks of climate change. - Write a report on the obtained results of communicating social, economic and ecological risks of climate change. - Orally present the outcomes of the above report
Module 5	Climate Change: Justice and Future Scenarios
Key Concepts	climate change fairness, justice; future scenarios.
Overview	This module is about climate change scenarios. Socioeconomic scenarios are used by analysts to make projections of future greenhouse gas (GHG) emissions and to assess future vulnerability to climate change. Producing scenarios requires estimates of future population levels, economic activity, the structure of governance, social values, and patterns of

	technological change. Economic and energy modelling (such as via the World3 or the POLES models) can be used to analyse and quantify the effects. These scenarios can be thought of as stories of possible futures. They allow the description of factors that are difficult to quantify, such as governance, social structures, and institutions. However, researcher claim a considerable variety among scenarios, ranging from variants of sustainable development, to the collapse of social, economic, and environmental systems.
Aim	The overriding aim of this module is to equip students with the capacity to actualise issues such as fairness and climate change justice; future climate change scenarios.
Learning Outcomes	At the end of this module learners will be able to contribute to group discussion with regard: • possible future environmental change and identify possible development consequences. • the importance and practical characteristics of adaptive approaches. • The relationship between poverty, environment, climate change, economics and social issues. • climate change and sustainability policy and a range of curricular areas in formal, non formal and informal education.
Units	Unit 5.1: Fairness and climate change justice Unit 5.2: Future climate change scenarios

Course Description/Overview

The present course is intended to raise the students' awareness of soil . The course concentrates on the techniques employed in the analysis of the physical, hydrological, chemical, and biological properties of soils as well as those processes which control the development of the soil. It introduces students to the fundamentals of soil pollution with a background on historical perspective on soil pollution and a commentary on current soil quality policies and standards. It does so through tackling the following aspects: 1) natural sources of soil pollution, 2) anthropogenic sources of soil pollution, 3) airborne particulate matter, 5) negative impacts, 6) global warming, 7) soil pollution act, 8) atmospheric stability, 9) thermal invasion, 10) modelling of soil pollution and control devices. That is they are asked to read and summarize articles on soil pollution and its treatment. They are invited to discuss impacts of soil pollution on environment at local, national and international scales.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of soil pollution; b) to raise awareness of the learners about effects of soil pollution on climate; c) help learners use traditional and electronic tools to identify the risks the different types of soil pollutants; and d) to identify risks of soil pollution.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

36. Discuss the sources of domestic, agricultural and industrial wastes and pollutants.
37. Identify the problems arising at pollution sites.
38. Devise solutions to the soil pollution problems.
39. Design soil treatment and water treatment process systems, among environmental processes.
40. Anticipate possible future environmental change and identify possible development consequences.

41. Estimate health impact of changes in soil pollution
42. Identify the different types of soil pollutants.

Course Description/Overview

The present course is intended to provide students with the key concepts about the methods and principles of environmental assessment of the impacts of activities and pollutants (predicting dispersion and ecological distribution of pollutants during discharge and after emission) with the introduction of the basics of project formulation, relationships between organisms and their environment and managing human, air and soil resources, A course which will familiarize students with a wide range of laboratory and held methods directly applicable to the study of environmental problems.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of methods and principles of environmental assessment of the impacts of activities and pollutants; b) to raise awareness of the learners about the need for predicting dispersion and ecological distribution of pollutants during discharge and after emission; c) and help learners to acquire the basics of project formulation, relationships between organisms and their environment and managing human, air and soil resources and d) give the basic understanding of a wide range of laboratory and held methods directly applicable to the study of environmental problems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Identify methods and principles of environmental assessment of the impacts of activities and pollutants.

2-Explain the dispersion and ecological distribution of pollutants during discharge and after emission.

3- Discuss the basics of project formulation, relationships between organisms and their environment and managing human, air and soil resources.

4- Explore the influence of economic activities on surrounding environment.

5- Summarize a wide range of laboratory and held methods directly applicable to the study of environmental problems.

Course Description/Overview

The present course is intended to raise the students' awareness water. It introduces them to the benefits of using clean energy resources. It does so through tackling the following aspects: 1) natural sources of air pollution, 2) anthropogenic sources of air pollution, 3) airborne particulate matter, 4) size distribution of atmospheric aerosols, 5) negative impacts, 6) global warming, 7) air pollution act, 8) atmospheric stability, 9) thermal invasion, 10) modelling of air pollution and control devices. That is they are asked to read and summarize articles on renewable energy resources. They are invited to discuss impacts of energy resources on environment at local, national and international scales. In short, the course provides an appropriate chance for the students to get the minimum knowledge of the advantages and disadvantages of renewable energy resources.

Course Learning Objectives

The overarching goals of this course are: a) to provide a basic knowledge of air pollution; b) to raise awareness of the learners about effects of air pollution on climate; c) help learners use traditional and electronic tools to identify the risks the different types of air pollutants; and d) to highlight

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

147. Discuss the sources of domestic, agricultural and industrial wastes and pollutants.
148. Identify the problems arising at pollution sites.
149. Devise solutions to the water pollution problem.
150. Design water treatment and wastewater treatment process systems, among environmental processes.
151. Apply the different steps of the monitoring cycle in rivers and lakes.
152. Anticipate possible future environmental change and identify possible development consequences.
153. Appreciate the positive impacts of utilizing renewable energy resources on the environment.
154. Apply common statistical techniques for water quality data evaluation.
155. Use the different tools and equipments of renewable energy resources .
156. Apply concepts of water pollution processes in rivers and lakes.

Course Website(s)

Required Course Texts and Materials

Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Energy Resources and Supply.
3		Renewable energies and clean technologies.
4		Solar Energy, solar cells, solar thermal heating systems, and electricity generation.
5		Tidal and Hydro as renewable energy resources.
6		Renewable Energy Integration and Energy Efficiency in the Built Environment
7		Research Design Methods.

EGYPT SCU

The CLIMASP Course Modules

Course: Principals of Pest Control

Key Concepts

Overview

The alarming increase in world population is a major concern. Food security and ability to feed such growing demand is a daunting challenge that face developing countries where growth rates are exceptionally high. With climate change, the possibility of major changes in pests landscape are very likely. The emergence of new pests, and the changing climate pattern would cause substantial change in plant protection policies and practices. Plant protection is a major tool to secure food security, nevertheless, the general view still holding is the negative image of pesticides as a potential culprit of biodiversity losses and environmental disturbance.

The present course is portraying advances in pest control methods, pesticides safe use, the application of new techniques including biotechnology and gene transfer in the domain of pesticides, and how to maintain environmental sustainability as an overarching paradigm. The present course is also a window to overview how changes in climate would affect the status of pests, their hosts and how to cope with these changes. The course is also giving special importance on how to control pests while maintaining sustainability and environmental integrity.

Aim of the Course

The course is to equip students with information about how control major pests, pests emerging as a result of climate changes. Principals of integrated pest management and biocontrol of pests are in the core of this course. Green chemistry as a major constituent of chemical control agents is highlighted.

Learning Outcome

At the end of this module learners will be able to:

-major pests and their economic impact

- weed control and herbicides selectivity

-how to manage pests, use of biocontol, chemical agents, pests and sustainbility

- how climate change might bring new species of pests,
-adaptation to climate change including how to mange newly emerged pests

Units

Unit 1.1- introduction to pest emergence, ecology, dynamics, ecosystem services, and sustainability
Unit 1.2 major changes in pest status and control methods, and the role of integrated pest management
Unit 1.3 pesticides classification, toxicity, persistence,
Unit 1.4 pesticides formulation, mixtures, label, registration and safe use
Unit 1.5 weeds classification and damage, herbicides, classification, mode of action and structure activity relationship, weeds selectivity
Unit 1.6 fungicides, acaricides, rodenticides, and nematocides
Unit 1.7 climate change as a factor contributing to emergence of new pests and how to adapt

Reading

1- -Pesticides Application Methods. Matthews G.A. (1985).
2- -Pesticides, preparation and mode of action. By R.Cremlyn. copyright by John Wiley and Sons, Ltd. 1978.
3--Pollution cases, effects and control. Third edition. By Roy M. Harrison. Published by the Royal Society of Chemistry (1996).
4- Complete Guide To Pest Control … Ware , W.G. (1988)

5-Pesticides, preparation and mode of action. By R. Cremlyn. copyright by John Wiley and Sons, Ltd. 1978.

6-Pesticides, preparation and mode of action. By R.Cremlyn. copyright by John Wiley and Sons, Ltd. 1978.
6- The Biochemistry and uses of Pesticides Hassal , K.A . (1990)

Activity

Assignment

1- what are the major drawback resulted from irrational use of pesticides
2- how to raise awareness to counter the irrational use of pesticides and their impact on ecosystem services and sustainability

3- how to draw a plan to combat pest resistance to pesticides
4- a pesticide is as good as its formulation, how to comment on this view
5- weed biology, classification, morphology and how to take advantage of shape and structure in herbicides selectivity
6- survey of contact and systemic fungicides, rodent control practices
7- emerging new pests as a potential threat, how to cope

The CLIMASP Course Modules

Course Name: Pollution of Water Resource

Key Concepts

Overview

Water scarcity if one of the daunting challenges facing millions around the globe. The massive increase in world population, coupled with the limited sources of water are causing serious drawbacks in many countries and Egypt is no exception. Water pollution is emerging as adding some new and dire dimension through limiting the use of the already scarce resource of water. Several reports, including IPPCs scenarios are expecting the worst to come for some countries in which Egypt is a potential one.

Fighting water pollution, is beyond doubt is one of the urgent tasks that should be looked at within the framework of sustainability. The present course is an endeavor to bring the generic view of water pollution to students, exploring the long term and short term impacts on livelihood and human wellbeing. The course introduces types of water pollutants including point and point pollutant, different species of pollutants, including organic and non organics, and the behaviour of each species on water ecosystem and humans. The course would also portray major environmental management systems employed in preserving water quality, including environmental impact assessment, water footprint, and others. The study of simple indicators that reflect the quality of water is also one of the sections dealt with.

Wastewater as one of the major pollutants of water bodies is a focal study part. Approaches to wastewater treatment are also studies with the main objective of using treated wastewater as a sustainable source of water, augmenting freshwater in particular usage such as industry and agriculture.

The impact of climate change on water resources and the possible repercussions is given special emphases, as part of global environmental changes.

Aim of the Course

The course is to equip students with information about major sources of water pollution, sources of pollution and the different species of these pollutants. In addition, the course would aim to introduce envirnmental management system as a measure to keep water integrity and quality. The expected impact of climate change on water resources is also one of main aims of this course

Learning Outcome

At the end of this module learners will be able to:

-how to identify major pollutants of water bodies
-how to apply environmental management system to manage water pollution
- how to restore the quality of polluted lakes
- sound treatment of wastewater in order to reuse in

Units

Unit 1.1- water as a main ecosystem service, global view, increasing demand and limited resource
Unit 1.2 major sources of pollution, their impacts, chronic and acute toxicity, behaviour in water bodies, including biomagnification, bioaccumulation, and others
Unit 1.3 Indicators of pollution, biological, BOD, COD, DO, and others
Unit 1.4 environmental management system, EIA, water fooprint, and use of green chemistry
Unit 1.5 treatment of polluted lakes and how to restore water quality
Unit 1.6 water bacteriology and methods of wastewater treatment
Unit 1.7 water self purification and metal bioremediation

Class Times: Monday 9.00 am – 11.00am
Prerequisites: ICT literacy
Faculty Web Page: http://www. *agriscu.scuegypt.edu.eg*

Course Description/Overview

Zoology is the scientific study of animal. Zoology is the study of animals, their behaviour, their physiology and evolution, as well as their interactions with each other
and with their environment. Zoologists also study how animals evolved and the impact of environmental change on their survival. They search for ways to manage wildlife populations, and to conserve rare and endangered species, such as takahe and tuatara. They study costs and benefits of conservation and ways to enhance species survival. Zoology is the branch of biology that includes the study of animals and animal life, including, but not limited to, the study of the structure, physiology and classification of animals. Zoology can be subdivided into two categories: Invertebrate zoology and Vertebrate zoology

Invertebrate means lacking a spinal column. Animals in this category include species of the following: protozoans, annelids, cnidarians, echinoderms, flatworms, nematodes, molluscs, and arthropods. Invertebrates make up 90% of the Earth's animals.

Vertebrate means to have a spinal column or backbone. Animals in this category include species of the phylum Chordata: fish, birds, reptiles, amphibians, and mammals. These are characterized by a segmented spinal cord and a distinct differentiated head. These animals possess internal skeletons which include the vertebral column which at least partially encloses the spinal cord and a skull which houses the brain. Finally climate change and animals - how does climate change affect animals?

Course Learning Objectives

The overarching goals of this course are: a) known description and installation of the animal cell and known to the different types of animal tissues. ; b) Study the morphology, structure and taxonomy of protozoa and helminthes. ;c) Know the a
cademic learning and introducing of basic physiology for an animal (vertebrate) models, different body systems ;d) propose plans to develop agricultural business including animal avoids the injury problems and defines the priorities for the development of rural communities ; and e) use participatory video and social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

a-Knowledge and Understanding:

a1-Understand the types of life cycles.
a2-Understand the physiology and reproduction of the invertebrates.
a3-Understand the food and Nutrition.
a4-Understand the Physiology and anatomy of body systems.

b-Intellectual Skills

b1-Understand the difference between the sexual and asexual reproduction and their life cycles.
b2-Know the normal physiology of animal (vertebrate) model with the anatomy of body systems.

c-Professional and Practical Skills

c1-General knowledge about the different phylam of zoology.
c2-Identification and dissection of different body systems of vertebrate models.

d-General and Transferable Skills

d1-Study the general classes in animal kingdom.

d2-Basic science knowledge of food and nutrition and different body system anatomy and physiology.

Course Resources

Required Course Texts and Materials

Agriculture Zoology Syllabus

Paper I- Life general considerations and biological principles

1- Cell Biology: Structure and function of cell, Ultra structure of Plasma membrane , Structure and function of cell organelles

2- Classification of kingdom Animalia

Paper II –The Diversity of Animal life

Part 1-

Lower Non Chordata (*Protista to Helminths*)

The habits, morphology, physiology, reproduction, development (in outline) and classification of the following groups of animals including a detailed study of the types given in each:

Protista-	*Euglena, Monocystis* , and *Paramecium*
Porifera -	*Sycon –Ascon*
Coelenterata -	*Obelia,Hydra* and *Aurelia*
Platyhelminthes -	*Fasciola* (liver fluke) and *Taenia* (tape worm)
Nematehelminthes	*Ascaris*

Part 2 –

Higher Non Chordata (*Annelida to Echinodermata*)

The habits, morphology, physiology, reproduction, development (in outline) and classification of the following groups of animals including a detailed study of the types given in each:

Annelida *Nereis, Pheretima, Heteronereis, Arenicola* .
Arthropoda *Periplaneta*, *Anopheles* and *Cules*
Mollusca *Lamellidens*, Chiton, *Teredo, Turbinellai* (Shankh)
Echinodermata *Echinus* (Sea urchin), *Ophiothrix* (brittle star)

Part III:

Chordata

Hemichordata: Classification and detailed study (habit, morphology, anatomy, physiology and development) of *Balanoglossus*

Cephalochordata: Classification and detailed study (habit, morphology, anatomy and physiology) of *Branchiostoma* (*Amphioxus)*

Urochordata: Classification and detailed study (habit, morphology, anatomy, physiology and post embryonic development) of *Herdmania*

Classification of different classes of vertebrates (Pisces, Amphibia, Reptilia,) up to order with characters and examples. Poisonous and non poisonous snakes and biting mechanism. Neoteny

Classification of different classes of vertebrates (Aves and Mammalian) up to order with characters and examples. Dentition in mammals.

Paper III –Enviromental biology

Ecology, Animal Behavior and Pollution and Toxicology :

Ecosystem: Concept, components, fundamental operations, energy flow, food-chain, foodwebs and trophic levels, ecological niche, abiotic and biotic factors. Population: Characteristics and regulation. Ecological succession. Adaptation: Aquatic, terrestrial, aerial and arboreal .climate change.

Animal Behavior :Introduction to Ethology, Patterns of behavior (taxes, reflexes, instinct and motivation); biorhythms; learning and memory, Migration of fishes & birds.

Pollution and Toxicology: Concept, sources, types (air, water, soil, noise & radiation), and control of environmental pollution. Exposure of toxicants (routes of exposure, and duration and frequency of exposure); dose -response relationship categories of toxic e

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	20%
Exams	60%
Class attendance/participation	20%
Total Points	**100**

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	/10/20131	Course Overview Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2	/108	Life general considerations and biological principles
3	15/10	Cell Biology, Structure and function of cell , Structure and fun of cell organelles.

4	22/10	Classification of kingdom Animalia
5	29/10	Organizing the Animal and The Diversity of Animal life
6	5/11	Lower Non Chordata (*Protista to Helminths*)
7	12/11	Higher Non Chordata (*Annelida to Echinodermata*)
8	19/11	Chordata
9	26/11	Vertebrata (Notochord is replaced by vertebral column)
10	3/12	Environmental zoology and ecology
11	10/12	Revision
12	17/12	Final assessment

Course	**Climatic Changes & Coastal Protection and Management**
Module 1	Beach profile configuration and its components
Key Concepts	Beach profile, Coastal zone, shoreface, Backshore, Beach berm and Shoreline
Overview	A beach profile represents the cross-shore morphology of the beach along the coast; it may extend out through the breaker zone and into deep water offshore (Komar, 1998) and the landward limit tends to end at the berm or backshore. An equilibrium beach profile represents a profile morphology

	which has adjusted its shape to the characteristics of the incoming waves (Bruun, 1954; Komar, 1998). Larson (1991) described the equilibrium beach profile for a beach of a specific grain size, its shape displays no net change in time when it is subjected to constant short-period breaking waves.
Aim	Beach profile equilibrium is the principal concept assumed by most numerical modeling. The response of beach profile configuration to natural and anthropogenic changes could be predicted to help in selecting the most appropriate engineering design required to mitigate coastal erosion and accretion alongshore.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different part of beach profile • Discuss the equilibrium beach profile concept
Units	Unit 1.1 Coastal zone definitions and subdivisions Unit 1.2: Equilibrium beach profile
Readings	Dean, R.G., 1991. Equilibrium beach profiles: characteristics and applications. Journal of Coastal Research 7, 53–84. Kaiser, M.F.M., 2004. Monitoring and modeling the impact of engineering structures on coastline change, Nile Delta, Egypt. Ph.D. thesis, University of Reading, U.K. Komar, P.D., 1998. Beach Processes and Sedimentation, Second Edition. Prentice-Hall, Inc., New Jersey. 544 pp. Larson, M., 1991. Equilibrium profile of a beach with varying grain size. Proceedings of Coastal Sediments, American Society of Civil Engineers (ASCE) 27, 905–919. Kaiser, M.F. and Frihy, O.E. (2009). Validity of the equilibrium beach Nile Delta, Egypt. Geomorphology, 107, (1-2), Elsevier publication, 25-31.
Activity	**Overview** **Assignment.1:** - Manual drawing of beach profile configuration based on field measurements data

	- Comparison between eroded and accreted beach profiles - Grain size and beach profile configuration
Module 2	Factors controlling changes in beach profiles
Key Concepts	Waves, currents, tides, sea level and wind
Overview	Climatic change is one of the most important factors contributing to changes in patterns of shoreline evolution. The beach profile and planform shapes will be discussed in the preceding section are a result of the action of waves and currents at the shoreline. The waves not only suspend the sediments but give rise to nearshore currents that carry the suspended sediment a The sediment carried by the waves and currents is referred to as the *littoral drift*, and the amount of sediment moved along the coast is the *littoral transport*, or longshore sediment transport, which is usually measured in units such as cubic meters per year or cubic yards per year longshore or cross-shore. The *cross-shore transport*, which is caused by wave- or wind-induced mean crossshore flows, is largely responsible for the existence of sandbars and other beach profile changes. These changes can be slow, on the order of years in duration, or they can occur rapidly during storms with time scales on the order of hours.
Aim	The aim of this module is understand factors controlling beach profiles and coastline changes to suggest the suitable protective works along the beach. Recently, recreation and tourism at the shoreline have become more important economically, coastal development, taking the form of homes and businesses, population now lives within 50 miles of the coastline.
Learning Outcomes	At the end of this module learners will be able to: • Understand the main factors affecting coastline changes and beach profile configuration • Identify waves characteristics and its impacts of the beach
Units	Unit 2.1: Identify factors controlling coastal changes

	Unit 2.2: Field measurements data including, waves, currents, tides, etc. Unit 2.3: Impacts of waves characteristics on the patterns of shoreline changes
Readings	Komar, P.D., McDougal,W.G., 1994. The analysis of exponential beach profiles. Journal of Coastal Research 10, 59–69. Robert, G.D. and Robert, A.D. 2004. Coastal processes with Engineering applications, Cambridge University Press, 475pp. Kaiser, M.F. 2014. Disturbance of hydrodynamic regime in the Mediterranean coastal zone of Egypt. Journal of Coastal Research, In Press, DOI: http://dx.doi.org/10.2112/JCOASTRES-D-12-00247.1
Activity	**Overview**
	Assignment.2: Students in this assignment will construct and compare among measured, equilibrium and exponential beach profiles.
Module 3	Monitoring of coastline changes
Key Concepts	Shoreline positions, Patterns of shoreline changes, Shoreline field survey and Remote Sensing data.
Overview	Monitoring of coastal changes (erosion and accretion) is necessary in management in order to anticipate and provide scheme for mitigating potential problems. Generally, the most common sources for shoreline data include aerial photographs, historical maps and beach profiles. Satellite remote sensing is also a potentially powerful tool for detecting shoreline change at high spatial resolution and lower costs than those associated with traditional field-based methods (Jensen and Toll, 1982; El Raey, 1988).

	Shoreline positions established from beach profile surveys combined with wave data are jointly analyzed, as a function of their contribution to coastal processes, to investigate the interaction between waves, shoreline orientation and coastal structures. The coastline changes can be detected clearly by remote sensing that provides more details than ground surveys which mainly depend on the distance between the profiles (El- Raey et al., 1999). The interval distances between beach profiles measured in the field are usually ranging from 100 t 500 m, so data in between cannot be addressed. While, more detailed data can be extracted from the remote sensing, depending on its resolution.
Aim	This module aims at monitoring planform shoreline changes using remote sensing data.
Learning Outcomes	At the end of this module learners will be able to: • Using satellite images data to extract shoreline positions • Identify the patterns of erosion and accretion alongshore
Units	Unit 3.1: How the satellite image processing will be selected *Unit 3.2: Extracting vector data using ENVI software packages* Unit 3.3: *Vectors data integration using ArcGIS software package* Unit 3.4: *Recognizing the patterns of shoreline changes* Unit 3.5: Measuring the rates of coastline changes
Readings	El Raey, M. (1988). Remote sensing of environment. *Symposium of Enviror Science (UNARC), Alexandria, Egypt, Alexandria University, 1-19.* El Raey, M., Sharaf El Din, S. H., Khafagy, A.A. and Abo Zed, A. I. (1999). I sensing of beach erosion/ accretion along Damietta-Port said shoreline, *International Journal of Remote Sensing, **20**, 1087-1106.* Jensen, J. R. and Toll, D. L. (1982). Urban change detection mapping using I data. *The American Cartographer, **2**, 127-147.*
Activity	**Overview**
	Assignment.3: Students in this assignment will analyse remote sensing data (Enhanced Landsat Thematic Mapper images, 30m resolution) of the Nile Delta coastal

	zone for years 2000, 2005, 2010 and 2015. Vectors data for years 2000, 2005, 2010 and 2015 will be extracted. Detect and monitor the patterns of erosion and accretion along the Mediterranean coastal zone of Egypt in the Nile Delta beach.
Module 4	Types of protective work along the beaches
Key Concepts	Protective structures, seawalls, breakwaters, groins and jetties
Overview	The protective structures built to stabilize the shoreline are classified into tw types. The first is structures used to prevent waves from reaching the shore, especially in front of the harbours, such as seawalls and onshore breakwaters. The second type includes structures that retard the longshore transport of littoral drift such as detached breakwaters and jetties. The impact of human activities on coastal processes was studied intensively. However, much of this research was concerned with the design of structures rather than the impact of structures on the coastline changes following protection (Nordstrom, 1994). The shoreline deformation, the coastal instability and bottom changes reflect the natural effect of interrupted sediment supply, sediment transport processes, shoreline configuration, sea floor gradient as well as impact of the construction of protective structures.
Aim	This module aims at to identify the protective structures along the beach and its impacts on the coastline changes
Learning Outcomes	At the end of this module learners will be able to: • Identify the characters of each protective work • Understand positive and negative impacts of each engineering protection
Units	Unit 3.1: Types of protective coastal protection Unit 3.2: Advantages and disadvantages of each engineering work Unit 3.3: Selecting the optimal protective work along the beach

	Unit 3.4: Assessing the protective works along the Mediterranean coastal zone of Egypt, e.g., Nile Delta coastal zone.
Readings	Nordstrom, K.F. (1994). Developed coasts. *In: Coastal evolution Late Qua shoreline morphodynamics. Carter, R.W.G. and Woodroffe, C.D. (Editor) Syndicate of the University of Cambridge, 517pp.* Kaiser, M.F. 2014. Disturbance of hydrodynamic regime in the Mediterranean coastal zone of Egypt. Journal of Coastal Research, In Press, DOI: http://dx.doi.org/10.2112/JCOASTRES-D-12-00247.1
Activity	**Overview**
	Assignment.4: Students in this assignment will read a scientific research paper concerning with different types of protective structures and discuss together in its negative and positive impacts on the coastline changes. Students will suggest alternative protective work aiming to mitigate its negative impacts. **Assignment.5:** Reading the Manual of MIKE21 Models including M21 BW and M21 HD
Module 5	**Simulation of shoreline changes using modeling techniques**
Key Concepts	Sediment transport, boundary condition, Data input, sensitivity testing,
Overview	The evolution of shorelines and how their shapes relate to wave conditions and sources of sediment can be analysed using numerical simulation models. The results of the modelling can be compared to the measured shoreline changes indicated by the remote images. Numerical modelling can then be applied to analyse the impact of the construction of protective work on the shoreline configuration and to predict the patterns of erosion and accretion. The general approach underlying many simple models of shoreline change involves the use of three combined equations a) the continuity equation b) the transport equation and c) the equilibrium beach profile equation (Hanson and Kraus, 1989). MIKE 21 Boussinesq Wave (BW) module is mainly used to study wave dynamics (significant wave height, wave disturbance coefficient, water surface elevation and the depth-averaged particle velocity) in ports and

	harbours and in small coastal areas. The model has been primarily designed for coastal harbours but can also be applied to small and complex coastal embayments (Eurosion, 2004) and (DHI Software website, 2006). MIKE 21 Hydrodynamic (HD) simulates the water level variations and flows in response to a variety of forcing functions in lakes, estuaries, bays and coastal areas.
Aim	The main objectives of this module is application of 2D and 3D numerical modelling approach such as DHI software package to simulate shoreline changes, waves dissipation and hydrodynamic. Modelling simulation helps decision makers to suggest the optimal protective works which mitigate severe erosion and accretion along the coastal zones. In addition, prediction could be achieved based on calibration and verification procedures.
Learning Outcomes	At the end of this module learners will be able to: • Recognize different types of shoreline change models • Specify the suitable software for each case • Know the input data required for simulations
Units	Unit 5.1: Applications of shoreline changes modelling techniques Unit 5.2: Required data input Unit 5.3: Concepts and limitations of 1D GENESIS (Planform shoreline changes). Unit 5.4: Sensitivity testing Unit 5.5: Beach profiles changes Unit 5.6: DHI Software Models; Basic principles and Limitations
Readings	Hansons, H. and N.C. Kraus (1989): GENESIS: Generalized Model for Simulating Change, Report 1: Reference manual and User Guide. *Technical Report CERC, U.S. Army Engineer Waterways Experimental Station, Coastal Engineer Research Center, Vicksburg, Mississippi.* http://www.dhisoftware.com. DHI Software. Eurosion. (2004). Living with coastal erosion in Europe: Sediment and Space for Sustainability. A guide to coastal erosion management practices in Europe:

	lessons learned. Coastal erosion–Evaluation of the need for action. Directorate General Environment. European Commission. Prepared by the National Institute of Coastal and Marine Management of the Netherlands.
Activity	**Overview**
	This module will be given for students in cooperation with the Egyptian Public Authority for Shore Protection. **Assignment.6:** Students in this assignment will read Manual of 1D GENESIS and 2D &3D DHI software packages. **Assignment.7:** Using GENESIS 1D Planform shoreline changes model **Assignment.8:** Using DHI Wave models Using DHI Sediment Transport models **Assignment.9:** Using DHI Hydrodynamic models Using DHI Beach profile models

Name of the Course: Principals of Plant Protection

Course Description and Overview

Crops are attacked by a variety of pests that causes significant damage and losses in both quantity and quality. Crop protection is emerging as one of the key factors for food security and for the provision of enough food to the growing population. Nevertheless, some of the practices of crop protection, especially those related to the irrational use of pesticides have caused some potential damage to man and his environment.

Some major change in the state of the art was inevitable in order to keep the momentum of pest control, while saving environment and human health.
One of the expected repercussions of climate change is the new landscape of crop pests and diseases, with many new pest species emerging, and could cause considerable damage in places with no past experience in controlling them, pausing daunting challenges that should be addressed. Within the domain of the course, an introductory section portraying how the status of pest was developed for some insects, and the theories explaining this, and also how pest control tools emerged and developed. This part would also dwell on the drawbacks of the irrational use of chemical pest control agents, and the damage they inflect, and the emergence of new pest control paradigm "integrated pest management and crop hygiene". Sustainability and how to promote sustainable use of pest control methods as a basic framework of plant protection have special emphases in this part. Issues of considerable concern such as pest resistance to pesticides, environmental pollution and upsetting environmental biological balance are addressed in full details. In another section, pesticides used in pest control are introduced, including insecticides, fungicides, herbicides and others, with information about their classification and mode of action. A major constituent of this section is the study of pesticides formulations, their types, components and the purpose of their use are tackled in details.
In another section factors affecting the efficacy of pesticides are discussed with special reference to the role of soil type, chemical characters and some other factors.
The impact of climate change on pest landscape is another new issue that would be discussed in details, including how to cope and possible mechanisms, and expert systems that should be used.
Assignments, and group discussion are basic elements of the course, along with extensive field visits, field experiments, and laboratory practices.

Course Learning Objectives

The overarching goals of this course are: a) to provide information to assess the magnitude of pest infestation and pest damage
b) to provide information relevant to decision making for the timing for the use pesticides c) to provide information relevant to selecting proper formulation and proper conditions for the use of pesticides d) to provide information on how to cope with unexpected pests that might emerge as a consequence of climate change.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Understand the different methods of plant protection and diseases of different crops and to use pesticides in a rational way that would minimize side effects on man and environment

2- To have good information about available pesticides in the market and to be able to select the most effective with least side effects and to mix pesticides if necessary in a safe manner

3- To identify major pests, the damage they may cause and the proper timing and tools and to draw a plan for controlling pests

4- To control weeds, including aquatic weeds

5- To manage newly emerging pests based on his experience with similar pests and database information

Reading

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	20%
Exams	60
Class attendance/participation	20%
Total Points	**100**

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than four classes. Students are expected to arrive on time and stay until the class period ends. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** General view of the course contents, requirements and reporting
2		Ecosystem types, ecosystem goods and services, agriculture ecosystem Plant protection and food security, a generic view, emergence of pests, ,
3		tools used for plant protection, past and development of methods use crop protection, irrational use of pesticides, drawbacks, emergence of paradigms, integrated pest management, crop hygiene, principal integrated pest management
4		Integrated pest management bases, introduction to pesticides classification, bioratonal pesticides, acute and chronic toxicity
5		Pesticides formulations,
6		Pesticides formulation, labelling, pesticides mix and compatibility
7		Factors affecting the efficacy of pesticides, timing, selection, cher properties

8		Fungicides, classification and mode of action
9		Herbicides, classification and mode of action
10		Herbicides, factors affecting efficacy, soil type, solubility, Herbicides selectivity, GM crops
11		Aquatic herbicides
12		Nematicides, acaricides
13		Rodenticides, and fumigants
14		Climate change and pest control, a generic view and how to cope with alien pests

COURSE SYLLABUS TEMPLATE

Course Description and Overview: Pollution of Water Resource

Industrial growth and development is beyond doubt, the major driver of economic progress and societal prosperity. Industry has always been the nuclei that communities and civic activities cascaded around, allowing all other activities to develop and cherish. Industry is also one of the major causes for environmental degradation, resources depletions and pollution. Environmental pollution is a daunting challenge casting its adverse influence on human prosperity and livelihood. Water pollution is one of the most serious types of pollution since pollutants of other spheres, including air and soil would normally end up in water. Within this course, an introductory part would deal with water and water bodies as one of the main ecosystem services, and major drivers of changes that affect this service. . This part would also entail an overview of global environmental changes, with special reference to climate change, acid rain.

The course would than elaborate on major sources of water pollution, including point and non point sources, along with the various types of potential water pollutants, including organic, non organic and biological pollutants, their emission source, and their impacts on the entire ecosystem. Studies are also focusing on the behaviour of particular pollutants, specially the persistent organic pollutants in water bodies, and their possible magnification in the environment, causing substantial damage to water quality, humans and water ecosystem.

Group discussion is frequently used to introduce different things and to establish iterative circles in which various topics are discussed and analyzed.
In one other section, the role of environmental management systems, including environmental impact assessment, water foodprint, green chemistry and other systems are introduced and their role in empowering sustainability of water is highlighted.
In another major section of the course, the role of microorganisms as a major pollutant of water is envisaged. Special emphases are laid on wastewater as a potential pollutant of water bodies, and methods of wastewater treatment are focused on

Course Learning Objectives

The overarching goals of this course would include:

A) to raise awareness of water pollution issues as a main source of poverty, sickness, environmental degradation, and to explore the role of global changes including climate change on water resources and water scarcity;
B) to identify major sources of pollution and major species of pollutants, and their impacts on water ecosystems;
C) to ascertain the role played by environmental management systems, including EIA, water footprint and others in improving water quantity and quality
D) the use of advanced techniques in wastewater treatment in order to use treated wastewater as a sustainable source of water, augmenting natural water supply and minimizing the impact of untreated wastewater discharged into water bodies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- water as a valuable ecosystem service, and the various drivers of ecosystem change that might affect the quantity and quality of water with special reference to climate change, global warm up, and other factors
2- identify the source of water pollution in any particular area, and to evaluate the quality of water using indicator organisms
3- to draw an action plan to resort the vitality of polluted water body
4- to suggest alternatives for polluting agents
5- to use environmental management system with special reference to EIA as a planning process that should be employed to protect water bodies
6- water bacteriology, sampling of microorganisms, identification of coliform bacteria.
7- sound use of treated wastewater as a sustainable use of water

Important Dates to Remember

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** General view of the course contents, requirements and reporting
2		Water, an ecosystem service, global view, supply and growing demand, climate change and impacts on water resources, other factors affecting supply, with special emphases on pollution
3		Water pollution, major sources of water pollution, point and non p organic and non organic, agricultural and industrial drainage Toxicity, type of toxicity, chronic and acute, how to measure, do response relationship, factors affecting type of toxicity, fat solubility, Partition coefficient,
4		Highlights of major pollutants, pesticides, heavy metals, persistent organic pollutants, behaviour in water, biomagnification and bioaccumulation, acidity and alkalinity
5		Other type of pollutants, including heat, oil, nutrients, ballasting water Pollution indicators, biological indicator, chemical and biochemical indicators,

6		Basic information about lakes including lake stratum, how to rejuvenate polluted lakes,
7		Environmental management system, risk assessment, water footprint Brief introduction to modelling
8		Water microbiology, biological indicators of water pollution,
9		Examination of water micorbioloogy, Water sampling, and detection of coliform bacteria
10		Wastewater treatment methodology, biological treatment conditions and limitations, conventional methods
11		Wastewater treatment methodology, biological treatment conditions and limitations, advanced methods
12		Water self purification, general aspects
13		Bioremediation, limitations and conditions
14		Bioremediation, with special reference to heavy metals

The CLIMASP Course Module

Course	***Environmental Studies***
Module 1	**Environment: Types and characteristics**
Key Concepts	Environment, types, Ecology, climate
Overview	This module covers definitions of different environments and monitoring the natural environment and the built environment characteristics and the impact on each other and the human relationship with them.
Aim	The overriding aim of this module is to turn students able to know different types of environment and definitions

Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the different types of environment. • Identify definitions and basic terms of environment, ecology, climate
Units	Unit 1.1 The Environment Unit 1.2: Environments : Basic Terms Unit 1.3: The built environment
Readings	• Randall McMullan, "Environmental Science in Building", 7th edition, Palagrave Macmillan, 2012 p. 3-10
Activity	**Assignment 1.:** Connection between Environments 1. What is the natural Environment and its characteristics? 2. What is the built environment and its characteristics? 3. How do they affect each other?
Module 2	**Man and Climate: The climatic regions**
Key Concepts	Climate, climatic region, macro and micro climate
Overview	To achieve climatic environment that suitable for human comfort inside the building spaces, it must identify the climatic zone in which they live and analyze of its properties to benefit from the advantages and avoid disadvantages. It also must examine the impact of these climatic conditions on the building and try to take advantage of them or treated and controlled by the scientific studying of the architectural elements of the building. Therefore, this module concerns with the study of the geographical distribution of climate regions to find out the climatic characteristics of each region, which affect the architectural design of the buildings in this region.
Aim	The overriding aim of this module is to identify the characteristics imposed by the climate on architecture, especially in the hot zone to find the appropriate design solutions that suitable with the human comfort in the spaces of the buildings.
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the different climatic regions. • Find out the climatic characteristics of each region that affect the design • Identify definitions of climate • Identify the climatic characteristics of the hot zone

Units	Unit 2.1: The division of climatic regions Unit 2.2: The geographical of the hot / tropical zone Unit 2.3: The micro climate and its effect on the natural environment
Readings	• Shafaq El Wakeel and Mohammed Siraj, "Climate and Architecture of Tropical Zones," - Cairo 1989 • Koenigsberger, Ingersoll, Mauhew, Szokolay, "Manual of Tropical Housing and Building", Longman, London 1973
Activity	**Assignment 2**: The Climatic factors affecting the architectural design in hot region in general and Egypt in particular.
Module 3	**Climate Change & Sustainability**
Key Concepts	Climate Change, adaptation, mitigation , Sustainability development
Overview	Climate change is the greatest challenge facing human development which is affecting man all over the world. There is a mutual relationship between climate change an sustainable development, so it is important to identify this relation and how to deal with it, in order to reach the climate change mitigation
Aim	The overriding aim of this module is to enhance understandings of the Climate Change phenomena and its characteristics in Egypt, and what is the process to mitigate the effect of climate change.
Learning Outcomes	At the end of this module students will be able to: • Identify the Climate Change phenomena • Identify Sustainable development policy and principles • Understand the relationship between climate change an sustainable development
Units	Unit 3.1: Climate Change phenomena Unit 3.2: Climate Change: adaptation and mitigation Unit 3.3: Sustainable development policy
Readings	• Randall McMullan, “Environmental Science in Building”, 7th edition, Palagrave Macmillan, 2012

	• Egypt's National Strategy for Adaptation to Climate Change And Disaster Risk Reduction, UNDP, December 2011 • Sathaye, J., A. Najam, C. Cocklin, T. Heller, F. Lecocq, J. Llanes-Regueiro, J. Pan, G. Petschel-Held , S. Rayner, J. Robinson, R. Schaeffer, Y. Sokona, R. Swart, H. Winkler,: "Sustainable Development and Mitigation. In Climate Change" 2007: Mitigation. Contribution of Working Group III to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change Cambridge University Press, Cambridge, United Kingdom and New York, NY, USA. 2007
Activity	**Assignment 3**: The relationship between climate change an sustainable development
Module 4	**The climatic factors affecting the design: Temperature, Wind, Precipitation**
Key Concepts	Temperature, Wind, Precipitation
Overview	
Aim	The overriding aim of this module is to identify and study the climatic factors affecting the architectural design.
Learning Outcomes	At the end of this module students will be able to: • Identify the climatic factors affecting the design • Identify the means of thermal control • Proficiency in dealing with climate factors to reach the appropriate architectural design.
Units	Unit 3.1: Sun: Protection from the sun Unit 3.2: Temperature: Thermal quantities, heat exchange of buildings Unit 3.3: Means of thermal control Unit 3.4: Wind: local factors affect the wind movement, wind control Unit 3.5: Evaporation and precipitation and humidity Unit 3.6: Daylight : definitions, principles and design
Readings	• Shafaq El Wakeel and Mohammed Siraj, "Climate and Architecture of Tropical Zones," - Cairo 1989 • Koenigsberger, Ingersoll, Mauhew, Szokolay, "Manual of Tropical

	Housing and Building", Longman, London 1973 • Randall McMullan, "Environmental Science in Building", 7th edition, Palagrave Macmillan, 2012 • Robins, C., Daylighting Design and Analysis, Van Nostrand Reinhold Co., 1986. Avoidance. • Guzowski, M., Daylighting Sustainable Design, McGraw Hill, Co., 2000. • Brown, G. Z., Sun, Wind and Light, Architectural Design Strategies, John Wiley and Sons Inc., 2000
Activity	**Overview**
	Assignment 4: Monitor aspects of climate change in the region warm and its impact on sustainable development of the desert environment.
Module 5	**Renewable Energy and Architecture**
Key Concepts	Solar energy, passive and active solar, photovoltaic panels, wind turbines
Overview	Renewable energy is generally defined as energy that comes from natural resources such as sunlight, wind, rain… Solar energy refers primarily to the use of solar radiation for practical ends. However, all renewable energies, other than geothermal and tidal, derive their energy from the sun. Solar technologies are broadly characterized as either passive or active depending on the way they capture, convert and distribute sunlight. This module covers different types of renewable energies and its uses.
Aim	The overriding aim of this module is to increase awareness of using the renewable energy especially solar energy in building design
Learning Outcomes	At the end of this module students will be able to: • Identify the different types of renewable energies and its resources • Understanding the differences between types and its uses. • Recognize applications of renewable energies especially solar technology in the field of Architecture and urban planning
Units	Unit 5.1: Renewable energy: types, resources, uses Unit 5.2: Passive use of solar energy Unit 5.3: Applications of solar technology Unit 5.4: Renewable energy and climate change mitigation
Readings	• Shafaq El Wakeel and Mohammed Siraj, "Climate and Architecture of

	Tropical Zones," - Cairo 1989 • Randall McMullan, "Environmental Science in Building", 7th edition, Palagrave Macmillan, 2012 • IPCC. "Special Report on Renewable Energy Sources and Climate Change Mitigation". Cambridge University Press, Cambridge, United Kingdom and New York, United State, 2011
Activity	**Overview**
	• Research in groups, each group (2-3 students) • Each group chooses a heritage building in a particular climatic region • Studying of the architectural elements of the building and demonstrate the work theories of these different treatments • Analysing the building in terms of materials, construction, function and its suitability for the environment • Prepare a poster size 90 cm × 180 cm includes: • Theoretical study summarizes of the course • Applied and analytical Study of the heritage building, which was chosen
Module 6	**Analytical study of the heritage architectural elements**
Key Concepts	Architectural elements, heritage,
Overview	Traditional and heritage architecture is considered of an ideal model in the use of architectural elements that control climatic factors that affect the internal spaces in buildings. This differs from the use of elements such as dome, vaults, inner courtyard, Mashrabeya and other architectural treatments depending on the characteristics of the climatic region in which the building is located. This part interested in studying these architectural treatments in addition to the analytical study of some different models of heritage architectural buildings
Aim	The overriding aim of this module is to study the traditional treatments used in the architectural heritage and to learn how to use these architectural elements to control the climatic factors naturally
Learning Outcomes	At the end of this module students will be able to: • Identify the different types of heritage architectural elements

	• Understanding the differences between types and its uses. • Analyzing the different types of heritage architectural treatments • Recognize applications and different models of heritage architectural buildings
Units	Unit 6.1: Types of the heritage architectural treatments: Theory and function Unit 6.2: Analytical study of some different models of heritage architectural buildings
Readings	• Shafaq El Wakeel and Mohammed Siraj, "Climate and Architecture of Tropical Zones," - Cairo 1989 • Koenigsberger, Ingersoll, Mauhew, Szokolay, "Manual of Tropical Housing and Building", Longman, London 1973 • Using the websites
Activity	**Reviewing the research progress**

The CLIMASP Course Module

Course	**Urban Renewal of Residential Areas**
Module 1	**Urbanization and its problems**
Key Concepts	Urbanization, overpopulation, housing
Overview	This module covers definitions of urbanization and the overpopulation as it is considered one of the great problems facing cities and the consequences of severe problems such as lack of housing, the spread of deteriorating neighborhoods, the informal extensions, slums and pollution as well
Aim	The overriding aim of this module is to turn students able to raise awareness about urbanization and the problems resulting from it
Learning Outcomes	At the end of this module students will be able to: • Identify definitions and basic terms of urbanization • Identify and discuss rapid urbanization. • Identify and discuss the problem of the overpopulation
Units	Unit 1.1 Rapid urbanization : Overpopulation in Egypt Unit 1.2: Problem of urbanization

Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997 • Forbes Davisdson and Geoff Payne, Urban Projects Manual, Liverpool University Press, 1996
Activity	**Assignment 1. :** The overpopulation in Egypt: Causes and its effect on urbanization.
Module 2	**Types of the residential areas**
Key Concepts	Housing, formal and informal housing, slums, deteriorated areas
Overview	This module covers the classification of the different types of residential areas in Egypt. The module discusses the characteristics of each type and the reasons for the appearance of this pattern.
Aim	The overriding aim of this module is to identify the characteristics of the different types of the residential areas in Egypt
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the different types of the residential areas • Find out the characteristics of each pattern • Analyzing the urban fabric of residential areas models
Units	Unit 2.1: The different types of the residential areas • Old deteriorated districts • Informal Housing • Shanty Towns & Dead Cities • The Historical Areas Unit 2.2: The urban characteristics of the residential areas Unit 2.3: The urban fabric of residential areas models in Egypt
Readings	• White, R and Whitney, J, "Cities and environment: an over- view. In Sustainable Cities: urbanization and the environment in international perspective", ed. R Stren, R White and D Whitney,1992 • Forbes Davisdson and Geoff Payne, Urban Projects Manual, Liverpool University Press, 1996
Activity	**Assignment 2**: Monitor and Analyze the types and urban fabric of the residential areas in Ismalia City.

Module 3	**The Urban Renewal Programs**
Key Concepts	Slum clearance, Redevelopment , Up- Grading , Conservation
Overview	This module covers and discusses the different systems and programs of the urban renewal for the residential areas, deals with the concepts, definitions and theories. Different objectives and programs of urban upgrading from project to another, but they are often deal with three main components: Economic activities, social services, and urban improvements
Aim	The overriding aim of this module is to find out the different systems and programs of the urban renewal for the residential areas
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the different and programs of the urban renewal • Find out the mechanism of each system • Analyzing the urban fabric of residential areas models
Units	Unit 3.1: The Concept of The Urban Renewal Programs Unit 3.2: Definitions and Theories Unit 3.3: Slum clearance and Redevelopment Unit 3.4: Up- Grading and Rehabilitation Unit 3.5: Historical Conservation
Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997 • Turner, J. F. C, "Housing by People, Towards Autonomy in Building Environments", Marian Boyars, London, 1979.
Activity	• Research in groups, each group (3-5 students) • Each group chooses a residential area in Ismalia facing urban problems • Studying of its characteristics • Analysing the urban fabric • Choose the suitable renewal system to apply • Prepare a poster size 90 cm × 180 cm includes: • Theoretical study summarizes of the course • Applied and analytical Study of the chosen residential area
Module 4	**Sustainable urbanization and development**
Key Concepts	Sustainability, urban development, sustainable development

Overview	This module covers the concept of sustainable urban development and the impact of climate change on the cities.
Aim	The overriding aim of this module is to enhance understandings of the term sustainable urban development.
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the different and programs of the urban renewa • Find out the mechanism of each system • Analyzing the urban fabric of residential areas models
Units	Unit 4.1: Sustainable Urban Development Unit 4.2: Challenges facing Sustainable Urbanism Unit 4.3: Approaches to Sustainable Urban Development
Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997 • Haughton, G and Hunter, ‘‘Sustainable Cities. Jessica Kingsley, London. 1994
Activity	Reviewing the research progress
Module 5	**The Urban Renewal Experiences**
Key Concepts	International , National Experiences
Overview	This module covers studying and analyzing the national and international experiences its advantages and disadvantages. The module demonstrates the implementation of the urban renewal projects in different countries.
Aim	The overriding aim of this module is to enhance understandings of the national and international experiences.
Learning Outcomes	At the end of this module students will be able to: • Identify the international Urban Renewal Experiences • Identify The national Urban Renewal Experiences • Find out and analyzing the mechanism and implementation
Units	Unit 5.1: The international Urban Renewal Experiences Unit 5.2: The national Urban Renewal Experiences
Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997

	• Haughton, G and Hunter, "Sustainable Cities. Jessica Kingsley, London. 1994 • Payne, G,"Low Income Housing in the Developing World", Liverpool University Press, 1986. • Forbes Davisdson and Geoff Payne, Urban Projects Manual, Liverpool University Press, 1996.
Activity	Reviewing the research progress
Module 6	**Urban Renewal Legislations**
Key Concepts	Urban Legislations , laws, policy makers
Overview	
Aim	The overriding aim of this module is to identify and study
Learning Outcomes	At the end of this module students will be able to: • Identify the • Identify the means of • Proficiency in dealing with.
Units	Unit 6.1: The international Urban Renewal Legislations Unit 6.2: The national Urban Renewal Legislations
Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997
Activity	Reviewing the research progress

The CLIMASP Course Module

Course	**Urban Renewal of Residential Areas**
Module 1	**Urbanization and its problems**
Key Concepts	Urbanization, overpopulation, housing
Overview	This module covers definitions of urbanization and the overpopulation as it is considered one of the great problems facing cities and the consequences of severe problems such as lack of housing, the spread of deteriorating neighborhoods, the informal extensions, slums and pollution as well
Aim	The overriding aim of this module is to turn students able to raise

	awareness about urbanization and the problems resulting from it
Learning Outcomes	At the end of this module students will be able to: • Identify definitions and basic terms of urbanization • Identify and discuss rapid urbanization. • Identify and discuss the problem of the overpopulation
Units	Unit 1.1 Rapid urbanization : Overpopulation in Egypt Unit 1.2: Problem of urbanization
Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997 • Forbes Davisdson and Geoff Payne, Urban Projects Manual, Liverpool University Press, 1996
Activity	**Assignment 1. :** The overpopulation in Egypt: Causes and its effect on urbanization.
Module 2	**Types of the residential areas**
Key Concepts	Housing, formal and informal housing, slums, deteriorated areas
Overview	This module covers the classification of the different types of residential areas in Egypt. The module discusses the characteristics of each type and the reasons for the appearance of this pattern.
Aim	The overriding aim of this module is to identify the characteristics of the different types of the residential areas in Egypt
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the different types of the residential areas • Find out the characteristics of each pattern • Analyzing the urban fabric of residential areas models
Units	Unit 2.1: The different types of the residential areas • Old deteriorated districts • Informal Housing • Shanty Towns & Dead Cities • The Historical Areas Unit 2.2: The urban characteristics of the residential areas Unit 2.3: The urban fabric of residential areas models in Egypt

Readings	• White, R and Whitney, J, "Cities and environment: an over- view. In Sustainable Cities: urbanization and the environment in international perspective", ed. R Stren, R White and D Whitney,1992 • Forbes Davisdson and Geoff Payne, Urban Projects Manual, Liverpool University Press, 1996
Activity	**Assignment 2**: Monitor and Analyze the types and urban fabric of the residential areas in Ismalia City.
Module 3	**The Urban Renewal Programs**
Key Concepts	Slum clearance, Redevelopment , Up- Grading , Conservation
Overview	This module covers and discusses the different systems and programs of the urban renewal for the residential areas, deals with the concepts, definitions and theories. Different objectives and programs of urban upgrading from project to another, but they are often deal with three main components: Economic activities, social services, and urban improvements
Aim	The overriding aim of this module is to find out the different systems and programs of the urban renewal for the residential areas
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the different and programs of the urban renewal • Find out the mechanism of each system • Analyzing the urban fabric of residential areas models
Units	Unit 3.1: The Concept of The Urban Renewal Programs Unit 3.2: Definitions and Theories Unit 3.3: Slum clearance and Redevelopment Unit 3.4: Up- Grading and Rehabilitation Unit 3.5: Historical Conservation
Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997 • Turner, J. F. C, "Housing by People, Towards Autonomy in Building Environments", Marian Boyars, London, 1979.
Activity	• Research in groups, each group (3-5 students) • Each group chooses a residential area in Ismalia facing urban problems

	• Studying of its characteristics • Analysing the urban fabric • Choose the suitable renewal system to apply • Prepare a poster size 90 cm × 180 cm includes: • Theoretical study summarizes of the course • Applied and analytical Study of the chosen residential area
Module 4	**Sustainable urbanization and development**
Key Concepts	Sustainability, urban development, sustainable development
Overview	This module covers the concept of sustainable urban development and the impact of climate change on the cities.
Aim	The overriding aim of this module is to enhance understandings of the term sustainable urban development.
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the different and programs of the urban renewa • Find out the mechanism of each system • Analyzing the urban fabric of residential areas models
Units	Unit 4.1: Sustainable Urban Development Unit 4.2: Challenges facing Sustainable Urbanism Unit 4.3: Approaches to Sustainable Urban Development
Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997 • Haughton, G and Hunter, "Sustainable Cities. Jessica Kingsley, London. 1994
Activity	Reviewing the research progress
Module 5	**The Urban Renewal Experiences**
Key Concepts	International , National Experiences
Overview	This module covers studying and analyzing the national and international experiences its advantages and disadvantages. The module demonstrates the implementation of the urban renewal projects in different countries.
Aim	The overriding aim of this module is to enhance understandings of the national and international experiences.
Learning Outcomes	At the end of this module students will be able to:

	• Identify the international Urban Renewal Experiences • Identify The national Urban Renewal Experiences • Find out and analyzing the mechanism and implementation
Units	Unit 5.1: The international Urban Renewal Experiences Unit 5.2: The national Urban Renewal Experiences
Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997 • Haughton, G and Hunter, "Sustainable Cities. Jessica Kingsley, London. 1994 • Payne, G,"Low Income Housing in the Developing World", Liverpool University Press, 1986. • Forbes Davisdson and Geoff Payne, Urban Projects Manual, Liverpool University Press, 1996.
Activity	Reviewing the research progress
Module 6	**Urban Renewal Legislations**
Key Concepts	Urban Legislations , laws, policy makers
Overview	
Aim	The overriding aim of this module is to identify and study
Learning Outcomes	At the end of this module students will be able to: • Identify the • Identify the means of • Proficiency in dealing with.
Units	Unit 6.1: The international Urban Renewal Legislations Unit 6.2: The national Urban Renewal Legislations
Readings	• Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997
Activity	Reviewing the research progress

Marwa samir kamel Ali Mohamed
(Lecturer in plant protection department- faculty of Agriculture –Suze Canal University.)
Course Name: Agriculture zoology (Credits)

Number of modules: Theoretical (1) – Practical (2)

KNOWLEDGE (Concepts, theories, processes)	SKILLS (Tools, methodologies, dynamics)	ATTRIBUTES (Innate abilities)	CLIMASP CORE COMPETENCES
adaptation Economics of climate change Gender and climate change Science, impacts & scenarios Strategic planning Integrated assessment Vulnerability assessment Environmental awareness Environmental management Spatial decision tools Technology and innovation Consumer habits Anticipation and monitoring Risk assessment Gender-sensitive response to climate change Biodiversity and climate change Green economics Environmental economics Economics and growth Environmental awareness Vulnerability risk assessment Forecasting and scenario planning Spatial decision tools Biodiversity, ecosystems change Social learning	Systems thinking Anticipatory adaptation Validation and testing Dealing with uncertainty Prioritising Monitoring Reporting Anticipating risk Reducing vulnerability Risk assessment Impact assessment Futures thinking Local knowledge Risk prediction Critical thinking Crisis management Integrated assessment Costing and valuation Adaptive capacity Critical, systemic and futures thinking Spatial planning systems Problem solving Communicating Connecting Team management Ecological footprinting SWOT analysis Discourse	Optimism Openness to novelty and change Accountability Fairness Open-minded Proactive Organised Decisive Democratic Responsible Empathy Perspective Co-responsibility Systematic Focussed Confident	1. Identify and categorise local livelihood assets and resources. . 2. Gain an overview and quantify climatic hazard risk and resilience capacity of local communities. 3. Identify and assess the effectiveness of the current coping mechanisms practiced by communities to secure and improve their livelihoods and 4. conserve ecosystem bio-diversity in the context of climate change. 5. Explore the institutional context in which the community operates and identify appropriate institutional partners for adaptation. 6. Develop urgent and immediate short term and long term adaptation priorities for district, regional and national level planning. 7. Identifying and nurturing collaborative partnerships either within an organisation or in the wider community to create common purpose to resolve systemic problems. 8. Questioning business as usual can threaten our ideals, values, beliefs, business strategies and technical understanding and is not necessarily what everyone wants to hear. 9. Dealing with values and ‘big picture’ sustainability is outside the comfort zone of many people in the workplace. 10. Understanding sources of risk and insecurity, their impacts on livelihoods and application to building resilience (to climate and natural resource shocks, food and nutrition insecurity, political economy and in fragile contexts). 11. Knowledge and application of analytical tools, ways of working

processes	Debating Advocating		and evidence, innovation and learning. 12. Compare local problems with problems elsewhere and to gain adaptation ideas from this comparison. 13. Anticipate possible future environmental change and identify possible development consequences. 14. Analyse and evaluate complex and sometimes competing environment and development issues and integrate these into practical, balanced and sustainable solutions. 15. Evaluating the risks that climate change poses to economic development and evaluating potential adaptations that address risks to economic development 16. Be able to give local examples of the effects of climate change on agriculture and how producers might help adapt to climate change. 17. Evaluating the risks that climate change poses to public health and quality of life and evaluating potential adaptations that address risks to public health and quality of life. 18. Determine what happens with climatic variations, which components are most vulnerable and how they are affected. 19. Knowledge and understanding of tools and mechanisms for achieving sustainable development and green growth. 20. Build linkages between poverty reduction, MDGs, macroeconomic policies, environment, energy, climate change and sustainable development. 21. Able to carefully and systematically examine research to judge its trustworthiness and its value and relevance in a particular context and other potential sources of evidence. 22. Able to interpret, use and present data and evidence in defining policy and practice. 23. Able to design, commission and manage evaluations including rigorous impact evaluations. 24. Assess and monitor impacts of climate variability and climate change on agriculture, forestry and fisheries and the livelihoods that rely on these sectors, taking into account socio-economic scenarios and drivers of change in agricultural sectors per major

			eco-region. 25. Develop and disseminate guidelines, methodologies and tools for collection, processing and analysis of climate change-related data and information, and strengthen databases for use in impact and vulnerability assessments and adaptation. 26. Communicate information and promote equitable access of rural people and institutions to information related to impacts of climate variability and change and adaptation in the agriculture, forestry from global to local levels, and vice versa through appropriate channels. 27. Document, evaluate and disseminate successful experiences in sustainable natural resources management, agriculture and food production and gender and rights-based adaptation strategies and practices. 28. Advocate at the regional and international level for a stronger recognition of the challenges to and potential of agriculture, forestry and fisheries sectors in climate change adaptation frameworks and financing mechanisms, and ensure that main stakeholders, including indigenous people and vulnerable groups, have a voice in advocacy. . 29. Reinforce national and regional capacities for plant, forest and animal health and food safety and improve monitoring and control of variations in pests, diseases and food safety, related to climate change. 30. Strengthen food value chains and, in particular, improve small-scale producers' access to markets to increase resilience of food systems. 31. Understand the concept of 'footprinting', for example, the 'carbon footprint' and 'ecological footprint' of individuals and organizations; the different methods of footprinting; and the advantages and disadvantages of each. 32. Use systems and 'futures' thinking allows us to better

			appreciate the natural and social systems that come together and interact in the built environment. 33. Use techniques for resolving or avoiding conflict in an ethical manner and know where to get help if ethical dilemmas arise. 34. Ability to translate scientific climate information into policy and practical guidance .

Course Syllabus

Environmental Studies

ARCH 42X- Elective 9

Suez Canal University, Faculty of Engineering,
Department of Architecture and Urban Planning,
Second Semester, 2014-2015

Instructor Information

Instructor: Dr. Mervat Abdel Aziz M. Nasr
Office Location: SCU Campus
Telephone: -
Office Hours: Mon 12:00 pm- 01.00 pm, Wed 09:00 am- 12.00 pm
E-mail: Mervat_Nasr@eng.suez.edu.eg
Website:

Course Identification

Course Number: ARCH 42X- Elective 9
Course Name: Environmental Studies
Course Location: University Campus
Class Times: ---
Prerequisites: ----
Faculty Web Page: http://www.scuegypt.edu.eg/

Course Description/Overview

The course covers the study and definition of different environments and monitoring the natural environment and the built environment characteristics and the impact on each other and the human relationship with them. The course includes:

- The concept of the environment and its relationship to human beings (natural environment and the built environment)
- Climate Change & Sustainability
- Geographical division of the climatic regions in the world and considerations for human thermal comfort
- Climatic factors affecting the design
  (Sunlight - Temperature - wind - natural lighting - evaporation and humidity and precipitation)

- Models, examples and analysis of the heritage architectural elements

Course Learning Objectives

The overarching goals of this course are:

- Identify the different environments (the natural environment - the built environment).
- Identify the manifestations of climate change and sustainable principles.
- Learn the climatic factors influencing the design.
- Raise awareness of different types of environmental treatments through studying and analyzing models of local and heritage architecture.
- Acquire the skill of analyzing environmental factors to raise the efficiency of the environmental performance in the buildings.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

40. Knowledge of various environmental treatments.
41. Proficiency analysis of climatic and environmental factors affecting the architectural design.
42. Mastering the skill of design elements and architectural treatments verify control climatic factors
43. Apply principles of sustainability on the architectural design.

Course Resources

Required Course Texts and Materials

- Shafaq El Wakeel and Mohammed Siraj, "Climate and Architecture of Tropical Zones," - Cairo 1989
- Koenigsberger, Ingersoll, Mauhew, Szokolay, "Manual of Tropical Housing and Building", Longman, London 1973
- Randall McMullan, “Environmental Science in Building”, 7th edition, Palagrave Macmillan, 2012
- Robins, C., Daylighting Design and Analysis, Van Nostrand Reinhold Co., 1986. avoidance.
- Guzowski, M., Daylighting Sustainable Design, McGraw Hill, Co., 2000.
- Brown, G. Z., Sun, Wind and Light, Architectural Design Strategies, John Wiley and Sons Inc., 2000.

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Class attendance /Assignments & presentation	20%
Half Exam	20%
Final research and poster	30%
Final Exam	30%
Total Points	**100**

Course Policies

Classroom Protocol

- Students must attend all lectures on time.
- Students must be active class participation, which counts for 20% of the grade.
- Students must adhere to submit duties and assignments in time according the schedule to avoid deduction grades of delay.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Half Exam	Week 8
Final research and poster	Week 15
Final Exam	Week 16

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Environment: Types and characteristics
3		Man and Climate: The climatic regions
4-6		Climate Change & Sustainability
7-9		The climatic factors affecting the design: Temperature, Wind,

		Precipitation
9-11		Renewable Energy and Architecture
12-13		Analytical study of the heritage architectural elements
14-15		Final presentation of the researches and posters
16		Final Exam

APENDIX II: The CLIMASP Course Modules Template Example

Course	**Curriculum and Hypermedia**
Module 1	**Dynamic Earth and Earth systems**
Key Concepts	Dynamic Earth, plate tectonic, continental drift, sea floor spreading
Overview	This module briefly explains how and why Earth's surface, and its interior, are constantly changing. It relates this constant change to the major geological topics of interaction of the atmosphere, water and rock, the modern theory of plate tectonics. In the early 1960s, the emergence of the theory of plate tectonics started a revolution in the earth sciences. Since then, scientists have verified and refined this theory, and now have a much better understanding of how our planet has been shaped by plate-tectonic processes. We now know that, directly or indirectly, plate tectonics influences nearly all geologic processes, past and present.Plate tectonic theory affects all of us because it explains where and why such natural disasters as earthquakes, volcanic eruptions, and tsunami occur as well as the formation and distribution of many economically valuable natural resources.
Aim	An appreciation of how the Scientific Method relates to the development of the Theory of Plate Tectonics.

Learning Outcomes	At the end of this module learners will be able to: • Contrast the concept of catastrophism and uniformitarianism. • Describe the earth's basic internal structure. • Describe the basic types of plate boundaries (divergent, convergent, transform) and describe the relative motions of each. • Discuss the driving mechanisms that might cause plate motion (Thermal convection, mantle plumes, hot spots). • cite the lines of evidence in support of the Plate Tectonics Theory, Continental Drift and Sea floor Spreading.
Units	Unit 1.1 Earth system Unit 1.2: Continental drift Unit 1.3: Sea floor spreading, wonder of poles Unit 1.4: Plate Tectonic Unit 1.5. Earth Science Literacy Principles
Readings	Tarbuck, E.J. and Lutgens, F.K. (2012) Earth science 13th ed., Prentice Hall, New Jersey, Ch 7. James S. Monroe, Reed Wicander, and Richard Hazlett (2007) Physical Geology: Exploring the Earth, 6th ed, ch. 2: 33-69
Activity	**Overview** Assignment 1.1 to 1.4 • The history of the concept of plate tectonics is a good example of how scientists think and work and how a hypothesis can be proposed, discarded, modified, and then reborn. Discuss the evolution of an idea - how the earlier hypothesis of moving continents (continental drift) and a moving sea floor (sea-floor spreading) were combined to form a theory of plate tectonics • possible connections between plate tectonic behavior and climate change, because plate tectonics influences the cycling of material throught the earth's crust.
	Assignment 1.5 According to Earth Science Literacy Principles: discuss in deails the

	following statements:- • Civilization exist by geologic consent, subject to change without notice • Humans signifanly alter the earth/
Module 2	**Earth Material**
Key Concepts	Extrusive and intrusive Igneous rocks, weathering, sedimentary rocks, soil, metamorphic rocks
Overview	Plutonism is igneous activity at depth in the crust, which produces the intrusive igneous rocks. In volcanism, ash and lava are erupted and extrusive igneous rocks are formed as the ejected material cools rapidly. These processes are associated primarily with three plate-tectonic settings On the continents, the circulation of the atmosphere weathers, transports, and deposits sediments by wind, water, and ice. Subsidence of an oceanic plate causes deposition, burial, and lithification of sediment transported from the continents. Metamorphism and uplift occur where continental plates collide at convergent boundaries. These collisions uplift mountains and create the great pressures and temperatures that metamorphose rocks.
Aim	Development of skills to recognize major rock types, their constituent minerals, and their origin.
Learning Outcomes	At the end of this module learners will be able to: • Identify examples of intrusive and extrusive rocks • Differentiate between chemical and physical weathering • Classify clastic and non-clastic sediments • Introduce metamorphic agents, processes, protoliths and types of metamorphism.
Units	Unit 2.1: Igneous rocks. Unit 2.2: Weathering and soil formation Unit 2.3: Sedimentary rocks. Unit 2.4: Metamorphic rocks
Readings	

	Buol, S. W., F. D. Hole, R. J. McCracken, and R. J. Southard. 1997. *Soil Genesis and Classification. 4th ed.* Ames, IA: Iowa State University Press. Diane H. Carlson, Charles C. Plummer, Lisa Hammersley (2011) Physical geology: earth revealed.—9th ed. /
Activity	Identify and classify minerals and rocks
	• Design a plan to maintain balance between the increment of mineral and rock consumption and our limited resources (DEPLETION OF INDUSTRIAL MATERIALS). • Describe the types of environments where sedimentary rocks are formed. • Describe sedimentary structures. • Explain the significance of fossils in sedimentary rocks. • Relate the rock cycle with plate tectonic setting
Module 3	• **Force within (Deformation, Earthquakes)**
Key Concepts	Stress Strain, Fault, joint, fold
Overview	Rocks deform in response to differential stress. Some rocks are brittle, others are ductile, and the same rock can be brittle at shallow depths and ductile deep in the crust. • Rock type affects the way rocks deform. In particular, the old, hard igneous and metamorphic rocks that form the crystalline basement act as brittle materials, fracturing along fault planes in earthquakes, while the younger, softer sediments that overlie them fold gradually as ductile materials To understand earthquakes, for instance, one must know about faults. Appreciating how major mountain belts and the continents have evolved calls for a comprehension of faulting and folding. Understanding plate tectonic theory as a whole also requires a knowledge of structural geology. (Plate tectonic theory developed primarily to explain certain structural features.) In areas of active tectonics, the location of geologic structures is important in the

	selection of safe sites for schools, hospitals, dams, bridges, and nuclear power facilities. Also, understanding structural geology can help us more fully appreciate the problem of finding more of Earth's dwindling natural resources
Aim	An understanding of three-dimensional analysis of Earth structures, and the stresses that produce them along with how major landforms relate to geological processes.
Learning Outcomes	At the end of this module learners will be able to: • Know the difference between **elastic, brittle, and plastic deformation** in rocks • Describe the cause of earthquakes. • Describe how an earthquake epicenter is located, how the magnitude of an earthquake is determined • Discuss the status of earthquake prediction, can Earthquakes be Controlled?
Units	Unit 3.1: Deformation: Stress and strain; Folds, Fractures and faults *Unit 3.2: Earhquake:* Causes and seismic waves Global distribution, effects, and plate kinematics
Readings	Lisle, R. (2004) Geological Structures and Maps: A practical guide. 3rd ed. Elsevier Butterworth-Heinemann, 106p Platt, J. (1970) A series of elementary exercises upon geological maps. Thomas Murby & Co Reichard, J. S. (2011) Environmental Geology / James S. Reichard. -- 1st ed. Part 2-Ch.5
Activity	**Overview**
	3.1. Based on geologic maps excersies, (rock formation and geologic structure. □ What are the definitions of **strike and dip**. From a cross-section (road-cut exposure) of beds, be able to recognize an **anticline** and a

syncline. Also, from a cross section, be able to recognize an **overturned fold**, an **open (normal or symmetrical) fold**, a **recumbent fold**, and an **isoclinal fold**. Know how to identify an anticline and syncline by the **relative age of beds exposed in their surface outcrops**. Be able to recognize an anticline, syncline, dome, and basin from a surface map showing **strike and dip symbols**. Know how to use the **nose of a plunging fold** on a surface outcrop to determine the direction an anticline or syncline is plunging.
Know the difference between **strike slip** and **dip slip** movement on fault planes? What types of stress creates a normal fault and reverse faults. Be able to identify in cross-section: a **reverse fault**, a **normal (gravity) fault**, and a **thrust fault**; and from surface view: a **left lateral strike slip fault** and a **right lateral strike slip fault**. At **which plate boundary** would you expect to find strike slip faults, to find reverse faults, and to find normal faults?

3.2. Assignment

- About 95 percent of the energy released by earthquake is concentrated in narrow zone that wind around the globe.

a. Discuss the difference between earthquake intensity and magnitude.
b. How are faults, foci, and epicenters are related?
c. Elaborate the factors that affect amount of Ground Motion?

- What is the seismic risk of Suez Canal district? How safe or unsafe the infrastructure and big projects (Bridge/tunnel)? Upon what factors would your answer depend?

Module 4	**Sculpturing Earth's Surface**
Key Concepts	Chemical, physical weathering, soil, mass wasting
Overview	Minerals making up igneous rocks crystallize at relatively high temperatures and sometimes at high pressures as magma and lava cool. Although these minerals are stable when they form, most of them

	are not stable during prolonged exposure at the surface. Explore some of the interactions between the climate and plate tectonic systems. The systems interact to give us three geologic processes that break down and fragment rocks and transport these products over short distances: weathering, erosion, and mass wasting. These processes are the first steps in flattening mountains that have been uplifted by tectonic processes. When material on a hillside has weathered, it is likely to move downslope because of the pull of gravity. Soil or rock moving in bulk at Earth's surface is called mass wasting. Mass wasting is one of several surficial processes. Other processes of erosion, transportation, deposition - involving streams, glaciers, wind, and ocean waves - are discussed in following modules we describe how different types of mass wasting shape the land and alter the environment and what factors control the rapidity or slowness of the process. Understanding mass wasting and its possible hazards is particularly important in hilly or mountainous regions.
Aim	The overriding aim of this module is first to explore the process change the earth surface with the focus on weathering and mass wasting
Learning Outcomes	At the end of this module learners will be able to: • Explain the difference between mechanical and chemical weathering. • Discuss soil composition, texture, structure, formation, and classification. • Describe the controls of mass wasting. • List and describe the various types of mass wasting.
Units	Unit 4.1: Weathering and soil formation Unit 4.2: Mass wasting
Readings	Carlson, D., Plummer, C., Hammersley, L. (2011) Physical geology: earth revealed.—9th ed, Ch. 12&13

Activity	**Overview**
	Assignment: 4.1 Land degradation is world wide environmental problem, what was damage in the past we can`t restore. Land degradation includes soil erosion, desertification, and salinization. Discuss briefly 4.2 • What triggers mass wasting? Discuss the methods prevent it. • The crisis took place in Mokattam Plateau few years ago is one form of mass wasting. Discuss briefly the causes of mass movement and preventive measures.
Module 5	**Water system**
Key Concepts	River, ground water, pollution, aquifer, coast, ocean
Overview	The module also discuss the causes and effects of flooding, and various measures used to control flooding . Surprisingly, water underground is about 60 times as plentiful as fresh water in lakes and rivers on the land surface (not including water stored as ice in glaciers). Groundwater is a tremendously important resource. How it gets underground, where it is stored, how it moves while underground, how we look for it, and, perhaps most important of all, why we need to protect it For most of human history, the 71 percent of Earth's surface covered by the oceans was a mystery. The large populations who lived at the edge of the sea knew well the impact of the waves, the rise and fall of The energy of the waves comes from the wind. This energy is used to a large extent in eroding and transporting sediment along the shoreline. Understanding how waves travel and move sediment can help you see how easily the balance of supply, transportation, and deposition of beach sediment can be disturbed. Such disturbances can be natural or human-made, and the changes that result often destroy beachfront

	homes and block harbors with sand.
Aim	The overriding aim of this module is first to Understand how freshwater originates and moves within the hydrologic cycle either as surface water or underground water. secondly, explore some of the natural processes and hazards that occur along coastlines, focusing on how humans interact with this unique environment.
Learning Outcomes	At the end of this module learners will be able to: • Discuss a river process (erosion, transportation and deposition) and a river feature • Flood hazard reduction • Describe the character and behavior of groundwater in various settings. • Discuss environmental problems related to groundwater • Describe wave erosion and the features produced by wave erosion. • Discuss shoreline erosional problems and solutions.
Units	Unit 5.1: Surface Water (transport from mountains to oceans) Unit 5.2: Underground water Unit 5.3: Coastlines and Ocean Basins
Readings	A compilation of hands-out, Grotzinger, J., Jordan, H., Press, F., and Siever, R. (2007) Understanding Earth. W. H. Freeman and company. Ch. 17, 18, 20

	Reichard, J. S. (2011) Environmental Geology / James S. Reichard. 1st ed. Part 2-Ch.9
Activity	**Assignment** 5.1. The impact of Grand Ethiopian Renaissance Dam on climatic change. The environmental impact of Grand Ethiopian Renaissance Dam on Egypt.
	Assignment 5.2. What groundwater problems might be encountered in your region? Write a brief description of each of the problems. Can you think of potential solutions to these problem? 5.3. The effect of global warming on Egyptian delta and sea rise especially after establishing High dam!
Module	**Global Climatic change**
Key Concepts	Milankovitch cycles, greenhouse effect
Overview	**Climate change and global warming are** potentially our most serious environmental issues today because human existence is so intimately tied to the planet's climate system. Earth's position within the solar system's habitable zone resulted in an atmosphere and a climate system that are ideal for complex plant and animal life because temperatures fall within the relatively narrow range where liquid water can exist at the surface..
Aim	The overriding aim of this module is to help students realize the causes of global warming due to release of green house gases, understand mitigation methods
Learning Outcomes	At the end of this module learners will be able to: • Explain how the greenhouse effect operates. • Describe how humans have disrupted the carbon cycle and how this affects the climate system. • Know how climate change can be triggered by orbital variations,

	and then amplified by positive feedbacks. • Describe the role the oceans have in shaping Earth's climate and weather patterns. • Explain how the study of glacial ice has led to a better understanding of the climate system • Describe the basic mitigation strategy for reducing carbon dioxide emissions and why it is imperative to begin making immediate and significant reductions.
Units	Unit 6.1: Global warming
Readings	Reichard, J. S. (2011) Environmental Geology / James S. Reichard. 1st ed. Part 2-Ch.16 Goudie, A. (2006) The Human Impact: On The Natural Environment Past, Present, And Future. Blackwell Publishing. 6th ed.
Activity	**Overview**
	Assignment: An appreciation of origin of major geologic hazards and their impacts. An understanding of three-dimensional analysis of Earth structures (big and small), and the stresses that produce them along with how major landforms relate to geological processes.

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Course Number:

Physical Geology (GE107)

Suez Canal University, Faculty of Science

Spring Semester, 2014-2015

Instructor Information

Instructor: Dr. Salah Shata

Office Location: Suez Canal University

Telephone: Office – +30 28310 77625

Office Hours: Saturday 8:30- 12:00, Thursday 8:30- 12:00

E-mail: salah215@hotmail.com

Website:

Course Identification

Course Number: **GE107**

Course Name: **Physical Geology**

Course Location: University Campus (Auditorium 1)

Class Times: Wednesday 9:00– 11:00am, lab (Wednesday 4:00-6:00pm)

Prerequisites: Non

Faculty Web Page:

Course Description/Overview

"Earth is a unique place, home to more than a million life forms, including ourselves. No other planet yet discovered has the same delicate balance necessary to sustain life. Geology is the science that studies the Earth -- how it was born, how it evolved, how it works, and how we can help it." [Press and Siever, Third Edition, 2001]

This course will further your understanding of, and ongoing curiosity about the Earth: what it's made of, its landforms, and the dynamic processes that have created and repeatedly changed the landscape (and ocean basins) through time. We will be exposed to the breadth of geology and its connections with the other major sciences, including chemistry, physics, meteorology, astronomy, and biology. As a resident of Earth, we can experience, observe, read about, and/or use much of what will be covered in course, regardless of what career paths we might take. At this time, we are fortunate to be witnesses to revolutionary changes in our understanding of the Earth's processes. These revolutions are going on in plate tectonics, Earth systems, Earth history, and more. We will cover these topics plus find out where we can access geologic information as life-long learners.

Course Learning Objectives

This course aims to provide the basic knowledge about the different internal and external processes taken place in the plant Earth. Types of these processes, their magnitude, duration and resultant landforms. Also how human being is affect by these processes as well as how human disrupt geologic process balance.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

The goals of this course are to enable the student to understand the Earth and Earth processes so that the student will be able to:

1. Read the landscape for the story of its evolution, development, hazards, potential and likely future given common Earth surface processes.
2. Interpret hazards and resource opportunities posed by geologic environments created through plate tectonic and Earth surface processes such as earthquakes, volcanoes, river valley evolution, coastal processes, and climatic change.
3. Describe the interaction and interdependence of the geologic environment and human activity at the societal level.
4. Participate meaningfully in public discussion of geoscience issues correctly using the methods and data of science.
5. An appreciation of origin of major geologic hazards and their impacts

Optional Course Texts and Materials

Buol, S. W., F. D. Hole, R. J. McCracken, and R. J. Southard. 1997. *Soil Genesis and Classification. 4th ed.* Ames, IA: Iowa State University Press.

David McGeary, Charles, M.Plummer, Diane H.Carlson (2001) Physical Geology, earth revealed.**4th ed.** McGraw Hill. 578p.

Assignments and Grading Scheme

Grading System

Student should score in every item

Grading Policy

Grades can be based on the following: (Example)

Assignments	20%
Exams	60
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	24/9	**Course Overview** Internal structure of the earth, Continental drift
2	1/10/2014	Sea-Floor Spreading, Plate tectonic
3	8/10	Earth Science Literacy Principles
4	15/10/2014	Volcanism, magmas and igneous rock
5	22/10	Weathering, Sedimentary Rocks, Soil
6	29/10	Metamorphic rocks, rock cycle, relationship between rock cycle and plate tectonics
7	5/11	Geologic time, Deformation
8	12/11	Fault, Fold, Joints
9	19/11	Earth quakes
10	26/11	Mass wasting
11	3/12	Running water process
12	10/12	Ground water activity

13	17/12	Ocean costal process
14	24/12	Global warming

Template No (12)
Course Specification

University/Academy: Suez Canal University
Faculty/Institute: Faculty of Sciences
Department: Geology

1-Course data		
Code: GE 318	**Course Title:** Coastal protection and management	**Academic year/ Level:** 3rd level
Credit/ Taught Hours: 3 **Theoretical: 2** **Practical: 2**		**Department/program:** Geology

2- Course aim	This course aims to provide the basic information about beaches, coastal processes controlling beach changes, monitoring coastline changes using field measurements and remote sensing. The course acquire the student the necessary skills concerning the techniques, types of engineering structures built to protect the coasts, impact of each type on the pattern of shoreline changes, numerical modeling approaches used to simulate and predict coastline changes.

3- Intended Learning Outcomes (ILOs):	
A- Knowledge and understandings:	**The students will be able to:** a1- Recognize the main parts of beach profile. a2- Recognize the factors controlling beach configuration. a3- Acquire the different types of engineering protection a4- Recognize the impact on the patterns of coastline changes.
B- Intellectual Skills:	**At the end of the course, the students will be able to:** b1- Draw cross-shore beach profiles from field measurements and detecting its components. b2- Differentiate between eroded and accreted beach profiles b3- Detect the relationship between the pattern of coastline changes and beach profile configuration, b4- detect coastal changes from satellite image data
C- Professional Skills:	**At the end of this course, the students will be able to:** c1- Use the types of soft-wares used to simulate shoreline changes c2- Assess the impact of engineering structures built at some sites in Egypt. c3- Evaluate the possible engineering structures used to get positive impact along the beach and neighboring areas
D- General Skills:	**At the end of the course, the students will able to:** d1- Mitigate coastal problems d2- Deal with software used for modeling simulation and prediction d3- Simulate the most appropriate methods for coastal protection

4- Course content: (theoretical and then practical)

Theoretical part content

Topic	No. of Hours	Week(s) No.	No. of Lecture(s)
Beach profile configuration and its components. Unit 1.1 Coastal zone definitions subdivisions Unit 1.2: Equilibrium beach profile	4	1,2	One
Factors controlling changes in beach profiles. Unit 2.1: Identify factors controlling coastal changes Unit 2.2: Field measurements data including, waves, currents, tides, etc. Unit 2.3: Impacts of waves characteristics on the patterns of shoreline changes	4	3,4	Two
Shoreline positions, Patterns of shoreline changes, Shoreline field survey and Remote Sensing data. Unit 3.1: How the satellite image processing will be selected Unit 3.2: Extracting vector data using ENVI software packages Unit 3.3: Vectors data integration using ArcGIS software package Unit 3.4: Recognizing the patterns of shoreline changes Unit 3.5: Measuring the rates of coastline changes.	4	5,6	Two

		Types of protective work along the beaches. Unit 3.1: Types of protective coastal protection Unit 3.2: Advantages and disadvantages of each engineering work Unit 3.3: Selecting the optimal protective work along the beach Unit 3.4: Assessing the protective works along the Mediterranean coastal zone of Egypt, e.g., Nile Delta coastal zone.	6	7,8,9	Three
		Simulation of shoreline changes using modeling techniques. Unit 5.1: Applications of shoreline changes modelling techniques Unit 5.2: Required data input Unit 5.3: Concepts and limitations of 1D GENESIS (Planform shoreline changes). Unit 5.4: Sensitivity testing Unit 5.5: Beach profiles changes Unit 5.6: DHI Software Models; Basic principles and Limitations	8	10,11,12,13	Four

Practical part content

Topic	No. of Hours	Week(s) No.	practical	Tutorial
Assignment.1: - Manual drawing of beach profile configuration based on field measurements data - Comparison between eroded and accreted beach profiles - Grain size and beach profile configuration	1	1	Excel Spread Sheet	
Assignment.2: Students in this assignment will construct and compare among measured, equilibrium and exponential beach profiles	2	2,3	Excel Spread Sheet	l
Assignment.3: Students in this assignment will analyse remote sensing data (Enhanced Landsat Thematic Mapper images, 30m resolution) of the Nile	2	4,5	1-Display and analyse images using ENVI 4.5& ERDAS Imagine 9.1 software packages 2- Display Raster and	ENVI and ERDAS tutorial

	Delta coastal zone for years 2000, 2005, 2010 and 2015. Vectors data for years 2000, 2005, 2010 and 2015 will be extracted. Detect and monitor the patterns of erosion and accretion along the Mediterranean coastal zone of Egypt in the Nile Delta beach.			Vector layers	
	Assignment.4: Students in this assignment will read a scientific research paper concerning with different types of protective structures and discuss together in its negative and positive impacts on the coastline changes. Students will suggest alternative protective work aiming to mitigate its negative impacts.	1	6	Case studies	

	Assignment.5: Reading the Manual of MIKE21 Models including M21 BW and M21 HD	1	7	Case studies	Manual and visual analyses
	Assignment.6: Students in this assignment will read Manual of 1D GENESIS and 2D &3D DHI software packages. **Assignment.7:** Using GENESIS 1D Planform shoreline changes model	2	8,9	Case studies & Modeling simulation	Manual and visual analyses
	Assignment.8: Using DHI Wave models Using DHI Sediment Transport models	2	10,11	Modeling simulation	Scientific researches
	Assignment.9: Using DHI Hydrodynamic models Using DHI Beach profile models	2	12,13	Modeling simulation	Scientific researches
5- Teaching and learning methods:	- Lectures using data show presentations and handouts - Sessions of oral discussion and critical thinking - Problems solve learning using written a structured academic report and presentat - Some parts of these sessions are based on self learning and feed back - Brain storming by session of oral discussion				

	- Lectures and handouts by the facilitator - Self learning and feedback by students
6- Teaching and learning methods for limited capability students:	- Office hours - Round discussion
7- Students assessment:	
A- Assessment Methods:	Class and lab discussion Written quizzes Mid-term exams Final practical exams Final written exams
B- Assessment schedule	Quiz-1 week-4 Mid-term exams week-7 Quiz-2 week-10 Final practical exam week-14 Final written exams End of semester
C- Assessments Weights	Mid-term exams 10% Oral Exam……..10% Final practical exam 30% Final written exams 60% Total ……..100%

Course coordinator: Head of Department:

Dr. Mona Fouad Kaiser Prof. Mohamed Helmi Gereish

Suez Canal University: **Course code:** GE 318
Faculty of Science: **Course title:** Coastal protection and management

1. Intended learning outcomes of course (ILOs):

A- Knowledge and Understanding:

a1- Recognize the main parts of beach profile
a2- Recognize the factors controlling beach configuration.
a3- Acquire the different types of engineering protection
a4- Recognize the impact on the patterns of coastline changes.

B -Intellectual skills:

b1- Draw cross-shore beach profiles from field measurements and detecting its components.
b2- Differentiate between eroded and accreted beach profiles
b3- Detect the relationship between the pattern of coastline changes and beach profile configuration
b4- Detect coastal changes from satellite image data.

C-Professional and practical skills:

c1- Use the types of soft-wares used to simulate shoreline changes
c2- Assess the impact of engineering structures built at some sites in Egypt.
c3- Evaluate the possible engineering structures used to get positive impact along the beach and neighbouring areas

d-General and transferable skills:

d1- Mitigate coastal problems
d2- Deal with software used for modeling simulation and prediction
d3- Simulate the most appropriate methods for coastal protection

The CLIMASP Course Modules

Course	Horticultural Crops Breeding
Module 1	**Horticultural crops breeding: Introduction, background and future prospective**
Key Concepts	Genetics, Evolution, Natural selection, Food Security, Genetic modification, GMO
Overview	The course is designed to Horticultural department senior year students to provide knowledge of the science and practice of horticultural crops (vegetables, fruits, ornamentals and medicinal plants) breeding. Background issues such as the history of genetics and natural selection are reviewed. How plant breeding is the major contributor to human food security are discussed in this module.
Aim	Introduce student to horticultural crops breeding and identify both historical background of the subject and the future trends in such topic.

Learning Outcomes	<u>At the end of this module students will be able to:</u> - Recognize the relation between breeding and other related biological sciences. - Recognize the role of plant breeding in world food security. - Understand the importance of breed new resistant genotypes to pests and diseases which reduce the application of pesticides and its positive impact on environment.
Units	Unit 1: Introduction and the relation to genetics, evolution and other related biological sciences.
Readings	- Course Notes - Principles of Plant Breeding, A. A. Hassan, 2009. (In Arabic) - Vegetable crops Breeding, A. A. Hassan, 2005. (In Arabic) - Poehlman, J. M. (1994). Breeding field crops. Iowa State University Press.
Activity	**Overview**

	Reading/ internet search Assignment
Module 2	**Methodology and fundamentals**
Key Concepts	Propagation, pollination, selection, hybridization,
Overview	Provide the basic knowledge of the science and practice of horticultural crops breeding that include the reproduction types, selection of parents for hybridization working with hybrid generation and breeding methods of some horticultural crops in order to solve problems associated with the field production. The plant origin, taxonomy and cytology are among the topics of focus in that module.
Aim	Introduce student to horticultural crops breeding methods and principles and identify propagation methods of plants.
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Recognize the reproduction types of plants that maintain

	sustainable use of resources. - Identify the different types of breeding methods. - Work in a breeding program to produce new horticultural plants with new characteristics.
Units	Unit 2: Reproduction and propagation of horticultural plants. Unit 3: Selection and hybridization of horticultural plants
Readings	- Course Notes - Principles of Plant Breeding, A. A. Hassan, 2009. (In Arabic) - Vegetable crops Breeding, A. A. Hassan, 2005. (In Arabic) - Hayward, M. D., Bosemark, N. O., & Romagosa, I. (1993). Plant breeding: principles and prospects. Chapman and Hall Ltd.
Activity	**Overview**
	Reading/ internet search Assignment

	Video viewing
Module 3	**Plant breeding and climate change**
Key Concepts	Climate change, global warming, CO_2 emission, desertification
Overview	Throughout this module, the students will be introduced to concepts and principles of sustainable agriculture and the methods to breed new plant varieties that can fit with such concepts. Environmental issues associated with horticultural crops breeding are discussed during the course. The major threats of climate change to agriculture sector in both general production and horticulture are discussed. Adaption of sustainability concepts and other steps to deal with climate changes is considered during the module. The safety methods of genetic modification to cope with climate change are a key issue of the module.
Aim	1- Introduce student to the importance of breeding practices

	that relate with the sustainable use of genetic resources. 2- Also, discuss how to benefit from those valuable resources to mitigate the effect of climate change. 3- Introduce students to the environmental and ethical dimensions during the various stages of horticultural crops.
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Recognize the current needs for new and efficient horticultural crops varieties that mange the dramatic changes in climate. - Identify how plant breeding is a major contributor to climate change mitigation. - Determine the best breeding methods to alleviate the effect of climate change. - The student understands the importance of breed new resistant genotypes to pests and diseases which reduce the application of pesticides and its positive impact on

	environment.
Units	Unit 4: Plant breeding and climate change
Readings	• Course Notes • Ceccarelli, S., Grando, S., Maatougui, M., Michael, M., Slash, M., Haghparast, R., ... & Nachit, M. (2010). Plant breeding and climate changes. The Journal of Agricultural Science, 148(06), 627-637. • Howden, S. M., Soussana, J. F., Tubiello, F. N., Chhetri, N., Dunlop, M., & Meinke, H. (2007). Adapting agriculture to climate change. Proceedings of the National Academy of Sciences, 104(50), 19691-19696.
Activity	Overview
	Reading/ internet search Assignment
Module 4	**Breeding of vegetable crops**

Key Concepts	Vegetables, varieties, hybrids, production
Overview	Provide knowledge of the science and practice of vegetable crops breeding, in order to solve problems associated with the field production of such vegetables.
Aim	Provide students with scientific knowledge and practical experience on the breeding of vegetable crops.
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Study the different types of breeding methods applied to vegetable crops. - Recognize the current needs for new and efficient vegetable crops varieties that mange the dramatic changes in climate. - Introduces students to new trend in producing vegetable crops high in antioxidant content for better human life.
Units	Unit 5: Cucurbit crops breeding Unit 6: Solanaceous crops breeding Unit 7: Cole crops breeding

Readings	• Course Notes • Vegetable crops Breeding, A. A. Hassan, 2005. (In Arabic) • Tomato, A. A. Hassan, 2001. (In Arabic) • Fruit Vegetables, A. A. Hassan, 2001. (In Arabic)
Activity	**Overview**
	Reading/ internet search Assignment Field and greenhouse trip
Module 5	**Breeding of fruit crops**
Key Concepts	Fruits, varieties, tree breeding, evergreen fruit trees, deciduous fruit trees
Overview	Provide knowledge of the science and practice of fruit crops breeding, in order to solve problems associated with the field production of such fruits.
Aim	Provide students with scientific knowledge and practical experience

	on the breeding of fruit crops.
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Study the different types of breeding methods applied to fruit crops. - Recognize the current needs for new and efficient fruit crops varieties that mange the dramatic changes in climate. - Introduce students to new trend in producing fruit crops high in antioxidant content for better human life.
Units	Unit 8: Citrus crops breeding Unit 9: Stone fruits breeding Unit 10: Grape and apple breeding Unit 11: Date palm and mango breeding
Readings	- Course Notes - Janick, J., & Moore, J. N. (1975). Advances in fruit breeding. Purdue University Press.. - Moore, J. N., & Janick, J. (1983). Methods in fruit breeding.

	Purdue University Press.
Activity	**Overview**
	Reading/ internet search Assignment Orchard trip
Module 6	**Breeding of ornamental and medicinal crops**
Key Concepts	Flowers, bulbs, trees, shrubs,
Overview	Provide knowledge of the science and practice of ornamental crops (flowers, bulbs, trees, shrubs) breeding, in order to solve problems associated with the field production of such plants.
Aim	Provide students with scientific knowledge and practical experience on the breeding of ornamental, aromatic and medicinal crops.
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Study the different types of breeding methods applied to

	ornamental, aromatic and medicinal crops. - Introduce students to new trend in medicinal plants usage in alternative medicine.
Units	Unit 12: Ornamental plants breeding
Readings	- Course Notes - Vainstein, A. (Ed.). (2002). *Breeding for ornamentals: classical and molecular approaches*. Springer. - De Jeu, M. J. (1998, July). In vitro techniques for ornamental breeding. In *XIX International Symposium on Improvement of Ornamental Plants 508* (pp. 55-60). - Shibata, M. (2008). Importance of genetic transformation in ornamental plant breeding. *Plant biotechnology*, *25*(1), 3-8.
Activity	**Overview**
	Reading/ internet search Assignment

	Park trip
Module 7	Biotechnology
Key Concepts	Biotechnology, Tissue Culture, Genetic Engineering, GMO
Overview	Provide knowledge of the science and practice of crops breeding using recent and modern techniques of biotechnology.
Aim	Introduce student to recent and modern techniques of biotechnology.
Learning Outcomes	At the end of this module students will be able to: - Recognize the current needs for biotechnology applications in field of breeding. - Recognize the role of biotechnology to cope with the dramatic changes in climate. - Introduce students to the safe use of biotennology.
Units	Unit 14: Tissue culture application in ornamental plants Unit 15: Genetic engineering in ornamental plants

Readings	- Course Notes - Bliss, F. A. (1992, June). Biotechnology and plant Breeding. In *II International Symposium on In Vitro Culture and Horticultural Breeding 336* (pp. 23-32). - Morandini, P., & Salamini, F. (2003). Course Description/Overview

The course is designed to Horticultural department senior year students to provide knowledge of the science and practice of horticultural crops (vegetables, fruits, ornamentals and medicinal plants) breeding, that include the reproduction types, selection of parents for hybridization working with hybrid generation and breeding methods of some horticultural crops in order to solve problems associated with the field production.

The plant origin, taxonomy and cytology are among the topics of focus in that course. Throughout the course, the students will be introduced to concepts and principles of sustainable agriculture and the methods to breed new plant varieties that can fit with such concepts. Environmental issues associated with horticultural crops breeding are discussed during the course.

The major threats of climate change to agriculture sector in both general production and horticulture are discussed. Adaption of sustainability concepts and other steps to deal with climate changes is considered during the syllabus. The safety methods of genetic modification to cope with climate change are a key part of the course.

Course Learning Objectives

1 - Provide students with scientific knowledge and practical experience on the breeding of horticultural crops (fruits, vegetables, ornamental plants).

2 - Introduce students to the interrelationship between different methods of horticultural crops breeding (mass selection, backcross, and recurrent selection).

3- Introduce student to the different breeding practices that relate with the sustainable use of genetic resources. Also, discuss how to benefit from those valuable resources to mitigate the effect of climate change.

4 - Introduce students to the environmental and ethical dimensions during the various stages of horticultural crops breeding to produce healthy and high quality product.

Course Content Learning Outcomes

1- Knowledge and concepts:

- Recognize the reproduction types of plants that maintain sustainable use of resources
- Study the different types of breeding methods.
- Recognize the current needs for new and efficient horticultural crops varieties that mange the dramatic changes in climate.
- Introduces students to new trend in producing vegetable and fruit crops high in antioxidant content.
- Introduce different agricultural methods that adopt the sustainable use of resources.
- Identify how plant breeding is a major contributor to climate change mitigation.

2- Intellectual and mental skills

- The student determines the best breeding methods to alleviate the effect of climate change.
- The student understands the importance of breed new resistant genotypes to pests and diseases which reduce the application of pesticides and its positive impact on environment.
- Analyze the needs of both domestic and international markets.

3-Professional and practical skills:

- Student will be able to breed different kinds of horticultural crops.
- Apply the appropriate methods of plant breeding to the third world limited resources.
- Student should be able to work in a breeding program to produce new horticultural plants with new characteristics.
- Discover problems associated with the breeding process and use of theoretical knowledge and information from lectures to solve those problems.

4- General and transferable skills:

- Each student explains the proper methods of breeding specific horticultural crop to his colleagues.
- The student presents the expected environmental impact of breeding new pests and diseases resistant genotypes

- Students work in groups to solve the problems associated with breeding complicated process.
- Students display the problems encountered during the breeding of crops and their vision to solve.

The CLIMASP Course Modules

Course	**Horticultural Crops Production**
Module 1	**Introduction to Horticulture Science, methodology and sustainability in agriculture.**
Key Concepts	Horticultural science, production, sustainability

Overview	The course is designed to plant protection department senior year students to be able to manage horticultural crops production. The focus of this module is introducing the different steps of production such as propagation, irrigation, fertilization, concepts and principles of sustainable agriculture.
Aim	Provide students with scientific knowledge and practical experience on the cultivation and production of horticultural crops (fruits, vegetables, ornamental plants).
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Recognize the morphological characteristics of horticultural crops and their growth requirements. - Study the optimum methods of cultivation and production of horticultural crops. - Recognize the problems associated with the production of horticultural crops and how to deal with these problems. - Apply the correct principles of fertilization and irrigation programs to achieve economically and environmentally-friendly production.
Units	Unit 1: Introduction to Horticulture Science and basic concepts associated with production such as propagation, fertilization, irrigation sustainability in agriculture.
Readings	- Course Notes - Horticultural Science, Jules Janick, 1986. - Plant Propagation (Principles and Practices), Hartman et al., 1997.

Activity	**Overview**
	Reading/ internet search Assignment Video viewing
Module 2	**Fruit crops**
Key Concepts	Fruits, varieties, evergreen fruit trees, deciduous fruit trees
Overview	Provide knowledge of the science and practice of fruit crops production, in order to solve problems associated with the field production of such fruits.
Aim	Provide students with scientific knowledge and practical experience on the production of fruit crops.
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Identify the different types of production methods applied to fruit crops. - Recognize the current needs for new and efficient fruit crops varieties that mange the dramatic changes in climate. - Introduces students to new trend in producing fruit crops high in antioxidant content for better human life.
Units	Unit 2: Stone Fruits (peach - plum - apricot - almond) production Unit 3: Pome Fruits (apples and pears) production Unit 4: Grapes production Unit 5: Citrus (orange, tangerine, lemon, grape fruit) production Unit 6: Tropical Fruits (banana, mango, date palm) production
Readings	- Course Notes

	- Faust, M. (1989). Physiology of temperate zone fruit trees. John Wiley & Sons, Inc.. - Kader, A. A. (Ed.). (2002). Postharvest technology of horticultural crops (Vol. 3311). UCANR Publications.
Activity	**Overview**
	Reading/ internet search Assignment Video viewing
Module 3	**Vegetable crops**
Key Concepts	Vegetables, varieties, production
Overview	Provide knowledge of the science and practice of vegetable crops production, in order to solve problems associated with the field production of such vegetables.
Aim	Provide students with scientific knowledge and practical experience on the production of vegetable crops.
Learning Outcomes	At the end of this module students will be able to: - Identify the different types of production methods applied to vegetable crops. - Recognize the current needs for new and efficient vegetable crops varieties that mange the dramatic changes in climate. - Introduces students to new trend in producing vegetable crops high in antioxidant content for better human life.
Units	Unit 7 : Production of tomatoes Unit 8: Production of cucurbits (watermelon, cucumber, melon,

	squash) Unit 9: Production of pulse crops (pea, beans) Unit 10: Production Cole crops (cabbage, cauliflower, broccoli)
Readings	• Course Notes • Vegetable crops, A. A. Hassan, 2001. (In Arabic) • Tomato, A. A. Hassan, 2001. (In Arabic) • Fruit Vegetables, A. A. Hassan, 2001. (In Arabic)
Activity	**Overview**
	Reading/ internet search Assignment Video viewing
Module 4	**Ornamental crops and their economic and environmental benefits**
Key Concepts	Flowers, bulbs, trees, shrubs
Overview	Provide knowledge of the science and practice of ornamental crops (flowers, bulbs, trees, shrubs) production, in order to solve problems associated with the field production of such plants.
Aim	Provide students with scientific knowledge and practical experience on the production of ornamental plants.
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Recognize the different types of production methods applied to ornamental plants.
Units	Unit 11: Introduction to ornamental plants and their different

	uses. Unit 12:Woody ornamental, shrubs and trees production and their economic and environmental benefits
Readings	- Course Notes - Handreck, K. A., & Black, N. D. (2002). *Growing media for ornamental plants and turf*. UNSW press. - Still, S. M. (1994). *Manual of herbaceous ornamental plants*. Champaign, IL: Stipes Publishing Company. - Hernández-Apaolaza, L., Gascó, A. M., Gascó, J. M., & Guerrero, F. (2005). Reuse of waste materials as growing media for ornamental plants. *Bioresource Technology*, *96*(1), 125-131.
Activity	**Overview**
	Reading/ internet search Assignment Video viewing
Module 5	**Landscape**
Key Concepts	Lawn, gardens, parks, sports fields
Overview	Provide knowledge of the science and practice of landscaping (lawn, gardens, parks, sports fields) management.
Aim	Provide students with scientific knowledge and practical experience on the management of landscaping.

Learning Outcomes	<u>At the end of this module students will be able to:</u> - Identify the different types of landscaping plants and management.
Units	Unit 13: Landscape
Readings	- Course Notes - Carpenter, P. L., Walker, T. D., & Lanphear, F. O. (1975). Plants in the landscape. WH Freeman & Co.. - Krupka, B. (1992). Roof gardening: use of plants and vegetation on buildings. Eugen Ulmer. - Liu, H., & Xia, Y. P. (2003). Aquatic Plants in Landscape Design. Journal of Chinese Landscape Architecture, 3, 59-62.
Activity	**Overview**
	Reading/ internet search Assignment Video viewing
Module 6	**Medicinal and aromatic plants and their benefits and applications in alternative medicine**
Key Concepts	Medicinal and aromatic plants, active ingredients
Overview	Provide knowledge of the science and practice of medicinal and aromatic plants production, in order to solve problems associated with the field production of such plants.

Aim	Provide students with scientific knowledge and practical experience on the production of aromatic and medicinal crops.
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Identify the different types of medicinal and aromatic plants. - Introduce students to new trend in medicinal plants usage in alternative medicine.
Units	Unit 14: Medicinal and aromatic plants and their benefits and applications in alternative medicine
Readings	- Course Notes - Boulos, L. (1983). Medicinal Plants of North Africa. *Medicinal plants of North Africa.* - Batanouny, K. H., Abou Tabl, S., Shabana, M., & Soliman, F. (1999). Wild medicinal plants in Egypt. *With contribution of: E. Aboutabl, M. Shabana & F. Soliman). With support of the Swiss Development Co-operation (SDC). Academy of Scientific Research and Technology, Egypt. The World Conservation Union (IUCN), Switzerland*, 60-64.
Activity	**Overview**
	Reading/ internet search Assignment Video viewing
Module 7	**Horticultural production and climate change**
Key Concepts	Climate change, global warming, CO_2 emission, desertification
Overview	Throughout the module, the students will be introduced to

	concepts and principles of sustainable agriculture. Environmental issues associated with horticultural crops production are discussed during the module. The major threats of climate change to agriculture sector in both general production and horticulture are discussed. Adaption of sustainability concepts and other steps to deal with climate changes is considered during the module. The safety methods of mitigation practices to cope with climate change are a key issue of this module.
Aim	4- Introduce student to the importance of production practices that relate with the sustainability. 5- Discuss how to benefit from valuable local resources to mitigate the effect of climate change. 6- Introduce students to the environmental and ethical dimensions during the various stages of horticultural crops.
Learning Outcomes	<u>At the end of this module students will be able to:</u> - Recognize the current needs for new and efficient horticultural crops varieties that mange the dramatic changes in climate. - Determine the best production methods to alleviate the effect of climate change. - The student understands the importance of adapt sustainable concepts of production.
Units	Unit 15: Horticultural production and climate change

Readings	- Course Notes - Howden, S. M., Soussana, J. F., Tubiello, F. N., Chhetri, N., Dunlop, M., & Meinke, H. (2007). Adapting agriculture to climate change. Proceedings of the National Academy of Sciences, 104(50), 19691-19696. - Coakley, S. M., Scherm, H., & Chakraborty, S. (1999). Climate change and plant disease management. *Annual review of phytopathology*, *37*(1), 399-426. - Ortiz, R., Sayre, K. D., Govaerts, B., Gupta, R., Subbarao, G. V., Ban, T., ... & Reynolds, M. (2008). Climate change: Can wheat beat the heat?. *Agriculture, Ecosystems & Environment*, *126*(1), 46-58.

Course Identification

Course Number: B.B 304
Course Name: Production of Horticultural Crops
Course Location: Department of Horticulture Building
Class Times: Lecturer, Sunday 11 AM-1 PM
Practical Session: Sunday 1-5 PM
Prerequisites: Fundamentals of Horticultural Science
Faculty Web Page: http://scuegypt.edu.eg/

Course Description/Overview

The course is designed to plant protection department senior year students to be able to manage horticultural crops production. The focus of this course is on the different steps of production such as propagation, irrigation, fertilization etc. Throughout the course, the students will be introduced to concepts and principles of sustainable agriculture and the methods to apply such concepts in farmer fields which include Integrated Pest Management and Organic Farming.
The major threats of climate change to the agricultural production with focus on the effect on horticultural plants are discussed. Environmental issues associated with horticultural crops production are discussed during the course.

Course Learning Objectives

1 - Provide students with scientific knowledge and practical experience on the cultivation and production of horticultural crops (fruits, vegetables, ornamental plants).
2 - Introduce students to the interrelationship between different horticultural crops production factors (soil, environment, irrigation,

fertilization).

3- Introduce students to the different agricultural practices that correspond with the sustainable production of various crops which reduce the harmful effect of climate change on plants.

4 - Introduce students to the environmental and ethical dimensions during the various stages of horticultural crops production to maintain healthy and high quality product.

Course Content Learning Outcomes

<u>1- Knowledge and concepts:</u>

- Recognize the morphological characteristics of horticultural crops and their growth requirements. - Study the optimum methods of cultivation and production of horticultural crops. - Recognize the problems associated with the production of horticultural crops and how to deal with these problems.

- Introduces students to the domestic market needs of fruits and vegetables.

- Recognize the knowledge related to climate change effects and mitigation practices.

- Introduce different agricultural practices that adopt the sustainable production.

<u>2- Intellectual and mental skills</u>

- The student determines the optimum methods of production and differentiates between the needs of each crop separately. - The student understands the importance of using resistant genotypes to pests and diseases in reducing the application of insecticides and the positive impact on environment.

- Analyze the needs of both the local and export market of horticultural crops and how to manage those needs in the production process. <u>3- Professional and practical skills:</u>

- Student will be able to establish horticultural crops farm using modern but sustainable approaches.

- Apply the correct principles of fertilization and irrigation programs to achieve economically and environmentally-friendly production.

- Apply the different sustainable practices that reduce the climate change effects.

- Student should be able to produce horticultural fruits of free of pesticides and harmful synthetic chemicals.

- Discover problems associated with production and use of theoretical knowledge and information from lectures to solve those problems. <u>4- General and transferable skills:</u>

- Each student explains the proper methods of specific horticultural crop production to his colleagues - The student presents the environmental expected impact of using pesticides in production of horticultural crops

- Students work in groups to solve the problems associated with production. - Students display the problems encountered during the

production of vegetable crops and their vision to solve.

Course Schedule

Lecturers, Sunday 11 AM-1 PM

Week	Date	Topics, Reading, Assignments and Deadlines
1	**15/2/2015**	**Introduction to Horticulture Science and basic concepts associated wi production such as propagation, fertilization, irrigation sustainability agriculture.**
2	**22/2/2015**	**Stone Fruits (peach - plum - apricot - almond) production**
3	**1/3/2015**	**Pome Fruits (apples and pears) production**
4	**8/3/2015**	**Grapes production**
5	**15/3/2015**	**Citrus (orange, tangerine, lemon, grape fruit) production**
6	**22/3/2015**	**Tropical Fruits (banana, mango, date palm) production**
7	**29/3/20**	**Production of tomatoes**
8	**5/4/2015**	**Production of cucurbits (watermelon, cucumber, melon, squash) Mid-Term Examination**
9	**12/4/2015**	**Production of pulse crops (pea, beans)**
10	**19/4/2015**	**production Cole crops (cabbage, cauliflower, broccoli)**

11	**26/4/2015**	• **- Introduction to ornamental, medicinal and aromatic pl and their different uses** • **- Woody ornamental, shrubs and trees production and t economic and environmental benefits**
12	**3/5/2015**	**Flowers and landscape**
13	**10/5/2015**	**Medicinal and aromatic plants and their benefits and applications in alternative medicine**
14	**17/5/2015**	**Horticultural production and climate change**
15	**24/5/2015**	**Oral and Final Examination**

Practical Sessions: Sunday 1-5 PM

Week	Date	Topics, Reading, Assignments and Deadlines
1	**15/2/2015**	**Training students to establish an orchard.(experimental farm trip)**
2	**22/2/2015**	**Morphological characteristics of the stone fruit plants and training or to prune those trees.**
3	**1/3/2015**	**Morphological characteristics of the pome fruit plants and training or to prune those trees.**
4	**8/3/2015**	**Morphological characteristics of grape plant and train students to propagate grape using cuttings.**
5	**15/3/2015**	**Morphological characteristics of citrus plants and train students to distinguish between different types of citrus vegetative growth and flowers.**
6	**22/3/2015**	**Morphological characteristics of date palm, mango, banana plants./ orchard trip**
7	**29/3/20**	**Morphological characteristics of tomato plants and training on transplanting./ nursery trip**
8	**5/4/2015**	**Morphological characteristics of watermelon, squash, melon and cucumber plants and training on greenhouse production. /greenhouse facility trip**

9	12/4/2015	orphological characteristics of pea, bean and cowpea plants./field trip
10	19/4/2015	orphological characteristics of cabbage, broccoli and cauliflower./field trip
11	26/4/2015	• - Identification of different ornamental plants (indoor an outdoor) /nursery trip • - Identification of woody ornamental, shrubs and trees. /p trip
12	3/5/2015	Design and establish of a garden
13	10/5/2015	Identification of various medicinal and aromatic plants /nursery trip
14	17/5/2015	Horticultural plants and climate change
15	24/5/2015	Practical Examination

LIST OF INSTRUCTORS AND THE COURSES TO BE REVISED			
Name of the instructor	**Faculty/Department**	**Course(s) to be revised for CLIMASP**	**E-mail**

Marwa samir kamel ali mohamed	Faculty of Agriculture – Suez Canal University	Agriculture zoology	Marwa.samir@yahoo.com

This course content on many points, likes biodiversity , taxonomy for animal pests , relation between Agriculture pests and climate change , finally how management animal pests by use integrated pest management .
Effect of climate change is more in temperate pests, it permits range expansion. Among the various a biotic factors, temperature is an important force to drive the population. Temperatures cause the direct effects like survival, growth and development, and dispersal. There may be the possibility of evolutionary adaption in pests for change population dynamics of pests differently in different agro-ecosystem and ecological zones

نظرة عامة/وصف المقرر

تتميز ايطاليا بالتنوع فى المناخ والتربة، وهذا التنوع الاقليمى يميز دائما حياة ايطاليا، وأدى الى تنوع حضارى واقتصادى ، كما أدى وجود الوديان المتباعده والاخاديد العميقة والهضاب العاليه الى ظهور مجتمعات رعوية منعزلة الواحده عن الاخرى، كما كانت ايضا شعوب ايطاليا من اصل اجناس مختلفة يتكلمون لغات مختلفه واستمر الوضع كذلك الى ان استطاعت روما ضم الاقاليم المختلفة بشبه الجزيرة الايطالية.

ونظرا لتنوع المناخ والتربة من منطقة لاخرى وجدت مناطق مزدهره ب**الزراعه** ومتنوعة المحاصيل ومناطق اخرى منحصره فى **الرعى** فقط .

ولعبت **الجبال** دورا هاما فى ايطاليا حيث توجد سلسله جبال الالب فى الشمال والتى تهتبر حاجز طبيعى منيع اما اى مغير من الشمال ، كما لعبت جبال ابنين دورا فى البداية فى تقسيم ايطاليا الى جزء شرقى وجزء غربى منفصلين الى ان استطاع الرومان بعمل ممرات فى الجبل ادت الى ربط الجزئين واقامة الدوله الواحده.

كما تاثرت الحضاره فى ايطاليا ايضا **بالبحر** الذى كان له اثر فى البداية فى تاخر دخول ايطاليا مجال النقل البحرى وذلك لقلة تعاريج السواحل رغم امتدادها الى جانب الرياح غير الملائمه للملاحه ثم استطاعت بعد ذلك دخول الملاحه البحريه .

الهدف الاساسى من هذا المقرر :-

1- تعريف الطالب بتاريخ وحضارة شبه الجزيره الايطاليه والرومان.

2- معرفة الدور الكبير الذى لعبته كل من للبيئه والمناخ فى قيام الحضارة فى ايطاليا.

3. جمع المعلومات التاريخية والحضارية والمتعلقة بتاريخ وحضارة والرومان من مصادرها القديمة والحديثة.

4- ضروره حرص الانسان فى وقتنا الحاضر على المحافظه على البئيه واهتمامه **بها**.

5 - فهم تطور تاريخ الرومان فى مراحله المختلفة ونتائج تلك التطورات فى مختلف المجالات.

عند نهاية االمقرر يكون الطالب قادرا على :-

أ- المعرفة و الفهم

knowledge and Understanding

ان يكون الخريج قادرا على فهم:-

أ-1 معني ومفهوم تاريخ وحضارة الرومان والغرض من دراسته.

أ-2 مراحل تطور تاريخ حضارة الرومان.

أ-3 اسباب قيام وانهيار الحضارة الرومانيه والنتائج المترتبه على ذلك.

ب- المهارات الذهنية

Intellectual skills

ان يكون الخريج قادرا على:-

ب-1 تشخيص القضايا التاريخية والحضارية التى مرت بايطاليا والدروس المستفادة منها.

ب-2 تحليل اسباب الصراعات التاريخية والحضارية

جـ- المهارات المهنية

Professional Skills

ج-1 جمع وتحليل المعلومات والبيانات التاريخية والحضارية الخاصة بتاريخ الرومان واعداد تقارير عنها وذلك بالاستعانه بتكنولوجيا المعلومات.

ج-2 القدرة على تحليل ونقد مصادر تاريخ وحضارة الرومانيه.

ج-3 القدرة على استخدام الخرائط التى تخدم المقرر الدراسى.

د- المهارات العامة

General Skills

د-1 استخدام إمكانيات الحاسوب والوسائط التكنولوجية الحديثة في التواصل والإطلاع والبحث تاريخ وحضارة الرومان.

د- 2 الالمام بلغة اجنبية واحده على الاقل للاستفاده منها فى الاطلاع على الوثائق والمراجع التى كتبت عن تاريخ وحضاره الرومان.

د-3 القدرة على جمع الماده العلمية الخاصة بتاريخ وحضارة الرومان من مصادرها المتنوعة.

المراجع التى يمكن الاستفاده منها :-

- حسين الشيخ: الرومان، دار المعرفة الجامعية، الاسكندرية،2005
- ابراهيم نصحى: تاريخ الرومان، جزءان، القاهره، 1978
- مصطفى العبادى- الامبراطورية الرومانيه-الاسكندرية- 1999.
- دونلدر دلى- حضارة روما- مترجم- القاهره

بيانات المقرر

كود المقرر:-
اسم المقرر:- حضارة وتاريخ اليونان
المكان: كلية الآداب والعلوم الانسانيه – جامعة قناة السويس

نظرة عامة/وصف المقرر

عندما تتوافر عوامل الاستقرار والامان بجانب وجود العنصر البشرى الذى يدرك تماما طبيعة بيئته، فهذا مؤشر على أنه سوف تولد حضارة فى هذا المكان، وقد تجمعت معظم هذه العوامل فى منطقة حوض البحر المتوسطفكان من الطبيعى ان تنتشر حوله المراكز الحضارية، والتى ساهم فى قيامها بشكل اساسى التكوين الطبيعى للمنطقة.

فاذا ماقمنا بدرسه تاريخ وحضارة بلاد اليونان سوف نجد ان طبيعة الارض كان لها تأثير قوى على التقدم السياسى للشعب ، فاليونان عبارة عن تكتل من الوديان الضيقه والاحواض المغلقه ، فوق كل هذا فانها مفتوحه على البحر ، والحدود المتداخلة أجبرت كل مدينه ان تصبح وحده سياسيه مستقله ، وهو ما أدى الى ظهور دولة المدينه فى اليونان، هذا فيما يخص **تأثير الطبيعه الجغرافية على نظام الحكم**

وعند دراسة **الزراعه** فنجد ايضا تاثير الطبيعه الجغرافيه عليها فالمناطق الصالحه للزراعه قليلة التساع تحيطها الجبال ، ولكن هذا لم يمنع من ان بعض هذه السهول كانت شديدة الخصوبةولكن الانتاج الزراعى لم يكن يكفى حاجات البلاد ولم يستطيعوا ان يعتمدوا عليها اقتصاديا ، وقد ادى ذلك الى ازدياد **التجاره الخارجيه** وان اصيحت بلاد اليونان تهتم **بالملاحه البحريه** .

وقد انتجت ارض اليونان بعض مقومات **الصناعه** ، فقد كانت غنية بالرخام للبناء والطمى لصناعة الاوانى الخزفية، والنحاس والفضة للمشغولات المعدنية .

الى جانب ماسبق فقد تأثرت ايضا **الديانه والاساطير الدينية** اليونانيه بقوى الطبيعة المحيطة بالانسان وتغض الالهه اذا ماحاول الانسان العبث بها.

بمحاولة تغيير الطبيعه.

الهدف الاساسى من هذا المقرر :-

1- تعريف الطالب بتاريخ وحضارة بلاد اليونان.

2- معرفة الدور الكبير الذى لعبته كل من للبيئه والمناخ فى قيام الحضارة فى اليونان.

3- اهتمام الانسان بالطبيعه وتعايشه وحرصه على ان يستخدم مايحيط به من مواد طبيعية .

4- ضروره حرص الانسان فى وقتنا الحاضر على المحافظه على البئيه واهتمامه **بها**.

عند نهاية االمقرر يكون الطالب قادرا على :-

أ- المعرفة و الفهم

knowledge and Understanding

ان يكون الخريج قادرا على فهم:-

أ-1 معني ومفهوم تاريخ وحضارة الاغريق والغرض من دراسته.

أ-2 مراحل تطور تاريخ حضارة الاغريق.

أ-3 اسباب قيام وانهيار الحضارة الاغريقية والنتائج المترتبه على ذلك

ب- المهارات الذهنية

Intellectual skills
ان يكون الخريج قادرا على:-

Course Syllabus

Urban Renewal of Residential Areas

UPL 403- Elective Course

Suez Canal University, Faculty of Engineering,
Department of Architecture and Urban Planning,
First Semester, 2014-2015

Instructor Information

Instructor: Dr. Mervat Abdel Aziz M. Nasr
Office Location: SCU Campus
Telephone: -
Office Hours: Monday 12:00 pm- 01.00 pm
Wednesday 09:00 am- 12.00 pm
E-mail: Mervat_Nasr@eng.suez.edu.eg
Website:

Course Identification

Course Number: ARCH 42X- Elective 9
Course Name: Urban Renewal of Residential Areas
Course Location: University Campus
Class Times: Wednesday 12:30 pm – 3:45 pm
Prerequisites: UPL 302
Faculty Web Page: http://www.scuegypt.edu.eg/

Course Description/Overview

The course covers the study and definition of urban renewal in general and especially the problems facing the residential areas. The overpopulation is considered one of the great problems facing cities and the consequences of severe problems such as lack of housing, the spread of deteriorating neighborhoods, the informal extensions, slums and pollution as well. The course discusses:

- The regional planning and city planning as means of controlling the migration from rural areas to urban.
- The urban renewal concepts: slum clearance, up-grading and conservation.
- The impact of climate change on the cities and how to apply the sustainable policy.

Course Learning Objectives

The overarching goals of this course are:

- Identify the urbanization and its problems
- Identify the different types of the residential areas.
- Identify the manifestations of climate change on the cities.
- Clarify the interrelationship between housing and social, economic factors and the impact of climate change.
- Acquire the skill of analyzing the renewal projects for residential areas.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

44. Knowledge of the different types of the residential areas
45. Proficiency analysis of the different and programs of the urban renewal
46. Mastering the skill of analyzing the renewal projects for residential areas.
47. Apply principles of sustainability on the urban renewal projects.

Course Resources

Required Course Texts and Materials

- Ahmed Kh. Allam, Yhya Shedid, Maged El Mahdi, "Urban Renewal," - Cairo 1997
- Payne, G,"Low Income Housing in the Developing World", Liverpool University Press, 1986.
- Forbes Davisdson and Geoff Payne, Urban Projects Manual, Liverpool University Press, 1996.
- Turner, J. F. C, "Housing by People, Towards Autonomy in Building Environments", Marian Boyars, London, 1979.

- Haughton, G and Hunter, "Sustainable Cities. Jessica Kingsley, London. 1994

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Class attendance /Assignments & presentation	20%
Half Exam	20%
Final research and poster	30%
Final Exam	30%
Total Points	**100**

Course Policies

Classroom Protocol

- Students must attend all lectures on time.
- Students must be active class participation, which counts for 20% of the grade.
- Students must adhere to submit duties and assignments in time according the schedule to avoid deduction grades of delay.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Half Exam	Week 8
Final research and poster	Week 15
Final Exam	Week 16

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Urbanization and its problems
3-5		Types of the residential areas
6-8		The Urban Renewal Programs
9-10		Sustainable urbanization and development
11-12		The Urban Renewal Experiences
13		Urban Renewal Legislations
14-15		Final presentation of the researches and posters
16		Final Exam

APENDIX II: The CLIMASP Course Modules Template Example

Course	**Curriculum and Hypermedia**
Module 1	مجالات الخدمة الاجتماعية

Key Concepts	البيئة–مدمنى المخدرات– الكوارث–التسول– الأسرة
Overview	لابد أن يعرف الطالب من خلال هذا المقرر أن الأفراد الذين يمارسون العمل الأخصائيون الاجتماعيون" بالإضافة إلى المتطوعين "الاجتماعي والذين يحملون لقب والباحثين الاجتماعين يهتمون بتحديد المشكلات الاجتماعية والبحث عن أسبابها وإيجاد حلول لها ودراسة مدى تأثير هذه المشكلات على أفراد المجتمع ككل، وعلى المعنيين فيها بشكل خاص، لذلك من الضرورى الإجابة على بعض التساؤلات فى إطار ذلك المقرر وهى: ما دور الأخصائى الاجتماعى فى معالجة بعض الظواهر والمشكلات الاجتماعية التى يعانى منها المجتمع؟ما الظواهر والمشكلات التى قد تشكل معوقا أمام تقدم المجتمع ؟
Aim	الهدف من المقرر يتمثل فى مساعدة الطلاب على فهم مجالات العمل الاجتماعى سواء فى مجال رعاية مدمنى المخدرات والمسكرات أو رعاية المتسولين أو فى مواجهة الأزمات والكوارث أو فى مجال حماية البيئة.
Learning Outcomes	فى نهاية هذا المقرر ينبغى أن يكون الطالب قادرا على : – تحديد العوامل الكامنة وراء تلوث البيئة والتغيرات المناخية، تعاطى المخدرات، المشكلات الأسرية، الكوارث، التسول. – يمارس الأدوار الفعلية المهنية للأخصائى الاجتماعى فى مجال البيئة، ورعاية مدمنى المخدرات، والأسرة، ورعاية المتسولين .

Units	- الخدمة الاجتماعية فى مجال حماية البيئة – الخدمة الاجتماعية فى مجال مدمنى المخدرات – الخدمة الاجتماعية فى مجال الأسرة -- الخدمة الاجتماعية فى مجال الكوارث والأزمات – الخدمة الاجتماعية فى مجال التسول
Readings	1– عبد الله تركماني، «التنمية المستدامة والأمن الإنساني في العالم العربي»، تونس، بحث مقدم للدورة السنوية لمعهد العلاقات الدولية، جمعية الدراسات الدولية، 2006. 2– محمد بنهان سويلم : التلوث البيئي وسبل مواجهته ، الهيئة المصرية العامة للكتاب ، القاهرة 1999 3–حسن شحاته احمد : البيئة والمشكلة السكانية ، الدار العربية للكتاب ، القاهرة ، 200 4–محمد السيد، الإنسان وتلوث البيئة،الدار المصرية اللبنانية، 2006. ماهر أبو المعاطى على، الخدمة الاجتماعية ومجالات الممارسة المهنية، القاهرة:مطبعة نور الإيمان، 1999.
Activity	– التدريب بإحدى المؤسسات أو المنظمات العاملة فى مجال رعاية المتسولين أو مدمنى المخدرات أو رعاية الأسرة

	– القيام بإعداد بحث حول أحد الظواهر الاجتماعية أو المشكلات الاجتماعية. – توضيح دور الأخصائى الاجتماعى فى حل تلك الظواهر أو المشكلات – القيام بدراسة تقييميه للسياسات الاجتماعية الموضوعة من قبل الدولة لحل تلك المشكلات
Module 2	علم اجتماع البيئة
Key Concepts	البيئة- تغير المناخ- التلوث- المشكلات البيئية
Overview	لم تعد قضية البيئة فى العقد الأخير من القرن العشرين قضية ثانوية فقد اتسع مفهوم الإنسان للبيئة ليشمل جميع جوانب حياته، فالبيئة هى الهواء الذى يتنفسه وهى السلوكيات التى ينتهجها البيئة هى المجتمع وأخلاقياته باختصار البيئة هى وجوده، فالبيئة اذن ليست ترف ولكنها وجود وفكر ومنهج وعلم ، فإما نكون أو لا نكون ، فإما أن نحافظ على ما تبقى لنا على هذا الكوكب أو أن نتمادى فى قتلنا البيئة فنفنى معها وعلى ضوء هذه الاعتبارات يطرح المقرر عدة تساؤلات:ما هو مفهوم البيئة، التلوث البيئى، تغير المناخ؟ ماهى المشكلات البيئية التى يعانى منها المجتمع؟ ما دور أفراد المجتمع والدولة فى مواجهة تلك المشكلات؟ ما علاقة البيئة بالتنمية المستدامة؟
Aim	يهدف علم الاجتماع البيئى إلى ترشيد الطالب بماهية النظام البيئى وما به .

	من شتى المكونات والطاقات، وإبراز العلاقة بين البيئة والإنسان وما استحدثه بوسائله التنموية نتيجة لثورته الزراعية والصناعية من تغيرات قد تلحق بالنظام البيئى بعض الأضرار أو تؤدى به إلى الانهيار. لذلك فإن الهدف الرئيسى من دراسة علم اجتماع البيئة هو ترشيد وتثقيف الطالب الجامعى بالبيئة كى يشعر الشباب الجامعى بمسئوليته فى المجتمع بعد تخرجه كصانع قرار ومخطط ومنفذ .
Learning Outcomes	– يتعرف على البيئة ومكوناتها. - يحدد العوامل الكامنة وراء تلوث البيئة والتغيرات المناخية. - يصمم برنامج لرفع الوعى البيئى لدى المواطنين. – يمارس الأدوار الفعلية المهنية للأخصائي الاجتماعى .
Units	الفصل الأول : مفهومات البيئة وتعريفاتها الفصل الثانى: مشكلات البيئة فى مصر والحلول المقترحة لها. الفصل الثالث: ملامح الأزمة البيئية فى مصر.

	الفصل الرابع: التشريعات الخاصة بحماية البيئة.
Readings	– أحمد رشيد ، علم البيئة ، بيروت: معهد الإنماء العربى. 2– أحمد مدحت، التلوث مشكلة العصر، الكويت، سلسلة عالم المعرفة، 1990. 3– السيد عبد العاطى ، الإنسان والبيئة، بيروت: لبنان، 1994 4– حسين طه وآخرون، البيئة والإنسان، الكويت،1984 5– سوزان أحمد، الإنسان والبيئة والمجتمع، الإسكندرية: دار المعرفة الجامعية، 1999 6– محمد الجوهرى، علياء شكرى، البيئة والمجتمع، الإسكندرية: دار المعرفة الجامعية، 1995
Activity	**Overview**
	- تقييم التشريعات الخاصة بحماية البيئة. - تحديد مظاهر التدهور البيئى فى بعض المجتمعات العشوائية. - تكليف الطلاب بالمشاركة فى احد برامج التنمية الاجتماعية للمواطنين
Module 3	علم اجتماع التنمية
Key Concepts	التنمية المستدامة، التغير- التقدم- التخلف-البيئة-
Overview	تعد قضية التنمية والتحديث من القضايا التى جذبت اهتمام التنظير العالمى المتعلق بالتحديث والسعى باتجاه بناء نظام عالمى حديث يستند الى مواجهة التخلف والنهوض بالمجتمعات التى سيطرت عليها القوى الاستعمارية، وسلبت كثيرا من مواردها الأساسية،

	اضافة الى تشوية بنيتها الثقافية والاجتماعية، لذلك يحاول هذا المقرر الإجابة على عدة تساؤلات:ما أسباب تخلف مجتمعات الجنوب؟ وما هى الجهود التى بذلتها من أجل التغلب على أسباب التخلف بتنمية هذه المجتمعات؟
Aim	**الهدف من المقرر** يتمثل فى مساعدة الطلاب على فهم عملية التنمية والتحديث فى مجتمعات العالم الثالث وذلك من خلال التعرف على عوامل واليات التنمية الاجتماعية ، التعرف على مراحل العملية التنموية، والتأكيد على أهمية المشاركة الشعبية فى مشروعات التنموية ، كذلك التعرف على أسباب تخلف مجتمعات العالم الثالث ، وكيفية تحقيق النجاح فى مجتمعاتنا وذلك من خلال التعرف على التجارب التنموية الناجحة فى بعض المجتمعات مثل تركيا وماليزيا . أيضا يهدف المقرر الى تعريف الطالب كيفية التحول من التنمية إلى التنمية المستدامة وذلك من خلال التعرف على طبيعة التنمية المستدامة ومكوناتها وأبعادها وشروطها ، وأفاق التنمية المستدامة فى المجتمعات العربية والإسلامية.
Learning Outcomes	فى نهاية المقرر نتوقع من الطالب: يتذكر مبادئ التنمية المستدامة وشروطها. يناقش المشكلات التى تواجه العملية التنموية فى المجتمع . يمارس الأدوار الفعلية المهنية للأخصائي التنموى . يشارك في أحد برامج تنمية المجتمع .

Units	1–مفاهيم التنمية والتخلف 2– خصائص مجتمعات الجنوب الثقافية والاجتماعية 3– العوامل المسئولة عن تخلف مجتمعات الجنوب 4– نظريتى التحديث والتبعية 5– مبادئ التنمية المستدامة ومكوناتها وشروطها 6– دور المنظمات غير الحكومية فى التنمية المستدامة 7– التجارب التنموية الناجحة فى العالم
Readings	– على ليلة، العالم الثالث، قضايا ومشكلات، دار الثقافة للطبع والنشر والتوزيع، 1985. – روبرت دال، التحليل السياسى للتحديث، ترجمة علا أبو زيد، مركز الأهرام للترجمة والنشر، الطبعة الخامسة 1993. – صلاح هاشم، التنمية والجريمة المعولمة، وزارة الثقافة، الهيئة العامة لقصور الثقافة، 2010. – على ليلة:العالم الثالث، مشكلات وقضايا، دار الثقافة للنشر والتوزيع، 1987. – أندرية جوندر فرانك، البرجوازية الرثة والتطور الرث، ترجمة هيثم الأبوبى، أكرم ديرى، دار العودة، بيروت، 1973.

نظرة عامة/وصف المقرر

لا شك أن الانسان فى كل زمان ومكان ادرك أنه جزء من البيئة التى يعيش فيها واستطاع ان يكيف نفسه مع المناخ المحيط به، وكان هذا هو الحال بالنسبة للمصريين الذين ادركوا بوضوح معنى البيئة واهميتها بالنسبه لهم، وعرفوا باسلوبهم كيف يتعاملون معها.

وترتبط الأحداث التاريخية ووضع أسس الحضارة المحلية فى أرض مصر ارتباطا وثيقا بعوامل البيئة الجغرافية، فقد ساهمت مقومات البيئة الطبيعية فى تقدم هذه الحضارة.

وسوف نقوم فى هذا الكورس بشرح ومناقشه مجموعه من الموضوعات التى توضح تأثر الحضارة المصريه بالبيئه المصرية وكذلك محاولات الانسان المصرى بالتكيف مع البيئة ومع المناخ المحيط به وهذه الموضوعات هى:-

- **تاثير جغرافية مصر وطبيعة الارض فى ترابط الدولة ونظام الحكم** حيث تتميز مصر بالأرض المنبسطه التى سهلت ارتباط اقاليم مصر المختلفه وادى ذلك الى سهوله حكمها فقد استطاع اى ملك يحكم مصر ان يحكم مصر كلها وذلك لعدم وجود اى معوقات تعوق الاتصال، كما أن **موقعها الجغراقى المتميز** فى وسط العالم القديم سهل اتتصالها مع حضارات العالم القديم. كما توفرت لمصر **حدود طبيعية أمنه** حمتها من الغزوات الخارجية فى معظم فتراتها التاريخية.

- **نهر النيل:**- فقد اخترق البلاد من اقصى الجنوب الى اقصى الشمال وكان هذا النيل سبب قويا فى ربط شمال مصر بجنوبها، وتعايش المصرى مع النهر وقام ببناء السدود لحماية البلاد من الفيضان ثم الاستفاده من المياه المخزنه فى الزراعه فى الاوقات قلة المياه.

كما حرصوا على عدم تلويث ماء النيل وفروعه وقد اكدت النصوص المصرية دائما " أن من يلوث ماء النيل سوف يصيبه غضب الالهه"

- **الزراعه** وقد كان النيل عامل اساسى لقيام الزراعه فى مصر، لذا نجد الانسان المصرى يهتم بالحفاظ على مياه هذا النهر بان نظم رى الاراضى وشق الترع، كما قام بزراعه المحاصيل الزراعيه طبقا للمناخ المناسب لها فكانت هناك محاصيل صيقيه ومحاصيل شتوبة.

- **المنازل:**- بنيت المساكن فى مصر القديمه من المواد الموجوده فى البيئه المحيطه به، وكانت عادة تتبنى من الطمى والاخشاب وكان السبب فى اختياره بناء المنازل من الطوب اللبن وليس من الحجاره حتى تكون ملائمه للمناخ المحيط به فجدرانها تقيه من حرارة الشمس الى جانب انها تسمح للهواء بان ينفذ من كل مكان ، كما حرص على حماية المنازل من الحشرات وذلك من خلال مايحيط به من مواد طبيعية.

- **الدين والاساطير**:- ارتبطت الديانه المصريه ايضا بالبيئه المحيطه بالمصرى حيث نجده يجعل اله للنيل (حاعبى) وذلك لاهمية النهر بالنسبه له، ولاهمية الشمس قانم بحعل اله للشمس (رع)، كما انا معظم الهتته مرتيطه بالحيوانات وذلك لدور الحياون الرئيسى فى الزراعه والتى قام على اساسها الاقتصاد المصرد ويظهر فى اسطوره (هلاك البشريه) غضب الاله "رع" على البشر عندما قاموا بمحاولة تغيير الطبيعه.

الهدف الاساسي من هذا المقرر:-

1- تعريف الطالب بالحضاره المصرية القديمه ومقومات قيام هذه الحضاره
2- معرفة الدور الكبيرالذى لعبته كل من للبيئه والمناخ فى مصر فى قيام الحضارة المصريه .
3- اهتمام المصرى القديم وتعايشه وحرصه على ان يستخدم مايحيط به من مواد طبيعية .
4- ضروره حرص المصرى فى وقتنا الحاضر على المحافظه على البئيه واهتمامه بها.

عند نهاية المقرر يكون الطالب قادرا على :-

أ- المعرفة و الفهم
knowledge and Understanding
ان يكون الخريج قادرا على معرفة وفهم:-
أ-1 معنى ومفهوم الحضارة المصرية القديمة.
أ-2 مراحل تطور التاريخ والحضارة المصرية القديمة.
أ-3 الدور الذى لعبته البيئة والجغرافيا فى الحضارة المصرية القديمة.
ب- المهارات الذهنية
Intellectual skills
ان يكون الخريج قادرا على:-
ب- 1 تحليل الظواهر البيئة التى مرت فى التاريخ المصرى القديم، وكيفية استفاده المصرى القديم منها فى حياته اليومية.
جـ- المهارات المهنية
Professional Skills
ان يكون الخريج قادرا على:-
ج-1 جمع وتحليل المعلومات والبيانات التاريخية والحضارية الخاصة بتاريخ مصر القديمة وحضارتها واعداد تقارير عنها وذلك بالاستعانه بتكنولوجيا المعلومات.
ج-2القدرة على استخدام الخرائط التى تخدم المقرر الدراسى.
ج-3 القدرة على عرض المادة التاريخية والحضارية التى تخص التاريخ المصرى القديم والاستفاده منها .
د- المهارات العامة

General Skills
ان يكون الخريج قادرا على:-
د-1 استخدام امكانيات الحاسوب والوسائط التكنولوجية الحديثة فى الاطلاع والبحث فى مجال التاريخ والحضارة المصرية القديمة.
د-2 1عرض الأفكار والنظريات التاريخية الخاصة بتاريخ وحضارة المصريين القدماء بصورة مكتوبة وشفهية.

تقسيم الدرجات

اعمال السنه 30 درجه

الامتحان 120 درجه

الاجمالى 150 درجه

نظام عرض المقرر:-

يتضمن الفصل الدراسى 14 اسبوع كل اسبوع 4 ساعات ، وسوف يتم دراسة الموضوعات من خلال اعطاء تمهيد عن الموضوع ثم يقوم مجموعه من الطلاب بعرض ماقاموا به من ابحاث عن الموضوع المقرر مناقشته فى الاسبوع كما يفومون بعرض مايخص الموضوع من لوحات او افلام تسجيليه، ثم ينتهى السبوع بمناقشه ماقام الطلاب بعرضه ومعرفة كيفية الاستفاده من البيئة المحيطة بنا والحفاظ عليها

محتويات المقرر

الاسبوع	الموضوع

1	عرض الموضوعات التى سيتم تدريسها فى الفصل الدراسى، تعريف بالتاريخ والحضارة المصريه
2	التعريف بمقومات قيام الحضارة المصرية القديمه
3	جغرافية مصر ودورها فى جعل مصر وحده واحده
4	نظام الحكم فى مصر ودور طبيعة الارض فى مركزية الحكم
5	نهر النيل واهميته بالنسبه للحضارة المصريه
6	الزراعه (طرق الرى)
7	الزراعه(المحاصيل الزراعيه)
8	المنازل (تخطيط المنازل فى عصر ماقبل الاسرات)
9	المنازل(تخطيط المنازل فى عصر الدولة الوسطى)
10	المنازل فى عصر الدولة الحديثة
11	الديانه المصريه القديمة (نشأتها وتطورها)
12	الاساطير الدينية
13	الآلهه والألهات
14	الانسان المصرى القديم ودوره فى اقامة الحضارة

اسم المقرر: علم اجتماع البيئة

كلية الآداب –قسم الاجتماع

الفصل الدراسي الثانى 2015

Instructor Information

Instructor: Dr. sahar hassany
Office Location: Faculty of Arts
Telephone: 01005562016
Office Hours:
Website: saharhassany1@yahoo.com

Course Description/Overview

يتكون الكتاب من ربع أقسام: يتناول القسم الأول مفهومات البيئة وتعريفاتها وعناصرها وأنواع البيئات مع عرض لمشاكل التلوث البيئى والتشريعات الخاصة بحماية البيئة مع دراسة البيئة الاجتماعية وعلاقتها بالإنسان ، ثم نظرة إلى المستقبل .

ويستعرض القسم الثانى مشكلات البيئة فى مصر والحلول المقترحة لها.

ونعرض فى القسم الثالث لملامح الأزمة البيئية ونتناول فيه للنشاطات الإنسانية المتسببة فى هدم المكونات البيئية ، والتغيرات التى طرأت على البيئة وكان لها تأثيرا سلبى عليها فى الوقت الحاضر وفى المستقبل.

ويركز القسم الرابع على التشريعات الخاصة بحماية البيئة.

Course Learning Objectives

يهدف علم الاجتماع البيئى إلى ترشيد الطالب بماهية النظام البيئى وما به من شتى المكونات والطاقات، وإبراز العلاقة بين البيئة والإنسان وما استحدثه بوسائله التنموية نتيجة لثورته الزراعية والصناعية من تغيرات قد تلحق بالنظام البيئى بعض الأضرار أو تؤدى به إلى الانهيار. لذلك فإن الهدف الرئيسى من دراسة علم اجتماع البيئة هو ترشيد وتثقيف الطالب الجامعى بالبيئة كى يشعر الشباب الجامعى بمسئوليته فى المجتمع بعد تخرجه كصانع قرار ومخطط ومنفذ .

Course Content Learning Outcomes

Upon successful completion of this course, students/teachers will be able to:

أ–1 يتعرف على البيئة ومكوناتها.

أ–2 يتعرف على ملامح أزمة البيئة .

أ–3– يتذكر أنواع البيئات

ب–1– يحدد العوامل الكامنة وراء تلوث البيئة والتغيرات المناخية.

ب–2يناقش المشكلات التى تواجه البيئة .

ب–3– يتفهم خطورة المشاكل البيئية على الاقتصاد المصري .

ج.1. يصمم برنامج لرفع الوعى البيئى لدى المواطنين.

ج.2. يمارس الأدوار الفعلية المهنية للأخصائي الاجتماعى .

د.1. يشارك في أحد برامج تنمية المجتمعات العشوائية .

د.2. يبحث عن حلول للمشاكل البيئية فى مصر.

Assignments and Grading Scheme

تقييم التشريعات الخاصة بحماية البيئة ومدى فاعليتها.

تحديد مظاهر التدهور البيئى فى بعض المجتمعات العشوائية.

تكليف الطلاب بالمشاركة فى احد برامج التنمية الاجتماعية للمواطنين (نشر الوعى بقضايا البيئة والتنمية)

Course Resources

1- أحمد رشيد ، علم البيئة ، بيروت: معهد الإنماء العربى.

2- أحمد مدحت، التلوث مشكلة العصر، الكويت، سلسلة عالم المعرفة، 1990.

3- السيد عبد العاطى ، الإنسان والبيئة، بيروت: لبنان، 1994

4- حسين طه وآخرون، البيئة والإنسان، الكويت،1984

5- سوزان أحمد، الإنسان والبيئة والمجتمع، الإسكندرية: دار المعرفة الجامعية، 1999

6- محمد الجوهرى، علياء شكرى، البيئة والمجتمع، الإسكندرية: دار المعرفة الجامعية، 1995

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		**البيئة : المفهوم وتعريفه**
3		**البيئة ومكوناتها**
4		**عناصر التوازن البيئى**
5		**ملامح أزمة البيئة**
6-7		**المشاكل البيئية**
8-9		**أبعاد مشكلة التلوث البيئى**
10-11		**مشكلات البيئة فى مصر**
12		**خطورة المشاكل البيئية على الاقتصاد المصري**

13		**الحلول والمقترحات**
14-16		**امتحان شفوى وتحريرى**

اسم المقرر: علم اجتماع التنمية

Office Hours:
Website: saharhassany1@yahoo.com

Course Description/Overview

يتناول المقرر المفاهيم الخاصة بالتنمية والتنمية المستدامة والتخلف والتقدم والتغير، كما يتناول خصائص التخلف الثقافية والاجتماعية المسئولة عن تخلف مجتمعات الجنوب، كذلك يتناول المقرر نظريات التنمية والتى من بينها نظرية التحديث والتبعية ، كذلك يركز المقرر على مبادئ التنمية المستدامة ومكوناتها ، بالإضافة إلى شروط التنمية وتحدياتها المستدامة ، أيضا أبعاد التنمية المستدامة ، ودور المنظمات غير الحكومية ودور أفراد المجتمع فى التنمية والتحديث.

ويحتوى المقرر على عرض لبعض النماذج والتجارب التنموية الناجحة فى العالم ، كما يتم تكليف الطلاب بجمع معلومات عن التجارب التنموية التى تم تطبيقها داخل أو خارج المجتمع المصرى وذلك للوقوف على أسباب نجاح أو فشل هذه التجارب التنموية

Course Learning Objectives

الهدف من المقرر يتمثل فى مساعدة الطلاب على فهم عملية التنمية والتحديث فى مجتمعات العالم الثالث وذلك من خلال التعرف على عوامل واليات التنمية الاجتماعية ، والتعرف على مراحل العملية التنموية، والتأكيد على أهمية المشاركة الشعبية فى المشروعات التنموية ، كذلك التعرف على أسباب تخلف مجتمعات العالم الثالث ، وكيفية تحقيق النجاح فى مجتمعاتنا وذلك من خلال التعرف على التجارب التنموية الناجحة فى بعض المجتمعات مثل تركيا وماليزيا . أيضا يهدف المقرر الى تعريف الطالب كيفية التحول من التنمية إلى التنمية المستدامة وذلك من خلال التعرف على طبيعة التنمية المستدامة ومكوناتها وأبعادها وشروطها ، وأفاق التنمية المستدامة فى المجتمعات العربية والإسلامية.

Course Content Learning Outcomes

Upon successful completion of this course, students/teachers will be able to:

أ-1 يتعرف على مداخل ومراحل عملية التنمية.

أ-2 يتعرف على برامج ومشروعات عملية التنمية .

أ-3- يتذكر مبادئ التنمية المستدامة وشروطها.

ب-1- يحدد العوامل الكامنة وراء نجاح أو فشل بعض المشروعات التنموية.

ب-2يناقش المشكلات التى تواجه العملية التنموية فى المجتمع .

ب-3- يتفهم أهمية الشمول والتكامل فى برامج التنمية .

ج.1. يصمم برنامج لتنمية أحدى المجتمعات المحلية.

ج.2. يمارس الأدوار الفعلية المهنية للأخصائي التنموى .

ج.3. يربط ما بين مراحل عملية التنمية المختلفة

د.1. يشارك في أحد برامج تنمية المجتمع .

د.2. يبحث عن عوامل نجاح أو فشل المشروع التنموى

Assignments and Grading Scheme

التقييم الذاتي للمشروعات التنموية التي تقوم بها الدولة.

. تقييم الممارسات على البيئة والتنمية المستدامة في الحياة اليومية

تكليف الطلاب بالمشاركة فى احد برامج تنمية المجتمع المحلى وتقييم الرنامج

Course Description/Overview

ينقسم المقرر إلى خمس مجالات ، يتناول القسم الأول دور الخدمة الاجتماعية فى المجال البيئى ونعرض فيه لمفهوم البيئة ، مفهوم المشكلة البيئية ، تغير المناخ، نماذج من المشكلات التى تواجهها البيئة مثل: التلوث البيئى ، التصحر ، الانقراض.كما يحتوى القسم على أسباب المشاكل البيئية ، والسياسة البيئية وعلاقتها بفلسفة التنمية المستدامة ، كذلك يتناول القسم موضوع التغيرات المناخية ، وتأثير تلك التغيرات على القطاعات الإنتاجية فى مصر ، ومخاطر التغيرات المناخية على مصر والعالم، والجهود المبذولة من أجل مواجهة تلك المخاطر. ودور الخدمة الاجتماعية فى مجال حماية البيئة.

ويتناول القسم الثانى دور الخدمة الاجتماعية فى مجال رعاية مدمنى المخدرات الاهتمام العالمى والمحلى بتلك المشكلة ، وأنواع المخدرات ، وأسباب انتشار المخدرات والدوافع وراء تعاطيها، والآثار المترتبة على التعاطى والإدمان، والمؤسسات التى تخدم مدمنى المخدرات والمسكرات،وجهود الدولة لمواجهة هذه المشكلة.

أما القسم الثالث فيهتم بالخدمة الاجتماعية والكوارث، ونعرض فيه لأشكال الكوارث ، ودور الخدمة الاجتماعية فى مواجهتها.

أما القسم الرابع فنعرض فيه لدور الخدمة الاجتماعية فى المجال الأسري، ونتناول فى ذلك القسم المشكلات الأسرية التى يواجهها الأفراد، ودور الخدمة الاجتماعية فى علاج تلك المشكلات سواء كان ذلك من خلال خدمة الفرد أو الجماعة أو تنظيم المجتمع.

أما القسم الخامس فنعرض فيه لدور الخدمة الاجتماعية فى مجال رعاية المتسولين، ونتناول فى ذلك القسم لظاهرة التسول، والأسباب التى تدفع الأشخاص للتسول، ودور الخدمة الاجتماعية فى مواجهة تلك الظاهرة.

Course Learning Objectives

الهدف من المقرر : يتمثل فى مساعدة الطلاب على فهم مجالات العمل الاجتماعى سواء فى مجال رعاية مدمنى المخدرات والمسكرات أو رعاية المتسولين أو فى مواجهة الأزمات والكوارث أو فى مجال حماية البيئة.

Course Content Learning Outcomes

Upon successful completion of this course, students/teachers will be able to:

أ-2 يتعرف على البرامج التى تقوم بها الدولة من أجل حماية البيئة .

أ-3- يتذكر مبادئ العمل الاجتماعى .

ب-1- يحدد العوامل الكامنة وراء تلوث البيئة والتغيرات المناخية، تعاطى المخدرات، المشكلات الأسرية، الكوارث، التسول

ب-2يناقش المشكلات التى تواجه البيئة ، والأسرة ، والمدمنين، والمتسولين .

ب-3- يتفهم أهمية مواجهة المخاطر التى تهدد البيئة .

ج.1. يطرح مجموعة من الأفكار والحلول لمجابهة المخاطر التى تهدد البيئة، الأسرة .

ج.2. يمارس الأدوار الفعلية المهنية للأخصائى الاجتماعى فى مجال البيئة، ورعاية مدمنى المخدرات، والأسرة، ورعاية المتسولين .

ج.3. يربط ما بين السياسة البيئية وفلسفة التنمية المستدامة.

د.1. يشارك في أحد البرامج العلاجية المقدمة لأفراد الأسرة أو المدمنين أو المتسولين .

د.2. يبحث عن دور ورؤية الدولة للتغيرات المناخية وتأثيرها على القطاعات الإنتاجية.

Assignments and Grading Scheme

– تقييم شدة تأثير المخاطر المناخية على موارد الرزق.

– تقييم فعالية آليات المواجهة الحالية التي تمارسها المجتمعات لتأمين وتحسين الأحوال المعيشية للمتسولين.

.– تحديد تأثير الممارسات الخاطئة على البيئة والتنمية المستدامة في الحياة اليومية

– تكليف الطلاب بالبحث عن استراتيجيات الدولة فى التصدي للمخاطر المناخية والبيئية

– وضع خطة وقائية وعلاجية لبعض المشاكل الأسرية.

– تكليف الطلاب بالبحث عن استراتيجيات الدولة فى التصدي لمشكلة الإدمان.

Course Resources

Suez Canal University
Faculty of Veterinary Medicine
Wildlife Management and Zoo Medicine Department

Courses Name:

1. Environmental Conservation Policies & Practices
2. Species Extinction crisis & Environmental problems
3. Biodiversity and Nature Resources Sustainability
4. Protected Areas, Biosphere Reserves Management and Climate Change

2013-2014

Suggested Courses Syllabus Modules

Course Coordinator: Prof. Dr. Atef Mohamed Kamel Ahmed, Head of Wildlife Conservation Department, Faculty of Veterinary Medicine, Suez Canal University.

Module.1. Environmental Conservation Policies & Practices (2hs Theoretical and 2 hs Practical)

Module 1	**Environmental Conservation Policies & Practices**
Key Concepts	Environmental conservation, laws, resources sustainability, Environmental changes
Overview	As environmental concerns become ever more pressing, there is an increasing need to understand how we can effectively conserve wildlife and manage our countryside. This Environmental Conservation course gives a theoretical grounding in how populations and ecosystems work and a practical understanding of the issues surrounding environmental conservation. We teach the skills needed by conservation professionals for monitoring habitats and species and we demonstrate the importance of social and economic factors in achieving successful conservation. • Concept of sustainability and sustainable development. • Water conservation & watershed management. • Climate change, global warming, acid rain, ozone layer depletion (Kyoto protocol/2005). • Disaster management : floods, earthquake, cyclones and

	landslides. • Environment Protection Law (4/1994). • Protected areas Law (102/1983) • Issues involved in enforcement of environmental legislation. • Environment Conservation: rights and duties.
Aim	This module aims to give you an understanding of the ways in which governments have attempted to address environmental issues such as climate change, conservation, and pollution control. It discusses the role of government and other interest groups in formulating environmental policy, outlining and applying key principles used to do so.
Learning Outcomes	At the end of this module learners will be able to: • You will gain an understanding of the problems and dilemmas involved in the formation and implementation of public policies on environmental issues • the strengths and weaknesses of policies on climate change, waste, transport, agriculture and pollution • general policy principles and practices such as ecological modernization, sustainable development and Local Agenda 21, and • the role of citizen action in making and changing environmental policies

Units	Unit 1.1: Wildlife and climate change Unit 1.2: Biodiversity losses Unit 1.3: Climate change Mitigation and adaptation
Readings	• Carter N (2007) The Politics of the Environment (2nd edition) • Connolly J & Smith G (2012) Politics and the Environment: From Theory to Practice (3rd edition) • Gray S (ed) (1995) UK Environmental Policy in the 1990s • Lowe P & Ward S (eds) (1988) British Environmental Policy and Europe: Politics and Policy in Transition • Vogel D (1986) National Styles of Regulation: Environmental Policy in Great Britain and the United States • Wallace D (1995) Environmental Policies and Industrial Innovation: Strategies in Europe, USA and Japan
Activity	Overview
	Implementing the environmental conservation policies towards global climate change

Course Identification

Course Type: Undergraduate
Course Name: Environmental Conservation Policies & Practices
Course Location: Faculty of Veterinary Medicine- Suez Canal University Campus
Class Times: Thursday 9:30pm – 12:30am
Sustainability Scope: focused
Prerequisites: -

Faculty Web Page: http:// vet.scuegypt.edu.eg

Course Description/Overview

In this course we study environmental conservation from a geographical perspective reviewing the biophysical, institutional, and socioeconomic dimensions of environmental problems in order to develop more effective conservation solutions. Environmental conservation is itself a social process. Thus we pay careful to how changes in values, scientific understandings of nature, economy and politics affect conservation practice. Not only will we trace the major debates in environmental conservation but will also explore how differences in people's biophysical, economic and political surroundings have led to different perceptions of environmental problems and their solutions.

Through this class, you will develop an understanding of the major approaches to environmental conservation, their relative strengths and weaknesses, and how they developed historically. While case material will come from around the world, we begin by gaining a sense of the history of environmental conservation thought and action in the United States. While different, there are many analogous transitions in the environmental histories of other countries and regions around the world. While we cannot go into detail – key themes that many world regions share will be brought up in lecture and discussion. A range of environmental issues will be touched upon in this course including: toxic waste, soil erosion, air/water pollution, mining impacts, grazing impacts , wilderness protection, and wetland mitigation.

Course Learning Objectives

The overarching goals of this course are:

This Environmental Conservation course

1. Understand a theoretical grounding in how populations and ecosystems work and a practical understanding of the issues surrounding environmental conservation.
2. gain the skills needed by conservation professionals for monitoring habitats and species and
3. Know the importance of social and economic factors in achieving successful conservation.
4. understanding of the ways in which governments have attempted to address environmental issues such as climate change, conservation, and pollution control.

Learning outcomes Knowledge:

At the end of this module learners will be able to:

- You will gain an understanding of the problems and dilemmas involved in the formation and implementation of public policies on environmental issues
- the strengths and weaknesses of policies on climate change, waste, transport, agriculture and pollution
- general policy principles and practices such as ecological modernization, sustainable development and Local Agenda 21, and
- the role of citizen action in making and changing environmental policies

Course Resources
Course Website(s)
Required Course Texts and Materials

- Carter N (2007) The Politics of the Environment (2nd edition)
- Connolly J & Smith G (2012) Politics and the Environment: From Theory to Practice (3rd edition)
- Gray S (ed) (1995) UK Environmental Policy in the 1990s
- Lowe P & Ward S (eds) (1988) British Environmental Policy and Europe: Politics and Policy in Transition
- Vogel D (1986) National Styles of Regulation: Environmental Policy in Great Britain and the United States

Optional Course Texts and Materials : Wallace D (1995) Environmental Policies and Industrial Innovation: Strategies in Europe, USA and Japan
Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	20%
Exams	60%
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Course Schedule

Week	Date	Subject
1		Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course

		modules)
2		Environmental Conservation Policies & Practices
3		Wildlife and climate change
4		Resources Conservation on sustainable basis and Environmental changes
5		Environmental Problems and Solutions
6		Biodiversity overview. Global distribution and major threats
7		Climate change Mitigation and adaptation
8		Concept of sustainability and sustainable development.

Module.2. Species Extinction crisis & Environmental problems (2hs Theoretical and 2 hs Practical)

Module 2	2. Species Extinction crisis & Environmental problems
Key Concepts	Protected areas, Biodiversity, Endangered species, biosphere reserve, climate change
Overview	Protected areas have been used as a tool to manage natural resources for biodiversity conservation and for the well-being of people dependent on these resources. They are widely regarded as one of the most successful measures implemented for the conservation of biodiversity, drawing upon traditional and community-based approaches, governance regimes, scientific and traditional knowledge and contemporary practices of governments and conservation agencies (IUCN). The protected area has historically been the main tool for conservation action. Contemporary conservation recognizes that the properties of landscapes beyond reserves also determine the success of conservation action. This module serves to integrate these two approaches through the concept of conservation prioritization: what (and where) do we consider to be important conservation actions

	and areas, and why? The role that protected areas can play in climate mitigation and adaptation, The module covers cutting-edge quantitative and qualitative techniques in strategic conservation planning, the range of concepts and target measures of biodiversity, the inherent conflict between conservation inside and outside protected areas, and how both play out in the wider context of shared and spared land use.
Aim	The participants get a clear understanding on the concept of protected areas and Biosphere Reserves, and also learn about some good practices in marine and terrestrial protected area management. Participants also get an overview of the protected area management in Egypt.
Learning Outcomes	At the end of this module learners will be able to: 1. A closer look at the definition of a Protected Area 2. Designation and Role of protected areas in climate change 3. Types of protected areas (According to IUCN) 4. UNESCO MAB reserves have a Core Area, Buffer and Transition Zone 5. Validation, Verification and Expert 6. Review improves WDPA qualityImportance of protected area conservation standards 7. Protected areas management plan

	8. Climate change mitigation and adaptation
Units	Unit 2.1: Protected Areas Resilient to Climate Change, Unit 2.2: protected areas conserve the endangered wildlife species (In Situ Conservation)
Readings	Secretariat of the Convention on Biological Diversity (2008). Synthesis and Review of the Best Available Scientific Studies on Priority Areas for Biodiversity Conservation in Marine Areas beyond the Limits of National Jurisdiction. Montreal, Technical Series No. 37, 63 pages available from http://www.cbd.int/doc/publications/cbd-ts-37-en.pdf
Activity	Overview
	• What is the percentage of terrestrial, coastal and marine areas of biodiversity importance under protection in your country/ state? • Do you know of good practices in marine and terrestrial protected areas management your country state/ site? Share good practice from your country/ site in the discussion forum.

Course Description/Overview

It is estimated that the current rate of species extinction is between 1,000 and 100,000 times more rapid than the average rate during the last several billion years. The growth of human populations, consumption levels, and mobility is the root of most of the serious threats to biodiversity today.

While learning about the negative impacts of humans on biodiversity, please keep a few things in mind. First, it is rare that humans intend to make a species go extinct, or to threaten biodiversity in some other way. Usually those impacts are the unfortunate by-products of people trying to provide a decent living for themselves or to serve some other purpose. Second, in the last 30 years or so, efforts to protect and preserve biodiversity have expanded exponentially. We will explore those efforts later in the module. As you learn about the current threats to biodiversity, resist the temptation to conclude that humans are simply foolish or short-sighted or greedy, and instead consider the larger pressures and systems that lead toward biodiversity loss. Global warming, acid rain and the depletion of the ozone layer are devastating events that humans have created in the post-industrial age. All levels of biodiversity will be impacted by these changes in the climate and atmosphere. In this module, you examine these relationships and look at how climate has influenced the diversity of life from the formation of the biosphere to the present day. You go on to discuss the actions which can be taken to mitigate the effects of climate change and the political and economic consequences of implementing such actions.

Course Learning Objectives

The overarching goals of this course are:

There are many threats to biodiversity today. The biggest ones can be remembered by using the acronym H.I.P.P.O.: **H**abitat Loss, **I**nvasive Species, **P**ollution, Human **P**opulation, and **O**verharvesting.

Habitat Loss: This occurs when a particular area is converted from usable to unusable habitat. Industrial activities, agriculture, aquaculture, mining, deforestation, and water extraction are all central causes of habitat loss.

Invasive Species: When an animal, plant, or microbe moves into a new area, it can affect the resident species in several different ways. New species can parasitize or predate upon residents, hybridize with them, compete with them for food, bring unfamiliar diseases, modify habitats, or disrupt important interactions.

Pollution: The discharge of toxic synthetic chemicals and heavy metals into the environment has a huge impact on species abundance, and can lead to extinctions. It's important to remember that substances that are "natural" can become pollution when they are too abundant in a certain area. For example, nitrogen and phosphorous are important nutrients for plant growth, but when they concentrate in water systems after being applied as agricultural fertilizers, they can cause "dead zones" that are uninhabitable for fish and other wildlife. Also, carbon dioxide is a "natural" component of the atmosphere, but is considered a pollutant when emitted by human industrial activities.

Bioaccumulation is an important concept connected with pollution. This is the process of chemicals becoming increasingly concentrated in animal tissues as they move up the food chain.

Human Population: In the year 1800, there were fewer than 1 billion people on earth, and today there are about 6.8 billion. Even without the vast increases in per capita resource use that have occurred during this period, the pressures on biodiversity would have increased during this time period simply based on population growth.

Overharvesting: This includes targeted hunting, gathering or fishing for a particular species as well as incidental harvesting such as by-catch in ocean fisheries. The megafauna extinction example earlier was an example of overharvesting causing biodiversity loss.

Climate Change

We saw that climate change is impacting ecosystems in several ways, including via temperature shifts. These shifts are making it difficult or even impossible for many species to survive. As the climate changes more and more, biodiversity will face ever greater threats. Likewise, efforts to conserve biodiversity will face ever greater challenges. Indeed, some are starting to speak about *conservation triage* as a situation in which not all species can be saved, forcing conservationists to decide which species to protect. This use of the term *triage* is adapted from its use in medical crises, such as in emergency response to natural disasters.

Learning outcomes Knowledge:

At the end of this module learners will be able to:

Students go on to discuss the actions which can be taken to mitigate the effects of climate change and the political and economic consequences of implementing such actions. The aim is to equip students with concepts and ideas necessary to understand and discuss environmental issues at the fundamental level.

The main objectives are

(1) Familiarity with the Global change about the environment (Climate change, Global warming and Ozone depletion,
(2) Understanding the key concepts of species extinction crisis and
(3) Developing a critical attitude toward environmental issues. In this module, Students examine these relationships and look at how climate has influenced the diversity of life from the formation of the biosphere to the present day.

Course Resources

Course Website(s)

Louis P. Jojman, *Environmental Ethics* (Wadsworth, 2005)

Optional Course Texts and Materials : Wallace D (1995) Environmental Policies and Industrial Innovation: Strategies in Europe, USA and Japan

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	20%
Exams	60%
Class attendance/participation	20%
Total Points	100

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Course Schedule

Week	Date	Subject
1		Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
2		Species extinction crisis, mass extinction
3		Threat of Biodiversity (H.I.P.P.O)
4		Climate change and conservation efforts
5		Environmental attitudes and concept
6		Conservation and Communities

7		Climate change and Conservation
8		Endangered species management

Module.3. Biodiversity and Nature Resources Sustainability (2hs Theoretical and 2 hs Practical)

Module 3	Biodiversity and Nature Resources Sustainability
Key Concepts	biogeography, biodiversity hotspots, Nature Resources sustainability
Overview	Introduction to Biodiversity. Elements of Biodiversity and their inter-relationships. Measuring biodiversity through time. Sources of information. Brief history of biodiversity. Mapping biodiversity hotspots. Issues of scale. Extremes of high and low biodiversity. Gradients in Biodiversity. Congruence. Value of biodiversity. Direct use value and indirect use value. Non- use value. Human impact. Species extinction. Populations, individual and genetic diversity. Threat to biodiversity. The scale of human enterprise. Management of biodiversity. General measures for conservation and sustainable use. Identification and monitoring. In-situ and ex-situ conservation. Sustainable use of components of biodiversity.
Aim	The course provides an overview on "biodiversity", mainly from a natural scientific point of view, to qualify students to critically follow the scientific and public debates on the subject and give them background knowledge for careers in research, education and consultancy. Basic biological facts relevant in the context of biodiversity will be discussed as well as methods, all in the context of

	value of organisms for ecosystem functioning and sustainable use by humans. A main goal is creation of understanding of complexity of organisms' roles and interactions. Working out of case examples provides training for literature searches and presentations. Changes of biodiversity due to human impacts, including alien species and global change, will be considered at various levels.
Learning Outcomes	At the end of this module learners will be able to: • Describe how isolation, environmental disturbance and environmental gradients contribute to global patterns of biodiversity. • Review how human activities impact on biodiversity and the environment • Evaluate the value of ecosystem services and describe methods for their valuation • Describe major climatic cycles and their impacts upon global biodiversity • Describe, critique and use social science concepts and research methods and their application in biodiversity conservation • Evaluate future projections of environmental degradation and biodiversity loss

	• Describe and evaluate strategies to mitigate for human impacts on biodiversity loss
Units	Unit 3.1: Biodiversity levels and hotspots Unit 3.2: Biodiversity components Unit 3.3: Threats to biodiversity Unit 3.4: cause of biodiversity losses Unit 3.5: Models of biodiversity and sustainability
Readings	Rice SA (2012) Encyclopedia of Biodiversity. New York: Facts On File Inc. Further reading will be provided on Campus library Online and during the module.
Activity	Overview
	Assignment 1: Generating Themes and Incentive measures. 15. Levels of biological diversity : genetic, species and ecosystem diversity. 16. Biogeographic zones of Egypt

	17. Ecosystem and biodiversity services: Ecological, economic, social, ethical, aesthetic and Informational values 18. Biodiversity patterns and global biodiversity hot spots 19. Endangered and endemic species of Egypt. 20. Threats to biodiversity : Habitat loss, poaching of wildlife, man-wildlife conflicts, biological invasions. 21. Conservation of biodiversity : In-situ and Ex-situ conservation of biodiversity.

Course Description/Overview

Introduction to Biodiversity. Elements of Biodiversity and their inter-relationships. Measuring biodiversity through time. Sources of information. Brief history of biodiversity. Mapping biodiversity hotspots. Issues of scale. Extremes of high and low biodiversity. Gradients in Biodiversity. Congruence. Value of biodiversity. Direct use value and indirect use value. Non- use value. Human impact. Species extinction. Populations, individual and genetic diversity. Threat to biodiversity. The scale of human enterprise. Management of biodiversity. General measures for conservation and sustainable use. Identification and monitoring. In-situ and ex-situ conservation. Sustainable use of components of biodiversity.

The course provides an overview on "biodiversity", mainly from a natural scientific point of view, to qualify students to critically follow the scientific and public debates on the subject and give them background knowledge for careers in research, education and consultancy. Basic biological facts relevant in the context of biodiversity will be discussed as well as methods, all in the context of value of organisms for ecosystem functioning and sustainable use by humans. A main goal is creation of understanding of complexity of organisms' roles and interactions. Working out of case examples provides training for literature searches and presentations. Changes of biodiversity due to human impacts, including alien species and global change, will be considered at various levels.

Course Learning Objectives

The overarching goals of this course are:

- Describe how isolation, environmental disturbance and environmental gradients contribute to global patterns of biodiversity.
- Review how human activities impact on biodiversity and the environment
- Evaluate the value of ecosystem services and describe methods for their valuation

- Describe major climatic cycles and their impacts upon global biodiversity
- Describe, critique and use social science concepts and research methods and their application in biodiversity conservation
- Evaluate future projections of environmental degradation and biodiversity loss
- Describe and evaluate strategies to mitigate for human impacts on biodiversity loss

Graduate students are equipped with:

- Key techniques that are used to mitigate threats to biodiversity, including selecting nature reserves, connectivity and wildlife corridors, ecosystem restoration, sustainable yield, translocation and control of pest plants and animals.
- Key threats to biodiversity, including habitat modification and loss, unsustainable resource use, introduced species and climate change.
- a critical awareness of current problems in wildlife conservation and diseases with implications for wildlife conservation and welfare, and a new insight into veterinary interventions for the management of captive and free-living wild animals, through gaining a systematic understanding of the biological principles underpinning wild animal conservation and management, and the epidemiology, diagnosis and treatment of wildlife disease;
- basic competence in veterinary techniques and preventative medicine for wild animals;
- a conceptual and practical understanding of how established techniques of research and enquiry are used to create knowledge in the field of wild animal health, and a comprehensive understanding of scientific skills, including critical review of the scientific literature, and design and analysis of laboratory or field studies; and
- identify risks and develop climate change adaptation strategies and role of

  protected areas and Biosphere Reserves to mitigate the effect.

Course Content Learning Outcomes
Upon successful completion of this course, students will be able to:
Acquire and analyze data describing the biological and social aspects of the environment. Make management decisions about land and water that integrate relevant ecological, physical, and social information. Appreciate the natural complexity of ecosystems, and the interdisciplinary nature of their conservation. Understand the multiple values of ecosystems and the environment across the spectrum of circumstances, from urban to rural and from developed to wild. Communicate to the public that natural resource conservation is essential to long-term sustainability. Behave professionally and ethically in the management of the environment for the benefit of society.
Learning outcomes Knowledge:
Discuss and define zoo, wildlife and conservation medicine and ecosystem health in relation to human, animal and environmental health Identify diseases in Egyptian wildlife and zoo animal species (mammals and birds), Understand how a conservation medical approach can be applied in a range of practical situations, including handling of environmental problems with toxics and antibiotics/ anthelmintics and climate change.
Skills
Perform simple field necropsy techniques and sampling regimes for wildlife diagnostics and surveillance Write protocols and prepare for working with wildlife, including human safety and laws and regulations Plan / organize basic trapping / immobilization of selected wildlife species, including animal handling, anaesthesia, and method of drug delivery and subsequent monitoring.
Role of protected areas and biosphere reserves in Nature resources conservation in sustainable basis, mitigate climate change effects to prevent biodiversity losses.
Competences
Apply theory and basic methods in relation to conservation medicine and surveillance of wildlife diseases, and discuss interdisciplinary solutions Work independently and in international and interdisciplinary groups on topics regarding wildlife conservation on sustainable basis and climate change and biodiversity.

You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules in the library and online
1		Levels of biological diversity : genetic, species and ecosystem diversity, values, threats and losses.
2		Biogeographic zones of Egypt
3		Ecosystem and biodiversity services: Ecological, economic, social, ethical, aesthetic and Informational values
4		Biodiversity patterns and global biodiversity hot spots
5		Endangered and endemic species of Egypt. Threats to biodiversity : Habitat loss, poaching of wildlife, man-wildlife conflicts, Alien invasive species.
6		Conservation of biodiversity : In-situ and Ex-situ conservation of biodiversity.

Module.4 . Protected Areas, Biosphere Reserves Management and Climate Change (2 hs Theoretical and 2 hs Practical)

Module 4	Protected Areas, Biosphere Reserves Management and Climate Change
Key Concepts	Protected areas, Biodiversity, Endangered species, biosphere reserve, climate change
Overview	Protected areas have been used as a tool to manage natural resources for biodiversity conservation and for the well-being of people dependent on these resources. They are widely regarded as one of the most successful measures implemented for the conservation of biodiversity, drawing upon traditional and community-based approaches, governance regimes, scientific and traditional knowledge and contemporary practices of governments and conservation agencies (IUCN). The protected area has historically been the main tool for conservation action. Contemporary conservation recognizes that the properties of landscapes beyond reserves also determine the success of conservation action. This module serves to integrate these two approaches through the concept of conservation prioritization: what (and where) do we consider to be important conservation actions and areas, and why? The role that protected areas can play in climate mitigation and adaptation, The module covers cutting-edge

	quantitative and qualitative techniques in strategic conservation planning, the range of concepts and target measures of biodiversity, the inherent conflict between conservation inside and outside protected areas, and how both play out in the wider context of shared and spared land use.
Aim	The participants get a clear understanding on the concept of protected areas and Biosphere Reserves, and also learn about some good practices in marine and terrestrial protected area management. Participants also get an overview of the protected area management in Egypt.
Learning Outcomes	At the end of this module learners will be able to: 1. A closer look at the definition of a Protected Area 2. Designation and Role of protected areas 3. Types of protected areas (According to IUCN) 4. UNESCO MAB reserves have a Core Area, Buffer and Transition Zone 5. Validation, Verification and Expert 6. Review improves WDPA qualityImportance of protected area conservation standards 7. Protected areas management plan
Units	Unit 4.1: Protected Areas Resilient to Climate Change,

	Unit 4.2: protected areas conserve the endangered wildlife species (In Situ Conservation)
Readings	Secretariat of the Convention on Biological Diversity (2008). Synthesis and Review of the Best Available Scientific Studies on Priority Areas for Biodiversity Conservation in Marine Areas beyond the Limits of National Jurisdiction. Montreal, Technical Series No. 37, 63 pages available from http://www.cbd.int/doc/publications/cbd-ts-37-en.pdf
Activity	Overview
	What is the percentage of terrestrial, coastal and marine areas of biodiversity importance under protection in your country/ state? Do you know of good practices in marine and terrestrial protected areas management your country state/ site? Share good practice from your country/ site in the discussion forum.

Course Description/Overview

Protected areas have been used as a tool to manage natural resources for biodiversity conservation and for the well-being of people dependent on these resources. They are widely regarded as one of the most successful measures implemented for the conservation of biodiversity, drawing upon traditional and community-based approaches, governance regimes, scientific and traditional knowledge and contemporary practices of governments and conservation agencies (IUCN). The protected area has

historically been the main tool for conservation action. Contemporary conservation recognizes that the properties of landscapes beyond reserves also determine the success of conservation action. This module serves to integrate these two approaches through the concept of conservation prioritization: what (and where) do we consider to be important conservation actions and areas, and why? The role that protected areas can play in climate mitigation and adaptation, The module covers cutting-edge quantitative and qualitative techniques in strategic conservation planning in side protected areas, the range of concepts and target measures of biodiversity, the inherent conflict between conservation inside and outside protected areas, and how both play out in the wider context of shared and spared land use.

Course Learning Objectives

The overarching goals of this course are:

The participants get a clear understanding on the concept of protected areas and Biosphere Reserves and World Heritage Sites, and also learn about some good practices in marine and terrestrial protected area management. Participants also get an overview of the protected area management in Egypt.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. A closer look at the definition of a Protected Area
2. Choose and Designation of new protected areas and its Role in conservation
3. Types of protected areas (According to IUCN)
4. UNESCO MAB Biosphere reserves have a Core Area, Buffer and Transition Zone Validation, Verification and Expert
5. Review improves WDPA qualityImportance of protected area conservation standards
6. Protected areas management: Assessment and plan
7. Protected Areas and Ecotourism

Learning outcomes Knowledge:
Graduate students are equipped with:

- identify risks, and develop climate change adaptation strategies and important role of protected areas and Biosphere Reserves to mitigate the hazard effect.

Skills
Perform simple field necropsy techniques and sampling regimes for role of protected areas and its values. Write protocols and prepare for working with Endangered wildlife species, including environmental safety and laws and regulations (102/1983 protected areas law). Management Plan / Assessment of protected areas. Role of protected areas and biosphere reserves in Nature resources conservation in sustainable basis, mitigate climate change effects to prevent biodiversity losses.
Competences
Apply IUCN Criteria for establishment of protected areas and UNESCO MAB basic procedures for designation of new biosphere reserve. Work independently and in international and interdisciplinary groups on topics regarding wildlife conservation in protected areas on sustainable basis and climate change mitigation and biodiversity.
Course Resources

Course Description:

This course gives students the theoretical and legislative framework for understanding natural and man-made disasters. This module brings together emergency planning, business continuity, crisis management and disaster recovery and introduces the skills and knowledge required for effective management in emergencies and disasters. This course looks at the entire spectrum of risks in the business environment together with a strong analysis of the consequences when things go wrong.

Course Objectives:

To provide students with a sound and comprehensive understanding of the following topics:

- Disaster management models;
- Vulnerability and resilience;
- Major incident management;
- Disaster Risk Reduction (DRR) strategies;
- Natural (i.e. environmental and climate change) and man-made disasters;
- International regulations and guidelines of DRR;
- Terrorism management.

Course Outcomes:

After completion of this course, student will:

1. Be able to analyze the different phases of natural and man-made disasters.
2. Be able to perform a Vulnerability and Capacity Assessment.
3. Be able to create a basic Disaster Risk Reduction plan and to communicate and discuss the structure of this plan amongst other students.
4. Be able to provide advice for real organizations on how to improve their DRR practice.
5. Apply disaster and emergency management frameworks in real case scenarios.
6. Apply the basic principles of disaster and emergency management in decision making.

Assessment Instruments

	Mark
Midterm Exam	30%
Project	20%

Participation	10%
Final Exam	40%
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1:	**Unit 1: Introduction:** Disaster sequence and Escalation of Incidents.	**Ch.1 Tolley's Handbook.**
Week 2:	**Unit 2:** The Disaster Life-Cycle Model.	**Ch.1 Tolley's Handbook.**
Week 3:	**Unit 3: Applications:** Case studies: Cyclone Tracy, El-Nino Drought, and Huang He Flood.	**Classroom Exercises and case studies**
Week 4:	**Unit 4:** Disaster types. **Unit 4:** Classification of events according to impact **and** Basic definitions **Unit 4:** Characteristics of crises.	**Ch.1 Tolley's Handbook.**
Week 5:	**Unit 5:** Classification of disasters in terms of probability **Unit 5:** Major incident management.	**Classroom discussions**
Week 6:	**Unit 6:** Causes of Disasters: The three models of disaster causes.	**Classroom discussions**
Week 7:	**Unit 7:** Sources of disasters: analysis of the business environment; environmental hazards; STEEPLED and SWOT analysis, **Exercise:** Internal & External analysis for the AUM.	**Ch.1 Tolley's Handbook.**
Week 8:	**Midterm Exam**	
Week 9:	**Unit 8:** The Hyogo Framework for Action (HFA) - UNISDR: 2005-2015. **Unit 8:** Collaboration in Disaster and Emergency Management.	

Week 10:	**Unit 9:** Disaster and emergency management systems. **Unit 9:** Monitoring of disaster and emergency management plans.	**Ch.5 Tolley's Handbook.**
Week 11:	**Unit 10:** Vulnerability and Capacity Assessment (VCA).	**Ch.5 Tolley's Handbook.**
Week 12:	**Unit 11: Exercises:** VCA for the AUM. **Unit 11: Quiz:** VCA quiz.	**Classroom Exercises and case studies**
Week 13:	**Unit 12:** How to improve the practice of DEM.	**Class discussions.**
Week 14:	**Unit 13:** Terrorism management.	**Ch.19 Tolley's Handbook.**
Week 15:	Revision and project discussions.	**Classroom discussions**
Week 16:	**Final Exam**	

Course Policies
University regulations apply to this course regarding class attendance, punctuality, exams, late submissions, absence with permission, penalties for cheating, and policies for assignments and projects, if any. Students should be aware of all those in addition to other rules and regulations stated and descried in the student handbook.

Course modules

Course	**Disaster and Emergency Management**
Module 1	**Basic Frameworks for Managing Disasters and Emergencies**
Key Concepts	Escalation of Incidents Framework. Disaster Lifecycle Framework. Disaster Phases: Before, During, and After.

Overview	This Module provides a comprehensive coverage of the concepts and definitions related to the Disaster and Emergency Management field. It is considered the basis for the next modules of this course.
Aim	Students will learn about the basic principles of managing disasters, crises, and emergencies. This includes man-made and natural disasters (i.e. those disasters related/resulting mainly from the environment degradation and climate change)
Learning Outcomes	At the end of this module, students will be able to show comprehensive understanding of: • The disaster lifecycle; • The basics of disaster and emergency management; • Various strategies required for managing disasters and emergencies before, during, and after their occurrences.
Units	**Unit 1: Introduction:** Disaster sequence and Escalation of Incidents. **Unit 2:** The Disaster Life-Cycle Model. **Unit 3: Applications:** coping with natural disasters: Cyclone Tracy, El-Nino Drought, and Huang He Flood. (Particular focus on the environmental and climate change causes).
Readings	**Coppola, D. (2011).** Introduction to International Disaster Management. 2nd Edition. Elsevier, BH. London. **Recht, E. (2004). "**Living Through a Natural Disaster". Pearson Education Limited, Essex.
Activity	**Case studies:** Cyclone Tracy, El-Nino Drought, and Huang He Flood.

Module 2	Sources and causes of natural and man-made disasters
Key Concepts	Disaster types, causes, and sources; including Man-induced, Hybrid, and Natural (environmental and climate change causes).
Overview	Every disaster occurrence has its own and unique characteristics; including the type of the occurrence, cause, and the source(s). Therefore, students should be able to determine and distinguish these factors in order to develop the necessary response techniques for the succeeding stages.
Aim	Students will be introduced to the different types, causes and sources of disasters and emergencies.
Learning Outcomes	At the end of this module, students will be able to: • Distinguish between the various types of disasters. • Identify the various causes of disaster occurrences. • Identify the various sources of disaster occurrences.
Units	**Unit 4:** Disaster types. **Unit 4:** Classification of events according to impact **and** Basic definitions **Unit 4:** Characteristics of crises. **Unit 5:** Classification of disasters in terms of probability **Unit 5:** Major incident management. **Unit 6:** Causes of Disasters: The three models of disaster causes. **Unit 7:** Sources of disasters: analysis of the business environment; environmental hazards; STEEPLED and SWOT analysis,

Readings	**Moore, T. and Lakha, R. (2006).** "Tolley's Handbook of Disaster and Emergency Management: Principles and Practice", 3rd Edition
Activity	**Exercise:** Internal & External analysis for any company (e.g. the AUM).

Module 3	**International applied frameworks of Disaster Risk Reduction (DRR)**
Key Concepts	The Hyogo Framework of Action 2005-2015 **HFA**
Overview	The **Hyogo Framework of Action 2005-2015**: is the most recognised international framework for Disaster Risk Reduction. It aims at building resilience of nations and communities world-wide to disasters, crises, and emergencies including natural (i.e. environmental) and man-made.
Aim	Students will be introduced to the HFA framework and will learn how to use it as a guideline for managing a wide range of disasters and emergencies including the Arab World and the middle East stressing on the cultural factors of different nations and communities.
Learning Outcomes	At the end of this module, students will be able to: • Interpret the significance of the HFA. • Use and apply the HFA. • Apply the knowledge gained from the HFA in particular contexts including the Middle East and Arab World. • Apply best practice of Disaster and Emergency Management in real

	organizations. • Understand how the United Nations (**UN)** sets plans and strategies for collaboration.
Units	**Unit 8:** The Hyogo Framework for Action (HFA) - UNISDR: 2005-2015. **Unit 8:** Collaboration in Disaster and Emergency Management.
Readings	http://www.unisdr.org/ http://www.unisdr.org/we/coordinate/hfa
Activity	Comprehensive in-class exercise on how to use and apply the HFA for reducing natural and man-made disasters and emergencies.

Module 4	**Disaster and Emergency Management systems and Vulnerability and Capacity Assessments**
Key Concepts	Implementing **Disaster and Emergency Management Systems** Undertaking **Vulnerability and Capacity Assessments (VAC)**
Overview	This module is significant as it shows the steps required to design and implement a comprehensive Disaster and Emergency Management system, as well as the techniques required to perform a Vulnerability and Capacity Assessments.
Aim	Students will be able to design Disaster and Emergency Management Systems, and perform Vulnerability and Capacity Assessments for different organizations, communities and nations.

Learning Outcomes	At the end of this module, students will be able to: • Develop and implement a Disaster and Emergency Management System. • Perform Vulnerability and Capacity Assessments. • Benchmark the developed disaster risk reduction plan against international standards and best practices. • Provide basic advice for real organizations on how to benchmark basic practices with best practices related to Disaster Risk Reduction.
Units	**Unit 9:** Disaster and emergency management systems. **Unit 9:** Monitoring of disaster and emergency management plans. **Unit 10:** Vulnerability and Capacity Assessment (VCA). **Unit 11: Exercises:** VCA for the AUM. **Unit 11: Quiz:** VCA quiz. **Unit 12:** How to improve the practice of DEM.
Readings	**Major Ref:** **Moore, T. and Lakha, R. (2006).** "Tolley's Handbook of Disaster and Emergency Management: Principles and Practice", 3rd Edition. **Extra reading on (VAC):** **Wisner, B., Blaikie, P., Cannon, T. and Davis, I. (2003**), "At Risk: natural hazards, people's vulnerability and disasters".
Activity	**Exercise 1:** Develop a Disaster and Emergency Management System for the AUM. **Exercise 2:** Perform VCA for the AUM and/or any selected Jordanian community. **Quiz:** VCA quiz.

Module 5	Terrorism: Concepts and Management
Key Concepts	**Terrorism:** mentality, modern structures, and management.
Overview	Terrorism is a growing phenomenon in our current times. It results in substantial disasters, crises and emergencies which should be mitigated/prevented in order to reduce damage and threat imposed on targeted people and societies.
Aim	Students will be introduced to concepts of modern terrorism, as well as the various management strategies required to counteract terrorism and terrorist activity.
Learning Outcomes	At the end of this module, students will be able to: • Understand terrorist mentality. • Interpret the reasons behind terrorist activities. • Understand the impact of terrorism and terrorist activity on the natural environment. • Develop different prevention mechanisms. • Develop strategies and action plans to counteract terrorism and terrorist activity.
Units	**Unit 13:** Terrorism management.
Readings	**Moore, T. and Lakha, R. (2006).** "Tolley's Handbook of Disaster and Emergency Management: Principles and Practice", 3rd Edition
Activity	**Exercises:** Examples and real case studies on terrorism and terrorist activities.

- **On line Resources:**

1. Institute of Risk Management : http://www.theirm.org/
2. Risk Management Library: http://www.praxiom.com/31000.htm

Course Description:

This course introduces the concepts of risk, risk identification, assessment and evaluation, the need for risk management, risk management practice, and Insurance as one tool of risk management. Both business and personal risk are addressed with emphasis on risk management treatment tools associated with controlling such risks. Students will be given opportunities to analyze and report business situations and to be competent in managing various risk cases. In addition, the course will provide opportunities to practice essential group skills', such as academic discussions, teamwork and debates. The course covers all types of risks; including natural (environmental); climate change risks; business risks; and operational risks.

Course Objectives:

After completion of this course, the student will be able to:

1- Explain theories and views related to risk.
2- Define the fundamental characteristics of risks; types, sources and classifications.
3- Identify the scope for enterprise risk management.
4- Describe the processes, techniques and methods associated with risk management.
5- Critically analyze the ISO-31000 model for risk management.
6- Explore the benefits of the risk management process.

Course Intended Learning Outcomes (ILOs)/Competencies:

A) **Knowledge and understanding:**

1- Demonstrate an understanding of the multidimensional nature and views of risk.
2- Appreciate and describe the in-depth variations between different contextual settings, causes, and sources in which risks may arise.
3- Understand the concepts and principles of Risk management.
4- Explain the basic concepts, elements and techniques associated with the risk management process and ISO 31000.
5- Understand the basics of crisis and disaster management.

B) **Cognitive and intellectual skills (thinking and analysis):**

1- Comprehend the application of risk management techniques in treating organizational risks
2- Explain the roots and theories of risk management.
3- Explain how risk management enhances the process of decision making.
4- Discuss how effective risk management helps in developing business strategies, operations, and compliance status.
5- Demonstrate ability to analyze the organizational environments and identify potential sources and causes of risk.

C) **Communication skills (personal and academic):**

1. Develop discussion and debating skills in issues related to risk and risk management.
2. Demonstrate innovative elaboration on topics that address issues of concern in the enterprise risk environments.
3. Exercise risk management considerations in the development and presentation of basic risk reduction ideas.

D) **Professional Skills:**

1. Articulate and explain technical and conceptual issues in relation to solving real-life practical problems taken from a diverse set of risk management applications
2. Apply the principles of effective risk management in decisions making.
3. Select, organize and analyze business basic records of which potential risks may be identified.

E) **Practical and subject specific skills (Transferable Skills):**

1. Apply the basics of ISO 31000, as well as principles of Enterprise Risk Management in real organizational contexts.
2. Understand the disaster formula and what actions that should be made to reduce potential crisis and disaster risks.

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom debates/discussions, assignments and home works.

Assessment Instruments

	Mark
First Exam	30%
Second Exam	20%
Quizzes, Homework and Participation	10%
Final Exam	40%
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates

Week 1:	**Unit 1:** Introduction.	
Week 2:	**Unit 2:** Definitions of Risk; Loss exposures; Objective Risk; Subjective Risk; Chance of Loss.	
Week 3:	**Unit 3:** Definitions of Peril and Hazard (including man-made and natural). Classification of Risk: Pure and Speculative. Diversifiable and non-diversifiable Risk. Enterprise Risk.	
Week 4:	**Unit 4:** Major Personal Risks and Commercial Risks. Burdens of Risks on Society.	
Week 5:	**Unit 5:** Case Studies. Meaning and Objectives of Risk Management.	
Week 6:	**First Exam**	
Week 7:	**Unit 6:** Steps of the Risk Management process. Identifying Loss Exposures.	
Week 8:	**Unit 7:** Measuring and Analyzing Loss Exposures.	
Week 9:	**Unit 8:** Risk Treatment	
Week 10:	**Unit 9:** Implementing and monitoring the risk management program.	
Week 11:	**Unit 10:** Benefits of Risk Management. Personal Risk Management.	
Week 12:	**Second Exam**	
Week 13:	**Unit 11:** Financial Risk Management. Commodity price risk. Interest rate risk. Currency Exchange Rate risk. Managing Financial Risks.	
Week 14:	**Unit 12:** Enterprise Risk Management.	

	Emerging Risks. Terrorism Risk. Environmental and Climate Change risks. Risk Management Information Systems.	
Week 15:	**Unit 13:** Insurance and Course Overview.	
Week 16:	**Final Exam**	

Course Policies

University regulations are applied to this course, regarding class attendance; punctuality, exams, late submissions; absence with permission; penalties for cheating; and policies for assignments and projects – if any. Students should be aware of all these regulations in addition to other regulations stated and described in the student's handbook.

Course	**Principles of Risk Management**
Module 1	**Risk and Its Treatment**
Key Concepts	Risk, Loss Exposures, objective Risk, Subjective Risk, Chance of loss, Objective Probability, Subjective probability, Peril, Hazard, Pure Risk, Speculative Risk, Diversifiable Risk, Non diversifiable Risk, Enterprise Risk, Financial Risk, Market Risk, Interest rate Risk, Price Risk, Currency Risk, Strategic Risk, Operational Risk, Reputation Risk, Personal Risk, Commercial Risk, Environmental and Climate change risks.
Overview	This module is intended to introduce the students to the concept of Risk and the associated terms to it. The various types and classifications of Risk will also be explained and the burden of Risk on society will be illustrated. This will allow the students to identify the Risks embedded in personal and commercial contexts.
Aim	Students will learn about the concepts, types, and classifications of Risk.
Learning	At the end of this module, students will be able to

Outcomes	- Explain the various definitions of Risk. - Explain the meaning of Loss Exposure. - Understand the following concepts: Pure Risk, Speculative Risk, Diversifiable Risk, and Enterprise Risk. - Identify the major pure Risks that are associated with financial insecurity. - Show how risk is a burden to society.
Units	1: Definitions of Risk 2: Chance of Loss 3: Peril and Hazard 4: Classification of Risk 5: Major Personal Risks and Commercial Risks. 6: Burden of Risk on Society.
Readings	**Rejda, G. (2014).** Principles of Risk Management and Insurance (12th Ed.).Prentice.
Activity	Case study and review
Module 2	**Introduction to Risk Management**
Key Concepts	The risk Management Process. Risk Control, Risk Financing, Avoidance, Loss Prevention, Loss Reduction, Retention, Non Insurance Transfer, Insurance.
Overview	This module is intended to introduce the students to the Risk Management Process with all of its steps: Risk Identification, Risk Analysis, Risk treatment, and Risk Implementation and Monitoring.
Aim	Students will be able to apply the steps in the Risk Management Process to manage personal and commercial Risks.
Learning Outcomes	At the end of this module, students will be able to - Define Risk Management and explain the objectives of risk management. - Describe the steps in the Risk Management process. - Explain risk- control techniques: Avoidance, Loss Prevention, and Loss Reduction. - Explain the major risk-financing techniques, including: retention, Non

	insurance transfer, and Insurance. - Apply the principles of risk management to personal risk management.
Units	5: Meaning of Risk Management 6: Objectives of Risk Management. 7: Steps if the Risk Management Process. 8: Benefits of Risk Management 9: Personal Risk Management
Readings	**Rejda, G. (2014).**Principles of Risk Management and Insurance (12th Ed.).Prentice. **ISO (2009).** "ISO 31000: 2009 Risk management — Principles and guidelines".
Activity	Case study and review
Module 3	**Financial Risk Management**
Key Concepts	Commodity Price Risk, Interest Rate Risk, Currency Exchange Risk, Hedging, Enterprise Risk Management, Terrorism Risk, Climate Change Risk, RMIS, Risk Maps.
Overview	This module will enable the students understand financial and Enterprise Risk Management.
Aim	Students will be familiarized with speculative financial risks and enterprise risks with examples on the ways these two Risks can be managed.
Learning Outcomes	At the end of this module, students are expected to - Explain the meaning of Financial Risk Management and Enterprise Risk Management - Describe how the Risks of terrorism and climate change impact risk management. - Explain Risk Maps
Units	11& 12: Enterprise Risk Management, Financial Risk Management

Readings	**Rejda, G. (2014).** Principles of Risk Management and Insurance (12th Ed.).Prentice.
Activity	Review and discussion session initiating project work.
Module 4	**Insurance and Risk**
Key Concepts	Insurance, Pooling, Law of Large Numbers, Fortuitous Loss, Indemnification.
Overview	This module is intended to explain to students the Role of Insurance in Mitigating Pure Risks.
Aim	Students will be familiarized with the characteristics of Insurance, and the requirements for a Risk to be ideally insurable
Learning Outcomes	At the end of this module, students will be able to - Explain the Characteristics of Insurance. - Explain the Law of Large Numbers. - Describe the characteristics of insurable risks from the viewpoint of a private insurer.
Units	13-Definition of Insurance, Basic Characteristics of Insurance, and characteristics of ideally insurable risks.
Readings	**Rejda, G. (2014).** Principles of Risk Management and Insurance (12th Ed.).
Activity	Case study and review.

Edition

C) Articles

1- Assuring Food Safety and Quality/Guidelines for Strengthening National Food Control Systems (joint paper by FAO and WHO).
2- Annual Reviews of Environmental Resources, Climate Change and Food Systems Sonja J. Vermeulen et. al., 2013.

D) Online resources
http://www.joe.org/joe/2006august/a2.php

2. Course Description:

This course deals with basic principles of institutional food service systems, methods of food purchasing, quality assurance, management of feeding establishment, financial planning of food services staff and application of food quality systems to institutions. It also describes agri-food systems and impact of climate change on food systems.

3. Course objectives/Learning Outcomes:

After completion of this course students will be able to:

1- Define food systems and the effect of climate change on them.
2- Explain different food quality standards used in food services.
3- Understand the principles of food service management.
4- Understand the food supply cycle chain and its role in food sustainability.
5- Describe Quality Management as GMP, GAP, ISO 22000 and their role in developing and managing Food systems.

4. Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom debates, assignments, exercises, homework and projects.

5. Assessment Instruments:

	Mark
Midterm Exam	30%
Quizzes, Homework and Participation	10%
Project	20%
Final Exam	40%
Total	**100%**

6. Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1:	Agri-food systems (Food Supply Cycle Chain, Sustainability)	
Week 2:	Impact of Climate Change on Food Systems	
Week 3:	Food, Law and Environment	
Week 4:	Assuring Food Safety and Quality: (Important Food Issues)	
Week 5:	Elements of the National Food Control System.	
Week 6:	Understanding the Joint FAO/WHO Codex Alimentarius	
Week 7:	Food Specific Issues of Developing Countries	
Week 8:	**Midterm Exam**	
Week 9:	Considerations of Food Safety and Consumer Protection	
Week 10:	Food Risk Assessment	
Week 11:	Case Studies	
Week 12:	National Food Control Agencies	
Week 13:	Food and Nutrition Services Organizational Management (Health Care Systems, School,…)	

Week 14:	Diet-based Managerial System	
Week 15:	Food Total Quality Management	
Week 16:	**Final Exam**	

7. Course Policies

University regulations are applied to this course, regarding class attendance; punctuality, exams, late submissions; absence with permission; penalties for cheating; and policies for assignments and projects. Students should be aware of all these regulations in addition to other rules and regulations stated and described in the student's handbook.

8. Module Description

Module 1	**Food Systems and climate change**
Key Concepts	Sustainable Agri-food Systems, Climate Change, Food Standards, Environment, Food Services.
Overview	• Students will be introduced during the course to the principles of agri-food systems and food supply chain cycle in order to familiarize them with environmentally sustainable food systems. • This part of the course will focus on the effect of agricultural practices on climate and environmental changes in the context of soil and underground

	water. • Followed by intensive discussion of quality standards used internationally to reinforce the traceability of food quality and systems, students will also be introduced to the environmental concerns encountered in international food laws to obtain sustainability through the cycle chain. • On the other hand, the impacts of climate change on food systems will be discussed, as global climate change is expected to be widespread, complex and temporarily variable. • Historical statistical studies and integrated assessment models provide evidence that climate change will affect agricultural yields and earnings, food prices, reliability of delivery, food quality and notably food safety. Low-income producers and consumers of food will be more vulnerable to climate change, owing to their comparatively limited ability to invest in adaptive institutions and technologies under increasing climatic risks. • Some synergies among food security, adaptation, and mitigation are feasible. However, promising interventions, such as agricultural intensification and reductions in waste will require careful management to distribute costs and benefits effectively. • Food and nutrition services are also discussed at the end of this module in order to apply the previous discussed rules at institutional level.
Aim	The aim of this module is to: • Introduce students to agri-food systems and concept of sustainability. • Outline the impact of global climate change on food systems. • Address the effect of agricultural practices on environmental issues. • Understand international food quality standards and importance of quality assurance. • Apply these standards and relevant laws to food services.

Learning Outcomes	At the end of this module the students will be able to: • Describe the food systems, food supply cycle chain and food sustainability concept. • Appreciate international concern about food security and sustainability. • Understand the international quality systems such as GMP, GAP, ISO 22000 and their role in developing the food quality management Systems. • Apply the food laws and standards concepts during the training course (Internship in Food Services.)
Units	• See above.
Readings	Some of the recommenced readings are: • Sonja J. Vermeulen, Bruce M. Campbell: "Climate Change and Food Systems" • John S.I. Ingram: "Sustainably Feeding the World".
Activities	Relevant activities: • Conducting field analysis on the local agricultural systems through visiting the Ministry of Agriculture and discussing the sustainability, food systems management, issues of concern, policies and measures used. • Running a campaign to detect the level of awareness of the community and their engagement toward local food systems in order to detect weakness and problems, and find solutions.

  Social Science Research Network eLibrary, available @ http://papers.ssrn.com/sol3/DisplayAbstractSearch.cfm

Course Description:

This course introduces students to the principles of project management with focus on Project Risk Management (**PRM**) as well as performance uncertainty management processes (**PUMPs**) and how effective they can be in minimizing the impact of project threats and seize the opportunities that occur. The direct result is to deliver projects on time, on budget and with the quality results the project sponsor demands. Environmental risks encountered during various project phases will be addressed whether these risks are threatening the environment or the project execution and delivery.

Course General Objectives:

The course aims at developing students’ awareness and understanding of:

1. Main principles of project management.
2. Project lifecycle
3. PRM/PUMP principles and various definitions.
4. Seven Ws framework: who, why, what, which, wherewithal, when and where.
5. Systemic relationships and ambiguity.
6. Uncertainty quantification techniques.
7. Project related environmental risks.

Intended Learning Outcomes (ILOs)/Competencies:

F) Knowledge and understanding:

1. Demonstrate an understanding of the multidimensional nature and views of project lifecycle and project risk management (PRM).
2. Appreciate and describe the in-depth variations between different contextual settings, causes, and sources of project risk.
3. Understand the concepts and principles of PRM.
4. Understand the different PRM prevention and reduction techniques, including enterprise, financial, and insurance risk.
5. Demonstrate an understanding of PRM best practice and some International Standards.

G) Cognitive and intellectual skills (thinking and analysis):

1. Understand the rationale behind the use and application of various PRM techniques in treating organizational project risk.
2. Explain the various theories of PRM.
3. Utilize the skills gained from studying PRM to enhance decision making.
4. Discuss the impact of effective PRM in improving strategic planning, operations, and compliance status.
5. Demonstrate ability to analyze the organizational environments and identify potential sources and causes of project risk.

H) Communication skills (personal and academic):

4. Demonstrate debating skills in aspects related to project risk and PRM.
5. Exercise PRM considerations in the development and presentation of basic PRM reduction techniques.
6. Demonstrate ability to communicate effectively in project risk situations.

7. Demonstrate ability to communicate with media and other local authorities about major PRM situations.

I) Professional Skills: upon completion of this course:

4. Articulate and explain technical and conceptual issues in relation to solving real-life project risk using a range of PRM applications.
5. Apply principles of PRM in decisions making.
6. Select, organize, and analyze business basic records of which potential project risks may be identified.
7. Address Environmental risks encountered during various project phases whether these risks are threatening the environment or the project execution and delivery

J) Practical and subject specific skills (Transferable Skills):

3. Demonstrate ability to deploy International Standards and best practice, as well as principles of PRM in real organizations.
4. Understand the PRM life-cycle and what actions and alternatives need to be considered in order to reduce potential project risk occurrences.

Teaching Methods:

The course is delivered via lectures, classroom discussions, exercises, and a main project which will be submitted at the end of the course duration, i.e. every student will be asked to submit a basic Corporate Governance model developed by him/herself in order to demonstrate comprehensive understanding of the content of the course.

Assessment Instruments

	Mark
Mid-term Exam	30%
Quizzes, Homework and Participation	10%
Project	20%

Final Exam	40%
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1:	Part I Setting the scene: 1. Project lifecycle	
Week 2:	Part I Setting the scene: 2. Critical thinking versus PRM 3. Project lifecycle continued 4. The 7 Ws framework 5. PRM objectives.	
Week 3:	Part I Setting the scene: 6. Uncertainty in and around projects. 7. Uncertainty, risk and opportunity 8. Key motives for uncertainty project management	
Week 4:	Part I Setting the scene: 9. An overview of generic process frameworks	**Classroom Exercises**
Week 5:	Part II The general process in one key lifecycle stage 10. Define the process 11. Focus the process	**Classroom Exercises**
Week 6:	12. Part II The general process in one key lifecycle stage Identify all relevant sources of uncertainty, response options and conditions

Week 16:	**Final Exam**	

Course Policies

University regulations are applied to this course, regarding class attendance; punctuality, exams, late submissions; absence with permission; penalties for cheating; and policies for assignments and projects – if any. Students should be aware of all these regulations in addition to other regulations stated and described in the student's handbook.

General Policies for the Course: students must comply with:

A) Lecture Management

1- Students should behave appropriately during lectures, in order to reflect the good reputation of the university.
2- Students should grasp the course objectives from the first day of attendance in order to work on achieving these objectives through the course duration.

3- Faculty members encourage students constantly to get involved in class discussions. Therefore, students should make use of these discussions in order to enhance their educational experience.
4- Students should not leave classrooms during lectures except for compelling reasons.

B) Scientific Honesty

The university prohibits students from any actions inconsistent with scientific honesty, including cheating in exams whether by giving or receiving information, or submitting assignments done by others. In case of breach of this sort, the student will be subject to an effective university punishment, which he/she should be well aware of.

C) Late Attendance or Absence for Lectures

1- Students attending a lecture more than 10 minutes late will be marked as "late attendant", and every four late attendances will be count for one day absence.
2- Students attending the lecture more than 20 minutes late will be allowed to enter the classroom but will be marked as "absent".
3- If absences exceed 15% of the lectures, then the student will be disqualified from the course, and will get the university zero mark for the course.

D) Absence from exams

1- Absentees from a short test (quiz) will not be allowed for a make-up test.
2- Official excuses for missing any exam must be provided to the lecturer for the appropriate actions to be taken.
3- Special forms designed for absence from final exams are available at the Admission and Registration Department. The Dean of the related course must be provided with these forms by the student within seven days from the date of the missed exam in order to take the appropriate action.
4- Medical excuses must be signed officially and stamped by the Medical Centre.
5- All make up exams will be given only once during the same semester.
6- Make up for the final exam must be held during the first two weeks of the following semester.
7- No excuse will be accepted in case of failing to attend the makeup exam. There will be no other chance for another make up exam.

E) Additional Instructions

1- Cell phones must be turned off during lectures and exams.
2- Students should refer to additional references and do extra reading for the course.
3- Students should submit their assignments within the due time.
4- In case of absence or late registration for the course, the student is fully responsible for the follow up of the missed lecture.
5- Students are advised to keep copies of their assignments as a reference and record.
6- Objection on final exam result is limited to the specific procedures developed by the university. Students have to refer to the Department of Admission and Registration to view relevant details.

Course	Project Risk Management
Module 1	Project management
Key Concepts	Project life cycle (PLC), 7Ws framework, critical thinking, uncertainty, risk, opportunity
Overview	During this module, the student will be introduced to the main concepts of project management, namely speaking, the project life cycle consisting of: conceptualization, planning, execution and delivery.
Aim	To introduce students to project management various phases
Learning Outcomes	At the end of this module, students will be able to - develop the various phases of the project lifecycle, - develop the plans necessary in the planning phase, - understand the main activities in each phase.
Readings	**Ward, S. and Chapman C. (2011).** " How to Manage Project Opportunity and Risk: Why Uncertainty Management can be a Much Better Approach than Risk Management", 3rd Edition, Wiley.
Activity	Case study and review
Module 2	**Project uncertainty**
Key Concepts	Project uncertainty management process (PUMP), generic process frameworks, process definition, process focusing.
Overview	Uncertainty (risk and opportunity) in each phase of the project lifecycle is a crucial issue to be thoroughly addressed for the success of any project. Uncertainty in each phase in the project lifecycle needs to be considered separately. Uncertainties will be structured based on the uncertainty nature.
Aim	Students will be able to understand and structure the various uncertainties in each phase of the project lifecycle.
Learning	At the end of this module, students will be able to

Outcomes	- Articulate and explain technical and conceptual issues in relation to solving real-life project risk using a range of PRM applications. - Apply principles of PRM in decisions making. - Select, organize, and analyze business basic records of which potential project risks may be identified. - Address Environmental risks encountered during various project phases whether these risks are threatening the environment or the project execution and delivery
Readings	Lynn R. Kahle, Eda Gurel-Atay, Eds (2014). Communicating Sustainability for the Green Economy. New York: M.E. Sharpe. ISBN 978-0-7656-3680-5.
Activity	Case study and classroom exercises.
Module 3	**Project Management Body of Knowledge (PMBOK Guide) processes**
Key Concepts	Risk planning, identification, qualitative analysis, quantitative analysis, response planning, monitoring and control.
Overview	PMBOK addresses project management and project uncertainty management in a sequential logical manner: risk planning, identification, qualitative analysis, quantitative analysis, response planning, monitoring and control.
Aim	To familiarize the students with a worldwide acceptable project risk management approach.
Learning Outcomes	At the end of this module, students are expected to conduct project uncertainty: - planning, - identification, - qualitative analysis, - quantitative analysis, - response planning, - monitoring and control.
Readings	**Project Management Institute (2013**): "A Guide to the Project Management Body of Knowledge (PMBOK Guide)", 5th Edition
Activity	Review, classroom exercises, project presentations by students.

Course Description:

In Introduction to Economics, we take an overall view of the study of how scarce resources are allocated. Our goal is to understand the behavior of economic aspects like: supply, demand, consumer behavior, and producer behavior. We will also discuss issues such as government intervention. Among other things, in this course we will examine the basic understanding of many facts of modern economic activity. This course focus on the one of the most important concept in the modern economics theory which is the" Scarcity" and the impact of the human activities on the natural resources, This holds true for environmental economics as well. However, environmental resources differ from other goods that economists study in that there is usually no market for them. Thus, government policies are needed to maintain and improve environmental quality.

The course also will pay attention to the Climate Change and its impact on humane preferences, tacking in consideration the costs and benefits of dealing with Climate Change.

Course Objectives:

By the end of the course, students are expected to

1.Be able to evaluate Demand and Supply opportunity
2.Be able to determine the consumer Preferences and Choices.
3.Be able to Identify and organize and the market structure .
4. Be able to provide clear Idea about The Economic Problem.
5.Be able to provide the right conclusions about the Economic Growth.
6. Be able to think critically about issues relating to natural recourses.
7. Be able to discuss the impact of using Green energy on the production efficiency.
8. Be able to determine the optimal allocation for the production factors that will maximize the benefits for both individual and society.

Course Outcomes:

After completion of this course, the student will be able to:
1. the language of Economics.
2. the basic methodology and models used in this area and their application to real-world situations by using these models, the ability to analyze hypothetical and/or real-world situations that occur in our economy.
3. Explain key concepts related to the human behavior and its impact on the economics recourses.
4. discuses the impact of government intervention on the free market system.
5. discuses the impact of Market failure on the market system and humane choices.
6. Explain how the government can use Externality to reduce the pollution and support Green firms.
7. Understand the concepts and notions of economics.
8. Understand the concept of Demand and Supply..
9. Understand the concept of The balance of payments
10. Understand the concept of Exchange Rate,
11. Understand the concept of Deficits
12. Understand the concept of Business cycles, Unemployment, and inflation
13. Evaluate various economic alternatives.
14. Explain the role of the government intervention in minimizing the climate change effect.
15. Understand the impact of the economic growth on the environment and Standards of Living
16. Understand What is the relationship between economic growth and the environment.
17. Understand How can economic development become environmentally sustainable.18. Explain how positive and negative externalities cause under- and over allocations of resources.

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom debates, assignments, exercises, homework and projects. Add text here

Assessment Instruments

	Mark
First Exam	15%
Second Exam	15%

Quizzes, Homework, Assignment and Participation	10%
Final Exam	50%
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1:	Limits, Alternatives, and Choices	
Week 2:	The Market system and circular flow	
Week 3:	Demand , Supply and Market Equilibrium	
Week 4+5:	Market Failures: Public Goods and Externalities	
Week 5:	First Exam	
Week 6+7	Resources, Environment, and Economic Development	
Week 8+9	An introduction to Macroeconomics	
Week 10	Measuring Domestic output and national Income	
Week 11:	Second Exam	
Week 12:	Economic Growth	
Week 13+14:	Business cycles, Unemployment, and inflation	

Week 15	**Overall Course Review, and Assignment discussion**	
Week 16	**Final Exam**	

Course Policies

University regulations are applied to this course, regarding class attendance; punctuality, exams, late submissions; absence with permission; penalties for cheating; and policies for assignments and projects – if any. Students should be aware of all these regulations in addition to other regulations stated and described in the student's handbook.

General Policies for the Course: students must comply with:

A) Lecture Management

1- Students should behave appropriately during lectures, in order to reflect the good reputation of the university.
2- Students should grasp the course objectives from the first day of attendance in order to work on achieving these objectives through the course duration.
3- Faculty members encourage students constantly to get involved in class discussions. Therefore, students should make use of these discussions in order to enhance their educational experience.
4- Students should not leave classrooms during lectures except for compelling reasons.

B) Scientific Honesty

The university prohibits students from any actions inconsistent with scientific honesty, including cheating in exams whether by giving or receiving information, or submitting assignments done by others. In case of breach of this sort, the student will be subject to an effective university punishment, which he/she should be well aware of.

C) Late Attendance or Absence for Lectures

1- Students attending a lecture more than 10 minutes late will be marked as "late attendant", and every four late attendances will be count for one day absence.
2- Students attending the lecture more than 20 minutes late will be allowed to enter the classroom but will be marked as "absent".

3- If absences exceed 15% of the lectures, then the student will be disqualified from the course, and will get the university zero mark for the course.

D) Absence from exams

1- Absentees from a short test (quiz) will not be allowed for a make-up test.
2- Official excuses for missing any exam must be provided to the lecturer for the appropriate actions to be taken.
3- Special forms designed for absence from final exams are available at the Admission and Registration Department. The Dean of the related course must be provided with these forms by the student within seven days from the date of the missed exam in order to take the appropriate action.
4- Medical excuses must be signed officially and stamped by the Medical Centre.
5- All make up exams will be given only once during the same semester.
6- Make up for the final exam must be held during the first two weeks of the following semester.
7- No excuse will be accepted in case of failing to attend the makeup exam. There will be no other chance for another make up exam.

E) Additional Instructions

1- Cell phones must be turned off during lectures and exams.
2- Students should refer to additional references and do extra reading for the course.
3- Students should submit their assignments within the due time.
4- In case of absence or late registration for the course, the student is fully responsible for the follow up of the missed lecture.
5- Students are advised to keep copies of their assignments as a reference and record.
6- Objection on final exam result is limited to the specific procedures developed by the university. Students have to refer to the Department of Admission and Registration to view relevant details.

Course modules

Course	Introduction to Economics
Module 1	**INTRODUCTION TO ECONOMICS AND THE ECONOMY**
Key Concepts	Economics, scarcity microeconomics, macroeconomics, natural resources Economics prospective
Overview	Economics is the social science concerned with how individuals, institutions, and society make optimal (best) choices under conditions of scarcity. like other sciences Economists view things from a unique perspective that envisions individuals and institutions making rational decisions by comparing the marginal benefits and marginal costs associated with their actions. all economics choices must build based on cost benefits analysis. Scarcity considered one of the most important concepts in the Economics where the institutions must deal with the fact that we have Scarce" limited" economic resources.

Aim	Students will learn how to distinguish between microeconomics and macroeconomics and explain how economists go about their work as social Scientists.
Learning Outcomes	At the end of this module, students will be able to - Define economics and the features of the economic perspective - List the categories of scarce resources and delineate the nature of the economizing problem . - Apply production possibilities analysis, increasing opportunity costs, and economic growth - learn how to bullied their own cost benefits analysis.
Units	- Limits, Alternatives, and Choices
Readings	Macconnell,.C, Brue, Flynn. Sean and Grant. Randy(2012) "Macrocosmic",19th edition. MaGraw Hall. http://www.economist.com/
Activity	- review
Module 2	The Capitalism and the Market system
Key Concepts	Capitalism, Socialism
Overview	Every society needs to develop an Economics Systems which is a particular set of institutional arrangements and a coordinating mechanism to respond to the economizing problem. The economic system has to determine what goods are produced, how they are produced, who gets them, how to accommodate change, and how to promote technological progress, from the Capitalism to Socialism in this model we will compare between different market systems and its impact on human choices and natural resources. and how the leads to what know as the market deficit and market surplus.

Aim	Students will be able to improve their knowledge about different types of market systems, and decide which system is the best.
Learning Outcomes	At the end of this module, students will be able to - Differentiate between a command system and a market system - List the main characteristics of the market system. - Explain how the market system decides what to produce, how to produce it, and who obtains it. - Discuss how the market system adjusts to change and promotes progress - Explain the relationship between the Climate change and the capitalism
Units	1- The Market System and the Circular Flow
Readings	Macconnell,.C, Brue, Flynn. Sean and Grant. Randy(2012) "Macrocosmic",19th edition. MaGraw Hall. - Hayes, Knox" Constructing Carbon Market Spacetime: Climate change and the onset of neo-modernity" School of Public Policy. - D. Z. Sui and D. W. Rejeski" Environmental Impacts of the Emerging Digital Economy: The E-for-Environment E-Commerce?" Journal of Environmental Management Vol. 29, No. 2, pp. 155–163.
Activity	Review
Module 3	**Market Mechanism**
Key Concepts	Demand, Supply, Market Equilibrium, Efficient Allocation, Uncertainty, government intervention, climate change, productive efficiency, price ceiling and price floor.
Overview	Market mechanism refer to the use of money exchanged by buyers and sellers with an open and understood system of value and time trade-offs to produce the best distribution of goods and services. The use of the market mechanism imply in a free market; there can be captive or controlled markets that seek to use supply and demand, or some other form of

	charging for scarcity, both in social situations and engineering.
Aim	Students' knowledge about the Market Mechanism and different concepts related to the demand supply and the role of the government in redistribute the production factors.
Learning Outcomes	At the end of this module, students are expected to - Describe demand and explain how it can change. - Describe supply and explain how it can change. - Relate how supply and demand interact to determine market equilibrium. - Explain how changes in supply and demand affect equilibrium prices and quantities. - Identify what government-set prices are and how they can cause product surpluses and shortages - Explain the role of the government intervention in minimizing the climate change effect
Units	- Demand , Supply and Market Equilibrium
Readings	- Macconnell,.C, Brue, Flynn. Sean and Grant. Randy(2012) "Macrocosmic",19th edition. MaGraw Hall. - "Uncertainty and Climate Change Intervention: An Introduction to the Economics of Climate Change" by Jisung Park The Journal of Sustainable Development. http://www.consiliencejournal.org/index.php/consilience/article/view/8
Activity	Review
Module 4	**Market Failures: Public Goods and Externalities**
Key Concepts	Market failures, excludability, public goods, free-rider problem, cost-benefit analysis, Externalities, The Invisible Hand, Marginal social cost, Environmental Economics, social welfare , optimal reduction of an externality

	and Carbon Taxes.
Overview	A market failure happens in a particular market when the market produces an equilibrium level of output that either over allocates or under allocates resources to the product being traded in the market. In competitive markets that feature many buyers and many sellers, market failures can be divided into two types: Demand-side market failures occur when demand curves do not reflect consumers' full willingness to pay; supply-side market failures occur when supply curves do not reflect all production costs, including those that may be borne by third parties. Market failures present government with opportunities to improve the allocation of society's resources and thereby enhance society's total well-being. But even when government correctly identifies the existence and cause of a market failure, political pressures may make it difficult or impossible for government officials to implement a proper solution.
Aim	Students will be able to understand the general aspect of market failure and the role of externalities.
Learning Outcomes	At the end of this module, students will be able to - Differentiate between demand-side market failures and supply-side market failures. - Explain the origin of both consumer surplus and producer surplus, and explain how properly functioning markets maximize their sum, total surplus, while optimally allocating resources. - Describe free riding and public goods, and illustrate why private firms cannot normally produce public goods. - Explain how positive and negative externalities cause under- and over allocations of resources. - Show why we normally won't want to pay what it would cost to eliminate every last bit of a negative externality such as air pollution
Units	- Market Failures: Public Goods and Externalities
Readings	- Macconnell,.C, Brue, Flynn. Sean and Grant. Randy(2012) "Macrocosmic",19th edition. MaGraw Hall.

	- J Norregaard, V Reppelin-Hill "Taxes and tradable permits as instruments for controlling pollution: theory and practice" IMF working paper series -
Activity	**Review**
Module 5	**GDP, Growth, and Instability**
Key Concepts	business cycle, unemployment, inflation, national income accounting, nondurable goods, taxes on production and imports, economic growth, Infrastructure. leader countries, natural capital, population momentum, Sustainable Development, and learning by doing
Overview	The determinants of economic growth to which we can attribute changes in growth rates include four supply factors (changes in the quantity and quality of natural resources, changes in the quantity and quality of human resources, changes in the stock of capital goods, and improvements in technology); one demand factor (changes in total spending); and one efficiency factor (changes in how well an economy achieves allocative and productive efficiency).The concept of sustainable development attempts to combine economic and environmental goals. Sustainable techniques for agricultural production, energy use, natural resource management, and industrial production have significant potential, but have yet to be widely adopted. A sustainable global economy also implies limits on population and material consumption.
Aim	Students will be able to understand the economic growth and its impact on

	production factors and the living standard for human
Learning Outcomes	At the end of this module, students will be able to - Interpret how macroeconomics studies both long-run economic growth and short-run fluctuations in output and unemployment. - Explain why economists focus on GDP, inflation, and unemployment when assessing the health of an entire economy. - Discuss why sustained increases in living standards are a historically recent phenomenon. - Identify why saving and investment are key factors in promoting rising living standards. - Describe why economists believe that "shocks" and "sticky prices" are responsible for short-run fluctuations in output and employment. - List and explain some limitations of the GDP measure - Discuss differing perspectives as to whether growth is desirable and sustainable - Discuss the impact of the economic growth on the environment and Standards of Living - Understand What is the relationship between economic growth and the environment. - Understand How can economic development become environmentally sustainable.
Units	1. AN INTRODUCTION TO MACROECONOMICS 2. MEASURING DOMESTIC OUTPUT AND NATIONAL INCOME 3. ECONOMIC GROWTH 4. Resources, Environment, and Economic Development
Readings	1. Barry C. Field & Martha K. Field "Environmental Economics: An Introduction", 5th edition. 2. **Macconnell,.C, Brue, Flynn. Sean and Grant. Randy(2012)**

3. Course Components

Resources:

Text book:

- 1. Mallor J. (2013) 'Business Law: The Ethical, Global, and E-Commerce Environment' 15th ed McGraw-Hill.

- **References:**

4. The Jordanian Constitution.
5. The Jordanian Commercial Law.
6. The Jordanian environment protection law.

- **On line Resources:**

1. Students are required to log on to the online learning center at: http://www.mhhe.com/mallor15e, to explore chapter by chapter test questions , links and further online study tools for business law.

Course Description:

The aim of this course is to review basic legal principles and sources of contract law, background of law and legal theory. The following topics are covered in detail: formation of contracts, modifications, terminations, remedies, pricing, patent, business organizations, company law, sales of goods, and transfer of ownership rights, employment law.

Course General Objectives:

Essentially, the course seeks to attain the following objectives:

1. Identify the importance and scope of law in general and business law in particular and develop an understanding of the legal aspects in business.
2. Introduce key legal terms and present fundamental legal concepts and procedures.
3. Provide and explore court cases from the United States and Jordan.

Course Intended Learning Outcomes (ILOs)/Competencies:

K) **Knowledge and understanding:**

1. Understand the nature of law and different types of laws.
2. Explain the concepts of jurisdiction.
3. Describe law supremacy.
4. Explain the functions of law.
5. Explore legal court cases and decisions.
6. Identify property rights and ownership transfer and property contracts.
7. Describe different commercial papers and their legal power.
8. Identify the ethical and legal issues in environmental protection and climate change.

L) **Cognitive and intellectual skills (thinking and analysis):**

1. Apply key legal and business law terms in future work.
2. Explain the theories of business law.
3. Analyze how business law can govern future dealings and protect rights.

M) **Communication skills (personal and academic):**

8. Develop and apply business law knowledge.
9. Exercise contracting in the development and presentation of ideas.
10. Develop effective speech introductions, relevant content and conclusions.
11. Participate actively in classroom debate, assignments and speech deliveries.
12. Evaluate classroom speeches, other student presentations, and own input in a structured professional manner away from judgment of legal cases.
13. Use legal knowledge, group presentation to improve better way of communication and team work.

N) **Professional Skills:**

8. Collaborate with small group team members to assess and argue for or against certain communication issues based on interpersonal and intercultural differences.
9. Apply conflict management strategies for sensitive issues that have a lot of passion statements.
10. Demonstrate leadership skills by mastering effective interpersonal and intercultural tolerance and inclusiveness in communication.
11. Apply the principles of effective supervision and delegation in addressing communication issues.

O) **Practical and subject specific skills (Transferable Skills):**

5. Communication skills, covering both written and oral communications.
6. Problem-solving skills, relating to qualitative and quantitative information, extending to situations where evaluations have to be made on the basis of limited information.
7. Study skills needed for continuing professional development.
8. Apply creative and critical thinking skills in carrying out studies.
9. Interpersonal skills, relating to the ability to interact with other people and to engage in team-working.
10. Time-management and organizational skills, as evidenced by the ability to plan and implement efficient and effective modes of working.

Course Intended Learning Outcomes and its Relation with Program Outcomes (PO's*):

- Asian Disaster Reduction Centre: http://www.adrc.asia/publication/index.php

Course Description:

The course introduces the students to the field of Disaster and Emergency Management. The course is designed in a way that helps students to develop an understanding of the different phases of a disaster and subsequently be able to develop governmental and corporate policies and strategies required to ensure survival of individuals, societies and organizations.

Course General Objectives:

This course is designed to provide students with a comprehensive understanding of:

— Disaster anatomy and life cycle;
— Escalation of events and vulnerability assessment;
— Principles of crisis and disaster management;
— Disaster management and reduction frameworks, strategies, and actions;
— Differences between natural and man-made disasters;
— Management of man-made and natural disasters;

— International regulations and standards concerning disaster risk reduction;
— Terrorism management.

Intended Learning Outcomes (ILOs)/Competencies:

P) **Knowledge and understanding:**

1. Understand disaster and emergency concepts;
2. Understand the disaster lifecycle;
3. Understand basics of disaster and emergency management;
4. Recognize the various strategies required for managing disasters and emergencies before, during, and after their occurrences.

Q) **Cognitive and intellectual skills (thinking and analysis):**

7. Be able to analyze the different phases of natural and man-made disasters in order to select the most appropriate strategies and actions for reduction and treatment.
8. Be able to perform vulnerability and risk assessment process.

R) **Communication skills (personal and academic):**

1. Be able to create a basic disaster risk reduction plan and to communicate and discuss the structure of this plan amongst other students and colleagues.
2. Be able to create a basic disaster risk reduction plan and to communicate this plan hypothetically between various business units and departments within an organization.

3. Be able to benchmark the disaster risk reduction plan against international standards and best practices of other organizations.

S) **Professional Skills: upon completion of this course:**

1. Students should be able to provide basic advice for real organizations on how to improve their disaster risk reduction practice.
2. Students should be able to provide basic advice for real organizations on how to improve their disaster risk reduction plans.
3. Students should be able to provide basic advice for real organizations on how to benchmark basic practice with best practice of disaster risk reduction according to international standards.

T) **Practical and subject specific skills (Transferable Skills):**

1. Students should be able to apply their knowledge of the DEM process and the different DEM approaches in real organizations from various industry sectors.
2. Students should be able to apply best practice in real organizations.
3. Apply the basic principles of disaster and emergency management in decision making.
4. Apply disaster and emergency management frameworks in real case scenarios.

Intended Learning Outcomes vs Program Outcomes (PO's*):

	PO1	PO2	PO3	PO4	PO5	PO6
A1, B1, C1, D1	**x**					**x**
A2, B2, C2, D1,E1		**x**			**x**	
A3, B2, C2, D1,E1			**x**	**x**		
A3, B2, C2, D1,E2		**x**			**x**	
A3, C3, D2,E3	**x**					**x**

A4, C2, D3,E4	**x**					**x**

*Programs Outcomes (PO's) are available at the academic department.

Teaching Methods:

The course is delivered via **lectures**, classroom **discussions**, **exercises**, and **case studies**. Case studies are aimed at improving students' understanding of the concepts of disasters and emergencies and in order to improve their way of thinking regarding the reduction of impacts of disaster and emergency situations. Students will be divided into groups in order to discuss a specific case study in order to demonstrate their understanding of the content of the course. Course work marks will then be distributed according to their performance in the case studies.

Course Policies

University regulations are applied to this course, regarding class attendance; punctuality, exams, late submissions; absence with permission; penalties for cheating; and policies for assignments and projects – if any. Students should be aware of all these regulations in addition to other regulations stated and described in the student's handbook.

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1:	**Unit 1:** Introduction: Basics of Disaster and Emergency Management.	
Week 2:	**Unit 2:** disaster anatomy and life cycle; Escalation of events framework.	
Week 3:	**Unit 3:** Major incident management.	
Week 4:	**Unit 4:** Introduction to Disaster and Emergency planning. Part1	**Classroom discussions**
Week 5:	**Unit 5:** Introduction to Disaster and Emergency planning. Part2: International standards and regulations.	**Classroom Exercises and case studies**
Week 6:	**Unit 6:** Disaster and Emergency Management cycle.	
Week 7:	Midterm exam	
Week 8:	**Unit 7:** Types of disasters, i.e. natural and man-made. Adapting and mitigating Climate change-Disasters	
Week 9:	**Unit 8:** Monitoring disaster and emergency plans.	
Week 10:	**Unit 9:**.Vulnerability assessment and resilience frameworks.	**Classroom Exercises and case studies**
Week 11:	**Unit 10:** Case studies: Analysis of actual disaster scenarios, locally and globally.	
Week 12:	**Second Exam**	

Week 13:	**Unit 11:** Terrorism management. **Part1**	
Week 14:	**Unit 12:** Terrorism management. **Part2**	
Week 15:	**Unit 13:** Revision and class discussions.	**Classroom discussions**
Week 16:	**Final Exam**

Course Description:

This foundation course for corporate environmental management, examines the key concepts, theories and principles of environmental management with an aim to equip students with a set of tools and techniques for managing environmental performance in both the context of government and international policies, as well as, corporate strategy.

The course focus on the integration of environmental management systems; ISO 14001, as a tool to enhance efficient environmental management, more to polish the ethical, economic, and scientific principles needed to manage the business sustainability “triple bottom line”: entities that businesses should be both profitable and responsible (socially and environmentally). It is hoped that that this course will enhance the practice of environmental and social responsibility in ways that achieve long term sustainability.

Course General Objectives:

After completion of this course, the student will be able to:

- Explore different definitions of social environmental responsibility, corporate environmental management and sustainability
- Identify key tasks for environmental managers and the difficulties they present
- Increase the awareness of human impact on the environment with main focus on climate change
- Generate principles for environmental management
- Develop and implement a successful business strategy and policy in the domain of environmental and social responsibility, specifically with regards to implementing ISO 14001

Course Intended Learning Outcomes (ILOs)/Competencies:

U) **Knowledge and understanding:**

6- Explain the basic concepts, principles and theories associated with corporate environmental management notion
7- Appreciate and Describe the in-depth variations between different contextual settings, causes, and sources in which environmental risks and impacts may arise.
8- Reflect a basic understanding of ISO14001 elements
9- Explain the elements of ethical and sustainable business; The triple bottom line notion

V) **Cognitive and intellectual skills (thinking and analysis):**

1- Critically analyze the ISO-14001 model for corporate environmental management.
2- Comprehend the implementation of an Environmental Management System in accordance with ISO14001
3- To understand the relationship between an Environmental Management System with the requirements of different stakeholders of the organization
4- Explain how environmental management enhances business success and sustainability.
5- Discuss the impact of effective environmental management in developing business strategies, operations, and compliance status.
6- Demonstrate ability to analyze the organizational activities in a way to identify potential sources and causes of influencing the environment.

W) **Communication skills (personal and academic):**

1- Demonstrate innovative elaboration and debating skills on topics that address issues of concern in corporate environmental management environmental responsibility and sustainability.

2- Exercise corporate environmental management considerations in the development and presentation of basic environmental risk reduction ideas

X) **Professional Skills:**

1- Articulate and explain practical and conceptual issues in relation to solving real-life practical environmental problems taken from a diverse set of case studies
2- Apply the principles of Environmental management in decisions making.
3- Contribute to the achievement of sustainable development, through developing and implementing sustainable strategies and policies
4- Acquire the necessary expertise to contribute in implementing an Environmental Management System (EMS) as specified in ISO14001

Y) **Practical and subject specific skills (Transferable Skills):**

1- Apply the basics of ISO 14001, as well as principles of corporate environmental management in real organizational contexts.
2- Identify the dimensions of corporates environmental impact and develop actions to reduce potential Environmental crisis and disaster risks.

Teaching Methods:

The structure of this course is elaborated throughout sessions of lectures, discussions based on real cases, exercises, reports, homework and projects.

Assessment Instruments

	Mark
Midterm Exam	**30%**
Quizzes and Participation	**10%**
Project	**20%**
Final Exam	**40%**
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1:	• Introduction to environmental management and sustainability • Impact formula	
Week 2:	• Definitions of Sustainability • The Local-Global Three Bottom Lines: ISO 9000, 14000, and 26000	
Week 3:	• Climate Science Primer • population • Changing Conditions	**Classroom Exercises**
Week 4:	• Driving change • Collaboration Formal and Informal • Ethics, rights and Principles of environmental management	**The small islands case study**
Week 5:	• Resilience and Capacity to Prepare and Respond	**Jordan's water crisis**
Week 6:	• Conveying and Reporting on business Mission and Vision of Environmental and Social Responsibility	**Classroom Exercises**
Week 7:	• Social and Environmental responsibility measures	
Week 8:	• Midterm exam	
Week 9:	• Environmental Economics and Policy	**Academic poster presentation and defense**

Week 10:	• The Environmental Management System (EMS) • Background of ISO 14000 and Why It Exists • Decoding ISO 14000	
Week 11:	• Requirements of ISO 14000 • Understanding the business environmental context and defining the environmental aspect • Environmental impact assessment and setting environmental measurements	
Week 12:	• The plan, Do, check, Review circle in ISO implementation	**Case study**
Week 13:	• EMS Documentation	
Week 14:	• Registration and the Audit Process	
Week 15:	• EMS Performance Improvement	
Week 16:	• Final Exam	

Course Policies

University regulations are applied to this course, regarding class attendance; punctuality, exams, late submissions; absence with permission; penalties for cheating; and policies for assignments and projects – if any. Students should be aware of all these regulations in addition to other regulations stated and described in the student's handbook.

General Policies for the Course: students must comply with:

A) Lecture Management

1- Students should behave appropriately during lectures, in order to reflect the good reputation of the university.

2- Students should grasp the course objectives from the first day of attendance in order to work on achieving these objectives through the course duration.

3- Faculty members encourage students constantly to get involved in class discussions. Therefore, students should make use of these discussions in order to enhance their educational experience.
4- Students should not leave classrooms during lectures except for compelling reasons.

B) Scientific Honesty

The university prohibits students from any actions inconsistent with scientific honesty, including cheating in exams whether by giving or receiving information, or submitting assignments done by others. In case of breach of this sort, the student will be subject to an effective university punishment, which he/she should be well aware of.

C) Late Attendance or Absence for Lectures

1- Students attending a lecture more than 10 minutes late will be marked as "late attendant", and every four late attendances will be count for one day absence.
2- Students attending the lecture more than 20 minutes late will be allowed to enter the classroom but will be marked as "absent".
3- If absences exceed 15% of the lectures, then the student will be disqualified from the course, and will get the university zero mark for the course.

D) Absence from exams

1- Absentees from a short test (quiz) will not be allowed for a make-up test.
2- Official excuses for missing any exam must be provided to the lecturer for the appropriate actions to be taken.
3- Special forms designed for absence from final exams are available at the Admission and Registration Department. The Dean of the related course must be provided with these forms by the student within seven days from the date of the missed exam in order to take the appropriate action.
4- Medical excuses must be signed officially and stamped by the Medical Centre.
5- All make up exams will be given only once during the same semester.
6- Make up for the final exam must be held during the first two weeks of the following semester.
7- No excuse will be accepted in case of failing to attend the makeup exam. There will be no other chance for another make up exam.

E) Additional Instructions

1- Cell phones must be turned off during lectures and exams.
2- Students should refer to additional references and do extra reading for the course.
3- Students should submit their assignments within the due time.
4- In case of absence or late registration for the course, the student is fully responsible for the follow up of the missed lecture.
5- Students are advised to keep copies of their assignments as a reference and record.
6- Objection on final exam result is limited to the specific procedures developed by the university. Students have to refer to the Department of Admission and Registration to view relevant details.

3. Institute of Risk Management : http://www.theirm.org/
4. Risk Management Library: http://www.praxiom.com/31000.htm

Course Description:

This introductory course introduce the concepts of risk, risk identification, assessment and evaluation, the need for risk management, the effects of limited risk management application, theory of disaster risk reduction, and introduction to Insurance as one main mean for risk management.

Both business and personal risk are addressed with emphasis on the risk management treatment tools associated with controlling such risks (The risk management 4 T's). Emphasis will be given on the development of basic professional skills (i.e., risk environment analysis, processing risk management, overcoming dangers and organizing investment ideas). Students will be given opportunities to analyze and report risky business situations and to be competent in managing endemic business risk cases. In addition, the course will provide opportunities to practice essential group skills', such as academic discussions, teamwork and debates.

Course General Objectives:

After completion of this course, the student will be able to:

7- Explain theories and views related to risk definitions.
8- Define the fundamental characteristics of risks; types, sources and classifications.
9- Identify the main scope for enterprise risks.
10- Describe the processes, techniques and methods associated with the risk management
11- Critically analyze the ISO-31000 model for risk management.
12- Explore the benefits of risk management processing and the importance of that on safeguarding businesses and communities.
13- Reflect the need of risk management processing on the reducing disasters risks.

Course Intended Learning Outcomes (ILOs)/Competencies:

Z) **Knowledge and understanding:**

6- Demonstrate an understanding of the multidimensional nature and views of risk, and the relevance of its cultural and environmental framework.
7- Appreciate and Describe the in-depth variations between different contextual settings, causes, and sources in which risks may arise.
8- Understand the concepts and principles of Risk management
9- Explain the basic concepts, elements and techniques associated with effective risk management processing with ISO 31000.

10- Understand the basics of crisis and disaster management.

AA) **Cognitive and intellectual skills (thinking and analysis):**

10- Comprehend the application of risk management techniques in treating organizational risks
11- Explain the roots and theories of risk management.
12- Explain how risk management enhances the process of decision making and business success assurance.
13- Discuss the impact of effective risk management in developing business strategies, operations, and compliance status.
14- Demonstrate ability to analyze the organizational environments and identify potential sources and causes of risk.

BB) **Communication skills (personal and academic):**

14. Develop discussion and debating skills in issues related to risk and risk management.
15. Demonstrate innovative elaboration on topics that address issues of concern in the enterprise risk environments.
16. Exercise risk management considerations in the development and presentation of basic risk reduction ideas

CC) **Professional Skills:**

12. Articulate and explain technical and conceptual issues in relation to solving real-life practical problems taken from a diverse set of risk management applications
13. Apply the principles of effective risk management in decisions making.
14. Select, organize and analyze business basic records of which potential risks may be identified.

DD) **Practical and subject specific skills (Transferable Skills):**

11. Apply the basics of ISO 31000, as well as principles of Enterprise Risk Management in real organizational contexts.
12. Understand the disaster formula and what actions that should be made to reduce potential crisis and disaster risks.

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom debates/discussions, assignments, homework and projects.

Assessment Instruments

	Mark
First Exam	15%
Second Exam	15%
Quizzes, Homework and Participation	10%
Project	10%
Final Exam	50%

Course Description:

This course is a first year calculus-based physics course, for scientist an engineers. This course covers the basic principles of classical mechanics; Introduction to the principles of mechanics, energy, heat, sound and properties of matter following, The emphasis in this course will be on helping you to develop an understanding of natural phenomena through your own direct observations and reasoning. Learning based only on what you can infer and reason from direct observations is not easy and can be quite frustrating at times. These moments of frustration are usually where the seeds of understanding are planted.

This course will present a short overview of the climate history of our planet as indicated by modern techniques of climate recording and focuses on the description and analysis of the underlying physical and chemical processes that define the earth climate. We will seek to lay down the fundamental scientific principles behind climate change, global warming and issues involving climate change impacts and the issue of *mitigatio*n -- that is, basic solutions to dealing with the challenges presented by climate change. The processes leading to the balance in the earth climate system are fundamental physical processes driven by the laws of thermodynamics, convective hydrodynamics, and radiative transfer which will be discussed in details in this course.

Course General Objectives:

After completion of this course, the student will be able to:

1. Explain theories related to physics principles and the Earth's climate system and its components.
2. Define the fundamental concepts of physics and communicate his ideas clearly.
3. Describe the challenges and issues related to the use of physics in technology.
4. Distinguish the factors governing natural climate variability from human-caused climate change.
5. Identify strategies to address the greenhouse effect.
6. Describe the benefits of studying physics for future career options.
7. Ability to analyze scientific data and presenting them in seminars.
8. Explore cross-cultural ethical issues and environmental issues.
9. Explore cross-cultural ethical issues and environmental issues

Course Intended Learning Outcomes (ILOs)/Competencies:

EE) **Knowledge and understanding:**

14- Ability to develop a clear understanding of basic concepts in classical mechanics and earth climate
15- To form a good background for follow up courses in physics, engineering and environment.
16- To develop the skills to deal with the physical concepts quantitatively.
17- To develop mathematical ability to manipulate formulae and derive correct numerical solutions that can be measured in real world.
18- To develop the learning skills of the student in using computers and internet resources while using them as educational tools, problem solving methods and demonstration tools.
19- To enhance the student self-learning ability.

FF) **Cognitive and intellectual skills (thinking and analysis):**

1- Ability to think about the physics concept in application
2- Appreciate physics principles and the importance of studying physics
3- Explore new ideas using existing theories.
4- Analyze and communicate ideas of physics used in devices and technology.

GG) **Communication skills (personal and academic):**

17. Develop and apply communication skills that improve competence in scientific meetings
18. Become creative by elaborating on scientific topics that address issues of concern in the workplace.
19. Exercise ethical considerations in the development and presentation of ideas.
20. Adapt ideas to listeners' attitudes, values and beliefs.
21. Conduct library research, and other information-gathering activities.
22. Participate actively in classroom debate, assignments and brain storming sessions.

HH)**Professional Skills:**

15. Collaborate with small group team members to study and solve problems in physics.
16. Participate effectively in classroom and brain storming sessions.
17. Demonstrate skills in communicating physics ideas and concepts.

II) **Practical and subject specific skills (Transferable Skills):**

13. Communication skills, covering both written and oral communications.
14. Problem-solving skills, relating to qualitative and quantitative information, extending to situations where evaluations have to be made on the basis of limited information.
15. Study skills needed for continuing professional development.
16. Apply creative and critical thinking skills in carrying out studies.
17. Interpersonal skills, relating to the ability to interact with other people and to engage in team-working.
18. Time-management and organizational skills, as evidenced by the ability to plan and implement efficient and effective modes of working.

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom debates, assignments, exercises, homework and projects.Add text here

Course Policies

University regulations are applied to this course, regarding class attendance; punctuality, exams, late submissions; absence with permission; penalties for cheating; and policies for assignments and projects – if any. Students should be aware of all those in addition to other rules and regulations stated and described in the student's handbook.

Course Modulus:
This course consists of 3 modulus units: Mechanics, Energy Conservation & Thermodynamics.

Course	**Curriculum and Hypermedia**
Module 1	Mechanics

Key Concepts	Units, One and Two Dimensional Motions, Newton's Laws of Motion and Kinematics and Dynamics.
Overview	Defining fundamental concepts in physics and related to our everyday events'. Use of physics in the new technology and its implementation. Explore new ideas related to physics application.
Aim	Apply theories to experiments and elaborate on their applications.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different types of functions and units • Discuss how technology can contribute to curriculum change • To form a good background for follow up courses in physics, engineering and environment. • To develop the skills to deal with the physical concepts quantitatively. • To develop mathematical ability to manipulate formulae and derive correct numerical solutions that can be measured in real world.
Units	**Chapter1: Mechanics (Physics and Measurements)** **Chapter2: Motion in one dimension** **Chapter3: Vectors** **Chapter4: Motion in two dimensions** **Chapter5: The Laws of Motion (Newton's Laws)**
Activity	**Homework assignment for each chapter and quizzes.** **Do short research projects related to the ideas discussed in the units.**
Module 2	Conservation of Energy
Key Concepts	Work, Energy, Isolated and Non-Isolated Systems and Concept of Conservation of Energy.
Overview	Defining the difference between isolated and non-isolated system in terms of

	conservative and non-conservative forces.
Aim	Relating work and energy to the forces applied to the system. Defining mechanical energy (kinetic and potential) and analyzing physical situations in terms of the mechanical energy. Utilize bar chart to and work-energy relation to analyze physical situations. Conduct energy analysis.
Learning Outcomes	At the end of this module learners will be able to: • Defining work and energy and their corresponding units. • Distinguish between work and power. • Defining kinetic and potential energies in physical situations. • Predicting object's mechanical energy. • Applying the principles of energy conservations for variety of physical situations. • Distinction between energy conservation and non-conservation.
Units	**Chapter7: Energy of a system** **Chapter8: Conservation of energy** **Chapter9: Linear Momentum and Collisions**
Activity	**Homework assignment for each chapter and quizzes.** **Do short research projects related to the ideas discussed in the units.**
Module 3	Heat and Thermodynamics
Key Concepts	Temperature, Heat, Entropy, Zeroth, First, Second and Third Laws of Thermodynamics.
Overview	One misconception about the threat of climate change is that it has to do with the absolute warmth of the Earth. In instead, it is the *rate **of change*** that has scientists concerned about. Living things, including humans, can easily adapt to substantial changes in climate as long as the changes take place slowly, over many thousands of years or longer. However, adapting

	to changes that are taking place on timescales of *decades* is far more challenging.The laws of physics driven by the laws of thermodynamics, convective hydrodynamics, and radiative transfer describe climate change system and global warming. This course will focus on the description and analysis of the underlying physical and chemical processes that define the earth climate. The course also seeks to lay down the fundamental scientific principles behind climate change, global warming and issues involving climate change impacts and the issue of *mitigatio*n -- that is, solutions to dealing with the challenges presented by climate change.
Aim	This module aims to lay down the fundamental scientific principles behind climate change, global warming and issues involving climate change impacts and the issue of *mitigatio*n -- that is, solutions to dealing with the challenges presented by climate change in the areas of the physical and biological sciences.
Learning Outcomes	At the end of this module learners will be able to: • Analyze variety of environmental issues • Human interactions in environment. • Becoming more environmentally literate. • Identify and describe the basic scientific principles and processes important in climate change. • Describe the effect of greenhouse gases and temperature. • Describe the effect of clouds on temperature. • Expalin why greenhouse gases affect temperature.
Units	**Chapter19: Temperature and Zeroth law of thermodynamics** **Chapter. 20: The First Law of Thermodynamics.** **Chapter22: Heat Engines, Entropy and the Second Law of Thermodynamics.**
Activity	**Overview**

Homework assignment for each chapter and quizzes.
Do short research projects related to the ideas discussed in the units.

1. Course Specifics

Course Title	**Ecology**
Course Number:	**201415**
Course Prerequisite(s)	**201311**
Course Co-requisite(s)	**-**
Credit Hours	**Lecture: 3 CH - (Lab: 1 CH -see 201416)**
Lecture Days & Time	
Class Location	
Course Instructor/s	**Prof. Fares Khoury**

Prof Fares Khoury	Professor	SB-G37		f.khoury@aum.edu.jo

3. Course Components

Resources:

- **Text book:**

Elements of Ecology. 7th or later edition; by T. Smith and R. Smith. Pearson.

- **References:** to be provided by the instructor

Course Description:

Ecology has advanced considerably as a science in recent years due to the growth of the environmental movement and the adverse anthropogenic imapcts on the climate and environment. Ecology is a scientific discipline, although the word *ecology* is often misused in the media and confusd by some with *environment* and *environmentalism*. This course introduces ecology as an inter-disciplinary, dynamic and contemporary discipline with an actual relevance to real world problems affecting all living organisms including humans. It covers the fundamental relationships of living organisms with their environment and introduces essential ecological concepts. The structure and dynamics of populations and communities, and ecosystem function will be introduced and related to various applications and environmental issues. The course includes both lectures and active learning. The students can select case studies or special topics which they will discuss and demonstrate as presentations. The theoretical course is concurrent with the ecology lab course (201416) where the students acuire basic skills in lab and field work.

. **Course Objectives:**

This course aims to 1) introduce the various relationships between organisms and their living and non-living environment, 2) raise awareness of the importance of the science of ecology and about the influence of human activities on the environment, and 3) provide the students the opportunity to critically evaluate and discuss case studies and current debates

Course Outcomes:

After completion of this course, the student will be able to:

10. Explain key concepts and themes in ecology
11. Describe and examine the basic features and dynamics of populations, communities and ecosystems
12. Compare and contrast various terrestrial and aquatic ecosystems
13. Describe interspecific interactions including their benefits to human well-being
14. Investigate the specific interactions between humans and their environment and use an interdisciplinary approach in demonstrating these interactions

15. Demonstrate awareness about the influence of human activity on the biosphere, and the impacts of climate change on ecosystems

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom discussions and debates, small projects or assignments. The theoretical part is closely related to and harmonized with the lab course (201312).

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1	Ch. 1: The Nature of Ecology	
Week 2	Ch. 2: Climate	
Week 3	Ch. 3-4: Aquatic and terrestrial environments	
Week 4	Ch. 5: Ecological Genetics, adaptations	***Discussion session***
Week 5	Ch. 6-7: Plant and animal adaptations	
Week 6		**First Exam**
Week 6	Ch. 8: Life History patterns	
Week 7	Ch. 9-10: Population properties and growth	
Week 8	Ch. 11 Intraspecific population regulation	
Week 9	Ch. 12: Metapopulations	
Week 10:	Ch. 13-15: Species interactions	
Week 11:	Ch. 16-17: Community structure; what influences community structure?	
Week 12:		**Second Exam**
Week 12	Ch. 18-19: Community dynamics; Landscape ecology	
Week 13:	Ch. 20: Ecosystem energetics	
Week 14:	Ch. 21-22 Nutrient cycling	
Week 15	Ch. 29 Global climate change	***Discussion session; Submission of projects***

		(reports/presentations)
Week 16:	**Final Exam**	

Course Policies
University regulations apply to this course regarding class attendance, punctuality, exams, late submissions, absence with permission, penalties for cheating, and policies for assignments and projects, if any. Students should be aware of all those in addition to other rules and regulations stated and descried in the student handbook.

Course modules

Course	**Ecology**
Module 1	**The Physical Environment**
Key Concepts	Climate, spatial and temporal variations, microclimates
Overview	Ecology is linked to the physical sciences by the concept of habitability, i.e. the capacity of the environment to support life. The understanding of the ecology of organisms depends much on the understanding of the physical environment. Interactions between organisms and the physical environment which span over a period of several generations are the driving force of natural selection leading to adaptations. Short-term interactions between individuals and the environment have a direct influence on physiological performance, survival, growth and reproduction.

	Many organisms also have to cope with short-term variation in their environment. This unit describes features of the physical environment which influence habitability in terrestrial and aquatic ecosystems. Spatial and temporal variation in climate, its causes and consequences will also be introduced.
Aim	Students will learn about the features of the physical environment which influence habitability.
Learning Outcomes	At the end of this module, students will be able to - describe the determinants of climate - discuss the causes for spatial and temporal variation in climate and features of the physical environment - compare the physical environment of aquatic and terrestrial ecosystems
Units	1- Climate 2- The Aquatic Environment 3- The Terrestrial Environment
Readings	- Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapters 1-4). - www.myecologyplace.com
Activity	- review
Module 2	**The Organism and its Environment**
Key Concepts	Natural Selection, Hardy-Weinberg Equation, adaptation, species distribution, life history
Overview	Every species has a specific geographic distribution. Some species are able to survive and thrive in extreme environments, e.g. deserts. The fundamental questions are, what controls the distribution and abundance of species? what enables a species to succeed in one environment but not another ? A species which has adaptations to a set of features in one environment preclude it to survive in another. Adaptations are physiological, morphological, and behavioral and life-style characteristics. These enable the organism to acquire and assimilate energy and matter, reproduce and

	respond to external stimuli in its environment. Autotrophs (e.g. plants) and heterotrophs differ considerably in the way energy is acquired, and their adaptations are discussed in two different chapters. The module starts with the basics of evolution of adaptations by means of natural selection.
Aim	Students will be able to improve their knowledge about natural selection and how it produces adaptations. Plants and animals differ in many ways, for example how they acquire energy. The adaptations of each group will be discussed, always taking into consideration constraints / trade-offs
Learning Outcomes	At the end of this module, students will be able to - describe the hierarchical levels of ecological study: organisms, populations, communities, ecosystems - define adaptation and discuss the role of natural selection - discuss the various physiological, morphological and behavioral adaptations of plants and animals to their environments - demonstrate that various life history patterns of growth, development and reproduction are adaptations to the environment
Units	2- Ecological Genetics: Adaptations and Natural Selection 3- Plant Adaptation to the Environment 4- Animal Adaptations to the Environment 5- Life History Patterns
Readings	- Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapters 5-8). - www.myecologyplace.com
Activity	review
Module 3	**Populations**
Key Concepts	Population structure, population growth, logistic and exponential growth, intra-specific competition, meta-populations

Overview	A population is a group of individuals of the same species which live in the same area at the same time. Reproduction and death of individuals affect population dynamics through time. These events are affected by various environmental and behavioral factors. Immigration/Emigration affects population dynamics, and is also an important interaction between local sub-populations which form large regional meta-populations.
Aim	Students' knowledge about population properties and dynamics will be enhanced.
Learning Outcomes	At the end of this module, students are expected to - define a population and its properties - describe the types of population growth using models - discuss the various factors, both intrinsic and extrinsic, which affect birth and death rates - explain the effect of competition among the individuals of the same population - describe interactions among local sub-populations and present awareness about the importance of the meta-population concept in conservation
Units	1- Properties of Population 2- Population growth 3- Intraspecific Population Regulation 4- Metapopulations
Readings	- Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapters 9-12). - www.myecologyplace.com
Activity	review discussion session initiating project work
Module 4	**Species Interactions**

Key Concepts	Lodtka-Volterra models, inter-specific competition, Resource and non-resource factors, Ecological niche, competitive exclusion, character displacement, resource partitioning, predation, optimal foraging theory, predator defences, mimicry, parasitism, mutualism, co-evolution
Overview	The population dynamics of each species is also affected by interactions with other species. These interactions include interspecific copmpetition, predation, parasitism, and mutualism. Some of these interactions have a profound effect on human well-being (e.g. pollination). Deeper knowledge about these interactions is crucial in managing many issues, e.g. pest control, assessing the effects of and controlling invasive species, and conserving biological diversity.
Aim	Students will be able to acquire a deeper knowledge about the nature of species interactions and how these vary and affect the populations of each species.
Learning Outcomes	At the end of this module, students will be able to - describe the various species interactions and present examples for each type of interaction and related adaptations - discuss the consequences of interspecific interactions and predation on population dynamics using current models - discuss the various theories and principles associated with the species interactions - demonstrate awareness about the possible consequences of species introductions and bio-invasions
Units	1- Interspecific Competition 2- Predation 3- Parasitism and mutualism
Readings	- Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapters 13-15). - www.myecologyplace.com - Howe, H, Westley, L (1990): Ecological Relationships of Plants and Animals. Oxford UP.
Activity	**Review**

Module 5	**Community Ecology**
Key Concepts	Community structure, biodiversity, food webs, keystone species, stress and resource availability, succession, edge effect, theory of island biogeography
Overview	The ecological community is defined as the set of plant and animal species that occupy an area. Some species in a community are abundant while others are rare, and some communities have many species while others have very few. The study of these properties and their causes including various interactions between species and their living and non-living environment are among the subjects of this module. The effect of habitat area on species diversity will also be discussed. Community structure changes with time, leading to ecological succession, and communities vary spatially due to variation in climate, geology, soils, disturbances, biotic factors etc.., leading to typical zonation patterns and mosaics of communities on the broader landscape.
Aim	Students will be able to understand the complex web of interactions within the community, and the factors that influence community structure and its temporal and spatial variation.
Learning Outcomes	At the end of this module, students will be able to - define the community and its structure - calculate various diversity indices - describe the factors which affect community structure and the change of community structure in time and space - explain the importance of habitat area and the interactions among habitat patches for species diversity - demonstrate awareness about impacts of man-made disturbances and

	habitat areas and their spatial arrangement at the landscape level on biodiversity
Units	1- Community structure 2- Factors influencing the structure of communities 3- community dynamics 4- landscape ecology
Readings	- Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapters 16-19). - www.myecologyplace.com
Activity	**review**
Module 6	**Ecosystem Ecology**
Key Concepts	Energy flow, primary and secondary production, ecological efficiencies, energy pyramids, nutrient cycles, decomposition
Overview	The ecosystem concept combines the physical (abiotic) and biological (biotic) components into a single interactive system. It provides a framework to integrate the student's accumulated understanding of adaptation populations, communities, and the abiotic environment. Ecosystem ecology uses a functional approach in describing the role of species or species group in terms of energy and material processing. The community is generally partitioned into autotrophs, or primary producers, and heterotrophs, or secondary producers. The driving force of ecosystems is ultimately the sun and most ecosystems are open, exchanging organic matter and nutrients with other ecosystems.
Aim	The overriding aim of this module is to integrate previously acquired knowledge and enhance understanding of energy flow and nutrient cycling in ecosystems.
Learning	At the end of this module, students will be able to

Outcomes	- define ecosystems and describe the flow of energy and nutrient cycling in ecosystems - discuss the importance of key processes, such as photosynthesis and decomposition, in energy flow and nutrient cycling - Describe the biogeochemical cycles of nutrients (carbon, nitrogen, phosphorus etc.)
Units	1- Ecosystem Energetics 2- Decomposition and nutrient cycling 3- biogeochemical cycles
Readings	- Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapters 20-22). - www.myecologyplace.com
Activity	- review - submit a summary of project
Module 7	**Human Ecology: Global Climate Change**
Key Concepts	Climate change
Overview	No other organism has affected Earth's environment as much as the human species. Our relationship with the environment is constantly re-defined, it is a relationship based largely on energy. The changes humans have brought about are mainly due to meeting the basic needs of a growing human population. We are now beginning to understand the consequences of our past and current activities. In this module the potential of human activity to significantly change Earth's climate will be discussed.
Aim	Students will be able to understand human impacts on the environment, especially the potential for human activities to significantly change global climate.
Learning Outcomes	At the end of this module, students will be able to - explain the role of greenhouse gases and the consequences of rising CO2 in the

	atmosphere - discuss the effects of climate change on ecosystems, coastal environments, agricultural production, and human health
Units	1- Global Climate change
Readings	- Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapter 29). - www.myecologyplace.com - Atkinson, P. (ed.) (2010): Vector Biology, Ecology and Control. Springer (this and other relevant books are available at AUM library as e-books)
Activity	- review - group discussions and presentations

3. Course Components

Resources:

- **Text book:** Primack, R. (2012) A primer of Conservation Biology. 5th edition. Sinauer Associates

Course Description:

Sustainability has become an important concept in resource management and development. Understanding and mimicking natural processes is the best way to preserve natural resources and avoid the adverse consequences of human activities including biodiversity loss. Deep understanding of the basic ecological concepts and interactions can thus help us solve actual problems threatening human well-being. This course introduces a sample of various applications based on ecological knowledge. The concepts of sustained yield, sustainable agriculture, forestry and fishery, and the importance of species interactions, e.g. in weed and pest control. The principles of conservation biology will be introduced and discussed, including biodiversity, ecosystem functions, and population viability and means of minimizing the threats to biodiversity. Case studies in restoration ecology will be demonstrated and will include phyto- and bioremediation. The influence of climate change on the spread of infectious diseases and their arthropod vectors will be one of the issues discussed during the course. This course will include lectures to introduce the various themes and demonstrate case studies, in addition to group discussions and presentations as part of projects carried out by the students. Students will also be encouraged to engage in discussions with professionals in the environmental and agricultural sectors during sessions with invited guests.

Course Objectives:

This course aims to educate students 1) about the importance of understanding population dynamics and ecosystem function as a base for estimating sustained yield and for sustainable use of resources, 2) how to avoid or reduce adverse anthropogenic impacts in natural ecosystems and other problems arising in rural and urban ecosystems; 3) in the integration of basic ecological concepts as a base for concerving biological diversity.

Course Outcomes:

After completion of this course, the student will be able to:

16. Explain and demonstrate the impacts of human population growth and unsustainable use of resources on climate, ecosystems and biodiversity
17. Realize that ecosystem services and biodiversity are extremely valuable
18. Describe sustained yield and sustainable use of natural resources
19. Describe the different levels of biodiversity and threats to biodiversity
20. Recognize population – level considerations related to population vialbility
21. Recommend and design possible solutions to various environmental problems in urban, rural and natural environments by intergrating knowledge about ecosytem and community processes and species interactions

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom discussions and debates, small projects or assignments.

Course modules

Course	Applied Ecology
Module 1	**Sustainable use of resources**
Key Concepts	Environmental sustainability, natural capital and ecosystem services, sustainable yield
Overview	The growing human population and the desire for expanded economic growth within the world community have brought the issue of sustainability to the forefront of current economic, political and environmental discussions. In this module Environmental sustainability which focusses on natural capital will be discussed. We will examine the basic environmental issues related to human activities of resource management and extraction and consider how these issues relate to the ecological processes and patterns discussed during the basic ecology course.
Aim	Students will learn about the sustainable use of natural resources
Learning Outcomes	At the end of this module, students will be able to - describe the consequences of human growth on natural capital - define environmental sustainability - explain the concept of sustainable yield based on population growth models
Units	4- Human population growth 5- Sustained yield
Readings	- Krebs, C. (2009): Ecology. Benjamin Cumming/Pearson - Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapter 27). - www.myecologyplace.com
Activity	- Review

Module 2	The role of species interactions
Key Concepts	Weed control, pests (parasite ecology), biological pest control, prey-predator interactions, herbivory, bio-invasions, mutualism, pollination
Overview	The study of various interspecific interactions provides the foundation for managing resources. Weeds often compete with crop plants, but the impact of weeds can be better controlled if the interaction and the factors which provide competitive advantage to the weeds are well understood. The populations of pests in agro-ecosystems can be managed by suitable design and predators of these pests, thus decreasing the need for harmful chemical pesticides. The interaction between herbivores and plants is important in managing range lands, and many of our crops would not be possible without the help of insect pollinators.
Aim	Students will be able to deepen their knowledge about the role of various interspecific interactions, and means of using the organisms for human benefit
Learning Outcomes	At the end of this module, students will be able to - analyse the basic interspecific interactions and associated models - describe the role and benefits of species interactions in agro-ecosystems and other systems
Units	6- Competition, weeds, bio-invasions 7- Herbivory and predation: their roles in range management and biological control 8- The role of pollination
Readings	- Howe, H, Westley, L (1990): Ecological Relationships of Plants and Animals. Oxford UP. - Vandermeer, J. (2011): The Ecology of Agroecosystems. Jones and Bartlett. - Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapters 13-15). - www.myecologyplace.com -
Activity	- Review - Group discussion

Module 3	**Climate change and Human Health**
Key Concepts	Climate change, disease vectors, conservation medicine
Overview	Climate variability has been shown to have an impact on the temporal and spatial distribution of infectious diseases. Climatic changes can directly or indirectly affect the populations of arthropod disease vectors, e.g. those carrying malaria or dengue fever. In this module, reviews and case studies will be discussed. The module will also include a demonstration of research carried out at AUM on mosquitoes and migratory birds.
Aim	Students will learn about the biology of disease vectors and factors affecting their distribution and abundance
Learning Outcomes	At the end of this module, students will able to - Define disease vectors and provide examples of wide-spread infectious diseases and their vectors - discuss the various factors which affects distribution and abundance of some arthropod vectors - realize the importance of understanding the ecology of vectors in assessing spread of vectors and controlling their populations
Units	5- Ecology of disease vectors
Readings	- Atkinson, P. (2010) Vector Biology, Ecology and Control. Springer. - Ecology of parasite-vector interactions - Takken, W., Koenraadt, C. (2013) Ecology of parasite vector Interactions; Ecology and control of vector-borne diseases, Volume 3. WAP. - Mehlhorn, H. (2012) Arthropods as vectors of emerging disease. Parasitology research Monographs, Vol. 3. Springer. - Becker, N. et al. (2010) Mosquitoes and their control. 3rd edition. Springer. -
Activity	Review discussion session initiating project work / submission of proposals

Module 4	Conservation Biology
Key Concepts	Biological diversity, genetic diversity, species, environmental ethics, value of ecosystem services, threats to biodiversity (habitat destruction, climate change, invasive species, etc…), population viability, protected areas
Overview	Earth is currently undergoing a mass extinction due to human activities. Interest in protecting the world's biological diversity – including its amazing range of species, its complex, biological communities and ecosystem processes, and the genetic variation within species – has intensified during the last few decades. Conservation biology is an integrated, multidisciplinary scientific field that has developed in response to the challenges of preserving species and ecosystems. Its goals is a) it document the full range of biological diversity, b) to investigate the impacts of human activities on species, genetic variation and ecosystems, and c) to develop practical approaches to prevent the extinction of species, maintain genetic diversity, and protect and restore biological communities and their associated ecosystem functions. In this module, basic concepts are introduced first, then threats are identified and means of preventing biodiversity loss are discussed.
Aim	Students will investigate the human impact on species, genetic variation and ecosystems, and learn about practical approaches to prevent the extinction of species, maintain genetic diversity, and protect and restore biological communities and their associated ecosystem functions
Learning Outcomes	At the end of this module, students will be able to - Define biological diversity at different levels (species, genetic…) - Realize that biodiversity is extremely valuable - Discuss and compare various ethical arguments supporting preservation - discuss the consequences of human activities (including climate change) on genetic diversity, habitats and their associated communities and ecosystem functions - identify relevant ecological concepts which can be integrated in the

	development of approaches for conserving biological diversity
Units	4- What is biodiversity 5- The value of biodiversity 6- Threats to biodiversity 7- Extinction, population viability 8- Conserving populations and species 9- Protected areas and ecosystem management
Readings	- Primack, R. (2012) A primer of Conservation Biology. 5th edition. Sinauer Associates. - Groom, M. (2006) Principles of Conservation Biology. Sinauer Associates. - Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapters 13-15). - www.myecologyplace.com
Activity	**Review**
Module 5	**Ecological Restoration**
Key Concepts	Ecological restoration
Overview	One goal of conservation biology is to preserve biodiversity. In recent years, however, conservationists have turned their attention to areas severely altered by human activities. Such areas, if restored ecologically, can significantly contribute to the conservation of biodiversity and provide a variety of ecosystem services. Restoring certain ecosystems can also be a means of adapting to climate change. Restoration ecology is a modern discipline which is playing an important role in the planning and programs of government agencies and non-governmental organizations.

Aim	This module introduces the potential for taking action and restoring disturbed ecosystems in unprotected areas
Learning Outcomes	At the end of this module, students will be able to - Define ecological restoration - Discuss the goals and approaches of ecological restoration - Analyze the factors which affect the success of restoration programs - Demonstrate the significance of ecological restoration in a variety of case studies
Units	5- Ecological restoration 6- The use of bioremediation in restoration
Readings	- Clewell, A., Aronson, J. (2013): Ecological Restoration, Principles, Values, and Structure of an Emerging Profession. 2nd edition. Island Press. - Primack, R. (2012) A primer of Conservation Biology. 5th edition. Sinauer - Groom, M. (2006) Principles of Conservation Biology. 3- Food and Agriculture Organization of the United Nations (www.fao.org)
4- World Health Organization (WHO) (www.who.org)

Course Description:

This course focuses on Chemical composition of food components, their physical properties and their functional roles. It discusses each of the food groups, such as carbohydrates, proteins, fats and oils,..etc., in terms of their composition and quality attributes. Beside that, an ecological approach to food science is targeted, so as to link between the climate change and food science. The effect of climate change on food science issues such as; food security, food production and quality is discussed. The concept of "going green" in food is also studied. The course also introduces principles of quality control and sensory evaluation of food.

Course General Objectives:

After completion of this course, the student will be able to:

6- Understand the principles of food science and different food terms.
7- Understand chemical composition of foods, their properties and functions.
8- Outline main reasons of perishability, sources of food spoilage.
9- Define the concept of shelf life.
10- Clarify the differences between Food Safety and Food Quality.
11- Understand the main attributes of Food Quality and means of preventing deterioration.

12- Identify principles of sensory evaluation.
13- Understand the effect of climate change on Food science issues.
14- Discuss the concept of going green related to food groups.

Course Intended Learning Outcomes (ILOs)/Competencies:

JJ) **Knowledge and understanding:**

20- Describe the chemical composition of food items, their reactions and role in nutrition.
21- Understand the role of food sciences in food and nutrition careers and technology.
22- Describe the methods of subjective and objective food quality evaluation.
23- Explain the role of water activity in food quality measurement.
24- Describe the reasons of food perishability, generally and for each type of the food groups.
25- Aknowledge the impact of climate change on food security, food production and quality.
26- Understand the effect of climate change on food production and food intake locally.
27- Describe the new trends in food science, like going green in food selection and production.

KK) **Cognitive and intellectual skills (thinking and analysis):**

1- Compare between different food components and their effect on food quality.
2- Analyze the food science applications; in industry, laboratory, quality assurance …etc.
3- Appreciate the sensory evaluation of food quality as a first impression affecting consumers' perception.
4- Appreciate the importance of quality evaluation and analysis of food.
5- Analyze the applications of food science for better health and for improvement of nutritional status.
6- Discuss new trends in food technology (such as GMO).
7- Analyze food problems related to the climate change locally and internationally.

LL) **Communication skills (personal and academic):**

23. Develop personal intercultural communication skills, through class activities and interaction.
24. Become creative by presenting topics of concern and new trend in food science and technology.
25. Exercise sensory evaluation by applying practical examples of food products from local market.
26. Adapt new ideas of food application and discuss their validity and degree of acceptance by society.
27. Conduct library research to find out more information about the recent concerning issues raised up around climate change impact on food production and security locally and worldwide.
28. Conduct Personal interviews, so as to gather information about consumer acceptance for different food types (such as junk food, ethnic foods, cultural home-made food).
29. Develop an idea about the areas which requires repair, awareness or development in food industry sectors.

MM) **Professional Skills:**

18. Collaborate with small group team members to assess and argue for or against certain issue of food conflicts
19. Prepare awareness sheet, publish it and distribute it among other colleagues of the university.
20. Field visit to food industrial sectors in order to understand how the production of food is regulated and quality is manipulated.
21. Suggest creative ideas for food awareness among school children, special needs…etc.

NN) **Practical and subject specific skills (Transferable Skills):**

19. Communication skills, covering both written and oral communications.
20. Problem-solving skills, relating to objective and subjective food quality evaluation.
21. Apply creative and critical thinking skills in carrying out studies related to new trends in food technology
22. Interpersonal skills, relating to the ability to interact with other people and to engage in team-working.
23. Time-management and organizational skills, as evidenced by the ability to plan and implement efficient and effective modes of working.
24. Encourage students to run small campaigns of climate change awareness within their colleagues and communities.

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom debates, assignments, exercises, homework and projects.
Add text here

Assessment Instruments

	Mark
Midterm Exam	30%
Quizzes, Homework and Participation	10%
Projects	20%
Final Exam	40%
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1:	Food Science-Introduction	
Week 2:	An ecological approach Impact of climate change on food science issues/Food Security	
Week 3:	Evaluation of Food Quality	
Week 4:	Sensory Evaluation	
Week 5:	Food composition/ Going green with food groups	
Week 6:	Water	
Week 7:	Carbohydrates	
Week 8:	**Midterm Exam**	
Week 9:	Grains: cereal, flour & rice	
Week 10:	Proteins: meat and meat substitutes	
Week 11:	poultry and fish	
Week 12:	milk and dairy products	
Week 13:	Eggs and egg replacements	

Week 14:	Fat and oil	
Week 15:	Fruits and vegetables/ Vegetarianism	
Week 16:	**Final Exam**	

Course Policies

University regulations are applied to this course, regarding class attendance; punctuality, exams, late submissions; absence with permission; penalties for cheating; and policies for assignments and projects – if any. Students should be aware of all those in addition to other rules and regulations stated and described in the student's handbook.

Module 1	**Food Science**
Key Concepts	Composition, quality, introduction, climate change.
Overview	Food Science is the science is based on studying the composition of food components. Their chemical and physical properties, their quality attributes, and reactions. The food groups are categorized according to their nutritional value, as water, carbohydrates, proteins, oil and fat,..etc. The course begins with a general overview and an introduction to the principles of food sciences, such as food chemistry, food processing, food safety...etc, their relationships to food science, then the quality attributes are studied, both the objective or subjective food quality evaluation method. Principles of consumer perception and sensory evaluation of food quality are also discussed. In the second week, an ecological approach to food science is also included. An introduction to ecological Literacy and The Current Need

	for an Ecological Approach, where the relationship between food sciences and environmental issues is discussed, the climate change mitigation, the effect of climate change on food supply and quality of health. Effect of food waste on climate change, effect of diet on climate change are also discussed.
Aim	The aim of this module is to: *Get through the concept of food sciences and their importance. *To define the different food groups based on their nutritional value. *To understand the difference between objective and subjective methods that are used in food quality evaluation. * Understand the effect of climate change on Food science issues. *Understand the relationship between climate change and quality of food, food shortage and insecurity. *discuss challenges to sustainably feeding the world.
Learning Outcomes	At the end of this module learners will be able to: *Describe the food components and categorize them regarding their nutritional value. *Understand the role of food science in food career and technology. *Describe the methods of subjective and objective food quality evaluation methods. *Describe the reasons of food perishability. *Link between environmental effects of climate change and food science issues. *Analyze the problems associated to climate change and discuss possible solutions.

Units	Chapter one: Food Science and Natural Environment. Chapter three: Sensory Evaluation. Chapter four: Food Composition.
Readings	Some of the suggested readings can be: *Sustainably feeding the world, from the main textbook page 19. *Food, Energy, and Society, for David Pimentel and Marcia Pimentel—Third Edition. Food Politics: How the Food Industry Influences Nutrition and Health for Marion Nestle.
Activity	Possible activites can be: *Visiting local farms and discuss the current climate change, food production, supply or shortage in local market *Visiting big supermarkets and collect data from owners and consumers. *Apply a questionnaire to a certain group of communities about their thoughts about Mediterranean diet, is adaptable to climate change, discuss, search, make questionnaires, check your community, debat and draw conclusions and suggestions for future work. *Check industrial sector, and find out if they are aware about healthy production, are they applying an environmental approach in their processes?

Module 2 Food groups

Key Concepts	food groups, going green, vegetarianism.
Overview	After understanding principles of Food Science and quality, and their relationship to climate change, then a deeper study will go through each of the food groups, one by one, by discussing their chemical composition and physical characteristics, their reactions and quality attributes. The application of concept of “going green” in food production and consumption is studied along with each of the food groups. The new trends in food industry, and biotechnology is also debated, like GMOs. The concept of vegetarianism is also discussed as well as quality and nutritional attributes of each of these food groups.
Aim	The aim of this module is to: *Get through the concept of “going green” in food production and their importance. *Define the chemical, physical and nutritional properties of each of the food components and their substitutes. *Define the new trends in food technology and production toward healthier and more environmentally friendly options.
Learning Outcomes	At the end of this module learners will be able to: *Describe the category of each of the food components based on their nutritional value. *Underline the chemical composition of food items and their reactions. *Discuss the meaning of the concept of “going green” as a new trend toward healthy options. * Analyze the new trends in food technology used to cope with climate change adaptation. *Debate the use of GMOs, Vegetarianism, food substitutes regarding their effectiveness and importance.
Units	Chapter 5: Meat and meat substitutes

	Chapter 6: Poultry and fish Food Science and Natural Environment. Chapter 7: Milk and Dairy products Chapter 8: Eggs and egg replacements. Chapter 9: Vegetarianism Chapter 10: Fruits and vegetables Chapter 11: Grains; cereals and breads Chapter 13: Fats and oils.
Readings	The Dietitian's Guide to Vegetarian Diets for Reed Mangels, Virginia Messina, Mark Messina. Phytonutrients and functional foods, in textbook page 114. Glycemic index of food, in textbook page 128 Mad cow disease from text book page 187
Activity	*Work with the people of special needs, the poor, elderlies, housewives, and the weakened parties to help them understand the value of healthy eating and living. *Gather data about variable deficiencies, disease and allergies available in your community, and find the link between these problems and food type, and weather conditions. Then make a campaign to aware people about its causes and how to prevent it.

APENDIX I: CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Course Number: 303455

Nutrition Education
American University of Madaba, Faculty of Health Sciences, Department of Nutrition and Dietetics, Spring Semester, 2015

Instructor Information

Instructor: Dr. Fadwa Hammouh
Office Location: American University of Madaba Campus
Telephone: Office: +
Office Hours:
E-mail: f.hammouh@aum.edu.jo

Course Identification

Course Number: 303455
Course Name: Nutrition Education
Course Location: University Campus
Class Times:
Prerequisites: Dietetics+ Nutrition Counselling
Faculty Web Page: http://www.aum.edu.jo

Course Description/Overview

Nutrition education is the combination of educational strategies, accompanied by environmental supports, designed to facilitate the voluntary adoption of food choices and other food- and nutrition- related behaviours conducive to health and well-being. It is delivered through multiple venues and involves activities at the individual, institutional, community, and policy levels. There is an increased appreciation that our food choices are influenced by social and environmental context, where the personal, environmental, and policy influences on food choices are needed to be addressed. Nutrition educators have to work in collaboration with others on activities as school and community gardens, cooking with children and adults, farm- to- school programs, school and community wellness policies, and initiatives to improve policy, social structures, and systems. What the course offers is a good introduction to the area of nutrition education and how to design, deliver, and evaluate the types of

educational interventions and programs. It does so in three main parts. The first part provides background of theories for nutrition education and the implement of the theories in practice. Here, the course provides case studies, particularly related to climate change issues, showing how nutrition especially food choice and dietary change is affected by different determinants one of them is the environment and how nutrition educators can be "empowered" to make their voices heard in the process for rebuilding a more sustainable society more care about the type of food to choose and how the selection of diet will be affected to environment changes and related to as a result to health. The second part discusses the six- step process for translating theory and evidence into educational plans, and provides guidance on how to link evaluation to theory and intervention objectives. Finally, the third part describes the nuts and bolts of implementing nutrition education with diverse groups ranging from preschool children to older adults to low- literacy and low- income audiences through a variety of venues, including group sessions, written and visual materials, new technologies, and different case studies.

Course Learning Objectives

The overarching goals of this course are: a) to increase the awareness of nutrition education in schools, worksites and communities and describe how nutrition education can address several levels of influence to support people's ability to take action; b) raise awareness of the potential determinants or mediators of action and behaviour change as well as updated evidence for their use, and translate the different self- determination theories into practical nutrition education activities and the case examples will clarify the use of the different theories in educational activities in practical settings; and c) use the numerous personal, environmental, and policy influences on food choices and dietary behaviours to assist individuals and communities in practising healthy behaviours and identify risks related to climate changes and develop adaptation strategies.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

48. Discuss the various potential determinants or mediators of action of food choice and diet- related behaviour.
49. Design strategies for nutrition education.
50. Produce a brochure of 4-6 bands with simple and understandable information about any of the nutrition education topics and environmental changes.
51. Use case examples to understand the determinants of food choice and dietary change.

52. Develop a diet for three days that integrates the determinants of food choice and diet- related behaviour.

Course Resources

Required Course Texts and Materials

Hands-out prepared by the instructor for the class and the following books and website(s) will be helpful:

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)

Assignments	80%
Exams	
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a discussion type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than five classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	Course Overview: Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2	Issues in nutrition education: An introduction
3	Overview of Determinants of Food Choice and Dietary Change: Implications for Nutrition education 1-Food- related determinants: Biology and experience
4	2-Person-related determinants 3-Economic determinants
5	4-Social and environmental determinants
6	5-Information environment
7	Implication for nutrition education
8	Implication for competencies and skills for nutrition educators
9	**Mid-term Exam**
10-11	Works with diverse population groups 1-Working with children, youths, and adults 2-Working with diverse cultural groups 3-Low- literacy audiences
12	Nutrition educators as change agents in the environment
13	Foundation in theory and research: Promoting environmental supports for action 1-Interpersonal environment: Family, peers, and social support
14	2-Organizational- level environmental change 3-Community- level activities 4-Policy and systems change activities

15	Projects discussion
16	**Final Exam**

APENDIX II: The CLIMASP Course Modules Template Example

Course	**Nutrition Education**
Module 1	Issues in Nutrition education
Key Concepts	Nutrition education, dietary guidance
Overview	When I ask my students what nutrition education means to them, they always indicate that it means the how to teach nutrition. However, the term "nutrition education" means more things. Nutrition educator also is another term to be discussed. It is therefore very important for students to evaluate the nutrition educator different works. Questions to be addressed in this module include the following: What is nutrition education? Why is nutrition education needed?

	What are the major functions of nutrition educators?
Aim	The overriding aim of this module is to make students able to define nutrition education, and state why it is important and difficult to do, also to describe what nutrition educators do.
Learning Outcomes	At the end of this module learners will be able to: • Define nutrition education and state why it is important and difficult to do • Evaluate the purposes and scope of nutrition education. • Describe what nutrition educators do.
Units	Chapter 1: Issues in Nutrition Education: An Introduction
Readings	Contento, I. R. (2011). Nutrition Education: linking research, theory, and practice. 2nd edition, Jones and Bartlett Publishers. USA. Abood, D.A., Black, D.R. and Feral, D. (2003). Nutrition education worksite intervention for university staff: Application of health belief model. Journal of Nutrition Education and Behaviour. 35(5): 260- 267. American Dietetic Association (ADA).(2009).Who we are, what we do. http://www.eatright.org/cps/rde/xchg/ada/hs.xsl/home_404_ENU_HTML_htm.
Activity	**Overview** Assignment 1.1: Nutrition Education 1. State reasons why nutrition education is needed for the public? (3-5 reasons) Describe your reasons. 2. What do you think about the approaches to nutrition education? Discuss. Assignment 1.2: Nutrition Educators Where you see yourself as a nutrition educator? What would you like to do?
Module 2	Implications for Nutrition Education: Determinants of Food Choice and Dietary Change
Key Concepts	Determinants of food choice and dietary behavior

Overview	Influences on food choice and dietary practices and their implications for nutrition education are discussed. This module will outline the determinants of food choice and diet- related behavior, where each determinant will be defined and the different factors affecting each of them will be discussed. A focus will be on the environmental determinants and the effect of climate changes on food choice and dietary behavior. Questions to be addressed in this module are: What are the research evidence for the influences of the different discussed determinants on human food choice and dietary behaviour? What is the role of intra- and interpersonal processes in food choice and dietary behaviour?
Aim	The overriding aim of this module is to overview the numerous influences on food choice and dietary practices and their implications for nutrition education and provides the competencies needed to be an effective nutrition educator.
Learning Outcomes	At the end of this module learners will be able to: • Identify examples of determinants of food choice and dietary behaviour. • State the competencies needed to be an effective nutrition educator.
Units	Chapter 2: Overview of Determinants of Food Choice and Dietary Change. Chapter 3: Facilitating Why and How to Take Action.
Readings	Contento, I. R. (2011). Nutrition Education: linking research, theory, and practice. 2nd edition, Jones and Bartlett Publishers. USA. Abusabha, R., Peacock, J., and Achterberg, C. (1999). How to make nutrition education more meaningful through facilitated group discussions. Journal of the American Dietetic Association. 99: 72- 76. Bronner, Y. (1994). Cultural sensitivity and nutrition counselling. Topics in Clinical Nutrition. 9: 13-19. Food Research and Action Center (FRAC). (2006). http://www.frac.org.

Activity	**Overview** Discuss how can nutrition educators help young children learn to self-regulate the amount of food they eat? Which competencies do you believe that you already posses? Which one would you like to develop further?
Module 3	Foundation in theory and research
Key Concepts	Theories and models for effective nutrition education and communication, food choice
Overview	Research suggests that the adoption and maintenance of health behaviours are a process involving two main phases: a decision- making or deliberative phase, and an action or implementation phase. This means that nutrition education programs should consists of both a motivational pre-action phase or component and a postdecision action and maintenance component. Different theories and research that explain the important role of food choice and nutrition- related behaviour change are discussed. Also a description for how each theory can be translated into effective nutrition communication and education. Questions to be answer: How theories have been used in nutrition education programs to increase awareness and enhance motivation? Describe the health belief model?
Aim	This module aims to focus on theories that can be translated into effective nutrition education.
Learning Outcomes	At the end of this module learners will be able to: • Describe theories that help nutrition educators understand motivation for health and nutrition behaviours. • Identify and design strategies to address potential mediators of change.

Units	Chapter 4: Foundation in Theory and Research: Increasing Awareness and Enhancing Motivation. Chapter 5: Facilitating the Ability to Take Action. Chapter 6: Promoting Environmental Supports for Action.
Readings	Contento, I. R. (2011). Nutrition Education: linking research, theory, and practice. 2nd edition, Jones and Bartlett Publishers. USA. Abood, D.A., Black, D.R. and Feral, D. (2003). Nutrition education worksite intervention for university staff: Application of health belief model. Journal of Nutrition Education and Behaviour. 35(5): 260- 267. Nestle, M. (2002). Food politics: How the food industry influences nutrition and health. Berkeley: University of California Press. Medeiros, L., Hillers, V., Kendall, P., and Mason, A. (2001). Evaluation of food safety education for consumers. Journal of Nutrition Education. 33: s27- s34. Ziegelmann, J.P. and Lippke, S. (2007). Planning and strategy use in health behaviour change: A life span view. International Journal of Behavioural Medicine. 14(1): 30- 39. Buchanan, D. (2004). Two models for defining the relationship between theory and practice in nutrition education: Is the scientific method meeting our needs? Journal of Nutrition Education and Behaviour. 36: 146- 154.
Activity	**Overview** Assignment 1: Case Study for Nutrition Education using the Health Belief Model 22. Think of 5 possible outcomes for the theories mentioned in the case? 23. Think of a climate change and discuss its effect on health- related behaviour? Discuss its effect on your community?

24. Describe strategies that nutrition educators can use to enhance motivation for healthy eating and active living? (3-5 strategies)

Assignment 2: Prepare a brochure for one of the nutrition education theories or determinants.

For this activity: Work in groups (2-3 in each).

1. Course Specifics

Course Title	Bio-Ethics
Course Number:	900116
Course Prerequisite(s)	None
Course Co-requisite(s)	None
Credit Hours	Lecture: 3 hrs
Lecture Days & Time	
Class Location	BB- S04
Course Instructor/s	Dr. Ahmed A-Smadi
Syllabus Approved by:	
b. Academic Committee	
a. Department Chair	Prof. Adi Arida

2. Academic Staff Specifics

Name	Academic Rank	Office Number, Location and Tel. Ext.	E-mail Address
Ahmed Al-Smadi	Assisstant Prof.	SB-G 37 Ext. 5607	a.smadi@aum.edu.jo

Resources:

- **Text book:**

Bioethics: An Introduction
Author: By: Marianne Talbot,
Publisher**:** University of Oxford

Resnik, D. B. (2009). Bioethics and Global Climate Change. In Bioethics forum (Vol. 39, No. 3, p. 1). NIH Public Access.

Moorthy, R., Choy, E. A., Selvadurai, S., & Lyndon, N. (2011). Bioethics principles in the teaching of climate change. American Journal of Applied Sciences, 8(10), 962.

Macpherson, C. C. (2013). Climate Change is a Bioethics Problem. Bioethics, 27(6), 305-308.

Course Description:

Bioethics studies the reasonableness of human choices and actions that typically occur in medical practice. In this course, we will study the particular subsection of this realm that covers issues involving medical care and biotechnology. Our consideration will extend to other areas where human life and death are involved, such as abortion, and genes. The course aims to develop moral wisdom and moral virtue.
This course is divided into four main sections. The first section aims to introduce bioethics and related terminologies and theories. The second explores bioethics issues related to pregnancy such as abortion, and pre implantation genetic diagnosis. The third section focus on the bioethical issues related to manipulation of humans' organs and tissues such as organ donation and stem cell research. The fourth section explores the bioethics and it is relation with climate changes.

Students in this course will participate in developing an awareness source such as booklet, video, or poster for two main topic discuses in the course; the first will be focus on one of the following topics: abortion, pre implantation genetic diagnosis, assisted reproductive technology, and pre natal genetic diagnosis. The second will focus on the relationship between bioethics and climate change.

In addition, before the end of the course, students can address and present any of bioethics related topic.

Course General Objectives:

The overreaching goals of this course are:

- A) To review central moral, philosophical, and social problems in medicine and health policy
- B) To differentiate between ethical questions and non-moral questions. Summarize and analyze arguments for a particular ethical conclusion.
- C) To identify ethical issues when they arise in the context of healthcare, biotechnology, and the role of a physician.
- D) To see the relevance of philosophy to the life sciences and social policy.
- E) To develop and practice skills relevant to preparing and delivering public presentations.
- F) Engage students in analysis of major contemporary controversies, enabling each student to acquire in-depth knowledge of one controversial issue concerning bioethics of their choice.

Course Intended Learning Outcomes (ILOs)/Competencies:

5- Demonstrate knowledge and understanding of essential facts, concepts, principles and theories relating to the subject areas identified above.
6- Apply such knowledge and understanding to the solution of qualitative and quantitative problems of a familiar and unfamiliar nature.
7- Recognize and analyze novel problems and plan strategies for their solution.
8- Students will be able to apply scientific approach in solving problems.
9- Ability to interpret data derived from theoretical observations and measurements in terms of their significance and the theory underlying them.

10- Participation shows an active engagement with the course and adequate familiarity with the assigned reading
7. Apply creative and critical thinking skills in carrying out studies.
8 . Develop interpersonal skills, relating to the ability to interact with other people and to engage in team-working.

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom debates, assignments, exercises, homework and projects.

Assessment Instruments

	Mark
1st Assessment	15%
2nd Asswssment	15%
Quizzes, participation and Homework	10%
Project presentation	10%
Final Exam	50%
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates

Week 1:	Introduction to Bioethics	
Week 2:	Introduction to Bioethics	
Week 3:	Abortion	
Week 4:	Abortion	
Week 5:	Assisted Reproductive technology	
Week 6:	Presentation of student's (first assessment)	
Week 7:	Pre-natal testing/ Pre-implantation genetic diagnosis	
Week 8:	Organ donation	
Week 9:	Organ donation	
Week 10:	Stem Cell research	
Week 11:	climate change: introduction	
Week 12:	Bioethics and climate change	
Week 13:	Bioethics and action to be taken for climate change	
Week 14:	Presentation of student's (second assessment)	
Week 15:	Students' presentation	
Week 16:	Students' presentation	

Course Policies

Lecture attendance is mandatory. If the rate of student absences, in a course unit, is greater than 15% (or 20% for student representing the University in sportive or cultural activities) of the completely accredited hours and the student has no acceptable justification, then this student is excluded from that course unit. If the Dean of the faculty accepts the justifications of absence, then this student is mentioned as withdrawn without refunding the registration fees.

Make-up exams, if existed, will be offered for valid reasons only with consent of the Dean. Make-up exams may be different from regular exams in content and format.

Mobiles are not tolerated in the class, and should be turned off during the lecture time.

Course	Bio-Ethics
Module 1	Introduction to Bioethics
Key Concepts	Bioethics, Ethics, morality, law, ethical dilemma, ethical theories, culture assimilation, decision making model, ethical committees,
Overview	This module gives an introduction to bioethics. Questions to be addressed in this module include the following: What is the definition of the following terminologies: Bioethics, Ethics, morality, law, and ethical dilemma? What are the ethical issues in modern healthcare? What are the differences between different ethical theories? What is the relationship between cultural diversity and ethics? How can we implement the decision making model to solve bioethical issues? What are the roles of the ethical committees?
Aim	The overall aim of this module is to turn student able to understand the nature of bioethics and related ethics theories.
Learning Outcomes	At the end of this module students will be able to: • Identify the different concepts related bioethics. • Discuss the ethical issues related to modern healthcare. • Implement the decision making model to solve bioethical issues. • Identify the roles of the ethical committees. .
Readings	Instructor hand outs

Activity	**Overview** During this module a discussion between students will be raised about different aspects such as different ethical issues, and role of ethical committees. In addition, a student's "Role Play" will be conducted to discuss those issues.
Module 2	Bioethical issues related to pregnancy
Key Concepts	The story of a little human being, Abortion, Assisted Reproductive technology, Pre-natal testing, Pre-implantation genetic diagnosis
Overview	This module introduces the Bioethical issues related to pregnancy. The module aims to answer the following questions: What does abortion mean? What are the different methods of abortion? What are the psychological and physiological consequences to the abortion? Is abortion considered wrong or right? Why? What is assisted reproductive technology? What are the methods of assisted reproductive technology? What are the psychological and physiological consequences to the assisted

	reproductive technology? Is assisted reproductive technology considered wrong or right? Why? What is preimplantation genetic diagnosis? What are the different methods of preimplantation genetic diagnosis? What are the ethical issues related to preimplantation genetic diagnosis? What is Prenatal testing and diagnosis? What are the different methods of Prenatal testing and diagnosis What are the ethical issues related to Prenatal testing and diagnosis?
Aim	The over aim of this module is to introduce ethical issues related pre, during pregnancy.
Learning Outcomes	At the end of this module students will be able to : • Identify different bioethical issues related to pregnancy. • Discuss the ethical implication of abortion, preimplantation genetic diagnosis, assisted reproductive technology, and prenatal testing.
Readings	. Instructor selected readings.

	. Selected YouTube
Activity	**Overview** During this module a discussion between students will be raised about different aspects such as abortion, preimplantation genetic diagnosis, assisted reproductive technology, and prenatal testing. In addition, a student's "Role Play" will be conducted to discuss those issues. Moreover, each student will have the chance to develop and present an educational material such as booklet, video, or poster about bioethical issues related to preganancy .
Module 3	Uses of organs and tissue in health care
Key Concepts	Organ donation, Stem Cell research
Overview	This module introduces the Bioethical issues related to Uses of organs and tissue in health care. The module aims to answer the following questions: How can we distribute organs fairly? How can we increase the pool of donors ethically? What are the arguments for and against opt-out? What are the ethical considerations related to organ donation? What are the stakes of stem cell research? What are the Sources and implications of stem cells? What are the ethical considerations related to stem cell research?
Aim	The over aim of this module is to introduce Uses of organs and tissue in health care particularly Organ donation, Stem Cell research.
Learning Outcomes	At the end of this module students will be able to: • Discuss the uses of organ donation and stem cells. • Identify the different methods of distribution for donated organs. • Discuss the ethical considerations related to uses of organ donation and stem cells.
Readings	Selected hand outs by the instructor.
Activity	**Overview** During this module a discussion between students will be raised about

	different aspects such as types of using Organ donation, and Stem Cell research. In addition, a student's "Role Play" will be conducted to discuss those issues. Moreover, each student will have the chance to develop and present an educational material such as booklet, video, or poster related to Organ donation, or Stem Cell research.
Module 4	Bioethics and Climate change
Key Concepts	climate change: introduction, Bioethics and climate change, Bioethics and action to be taken for climate change
Overview	This module focuses on bioethics it is relationship with climate change. The module introduces the climate change as a global challenging problem. The module aims to answer the following questions: What is climate change? Should bioethics take part in global warming? How? How bioethics and health analysis can impact positively on environment? What is the relationship between biomedical waste management and climate change? What are the actions that can be taken by health care personal to minimize the climate change?
Aim	The overall aim of this module is to introduce global warming and it is relationship with bioethics.
Learning Outcomes	At the end of this module students will be able to: • Identify the climate change and it is consequences as a global problem. • Discuss the relationship between bioethics and climate change.

	• Identify how health care persona l can impact positively on environment? • Discuss the relationship between biomedical waste management and climate change? • Discuss the actions that can be taken by health care personal to minimize the climate change.
Readings	Selected hand outs by instructor
Activity	**Overview** During this module a discussion between students will be raised about different aspects such as climate change and bioethical issues, and actions to be taken by health care professional to minimized climate change. In addition, a student's "Role Play" will be conducted to discuss those issues. Moreover, each student will have the chance to develop and present an educational material such as booklet, video, or poster related to bioethics and climate change.

Faculty: Engineering
Department: Civil Engineering

Course Syllabus

Course Title: Energy and the Environment	**Course Number:** 900170
Course Prerequisite(s) and/or Co-Requisite(s):	**Credit Hours:** 3
Lecture Days, and Timing:	**Course Prepared By:** Dr. Assal Haddad
Course Approved By **a. Name of Academic Coordinator:** Dr. Assal Haddad **b. Name of Department Committee Representative:** Dr. Munther Nimri **c. Dean:** Dr. Kareem Numayr	

Academic Staff Specifics

Name	Academic Rank	Office Number, Location and Tel. Ext.	Office Hours	E-mail Address
Dr. Assal Haddad	Assistant			a.haddad@aum.edu.jo

Course Description: Population growth, Energy demand, Energy renewable resources; Solar energy, Wind energy, Photovoltaic energy, Hydraulic energy, Bioenergy, Non-renewable energy resources; Oil, Coal, Natural gas, Nuclear energy, Environmental impacts; Global

warming, Ozone depletion, Acidification, Hazardous air pollution, Indoor air pollution, Life Cycle Assessment (LCA), Sustainability, Green buildings; LEED certified buildings. Mitigation of and adaptation to climate change.

Course Objectives:

- Understand the technological, economic, and social factors related to use of various forms of energy such as fossil fuels, solar energy, wind energy, biofuels, and other alternative and renewable energy resources (*scientific inquiry*).
- Understand why at various times and locations, different patterns of energy extraction, consumption, and conservation are used (*logical and integrative thinking*).
- Understand the limitations imposed on using various forms of energy by technological and socioeconomic factors (*quantitative skills*).
- Understand how energy conversion methods are used to change energy from one form to another for appropriate use (*quantitative skills, scientific inquiry*).
- Understand the tradeoffs between use of energy to raise the standard of living and the impact resulting from use of energy to the environmental pollution (*quantitative skills, ability to use modern technology, using resources*).
- Use various sources of knowledge to write logical and coherent papers on important aspects of energy and environment (*communication skills, scientific inquiry*).
- Understand how public policy can direct citizen's efforts in *wiser* use of energy resources, energy conservation, and prevention of pollution to the environment (*synthesis of knowledge from various disciplines*).
- Understand the causes and consequences of climate change and how to mitigate and adapt to environmental change.

Course Components:

Text book:

Title**:** Energy: Its Use and the Environment

Author**:** Roger A. Hinrichs, Merlin H. Kleinbach
Publisher: Thomson Brooks/ Cole; 4 edition (2005)

- ISBN-10: 047092764X

- ISBN-13: 978-0470927649

Course References:

1. "The Crash Course: The Unsustainable Future Of Our Economy, Energy, And Environment", Chris Martenson, 2011.
2. "Energy and the Environment", Robert A. Ristinen , Jack P. Kraushaar, 2005.
3. "The Impending World Energy Mess (The Environment)", Robert L. Hirsch, Roger H. Bezdek, Robert M. Wendling, 2010.
4. " The Post Carbon Reader: Managing the 21st Century's Sustainability Crises", Richard Heinberg (Editor), Daniel Lerch (Editor), 2010.

Links on Web Research, Supplemental Soft Sources:

1. http://energy.sourceguides.com/news.shtml : Provides daily news on the latest achievements in the field of renewable energy around the world to familiarize the student with current issues related to the energy-environmental impacts.

2. http://www.darvill.clara.net/altenerg/index.htm : A comprehensive list of the various energy resources on the planet; providing brief information on each type, which is helpful for comparison purposes.

3. www.thestoryofstuff.org

4. Technical journal papers and other materials will be periodically provided by the instructor during class. These materials should be reviewed and analyzed as they will be an integral part of class discussions and your knowledge development.

Teaching Methods: (Examples; Use the Applicable Ones)

Lectures: One and half hour lectures twice a week.
Home work: Selected sets of homework problems will have to be turned in for grading as announced by the instructor. All work submitted must be done neatly and professionally, by showing clearly all steps of the solution and labeling all answers.
Term paper to be supplied by the student on certain topics of the course.

Learning Outcomes:

- **Knowledge and understanding:** The students will differentiate between renewable and non-renewable sources of energy, and assess the various sources of energy based on their impact on the environment and society we live in.
- **Cognitive skills (thinking and analysis):** Students will be able to analyze the impact of using any particular energy resource in a "cradle to grave" point of view, from an environmental perspective; that is, environmental impacts associated with material extraction, transformation of fuel to energy, delivery of energy, and solid, liquid and gaseous waste output during the process.
- **Communication skills (personal and academic):** Students will form groups that will eventually produce a basic Life Cycle Assessment (LCA) comparing two products or processes chosen by the instructor, and will share their conclusions with the other teams. Also, students will present their term paper findings in front of their colleges and be able to answer other student's questions and defend their conclusions.

Assessment Instruments: (For Example)

Allocation of Marks	
Assessment Instruments	**Mark**

First examination	**20%**
Second examination	**20%**
Final Exam (written unseen exam)	**50%**
Reports, Research Projects, Quizzes, Home Works, Projects	**10%**
Total	**100%**

Documentation and Academic Honesty (Pledge of Honor):

- **Protection by Copyright**

Students will abide to the code of honour of the American University of Madaba.

- **Avoiding plagiarism**.

Students will abide to the code of honour of the American University of Madaba.

Course Academic Calendar:

Week	Basic and support material to be covered	Resources	Homework/reports and their due dates
1	Introduction to energy concepts and issues		
2	Population exponential increase		
3	Sustainable living		
4	Green buildings and LEED certification		
5	First exam		
6	Solar energy		
7	Photovoltaic and wind energy		

8	Fossil fuel		HW: Middle east and oil
9	Global warming and Ozone depletion		
10	Second exam		
11	Air pollution		
12	Waste management and landfills		
13	Nuclear power		Presentation about Jordan nuclear project
14	Biomass and geothermal energy		
15	Life Cycle Assessment (LCA)		
16	Final exam		

Expected workload:

On average you should expect to spend at least four hours per week on this module.

Attendance policy:

Lecture attendance is mandatory. If the rate of student absences, in a course unit, is greater than 15% (or 20% for student representing the University in sportive or cultural activities) of the completely accredited hours and the student has no acceptable justification, then this student is excluded from that course unit. If the Dean of the faculty accepts the justifications of absence, then this student is mentioned as withdrawn without refunding the registration fees.

Make-up exams, if existed, will be offered for valid reasons only with consent of the Dean. Make-up exams may be different from regular exams in content and format.

Penalty for Cheating, Plagiarism, and Mobile Usage inside rooms:

As per University regulations
Mobiles are not tolerated in the class, and should be turned off during the lecture time.

Course	Energy and the Environment
Module 1	Sustainability
Key Concepts	Population growth, sustainable building, LEED certificate.
Overview	At any level of development, human impact on the environment is a function of population size, per capita consumption and the environmental damage caused by the technology used to produce what is consumed. People in developed countries have the greatest impact on the global environment. The 20% of the world's people living in the highest income countries are responsible for 86% of total private consumption compared with the poorest 20%, who account for a mere 1.3%. The richest fifth account for 53% of carbon dioxide emissions, the poorest fifth, 3%. A child born in the industrial world adds more to consumption and pollution levels in one lifetime than do 30-50 children born in developing countries. As living standards rise in developing countries, the environmental consequences of population growth will be amplified with ever-increasing numbers of people aspiring, justifiably, to "live better." Rather than assign blame in the debate over environmental challenges, both current and new consumers need to realize and address the consequences of their levels of consumption.
Aim	The aim of this module is to establish a strong and clear link between the decisions that individuals and societies make and the environment they live in.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss various types of sustainable activities and life styles. • Understand the basic criteria and specifications by which the LEED certificate assesses green buildings.
Units	Unit 1.1 Introduction to Energy as a concept Unit 1.2: Population Growth

	Unit 1.3: Sustainability Unit 1.4: LEED certificate
Readings	www.thestoryofstuff.org
Activity	**HW. #1** Assess the buildings of your campus in terms of LEED criteria, and try to assign a grade to every credit point in the certificate. Report the final result of your assessment (Fail or pass), and provide suggestions to improve the sustainability level for your campus.
Module 2	Energy Resources
Key Concepts	Renewable and non-renewable energy resources, Oil politics
Overview	The bulk of our energy requirements today is met by fossil fuels, which are in short supply. At present rates of consumption, known reserves of natural gas will be exhausted within 35 years, and of petroleum within 70 years. If these rates continue to grow exponentially, as they have done since 1960, then natural gas will be exhausted within 14 years, and petroleum within 20. Coal is likely to last much longer (about 300 years), but the fossil fuels in general are required for so many purposes other than fuel – pesticides, fertilisers, plastics, and so on, making it virtually impossible to depend on it for energy. In an energy sense, sustainability has quite a concrete meaning, and points society in the clear direction of renewable energy. Some years ago renewable energy was not taken as a serious option and the notion of life after fossil fuels was not properly considered in the hope that the "market" would come up with something, probably making use of nuclear fission or fusion.

	It is imperative to realise that humanity has rapidly moved from a society that was primarily lived at the local level and in a sustainable manner to one of contemporary excess. In the past, sustainability was not such an important issue, since in general human society did not have the technology or the scale to live unsustainably. With the discoveries of recent times, this is no longer the case. We have moved into a situation where our powers have multiplied, and without much thought we have simply raced forward to use these powers. We are clearly in an adolescent phase, and are only beginning to think about the responsibilities of adulthood as a society. The good news is that we can be confident that adulthood will follow adolescence. Knowledge of purpose combined with an increasing appreciation of the wonder and complexity of the natural world will result in the human race "living lightly" upon the earth.
Aim	The aim of this module is to identify the impacts associated with the use of fossil fuel which is generally linked to a modern life style, but at the same time introduce the alternative of renewable energy resources and describe the physics behind the attainable possibilities of such choices.
Learning Outcomes	At the end of this module learners will be able to: • Identify fossil fuel origins and extraction methods. • Identify various typical and innovative types of renewable energy resources.
Units	Unit 2.1: Fossil fuel (Oil, Coal, and Natural Gas) Unit 2.2: Renewable Energy resources (Solar, Photovoltaic, Wind, biofuel)
Readings	http://energy.sourceguides.com/news.shtml

Activity	**HW. #2** Describe a new innovative renewable energy resource and describe the physics that lie behind the harnessing of energy, efficiency, and price.
Module 3	Pollution
Key Concepts	Air pollution, Global Warming, Ozone depletion, water pollution, Life Cycle Assessment, Solid waste management.
Overview	The increasing threat of global warming and climate change has attracted attention about the relationship between economic growth, energy consumption, and environmental pollution. Though Global warming depends on worldwide Greenhouse Gas (GHG) emissions, its consequences differ among countries, based on the latter's' social and natural characteristics. If no action is taken to reduce GHG emissions, the concentration of GHGs in the atmosphere could double as early as 2035 from its pre-industrial level. This implies that in the short run, global average temperature may rise by over 2°C. In the longer term, there is a greater than a 50% chance that this rise in temperature would exceed 5°C. This radical change in temperatures would affect all countries. Among them, the earliest and the hardest hit would be on the poorest and populous nations, even though they contributed least to GHG emissions. The Kyoto Protocol to the United Nations Framework Convention on Climate Change was a cornerstone in the promotion of renewable energy sources. However, by itself it became unsuccessful in addressing the issues pertaining to the climate change challenge and came up with a judgmental and adequate roadmap. Renewable energy sources are accepted as one of the key solutions to climate change and the increasing energy demand. Every country, either developing or developed is promoting and adopting policies to switch over the energy consumption towards renewable energy sources.

Aim	This module aims at linking our dependence on fossil fuels to the deteriorating quality of our environment and the risks of a global catastrophe.
Learning Outcomes	At the end of this module learners will be able to: • Demonstrate knowledge on the negative contribution of different types of emissions on the environment. • Conduct a Life Cycle Assessment comparing two industrial or commercial options.
Units	Unit 3.1: Global Warming Unit 3.2: Ozone Depletion Unit 3.3: Indoor air quality Unit 3.4: Solid Waste Management Unit 3.5: Life Cycle Assessment.
Readings	Title**:** Energy: Its Use and the Environment Author**:** Roger A. Hinrichs, Merlin H. Kleinbach Publisher: Thomson Brooks/ Cole; 4 edition (2005)
Activity	**HW. #3** Conduct a LCA comparing two industrial or commercial options.

- **References:**

  In addition to the above textbooks, students will be provided with handouts by the lecturer.

Course Description/Overview:

The course provides students with the flexibility to adapt their learning experience towards the main applications of plant biotechnology and the genetic basis of these applications. Applied plant biology explores how plants grow, develop, reproduce, evolve, fight off pests and diseases, and interact with and respond to their environment. Through a weekly two hour lecture, this module will describe traditional and genetic methods of plant manipulation. Topics will include tissue culture and its applications, the properties of plant symbionts and pathogens as they relate to biotechnology and the different applications of plant genetic engineering. Production of both novel and traditional plant products and their uses in biotechnological industries will be discussed. In addition, students will be introduced to the diverse therapeutic application of different plant products against various pharmacological targets including cancer, human brain, cardiovascular function, microbial infection, inflammation, pain, and many more.

The course will review possible procedures and methods of using plants to generate new products, such as foods, pharmaceuticals, or biofuels or processes, to solve environmental problems like food security and dwindling natural resources. Abiotic stresses cause morphological, physiological, biochemical, and molecular changes that adversely affect plant growth and productivity, and ultimately yield. Heat, drought, cold, and salinity are the major abiotic stresses that induce severe cellular damage in plant species, including crop plants. The molecular effect of such abiotic stresses on plant development and production are stressed. The impact of global climate change on crop production and food security would be addressed.

Course learning Objectives:

This course aims to 1) expose students to the theory and practice of many of the current techniques and advances of plant biology research, 2) provide students with an opportunity to develop an in-depth understanding of a specific area of plant biology, and 3) introduce students to biological research as a career.

Course Outcomes:

Upon successful completion of this course, students will be able to

1. Determine the importance of plant sciences to humankind.
2. Differentiate between classical and genetic approaches in plant/crop improvement.
3. Infer new techniques in plant breeding and propagation.
4. Signify the importance of medicinal plants, organic agriculture, and biofuel.
5. Describe different technologies that enable the genetic manipulation of crop plants.
6. Describe in detail the development of herbicide and pest resistance.
7. Discuss in detail the development of disease resistance.
8. Evaluate advantages and disadvantages of genetically modified crops and understand their future prospects.
9. Diagnose the impact of climate change on plant production and diversity.

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom debates, assignments, exercises, homework and projects. The theoretical part is closely related to and harmonized with the course (0201221) and its lab.

Assessment Instruments

	Mark
Midterm Exam	30%
Quizzes, Homework and Participation	10%
Project	20%
Final Exam	40%
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1	Economic importance of plants	

Week 2	Sustainable and organic agriculture	
Week 3	Medicinal plants	
Week 4	Plant breeding for plant improvement	
Week 5	Plant propagation	
Week 6	Plant cell and tissue culture	
Week 7	Techniques for plant transformation	
Week 8	The genetic manipulation of herbicide resistance	
Week 9	The genetic manipulation of pest resistance	
Week 10:	Reducing the effects of viral disease	
Week 11:	Strategies for engineering stress tolerance	
Week 12	The improvement of crop yield and quality	
Week 13:	Molecular farming	
Week 14:	Science and society: the public acceptance of GM crops	
Week 15	The impact of global climate change on crop production	
Week 16:	**Final Exam**	

Course Policies
University regulations apply to this course regarding class attendance, punctuality, exams, late submissions, absence with permission, penalties for cheating, and policies for assignments and projects, if any. Students should be aware of all those in addition to other rules and regulations stated and descried in the student handbook.

Course	**Applied Plant Biology**
Module 1	**Economic Importance of Plants and Applications**

Key Concepts	Economy, Organic agriculture, Medicinal Plants, Biofuels
Overview	Plants are very important in the lives of people throughout the world. People depend upon plants to satisfy such basic human needs as food, clothing, shelter, and health care. These needs are growing rapidly because of a growing world population, increasing incomes, and urbanization. Traditional application and usage of plants as part of the economic improvement to the developed and developing countries will be discussed. This would include the rapid increase or demand on organic agriculture, modern application of medicinal plants in the pharmacological industry, and planting special crops as a source of fuels.
Aim	Students will learn about the importance of plants to mankind and their applications.
Learning Outcomes	At the end of this module, students will be able to: - describe the importance of plants from an economical point view to humankind. - demonstrate the meaning, history, methods and economy of organic agriculture. - discuss the various types of medicinal plants and their applications. - illustrate applications and limitations of biofuel..
Units	6- Value of Plants 7- Organic Culture 8- Medicinal Plants 9- Biofuel
Readings	- Adrian Slater, A., Scott, N.W., and Flower, M.R. 2008. 2nd Edition. Plant Biotechnology, The Genetic Manipulation of Plants. Oxford University Press. - Simpson, B.B., Ogorzaly, M., and Beryl, S. 2001. 3rd Edition. Economic Botany: Plants in our World. McGraw-Hill (Boston)
Activity	- review
Module 2	**Traditional Methods of Plant Manipulation**
Key	Plant Breeding; Techniques and Applications

Concepts	
Overview	The aim of plant breeding is to produce new crop varieties that have maximum utility to growers in a region, to better serve the needs of the farmer, the processor, and the ultimate consumer. New varieties may have any or all of the following improvements: higher yield, more resistance to diseases and insects, maturity dates that fall into more-profitable market windows, and higher quality characteristics. Incorporation between plant breeding and genetic engineering methods would be discussed. Steps of plant breeding such as; collection of variation, selection, evaluation, release, multiplication, and distribution of the new variety will be raised. The use of tools such as molecular markers or DNA fingerprinting can map thousands of genes. This allows plant breeders to screen large populations of plants for those that possess the trait of interest. The screening is based on the presence or absence of a certain gene as determined by laboratory procedures, rather than on the visual identification of the expressed trait in the plant. The application of Marker Assisted Selection will be introduced. **Field trip could be arranged to one of the local Plant Breeding companies.**
Aim	Students will be introduced to the concept of plant breeding and its applications for crop improvement.
Learning Outcomes	At the end of this module, students will be able to: - Infer new techniques in plant breeding and propagation. - Evaluate the impact of plant breeding on crop improvement.
Units	9- Breeding Methods 10- Applications of Plant Breeding
Readings	- Adrian Slater, A., Scott, N.W., and Flower, M.R. 2008. 2nd Edition. Plant Biotechnology, The Genetic Manipulation of Plants. Oxford University Press. - Hartmann, H.T., Kester, D.E., Davies, F.T., Geneve, R. 2011. 8th Edition. Plant Propagation: Principles and Practices. Pearson/Benjamin Cummings, San Francisco, CA
Activity	Review

Module 3	Approaches of Plant Propagation
Key Concepts	Sexual, Asexual, Tissue Culture
Overview	In general, plants can be reproduced by two major mechanisms, sexual and asexual methods. Seeds are typically produced from sexual reproduction within a species, because genetic recombination has occurred. A plant grown from seeds may have different characteristics from its parents. Some species produce seeds that require special conditions to germinate. Plants have a number of mechanisms for asexual or vegetative reproduction. Some of these have been taken advantage of by horticulturists and gardeners to multiply or clone plants rapidly. Techniques for vegetative propagation include; cuttings, grafting and layering. Plant regeneration *in vitro* using growth medium under aseptic and regulated environmental conditions is extremely important and required to the production of genetically modified crops. The primary aim is therefore to produce, as easily and as quickly as possible, a large number of regenerable cells that are accessible to gene transfer. This module will consider some basic issues concerned with plant tissue culture *in vitro*, particularly as applied to plant transformation. It will also look at the basic culture types used for plant transformation and cover some of the techniques that can be used to regenerate whole transformed plants from transformed cells or tissue.
Aim	Students will learn the different methods used for plant propagation.
Learning Outcomes	At the end of this module, students will be able to:
Units	1- Seed Propagation 2- Types of Asexual Plant Propagation 3- Micropropagation
Readings	- Adrian Slater, A., Scott, N.W., and Flower, M.R. 2008. 2nd Edition. Plant Biotechnology, The Genetic Manipulation of Plants. Oxford University Press. - Hartmann, H.T., Kester, D.E., Davies, F.T., Geneve, R. 2011. 8th Edition. Plant Propagation: Principles and Practices. Pearson/Benjamin Cummings, San Francisco, CA.

Activity	Review
Module 4	**Plant Genetic Manipulation**
Key Concepts	Plant Transformation, Herbicide Resistance, Pest Resistance, Stress Tolerance, Molecular Farming, GM Acceptance
Overview	Plant Genetic engineering has become one of the most important molecular tools for crop improvement. Over the last decade, significant progress has been made in the development of new and efficient transformation methods in plants. Different methods used to transfer foreign gene(s) into plants will be presented. Several crops have been genetically modified to be resistant to non-selective herbicides. These transgenic crops contain genes that enable them to degrade the active ingredient in an herbicide, rendering it harmless. This eliminates weeds without risking their crops, thereby helping farmers to produce higher yields of their crops. Insect attack is a serious agricultural problem leading to yield losses and reduced product quality. Insects can cause damage both in the field and during storage in silos. *Bacillus thuringiensis*, or *Bt*, is a bacterium that has attracted much attention for its use in pest control. The soil bacterium produces a protein that is toxic to various herbivorous insects. DNA technology makes it possible to locate the gene that produces Bt proteins lethal to insects and transfer the gene into crop plants. The process will be depicted in this module. Plant abiotic stresses are external and nonliving factors that have harmful effects on plants. A nonliving factor must exert influence on the normal range of environmental variation to adversely and significantly affect the plant performance or the physiology of the organism. The most important abiotic stresses affecting crop plants are drought, salinity and alkalinity, floods or excess water, extreme temperatures, mineral toxicities and deficiencies, high or low pH, poor edaphic conditions and high winds causing rapid dehydration during seed germination. Genetically engineered crops resistant to selected abiotic stresses would be demonstrated in detalis.

	Protein-based biopharmaceuticals have become increasingly important due to a combination of their bioreactivity, specificity, safety and overall success rate. *Escherichia coli* , yeast and animal cells have traditionally been used as heterologous expression systems for production of pharmaceutical proteins. Plants have emerged as a promising alternative expression system for production of pharmaceutical proteins because they offer several potential advantages, including low production costs, ease of scale-up to commercial quantities of production and reduced risk of product contamination by mammalian viruses or toxins. Plants are already being used to produce antibodies, vaccines, growth factors and many other proteins of pharmaceutical importance. In this module, we will discuss the technological basis of molecular farming in plants. Benefits and risks of using genetically modified crops will be discussed in this module.
Aim	Students will be introduced to the application of plant genetic engineering towards crop improvement.
Learning Outcomes	At the end of this module, students will be able to: - Describe different technologies that enable the genetic manipulation of crop plants. - Describe in detail the development of herbicide and pest resistance. - Discuss in detail the development of disease resistance. - Evaluate advantages and disadvantages of genetically modified crops and understand their future prospects.
Units	1- Different Techniques of Plant Transformation. 2- Applications of Plant Genetic Manipulation of producing herbicide resistance, pest resistance, and stress tolerance. 3- Introduction to Molecular Farming. 4- Public Opinion of Genetically Modified Crops.
Readings	- Adrian Slater, A., Scott, N.W., and Flower, M.R. 2008. 2nd Edition. Plant Biotechnology, The Genetic Manipulation of Plants. Oxford University Press.
Activity	- review - discussion session initiating project work

Module 5	Climate Change Impacts on Crop Production
Key Concepts	Climate change, Crop Production, Food Security
Overview	Since the middle of the 19th century, there is an important body of evidence that shows that Earth has warmed. By the end of this century, the global mean temperature could be 1.8° to 4.0°C warmer than at the end of the previous century. Climate change can result from natural causes, from human activities through the emission of greenhouse gases such as carbon dioxide and methane, and from changes in land use. Thus, climate change is expected to bring warmer temperatures; changes to rainfall patterns; and increased frequency, and perhaps severity, of extreme weather. Hunger has multiple dimensions and causes, ranging from deficiencies in macro- and micro-nutrients, through short-term shocks on food access, to chronic shortages. Together, climate change and food security have multiple interrelated risks and uncertainties for societies and ecologies. Therefore, climate change has indirect impacts on crop productivity that could have consequences for food availability. The stability of whole food systems may be at risk under climate change because of short-term variability in supply. Consequences of climate change on plant production and food security will be thoroughly discussed.
Aim	Students will learn about the impact of climate change on plants and food security.
Learning Outcomes	At the end of this module, students will be able to: - Diagnose the impact of climate change on plant diversity, production and food security.
Units	7- Climate Change. 8- Global Food Security. 9- Future Prospects.
Readings	- Smith, T., Smith, R (2009): Elements of Ecology. 6th (or later) edition. Benjamin Cumming/Pearson. (chapters 16-19). - Tim Wheeler and Joachim von Braun (2013) Climate Change Impacts on

	Global Food Security. *Science* **341**, 508

Course Description:

This course is an introduction to where science and technology meet society. It explores the advances of science and technology and their impact on society and social behavior. It discusses approaches to analyzing social dimensions of recent advances in areas such as nutracuticals, abusable drugs, and climate change. The course will be run primarily as group discussions with high expectations of student involvement. This course is divided into four main sections. The first section introduces the philosophy of science and how

science and society interrelates. The second section introduces the drug abuse effect on society and how science helps us to prevent drug abuse. The third section focus on nurtracuticals and herbal medicine and it is effect on society. The forth section concentrates on climate change by introducing the concept, way to adapt, how science can help to minimize the problem, environmental awareness and renewable energy. One of the main focuses of this course is the climate change and its effect on local and international society.
Students in this course will participate in developing an awareness source such as booklet, video, or poster for two main topic discuses in the course; the first will be focus on one of the following topics: drug abuse, nutracuticals, herbal medicine and radiation. The second will focus on climate change.
In addition, before the end of the course, students can address the effects of sciences on society by conducting group projects that address the needs of local communities and the capacity to utilize scientific knowledge to promote the health and well being of individual, community and society.

Course General Objectives:

The overreaching goals of this course are:

a) To develop an understanding of philosophy of science and how science and society interrelates.
b) Engage students in analysis of major contemporary controversies, enabling each student to acquire in-depth knowledge of one controversial issue concerning science and society of their choice.
c) To develop and practice skills relevant to preparing and delivering public presentations.
d) Raise awareness of the role of science and society to limit drug abuse, uses of nutracuticals, herbal medicine, radiation, and climate change and related adaptation.

Course content Learning Outcomes (ILOs)/Competencies:

Upon successful completion of this course, students will be able to:

1- **Discuss the various characteristics of science and understand the nature of the science.**
2- **Demonstrate awareness about how science and society interrelates.**
3- **Demonstrate awareness of types of Abusable drugs effect on society and how science can help to eliminate and prevent it.**

4- **Produce two educational materials (i.e. such as video, booklet, or poster) that focus on public awareness of drug abuse, nutracuticals, herbal medicine, radiation and climate change.**
5- **Discuss the different ways of climate change adaptation.**
6- **Discuss the aspects of environmental awareness to deal with climate changes.**
7- **Shows creative and critical thinking skills in carrying out oral presentations on topic of choice related to science and society.**

Teaching Methods:

The structure of this course is elaborated throughout lectures, classroom debates, assignments, exercises, homework and projects.

Assessment Instruments

	Mark
1st Assessment	15%
2nd Assessment	15%
Quizzes, participation, and Homework	10%
Final Project presentation	10%
Final Exam	50%
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1:	Introduction; Philosophy of science	

Week 2:	How science and society interrelate	
Week 3:	Drugs and Society	
Week 4:	Drugs and Society	
Week 5:	Herbal medicine and society/ Nutracuticals	
Week 6:	Radiations/ Mobile radiations	
Week 7:	Presentation of student's (first assessment)	
Week 8:	Presentation of student's (first assessment)	
Week 9:	Climate change/ Global warming: An introduction	
Week 10:	Climate change adaptation	
Week 11:	Renewable energy technology	
Week 12:	Environmental Awareness	
Week 13:	Presentation of student's (second assessment)	
Week 14:	Presentation of student's (second assessment)	
Week 15:	Students' final Presentation	
Week 16:	Students' final Presentation	

Radiations/ Mobile radiations

Course Policies

Lecture attendance is mandatory. If the rate of student absences, in a course unit, is greater than 15% (or 20% for student representing the University in sportive or cultural activities) of the completely accredited hours and the student has no acceptable justification, then this student is excluded from that course unit. If the Dean of the faculty accepts the justifications of absence, then this student is mentioned as withdrawn without refunding the registration fees.

Make-up exams, if existed, will be offered for valid reasons only with consent of the Dean. Make-up exams may be different from regular exams in content and format.

Mobiles are not tolerated in the class, and should be turned off during the lecture time.

Course Modules

Course	**Science and Society**
Module 1	Philosophy of Science/ How science and society interrelates
Key Concepts	Nature of science, limitations of science, history of the science, how science can serve society
Overview	This module gives an introduction to science and society. Questions to be addressed in this module include the following: what is the definition of science? What are the limitations of science? How science and society interrelates? How science can help to solve our society problems?
Aim	The overall aim of this module is to turn student able to understand the nature of science and how it is interrelates with society.
Learning Outcomes	At the end of this module students will be able to: • Identify the definition of science. • Discuss the limitations of science. • Understand how science and society interrelates. • Demonstrate knowledge of how science can serve society.
Readings	Instructor hand outs
Activity	**Overview** During this module a discussion between students will be raised about different aspects such as philosophy of science and how science interrelates. In addition, a student's "Role Play" will be conducted to discuss those issues.
Module 2	Drugs abuse
Key Concepts	Science and understanding of drug abuse, Drugs and brain, consequences

	of drug abuse, major Abusable drugs.
Overview	This module introduces the drug abuse. The module aims to answer the following questions: How Science Has Revolutionized the Understanding of Drug addiction? Why study drug abuse and addiction? Why is adolescence a critical time for preventing drug addiction? How do science-validated prevention programs work? What is the effect of drug abuse and addiction on different specific population? How do drugs work in the brain? Why are drugs more addictive than natural rewards? What are the medical consequences of drug addiction? What are the principles of effective addiction treatment? What are some effects of specific abused substances?
Aim	The over aim of this module is to introduce drug abuse and it is effect on society.in addition how science can help society to eliminate and prevent drug abuse.
Learning Outcomes	At the end of this module students will be able to : • Understand how science revolutionized our understanding of drug abuse. • Discuss different harmful effect of drug abuse. • Identify the ways to prevent drug abuse.

	• Identify different types of addicted drugs and it is effect.
Readings	. Instructor selected readings. . Selected YouTube videos
Activity	**Overview** During this module a discussion between students will be raised about different aspects such as science and drugs, harmful effect of drugs. In addition, a student's "Role Play" will be conducted to discuss those issues. Moreover, each student will have the chance to develop and present an educational material such as booklet, video, or poster related to drug abuse prevention.
Module 3	Nutracuticals/ Herbal Medicine
Key Concepts	Definition of nutracuticals, Benefits of using Nutraceuticals, Scientific evidence for the biological function of nutraceuticals, Classification of Nutraceuticals, diffention of herbal medicine, Remedies production,
Overview	This module aims to answer the following questions: What are Nutraceuticals? Where We Can Find Nutraceuticals? What is the Scientific evidence for the biological function of nutraceuticals? What are the Classification of Nutraceuticals? What are the he potential dangers of herbal remedies? How sciences affect the development of herbal medicine?
Aim	The over aim of this module is to introduce herbal medicine and nutracuticals and the role of science on it.
Learning Outcomes	At the end of this module students will be able to: • Define herbal medicine and Nutracuticals. • Identify different types of nutracuticals and herbal medicine. • Differentiate between the scientific and non-scientific uses of nutrients.
Readings	Selected hand outs by the instructor.

Activity	**Overview** During this module a discussion between students will be raised about different aspects such as types of nutracuticals and herbs. In addition, a student's "Role Play" will be conducted to discuss those issues. Moreover, each student will have the chance to develop and present an educational material such as booklet, video, or poster related to herbal medicine and nutracuticals.
Module 4	Radiation and mobile radiations
Key Concepts	Radiation risk and prevention
Overview	This module focus on radiation and it is effect on humans.
Aim	The module aims to answer the following questions: What are the different types of radiation? How Radiation can harm humans? What are the side effects of radiation? How can we protect our self from radiation?
Learning Outcomes	At the end of this module students will be able to: • Identify different types of radiation • Discuss the radiation effect on humans. • Identify the ways to protect ourselves from radiation.
Readings	Selected hand outs by instructor

Activity	**Overview** During this module a discussion between students will be raised about different aspects such as types of radiation and it is effect on humans. In addition, a student's "Role Play" will be conducted to discuss those issues. Moreover, each student will have the chance to develop and present an educational material such as booklet, video, or poster related to radiation safety.
Module 5	Climate Change
Key Concepts	Climate change/ Global warming, Climate change adaptation, Renewable energy technology, Environmental Awareness
Overview	This module introduces the issue of climate change and adaptation. In addition, discuss the renewable energy as one of the solutions that can help our world to eliminate climate changes. Moreover, it focuses on environmental awareness in relation to climate change.
Aim	The overall aim of this module is to introduce the climate change issue. The module aims to answer the following questions: What is the defection of climate change? Why climate change occurring? How science deals with climate change? What are the effects of climate change on society? What is the role of human being on climate change? What is the greenhouse effect?

	What are the Myths and facts related to climate change? What we can do to minimized climate change? What are the types of renewable energy available, and how it can be effective in minimizing climate change?
Learning Outcomes	At the end of this module students will be able to: • Identify the definition of climate change • Discuss and identify the methods of climate change adaptation. • Discuss how renewable energy can help to minimized climate change issue. • Demonstrate knowledge on the environmental awareness in relation to climate change • Develop an educational material related to climate change.
Readings	- Selected hand-outs by instructor . - CLIMATE CHANGE: IMPACTS, VULNERABILITIESAND ADAPTATION IN DEVELOPING COUNTRIES- United Nations Framework Convention on Climate Change (UNFCCC).
Activity	**Overview** During this module a discussion between students will be raised about different aspects such as causes of climate change, and action to be taken to minimize the effect of climate change. In addition, a student's "Role Play" will be conducted to discuss those issues. Moreover, each student will have the chance to develop and present an educational material such as booklet, video, or poster related to climate change

Faculty: Foreign Languages and Communication
Department: Department of English

Course Syllabus

Course Title: Social Ethics	**Course Number: 700141**
Course Prerequisite(s) and/or Co-Requisite(s):NA	**Credit Hours: three**
Lecture Days, and Timing:	**Course Prepared By:** **Wafa Khadra**
Course Approved By **a. Name of Academic Coordinator: Wafa Khadra** **b. Name of Department Committee Representative: Faculty of Arts** **c. Dean: Professor Issam Abu Salim**	

Academic Staff Specifics

Name	Academic Rank	Office Number, Location and Tel. Ext.	Office Hours	E-mail Address
Wafa Khadra	Assistant Professor			W.khadra@aum.edu.jo

Course Description:

Social Ethics deals with some of the most challenging ethical issues in our contemporary world: abortion, euthanasia, the death penalty, torture and anti-terrorism, race, gender, world poverty, environmental ethics, climate change and animal rights. A variety of ethical approaches will be used to evaluate social and political issues in our current society for students to become consciously aware of their own moral traditions and others, and this will, naturally, enhance constructive critical thinking habits and reinforce students' values and issue relatedness.

Course Objectives:

The aim of this course is to enable students to:

- Identify and explain the relevant empirical considerations that may affect the ethical analysis of social, environment problems and climate change considered in this course

- Apply deontological, consequentialist and character-based frameworks to the analysis of the specific social, environment problems and climate change
- Develop and present arguments in support of your own position on the specific social, environment problems and climate change

- Critically evaluate arguments that have been advanced in the philosophical narrative on the social, environment problems and climate change

- Improve ability to clearly and concisely summarize, analyze and debate others' arguments.
- Learn several historically and philosophically significant ethical positions.
- Study competing arguments in several areas of contemporary ethical interest, matters and controversial issues.
- Initiate a project that deals with social, environment problems and climate change to bring about positive change

The aim of this course is to further develop:

- **How to assess arguments in social, environmental ethics and climate change.**
- **Students' ability to clearly and concisely summarize others' arguments.**
- **Knowledge on several historical and philosophical social and environmental ethics with special focus on climate change ethical positions.**
- **Debates in several areas of contemporary various positionality on social, environmental ethics and climate change.**
- **knowledge, consciousness and relatedness toward environmental issues and climate change.**
- **Diagnosis of environmental challenges and threats**
- **Problem solving of polemic ethical matters high among which is the climate change**

Course Components:

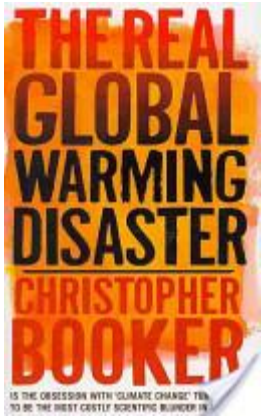
Text book:

Social Ethics (8TH 11 Edition) by Thomas Mappes - Powell's Books

"Social Ethics (8TH 11 Edition) by Thomas Mappes: With an assortment of readings and perspectives from some of the most respected thinkers of our time, Social Ethics: Morality and Social Policy provides a balanced, engaging introduction to today's most pressing social and moral problems. ..

With an assortment of readings and perspectives from some of the most respected thinkers of our time, *Social Ethics: Morality and Social Policy* provides a balanced, engaging introduction to today's most pressing social and moral problems. This highly popular anthology illuminates the issues at the heart of each contemporary problem and encourages critical, fair-minded examination of varying viewpoints—all presented in the words of those who embrace them. Helpful editorial features include substantial chapter introductions, a summary preceding each selection, discussion questions, and bibliographies for further reading. "

- **The Real Global Warming Disaster:** Is the Obsession with 'climate Change' Turning Out to be the Most Costly Scientific Blunder in History?



Christopher Booker

A&C Black, 2010 - Political Science - 384 pages

6 Reviews

This original book considers one of the most extraordinary scientific and political stories of our time: how in the 1980s a handful of scientists came to believe that mankind faced catastrophe from runaway global warming, and how today this has persuaded politicians to land us with what promises to be the biggest bill in history.

Christopher Booker interweaves the science of global warming with that of its growing political consequences, showing how just when the politicians are threatening to change our Western way of life beyond recognition, the scientific evidence behind the global warming theory is being challenged like never before.

The book exposes the myth that the global warming theory is supported by a 'consensus of the world's top climate scientists'. It shows how the UN's Intergovernmental Panel on Climate Change is run by a small group of 'global warming' zealots, who have repeatedly rigged evidence to support their theory. But the politicians, pushed by the media, have so fallen for its propaganda that, short of dramatic change, our Western world now faces an unprecedented disaster.

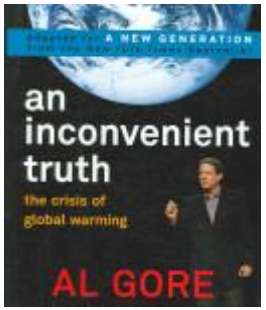
Course References:

An inconvenient truth: the crisis of global warming



Albert Gore
Viking, Apr 10, 2007 - Juvenile Nonfiction - 191 pages
14 Reviews
This young readers' version of the recent documentary film's companion adult volume cuts the page count by about a third but preserves the original's cogent message and many of its striking visuals. After explaining that his interest in the environment predates even his mother's reading of Silent Spring aloud to him as a teenager, Gore proceeds to document steeply rising carbon dioxide levels in our atmosphere, and then to link that to accelerating changes in temperature and precipitation patterns worldwide. Using easy-to-grasp

Teaching Methods: (Examples; Use the Applicable Ones)

- Simulations
- Negotiation Exercises
- Small Group Exercises
- Team Building Progress
- Presentation
- Seminar Discussion

- Lecturing
- Demonstration
- Workshops/Assignments

Learning Outcomes:

- **Knowledge and understanding**:

From the assigned and recommended readings and the classroom discussions, you will learn a lot about the specific cultural issues we consider this semester which will help you:

- Demonstrate knowledge and understanding of the different social, environmental ethics and climate change.
- Understand the basic concepts and terminology of contemporary social, environmental ethical issues with special focus on climate change.
- Demonstrate knowledge of the key paradigms of debate and discussion on the social, environmental issues and climate change
- Develop the competence of effective and fast discussion and debate on social, environmental ethics and climate change.

- **Cognitive skills (thinking and analysis):**

- Analyze and debate topics in texts from different positionality on social, environmental ethics and climate change.

- Structure ideas and arguments on social, environmental ethics and climate change, both orally and in writing, in a sustained and logical fashion, and support them with relevant examples.

- Generate and articulate personal responses to various contentious social , environmental matters and climate change, and explain the premises and assumptions underlying such personal responses.

- Differentiate between opinions, intentions, and facts.

- Detect and recognize the style and range of the argument used depending upon the social and cultural context in which it is used.

- **Communication skills (personal and academic):**

Throughout the semester, you will be asked to develop your own position on these issues, showing a critical awareness of what we have learned in class while at the same time presenting your own view on the issues.

Throughout the semester, you will be asked to develop your own position on these issues, showing a critical awareness of what we have learned in class while at the same time presenting your own view on the issues.

Practical and subject specific skills (Transferable Skills):

- Note significant details in various texts

- Cite evidence to prove a point
- Compare and contrast different point of views of a reading text
- Read for enjoyment
- Expand vocabulary
- Cite evidence to prove a point.
- Write resume, cover letter, proposals, etc.
- Moderate table topics
- Perform short speeches
- Give power-point presentation
- Debate contemporary issues highlighting their controversies and complexities
- Build a convincing argument in line with emerging contemporary issues

Assessment Instruments: (For Example)

Allocation of Marks	
Assessment Instruments	**Mark**
Midterm examination	**20%**
Presentations, Participation, Extended	**20%**

Essays.	
Final Exam (written unseen exam)	**30%**
Project	**30%**
Total	**100%**

Documentation and Academic Honesty (Pledge of Honor):

Avoiding plagiarism and cheating:

"The University's definition is that cheating is defined as any illegitimate behavior designed to deceive those setting, administering and marking the assessment.
Cheating can take a number of forms, including:

- The use of unauthorized books, notes, electronic aids or other materials in an examination;
- Obtaining an examination paper ahead of its authorized release;
- Collusion, i.e. the representation of another's work or ideas as one's own without appropriate acknowledgement or referencing, where the owner of the work knows of the situation and both work towards the deceit of a third party (while in plagiarism the owner of the work does not knowingly allow the use of his or her work);

- Acting dishonestly in any way including fabrication of data, whether before, during or after an examination or other assessment so as to either obtain or offer to others an unfair advantage in that examination or assessment; “

Plagiarism can take a number of forms, including:

> “Plagiarism, i.e. the act of representing another's work or ideas as one's own without appropriate acknowledgement or referencing. There are three main types of plagiarism, which could occur within all modes of assessment (including examination):
>
> - Direct copying of text or images from a book, article, essay, computer program, handout, thesis, web page or other source without proper acknowledgement.
> - Claiming individual ideas derived from a book, article etc. as one's own, and incorporating them into one's work without acknowledging the source of these ideas.
> - Overly depending on the work of one or more others without proper acknowledgement of the source, by constructing an essay, project etc. by extracting large sections of text from another source, and merely linking these together with a few of one's own sentences or using 'essay bank' material.

To avoid plagiarism, students are expected to keep systematic written notes of the sources they use at the time they refer to the sources. Without such notes, it is almost impossible to avoid committing plagiarism.

Penalty for Cheating, Plagiarism, and Mobile Usage inside rooms:

The University has strict rules and harsh penalties (including expulsion from the university) about cheating, plagiarism and mobile usage.”

<u>Attendance policy:</u>

Lecture attendance is mandatory. If the rate of student absences, in a course unit, is greater than 15% (or 20% for student representing the University in sportive or cultural activities) of the completely accredited hours and the student has no acceptable justification, then this student is excluded from that course unit. If the Dean of the faculty accepts the justifications of absence, then this student is mentioned as withdrawn without refunding the registration fees.
Make-up exams, if existed, will be offered for valid reasons only with consent of the Dean. Make-up exams may be different from regular exams in content and format.

Assessment Tasks in Detail

- Participation, Presentation and Extended Essays will be worth 20% of the semester grade

- Students are expected to attend all regularly scheduled classes. In this course you are permitted 4 unexcused absences (absences not caused by illness). If you have more than four unexcused absences your grade for the course will be lowered by one "mark" for each additional unexcused absence.
- Presentations: students are asked to choose a topic from the course syllabus and give a 15- minute presentation of the main themes, followed by 10 minutes of questions and answers. The presentation is worth 10% of the semester grade.
- Extended Essays of a maximum of 800 words each worth 10% of the semester grade; words of the essay in a standard essay format that conforms to the MLA format using 12 point Times New Roman font with 2.5 cm margins is required.

The essay must have at least 3 sources other than the assigned and recommended readings. Students are expected to cite and to discuss critically all assigned and recommended readings related to the paper. Essays that are more than 800 words will be penalized 5 points. Essays have to be handed in person at the beginning of a scheduled class. Essays submitted after the deadline will be penalized 5 points for each day of delay

- Project: students are expected to work on a project relevant to the subject matter of the course. The project can be pair or group work. Students are asked to give a 15- minute presentation of the project. The project is worth 30% of the semester grade

- Midterm exam: A 55- minute, in-class exam consisting mainly is worth 20% of the semester grade
-

- A final exam is worth 30% of the semester grade. The exam consists of short essay questions and attempts to cover the study material in proportion to class time (not number of pages in assigned readings). However, many of the questions will require drawing on knowledge from a variety of topics covered in different classes

3. Course Components

Resources:

- **Text book:** "Advertising and Promotion: An Integrated Marketing Communications Perspective", Belch & Belch, Global edition.
- **Other resources :** Robert Cox, "Environmental Communication and the Public Sphere" , 3rd edition (2012)
-

Course Description:

Marketing Communications will provide students who have a basic fluency in marketing with an opportunity to explore all aspects of advertising and promotion in depth and detail, with an emphasis on IMC. It includes very comprehensive coverage of agency issues and creative work and how it is related to the IMC mix. In order to best communicate with consumers, advertisers must utilize a myriad of tools (advertising, public relations, direct marketing, interactive/Internet marketing, sales promotion, and personal selling). This course also explores environmental

communication as an area of growing interest within the communication discipline; it aims to provide an overview of its theoretical approaches, research literature, and practical applications. The course will also tackle the issues of the communication and public forums that are used to address environmental controversies in the U.S. and other nations, and the influence of language on decisions to protect wilderness, health, or the global climate.

Course Objectives:

Essentially, the course seeks to attain the following objectives:

- To give you an understanding of integrated marketing communications, traditional promotional tools, and new media options such as advertising on the World Wide Web.
- To show how consumer behavior and marketing communications theories can be used to design effective promotional strategies
- To give you hands on experience preparing an integrated marketing communications plan.
- To Explain the social construction of nature, and human relationships with nature, through discourse, rhetoric, and communication practices
- To clarify communication about environmental issues in organizational, mass media, political, and international contexts
- To give you an understanding environmental risk communication

Course Outcomes:

The following outcomes are expected from this course:

- **Knowledge and understanding:** Understand how marketing communication concepts and functions can be used in organizations.(course material and guest speaker)
- **Cognitive skills (thinking and analysis):** Apply key terms and information as business tools and modern thoughts. (assignments)
- **Communication skills (personal and academic):** Use marketing skills, cases, group presentation to improve better way of communication and networking.(case analysis and presentation)
- **Practical and subject specific skills (Skills):** Explore the importance of marketing communication mix and planning in changing the way of reaching customers and linking between supply and demand sides.

Teaching Methods:

- This course is based on lectures that are given in English. Lecture sessions will be delivered using power points slides, whiteboard, and visual aids (videos & pictures). Presentations will focus on theoretical issues and real-life applications. Students should prepare for each lecture by:
    - Reading the nominated chapters from the recommended texts.
    - Reading the nominated case studies and working papers.
    - Reading any recommended material by the lecturer.
    - A guest lecturer is welcomed every semester to talk about some real life time aspect of marketing.

- A group presentation is required by students to present and solve a marketing case. Working in groups during this course will be valuable experience for your working life ahead.
- Case Presentation is necessary at the final two weeks of the semester.
- Students are strongly advised to participate during the lectures.
- A textbook is a must for students to read topics and understand this course.
- Course attendance is compulsory throughout the semester.

Students should be aware of all those in addition to other rules and regulations stated and descried in the student handbook.

Course modules

Course	**Marketing Communication**

Module 1	Introduction to Integrated Marketing Communication
Key Concepts	Marketing, The promotional mix, The IMC process, Marketing strategy and analysis, the target marketing process.
Overview	The purpose of this opening module is to provide the student with an overview of the field of advertising and promotion and its role in the marketing process. We introduce the concept of integrated marketing communications (IMC), its evolution, and examine how various marketing and promotional elements must be coordinated to communicate effectively. We also discuss the reasons for the increasing importance of the IMC perspective in planning and executing advertising and promotional programs. Marketers understand the value of strategically integrating the various communication functions rather than having them operate autonomously. The move to integrated marketing communications also reflects an adaptation by marketers to a changing environment, particularly with respect to consumers, technology, and media. The various elements of the promotional mix are introduced in this module along with a brief discussion of these basic tools of IMC. We discuss how many companies are taking an audience contact or touch point perspective in developing their IMC programs and consider four basic categories of touch points. This module also examines the various tasks and responsibilities involved in advertising and promotion management and a model of the integrated marketing communications planning process is presented.
Aim	1. To examine the marketing communication function and the growing importance advertising and other promotional elements play in the marketing programs of domestic and foreign companies. 2. To introduce the concept of integrated marketing communications (IMC) and consider how it has evolved. 3. To examine the reasons for the increasing importance of the IMC perspective in planning and executing advertising and promotional programs.

	4. To introduce the various elements of the promotional mix and consider their role in an IMC program. 5. To examine the various types of contact points through which marketers communicate with their target audiences. 6. To examine how various marketing and promotional elements must be coordinated to communicate effectively. 7. To introduce a model of the IMC planning process and examine the steps in developing a marketing communications program.
Learning Outcomes	At the end of this module, students will be able to - Explain the definition of marketing - Explain the definition of the IMC and its tools - Define the promotional mix - Explain the process of target marketing
Units	10- An introduction to integrated marketing communication 11- The role of IMC in the Marketing Process
Readings	"Advertising and Promotion: An Integrated Marketing Communications Perspective", Belch & Belch, Global edition. (chapters 1,2)
Module 2	**Conceptual and Historical Contexts**
Key Concepts	The Field of Environmental Communication, Nature, Communication, and the Public Sphere, Diverse Voices in a "Green" Public Sphere
Units	Study and Practice of Environmental Communication
Readings	• Robert Cox, "Environmental Communication and the Public Sphere" , 3rd edition (2012) (chapter 2).
Module 3	**Analyzing the Communication Process**
Key Concepts	The basic communication model, source, message, encoding, decoding, feedback, message structure, message appeals, the persuasion matrix.
Overview	The purpose of this module is to examine the communication process by introducing the student to the fundamentals of communication and examining

	various models and perspectives of how consumers respond to advertising messages. A basic model of communication developed by Schram is presented which introduces the controllable elements of the communications process—source, message, channel, and receiver. Source, message, and channel factors are discussed in Chapter 6 and the remainder of this module is devoted to examining the target audience or receiver and the process by which consumers respond to advertising and other promotional messages. The response process is analyzed in terms of traditional response hierarchy models as well as alternative response models. Attention is given to comparing alternative response models such as the standard learning versus low involvement models.
Aim	1. To understand the basic elements of the communications process and the role of Communications in marketing. 2. To examine various models of the communication process. 3. To analyze the response process of receivers of marketing communications including alternative response hierarchies and their implications for promotional planning and strategy. 4. To examine the nature of consumers' cognitive processing of marketing communications. 5. To examine considerations involved in the selecting a source or communicator of a promotional message. 6. To examine different types of message structures and appeals that can be used to develop a promotional message. 7. To consider how the channel or medium used to deliver a promotional message influences the communication process.
Learning Outcomes	Students should be able to explain the key terms and display their understanding by presenting real world cases (promotional campaigns).
Units	- The communication process

	- Source, message and channel factors
Readings	"Advertising and Promotion: An Integrated Marketing Communications Perspective", Belch & Belch, Global edition. (chapters 5,6)
Activity	discussion session initiating project work
Module 4	**Conceptual and Historical Contexts**
Key Concepts	Terministic Screens and Naming , Constructing an Environmental Problem, Rhetorical Perspective, Rhetorical Tropes and Genres Communication Frames, Dominant and Critical Discourses, Visual Rhetorics: Portraying Nature.
Aim	1. to understand the use of terministic screens and naming 2. to understand the construction of environmental issues as problems 3. To describe a rhetorical perspective on environmental communication using three dimensions (1) Rhetorical tropes and genres (2) Communication frames (3) Dominant and critical discourses 4. To explain visual rhetoric, the ways in which visual images (re)present natureand how to Visualize environmental problems
Learning Outcomes	Being able to explain the pervious terms and presenting examples from real world cases.
Units	Social–Symbolic Constructions of Environment
Readings	Robert Cox, "Environmental Communication and the Public Sphere" , 3rd edition (2012) (chapter 3)
Module 5	**Establishing Objectives, Budgeting and Developing the Integrated Marketing Communication Program.**
Key Concepts	Marketing objectives, communication objectives, sales oriented objectives, budget allocation, the media mix, target market coverage, geographic coverage, scheduling, reach, frequency, creative aspects and mood.

Overview	This module focuses on the process of setting objectives and budgeting for the IMC program. The major emphasis is on determining advertising objectives as it is often the lead element in the promotional mix, particularly in consumer products marketing. It stresses the value and importance of setting specific advertising objectives and the role they play in guiding decisions and evaluating performance. It also focuses on the importance of knowing what to expect from advertising and the differences between sales versus communication objectives. The module then presents students with an understanding of the advertising and promotions budgeting process. And theories underlying budgeting decisions and examines the various approaches to budgeting. This module also introduces the concepts involved in media planning. A number of problems associated with the planning process are discussed. The role and purpose of the media plan follows with a presentation of the steps required in developing this plan. After an in-depth discussion of the elements of the media plan.
Aim	1. To recognize the importance and value of setting specific objectives for advertising and promotion. 2. To understand the role of objectives in the IMC planning process and the relationship of promotional objectives to marketing objectives. 3. To know the differences between sales and communication objectives and issues regarding the use of each. 4. To recognize some problems marketers encounter in setting objectives for their IMC programs. 5. To understand the process of budgeting for IMC.

	6. To know various methods of budget setting. 7. To understand the key terminology necessary in media planning. 8. To know how a media plan is developed. 9. To know what constitutes media objectives. 10. To know the process of developing and implementing media strategies. 11. To be familiar with various characteristics of media.
Learning Outcomes	Students should be able to explain the key terms and display their understanding by presenting real world cases (developing a promotional plan and campaign for a local company).
Units	- Establishing objectives and budgeting for the promotional program - Media planning and strategy
Readings	"Advertising and Promotion: An Integrated Marketing Communications Perspective", Belch & Belch, Global edition. (chapters 7,10)
Module 6	**Media and the Environment**
Key Concepts	Growth and Nature of Environmental News, News Production and the Environment, Climate Change in the News, Media Effects Challenges to Traditional (Environmental) News Media, Environmental Journalism Migrates Online, Social Media and the Environment, Social Media and Environmental Advocacy.
Units	News Media and Environmental Journalism Social Media and the Environment Online
Readings	Robert Cox, "Environmental Communication and the Public Sphere" , 3rd edition (2012) (chapter 6,7).
Module 7	**Special Topics and Perspectives**

Key Concepts	The international environment, the economic, demographic, cultural, political and legal environments, Global advertising, localized advertising.
Overview	The purpose of this final module is to evaluate the social, ethical, and economic aspects of advertising. Advertising is a very powerful and influential force in our society, and this course would not be complete without considering the various perspectives and criticisms regarding its social and economic effects. The first half focuses on the various criticisms of advertising from an ethical and societal perspective. Attention is then given to appraising the effects of advertising on the economy including its effect on consumer choice, competition, and product costs and prices. Perspectives regarding the economic effects of advertising are summarized by considering two principal models or schools of thought: the Advertising = Market Power and Advertising = Information perspectives. It should be noted that the primary focus in this chapter is on social and economic aspects of advertising, as this is the promotional mix variable that is the subject of the most concern, controversy, and regulation.
Aim	1. To consider various perspectives concerning the ethical aspects of advertising and promotion. 2. To consider various perspectives concerning the social aspects of advertising and promotion. 3. To examine and evaluate the social criticisms of advertising. 4. To examine the economic role of advertising and its effects on consumer choice, competition, and product costs and prices.
Learning Outcomes	Students should be able to explain the key terms and display their understanding by presenting real world cases (videos and promotions from around the world).
Units	International Advertising and promotion.
Readings	"Advertising and Promotion: An Integrated Marketing Communications

	Perspective", Belch & Belch, Global edition. (chapter 20)

Resources:

- **Text book:**

Essential Reading:

Grant, D.B., Lambert, D.M., Stock, J.R., Ellram, L.M. (2011) Fundamentals of Logistics Management, European Edition, McGraw-Hill

Recommended Reading:
-Christopher, M., Peck. H. (2004) Marketing Logistics, Elsevier Butterworth-Heinemann.
-Rushton A., Oxley J., Croucher P. (2000) The Handbook of Logistics and Distribution Management, Kogan Page, London, 2nd edition.

- **References:** to be provided by the instructor

Course Description:

This course is designed to overview the marketing channels and logistics are analyzed as systems of interrelated and interdependent organizations engaged in making goods and services available for consumption by industrial, logistics, institutional and final consumers. This course emphasizes the means by which effective and efficient distribution channels, logistics and networks (comprising manufacturers, wholesalers, retailers, transportation firms and other actors in the distribution process) can be constructed. Particular attention is given to examining the enviromental issues and sustainability, in addition to, behavioral dimensions of channel relations, the roles of channel members, their use of power, the conflicts that arise among them and their communication procedures. Logistics is a major part of distribution channels management by which an organization may achieve a sustainable competitive advantage in today's private and public sectors.

Course Objectives:

Essentially, the course seeks to attain the following objectives:

- Explain the marketing channels and logistics frameworks, models and theories and describe the latest trends within that field, especially environmental changes.
- Explain the structure, dynamics and key processes of marketing channels and logistics and critically evaluate that evolving environment and sustainability.
- Identify and analyse the characteristics of the key marketing channel and logistics functions and evaluate relevant strengths and weaknesses; and solve related problems and changes.
- Analyse the essential role of marketing channels and logistics towards customer service, relationship management and value creation.
- Demonstrate written communication skills.
- Provide and explore examples from marketing practice and solve real-life marketing problems.

Course Outcomes:

After completion of this course, the student will be able to:

- **Knowledge and understanding:** Understand how marketing channels concepts and logistics can be used in organizations and affect on the environment.
- **Cognitive skills (thinking and analysis):** Apply key marketing terms and information as business tools and modern thoughts.
- **Communication skills (personal and academic):** Use marketing skills, cases, group presentation to improve better way of communication and networking.
- **Practical and subject specific skills (Skills):** Explore the importance of marketing channels and logistics in changing the way of reaching customers and linking between supply and demand sides based on the concept of sustainability and climate changes.
- **Practical and subject specific skills (Transferable Skills):**

Teaching Methods:

- This course is based on lectures that are given in English. Lecture sessions will be delivered using power points slides and blackboard. Presentations will focus on theoretical issues and real-life applications.
- A group presentation is required by students to provide a marketing case. Working in groups during this course will be valuable experience for your working life ahead.
- Case Presentation is necessary at the final two weeks of the semester.
- Students are strongly advised to participate during the lectures.
- A textbook is a must for students to read topics and understand this course.
- Course attendance is compulsory throughout the semester.

Students should be aware of all those in addition to other rules and regulations stated and descried in the student handbook.

Course Modules

Course	**Marketing Channels & Logistics**
Module 1	**Introduction to Marketing Channels & Logistics**
Key Concepts	Marketing channels, Logistics and evolving environment.
Overview	The concepts of marketing channels and logistics and supply chain are introduced. Key logistics costs include customer service, inventory carrying costs, transportation, warehousing, order-processing, lot quantity costs, and environmental issues are explained. The focus also is on Green / environmental logistics in order to illustrates the importance of the environment and doing business under sustainable climate and resources. More attention is for the supply chain which encompasses the planning & management of all activities involved in sourcing & procurement, conversion and all logistics activities. Importantly, it also includes coordination and collaboration

	with channel partners, which can be suppliers, intermediaries, third-party service providers and customers in business environment.
Aim	• To provide students with a solid theoretical grounding in marketing channels & logistics principles. • To make students familiar with marketing channels and logistics applications. • To illustrate its critical role towards a firm's successful marketing strategy implementationin specific environment and sustainability.
Learning Outcomes	Students will be able to: • Explain the marketing channels and logistics frameworks, models and theories and describe the latest trends within that field. • Explain the structure, dynamics and key processes of marketing channels and logistics and critically evaluate that evolving environment. • Identify and analyse the characteristics of the key marketing channel and logistics functions and evaluate relevant strengths and weaknesses. • Critically analyse the essential role of marketing channels and logistics towards customer service, relationship management and value creation.
Units	12- Marketing channels 13- Logistics 14- Evolving environment.
Readings	Grant, D.B., Lambert, D.M., Stock, J.R., Ellram, L.M. (2011) Fundamentals of Logistics Management, European Edition, McGraw-Hill (Ch.1)
Activity	Review
Module 2	**Customer Service, Logistics Information Systems & Technology, and Logistics Environment**
Key Concepts	Logistics, Customer Service, Information Systems, Technology, Environmental Issues and Sustainability.

Overview	The concepts of customer service, Information and IT, and environmental issues are introduced. The elements of customer service can be classified into three groups: pre-transaction, transaction, and post-transaction elements. Companies should identify and overcome impediments to customer service to improve customer service performance using the right information systems and IT for better control under the changeable environments in countries especially when we deal with storage or transportation within a country or between countries.
Aim	• To explain customer service, and organization's marketing and logistics efforts. • To provide an overview of the ways that IT can be used in logistics operations. • To examine the strategic role of IT in logistics supply chain operations. • To show the control of logistics and supply chain in various environments especially climate changes for better sustainability.
Learning Outcomes	At the end of this module, students will be able to • To define customer service. • To show the central role that customer service plays in an organization's marketing and logistics efforts. • To use an IT application in logistics operations and supply chain operations. • To frame the logistics and supply chain in for better sustainability.
Units	11- Customer service 12- Customer satisfaction 13- Pareto principle 14- Information System 15- Sustainability
Readings	- Grant, D.B., Lambert, D.M., Stock, J.R., Ellram, L.M. (2011) Fundamentals of Logistics Management, European Edition, McGraw-Hill (Ch.2,3,4)
Activity	Review and Case Study on the use of IT to control climate change.
Module 3	**Logistics components: Purchasing, Procurement & Inventory Management , Materials Management, Transportation**

Key Concepts	Purchasing, Procurement, Inventory, Materials, Transportation, and Climate Change.
Overview	Many issues are discussed for how better management of purchasing leads to increased profitability. This is also to examine various types of supplier relations and the role of purchasing in supply chain management, with an emphasis on various types of partnerships. The basic concepts of inventory management are examined and the EOQ model is introduced, along with methods for adjusting it. In addition, it discussed demand and order cycle uncertainty especially for business performance and climate changes. The administration and control of materials flow requires that firms measure, report, and improve performance. Concepts and approaches used to do so include MRP I, MRP II, DRP systems
Aim	Students' knowledge about the components of logistics will be enhanced and directed for better performance in real life cases.
Learning Outcomes	At the end of this module, students are expected to • To show how better management of purchasing activities can lead to increased profitability. • To describe the impact of just-in-time production on purchasing. • To examine how the basic concepts of inventory management are applied. • To show how production policies influence inventory levels. • To demonstrate how inventories and customer service levels are interrelated and how inventory management contributes to least total cost logistics. • To identify and describe a variety of materials management philosophies and techniques under specific environment. • To examine transportation's role in logistics and its relationship to marketing especially when climate changes could happen.
Units	6- Customer sell and buy units 7- Inventory 8- Material flow 9- Transportation modes 10- Climate change
Readings	- Grant, D.B., Lambert, D.M., Stock, J.R., Ellram, L.M. (2011) Fundamentals of Logistics

	Management, European Edition, McGraw-Hill (Ch.5,6,7)
Activity	Review
Module 4	**Business Process and Performance**
Key Concepts	Process, Effective Logistics, Quality, Financial Performance
Overview	Business process is a fundamental rethink and radical redesign of business processes to achieve dramatic improvements in critical contemporary measures of performance such as cost, quality, service and speed. Performance objectives consists of quality – customer service/score, scrap levels, complaints, cost – cost per hour, cost per unit, how competitive product is in the market place, dependability – reliable delivery, % of orders on time, flexibility – range of products offered, adaptability, time to market of new products, speed – responsiveness to the customer, and delivering product to the market ahead of time, cycle time, and lead time.
Aim	Students will be able to acquire a deeper knowledge about logistics in terms of the various process and effectiveness, total quality management, and business performance.
Learning Outcomes	At the end of this module, students will be able to • To describe the impact of business process on logistics. • To examine the total quality management concept of logistics management. • To show how the factors of performance are used
Units	10- Process flow 11- Quality 12- Performance factors
Readings	- Grant, D.B., Lambert, D.M., Stock, J.R., Ellram, L.M. (2011) Fundamentals of Logistics Management, European Edition, McGraw-Hill (Ch.8,9,10,11)
Activity	Review
Module 5	**Global Value Chain and Climate Change**
Key Concepts	Value Chain, Climate Change, Logistic Strategy, Sustainability, and Globalization.

Overview	The focus on the reasons firms expand into global markets. Firms that do so can become involved in exporting, joint ventures, direct ownership, importing. Our relationship with the environment is constantly re-defined, it is a relationship based largely on sustainability. The changes business and technology have brought about are mainly due to meeting the basic needs of a growing human population and their demand. It is therefore important to understand the consequences of our past and current activities for better future for business between countries.
Aim	Students will be able to understand relations between business and the environment, especially the potential for business activities to significantly change global climate and sustainability.
Learning Outcomes	At the end of this module, students will be able to • To identify some of the controllable and uncontrollable factors that affect global value chain and logistics activities. • To describe the major international distribution channel strategies—exporting, licensing, joint ventures, ownership, and importing in relation to climate change. • To identify the organisational, financial, and managerial issues related to global logistics focusing on the concept of sustainability.
Units	10- Value added 11- Business plan 12- Global business 13- Business changes
Readings	- Grant, D.B., Lambert, D.M., Stock, J.R., Ellram, L.M. (2011) Fundamentals of Logistics Management, European Edition, McGraw-Hill (Ch.12,13,14,14)

Course Description:

This course is designed to overview various topics on marketing related to climate change and how organizations and nations can adopt new strategies to provide sustainability. This course emphasizes the means by which having new products to market is the very foundation by which businesses grow their market share. Many of these businesses taking part in developing opportunity to identify what lies ahead in terms of a changing climate and the implications of such changes on our surroundings and our nations. In this course, a major part is focusing on putting significant efforts to explore the adaptation opportunities arising from issues of climate change and sustainability, such as modern marketing application, relationship marketing, green marketing, agricultural marketing, food security, and the process of global marketing.

Course Objectives:

Essentially, the course seeks to attain the following objectives:

- Explain the marketing and climate change, models and theories and describe the latest trends within that field, especially environmental changes.
- To develop awareness of the issue of climate change and the opportunities/challenges it presents for shareholder value-maximizing businesses.
- To understand the emerging climate economy and what it means to your company, its industry, and the global economy.
- To develop the frameworks to assess the market value/value-at-risk consequences of firms' exposure to climate change risks, and the economic analysis tools
- To develop your understanding of business to climate change and to inform your ability to shape the conversation in your company based on green marketing concepts.
- Demonstrate written communication skills.
- Provide and explore examples from marketing practice and solve real-life marketing problems.

Course Outcomes:

After completion of this course, the student will be able to:

- **Knowledge and understanding:** Understand how contemporary issues in marketing and climate change can be used in organizations.
- **Cognitive skills (thinking and analysis):** Apply key marketing terms and climate change as business tools and modern thoughts in global development.

- **Communication skills (personal and academic):** Use marketing skills, cases, group presentation to improve better way of communication and networking.
- **Practical and subject specific skills (Skills):** Explore the importance of marketing and climate change in changing the way of reaching customers and linking between supply and demand sides based on the concept of sustainability and climate changes.
- **Practical and subject specific skills (Transferable Skills):** Applying different issues.

Teaching Methods:

- This course is based on lectures that are given in English. Lecture sessions will be delivered using power points slides and blackboard. Presentations will focus on theoretical issues and real-life applications.
- A group presentation is required by students to provide a marketing case focusing on climate change. Working in groups during this course will be valuable experience for your working life ahead.
- Case presentation is necessary at the final two weeks of the semester.
- Students are strongly advised to participate during the lectures.
- A textbook is a must for students to read topics and understand this course.
- Course attendance is compulsory throughout the semester.

Assessment Instruments

	Mark
First Exam	15%
Second Exam	15%
Quizzes, Homework and Participation	10%
Project	10%

Final Exam	50%
Total	100%

Course Academic Calendar

Weeks	Basic and support material to be covered	Homework/reports and their due dates
Week 1	Ch. 1: Introduction to the module	**Task: Describe the key conceptual issues on marketing and climate change.**
Week 2	Ch. 2-3: Understand the Changing role of Marketing in the Modern Organization	**Task: Analysis the role of marketing in the modern organization**
Week 3		
Week 4	Ch. 4-5: Climate Change: Basic Issues and Corporate Implications	**Task: Analysis the climate change in modern implications.**
Week 5		
Week 6	Review and Exam	**First Exam**
Week 7	Ch. 6-7: Understand the Nature and Importance of Globalisation and the Process of Global Marketing	**Task: Describe the role of globalisation strategy for a business**
Week 8		
Week 9	Ch. 8-9: Climate Change, Sustainability, and Corporate Value Creation	**Task: Describe the importance of value creation.**
Week 10:		
Week 11:	Ch.10-12: Be aware of developments in the sphere of consumerism, environmentalism and 'green' marketing	**Task: Compare the various stages of green marketing**
Week 12		
Week 13:		
Week 14:	Review and Exam	**Second Exam**
Week 15	Group Presentation	**Discussion session; Submission of projects (reports/presentations)**
Week 16:	**Review and Exam**	**Final Exam**

Course Policies

University regulations apply to this course regarding class attendance, punctuality, exams, late submissions, absence with permission, penalties for cheating, and policies for assignments and projects, if any. Students should be aware of all those in addition to other rules and regulations stated and descried in the student handbook.

Course Modules

Course	Contemporary Issues in Marketing
Module 1	**Introduction to Contemporary Issue in Marketing**
Key Concepts	Marketing and Modern Organizations
Overview	The concepts of marketing in modern organizations are introduced. It is the fact that marketing as an organisational philosophy and activity is applicable to almost all types of organisation, whether profit making or not-for-profit. The number and type of organisations adopting marketing strategies is expanding. The philosophical aspect of marketing as a long-term company of wide business orientation is becoming more important.
Aim	To show that business take a rather myopic view of the subject and see marketing merely as a collection of well-developed management techniques, which when combined, constitute a functional area of the organisation's management operations for sustainability.
Learning Outcomes	Students will be able to: • Explain the marketing modern marketing frameworks, models and theories and

	describe the latest trends within that field. • Identify and analyse marketing for better value in business and sustainability for products in a connected world.
Units	15- Marketing value 16- Sustainability 17- Long-term business
Readings	Saren, M., Maclaran, P., Goulding, C., Elliot, R., Shanker, A., and Catterall, M. (2013), *'Critical Marketing: Defining the Field',* Butterworth-Heinemann, ISBN: 13; 978-0-7506-8066-0. (Ch.1,2)
Activity	Review
Module 2	**Climate Change And Implications**
Key Concepts	Climate Change, Marketing Strategy, Business Development, and Value.
Overview	This course should be able to answer many questions: What is climate change? What are its causes, what are its likely effects? What aspects of the evidence are strong? What are the key findings and uncertainties? Should marketing managers care about climate change? Why? What do businesses have to do with either the cause or effect of the phenomenon of climate change? What are the specific paths through which climate change impacts marketing? And how climate change could influence business value and its sustainability in business?
Aim	• To explain the importance of climate change in business. • To provide an overview of application of marketing in modern cases.
Learning Outcomes	At the end of this module, students will be able to • To define climate change. • To link between marketing and climate change in an organization.
Units	16- Climate

	17- Uncertainty 18- Value
Readings	- Pielke Jr., *The Climate Fix*, (2010), 'Dinner Table Climate Science,' (ch 1,2).
Activity	Review
Module 3	**Process of Global Marketing**
Key Concepts	Purchasing, Procurement, Inventory, Materials, Transportation, and Climate Change.
Overview	Understand that globalisation, the use of the Internet for information and transactional purposes, developments in transport and an increase in human mobility around the world has led to more discerning customers and different business models often using collaborative ventures and outsourcing of manufacturing and distribution.
Aim	Students' knowledge on how to be aware that more firms globally, especially in the new emerging markets are adopting a marketing approach to their business in order to secure and retain customers in an increasingly complex and volatile marketplace.
Learning Outcomes	At the end of this module, students are expected to • To show the importance of globalization on managing business. • To examine how various processes in global markets can affect businesses. • To develop a critical approach to the development of globalisation and understand the advantages and disadvantages of such developments to different types of organisations
Units	11- Global market 12- Global product 13- Global climate change
Readings	- Hollensen, S. (2005), *'Global Marketing',* Second edition, Prentice Hall, - ISBN: 978-0273706786. (Ch.6,7)
Activity	Review
Module 4	**Climate Change, Sustainability, and Corporate Value Creation**

Key Concepts	Climate Change, Sustainability, and Value Creation.
Overview	Climate change initiatives are closely linked to broader sustainability initiatives within companies. Needless to say, such initiatives become strategic only if and when they can be linked to the underlying business model, and to the value creation process in the company. The changes business and technology have brought about are mainly due to meeting the basic needs of a growing human population and their demand. It is therefore important to understand the consequences of our past and current activities for better future for business.
Aim	Students will be able to understand why climate change is needed for better value creation in the whole processes in doing businesses.
Learning Outcomes	At the end of this module, students will be able to • To gain the knowledge of links between climate change and marketing issues. • To identify the the different criteria that lead for sustainability in business.
Units	14- Change criteria 15- Sustainability 16- Value chain stages
Readings	- Allwin Initiative, "Corporate Sustainability Practices and Shareholder Value," http://mba.tuck.dartmouth.edu/initiative/pdf/ExecEnvSustainForum2009SummaryReport Fi nal.pdf (all)
Activity	review
Module 5	**Consumerism, Environmentalism and 'Green' Marketing**
Key Concepts	Consumers, Macro Environment, Micro Environment, Green Marketing
Overview	Be aware that the term 'green' is being applied in a number of situations these days. There are 'green' political parties in the world. Recycling of otherwise waste materials is

	another manifestation of what has come to be referred to as 'green consciousness'. Marketing firms have responded to these developments. Also firms need to have more 'green' in their business methods, particularly production and other operational methods. They have also become more 'green' in terms of the packaging used on their products, and of course in terms of the products themselves.
Aim	Students will be able to understand the concept of Green Marketing as a 'Pro-Active Policy'. Many firms are now adopting a 'pro active' rather than reactive 'green' marketing strategy in an attempt to gain a competitive business environment.
Learning Outcomes	At the end of this module, students will be able to • To identify the macro and micro environmental factors for better green marketing. • To examine the green marketing concept. • To show modeling for green marketing strategy.
Units	13- Macro environment 14- Micro environment
Readings	- McDonagh, P. and Prothero, A. (1997) *'Green Management: A Reader',* - Thomson Learning, ISBN: 978-1861524215. (Ch.8,9,10)
Activity	Review

Course Name:	**Environmental Volunteering**
Course Location:	University Campus
Class Times:	Sun - Thurs 8:00am – 9:10am
Prerequisites:	

Faculty Web Page: http://hu.edu.jo/fac/Default.aspx?facid=68000000

Course Description/Overview

This third year level course would enable students to learn about their community through finding new doors to open and to participate in activities of their own choice, through which they can become thoughtful, reflective and active citizens. This course provides a convenient way to capture record and recognize the work of volunteers among their own environments and issues they seek to get involved in. There are challenges to help plan and review volunteering activity along with logs to keep track of the work carried out.

The flexibility of Environmental Volunteering Course means they can be carried out in a variety of settings, over a time period to suit the individual or group of students. Challenge descriptions can be interpreted and adapted according to the situation.

Course Learning Objectives

The main goals of this course are: a) to provide a critical approach to environmental volunteering supported by new advanced technologies in the context of education for sustainable environment; b) raise awareness of the role of some technologies in enabling learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for a sustainable future for all; and c) use participatory video and social networking technologies as tools to help the community, including children, identify risks and develop climate change adaptation strategies. d) encourage students to work in groups and enhance presentation and social skills.
This course may also recognise one or more of the following motivations:
1) making a contribution to community, 2) promoting social interaction 3) personal development, 4) learning about the natural environment, 5) a general ethic of care for the environment, and 6) attachment to a particular place.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

53. Discuss the various learning outcomes of the student environmental volunteering
54. Connect theoretical background with their experience in their volunteering project.
55. Produce a 5-10 minute digital video (including storyboarding, lighting, shooting, editing sound tracks and graphics).
56. Use social media to raise awareness for action and advocacy from the bottom up.
57. Develop a lesson plan that integrates the produced digital artifact.
58. Apply principles of transformative learning design.
59. Demonstrate awareness and ability to discourse on ethical issues in using social media and social networking tools.

Course Resources

Students are encouraged to find and execute their volunteering projects and their outreach in any of the following bodies of interest such as: local communities, Governmental authorities, NGO's, or the private sector. The project scale of influence may extend from the community and national level to perhaps regional or global level.

Assignments and Grading Scheme

Grading System

Grades can be distributed as follow:

Project Title Submission Due on ( )	10 %
Progress Report Submission Due on ( )	20 %
Class attendance/participation (throughout the course)	10 %

Final Presentation (at the end of the semester)	60 %
Total Points	**100 %**

Requirements

Students present a portfolio of evidence of their activities. This portfolio will contain:

- completed Volunteering Short Course book and evidence of challenges completed
- planning and reviewing documents
- record of progress
- summary of achievement, identifying skills development

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL assigned classes. You cannot pass the class under any circumstances if you miss more than five classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 10% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites; Criteria for student selection
2		Discussion of reading material 1 and formulating working groups
3		Discussion of reading material 2 and submission of project title
4		Guest Speaker 1 and general discussion on volunteering options

5		Digital storytelling, participatory video (PV) and social media
6		Examples of participatory video clips and educational digital storytelling
7		Guest Speaker 2
8		The planning & design process for video clip/s production
9		Using scenarios in Video clip design and creating a storyboard
10		Participatory video clip production
11		Guest Speaker 3
12		Integrating participatory video clip in lesson planning
13		Integrating participatory video clip in lesson planning
14-16		Video clip uploading and posting along with other resources and plan for action. Final assessment Reflections on participatory video and social media as catalysts for personal and social change

APENDIX II: Environmental Volunteering Course Modules.

Course	Environmental Volunteering
Module 1	**Introducing Environmental Volunteering**
Key Concepts	Environmental Volunteering, Service learning
Overview	This module introduces concepts, principles and opportunities of environmental volunteering through reading materials and handouts. In more general terms course rational and expectations will be explained to students. The student centered approach in this class will enable learners to think, plan and interact with the community to execute their ideas, to record their learning outcome and share their own stories using media technology for producing a video clip.
Aim	The aim of this module is to introduce the concept of volunteerism, service learning, environmental leadership and environmental sustainability to students. And to explain the benefits of volunteerism to volunteers and community.
Learning Outcomes	At the end of this module learners will be able to: • Discuss potential volunteering ideas. • Discuss how technology and media can contribute to social change. • Explain how volunteerism reinforces capacity development.
Readings	- Using the world wide web as a learning medium student should explore

	the internet and look for potential ideas - Handouts will be given to students to read such as: Thomas G., Measham and Guy B. Barnett. (2007) Environmental Volunteering: Motivations, Mode and Outcome. Australian Geographer 39(4) pp. 537-552 http://dx.doi.org/10.1080/00049180802419 23
Activity	**Overview** - Discussion of student reading - Invite one or more of the students in previous class and explain how this - learning methods contributed to his/her development. - Discussing challenges and possible roundabouts (use of good planning and thinking a head). - Invite a guest speaker to the class to share experience and offer a wider horizon of thinking. - Plan a field trip to the Royal Botanical Gardens and demonstrate a whole day class volunteering. - Forming groups and discussing the pros and cons of working within a team. - At the end of this module students shall submit the names in the group and the title of volunteering project.
Module 2	**Volunteering Promoting Environmental Sustainability**
Key Concepts	Active citizen approach, think globally act locally
Overview	In this part of the course the volunteering impact on sustainable development will be highlighted through reading materials and case studies from different parts of the world. This module will outline the environmental sustainable development through volunteering examples where such approach was

	successfully implemented and highlighting some of the key challenges.
Aim	The aim of this module is to show the intrinsic interconnectedness of volunteerism and environmental sustainability
Learning Outcomes	At the end of this module learners will be able to: * Think outside the box and to experience a creative learning atmosphere. * Identify an environmental issue of interest. * Understand the links of volunteering and environmental sustainability.
Units	
Readings	Gough, A. (2005). Sustainable Schools: Renovating Educational Processes. Applied Environmental Education and Communication, 4:339–351 Ofsted (2009) Education for sustainable development: Improving schools, improving lives. Available at: www.ofsted.gov.uk/resources/education-for-sustainable-development-improving-schools-improving-lives . http://www.unv.org/fileadmin/docdb/pdf/2014/corporate/20443_UN_Volunteers_POST-2015_Brief_-_Environmental_Sustainability_and_Volunteerism_WEB.pdf Environmental Sustainability and Volunteerism. January 2014. UNV issue brief
Activity	**Overview**

	In this part of the course students will be asked to interact and connect with the community and start making arrangements for their work. A brief description of their work scheme should be presented and discussed with the teacher in order to give insights and comments for final approval of the project line.
Module 3	**Digital Video Design for Advocacy, Empowerment and Change.**
Key Concepts	Video design, Participatory video
Overview	This module is intended to use hypermedia technology to produce a digital video for advocacy, empowerment and to provide a summary of the environmental volunteering project. The advocacy using media technology is an important way to produce an educational material as a tool to boost education strategies.
Aim	This module aims at executing environmental volunteering projects during which media material is collected for video making.
Learning Outcomes	Towards the end of this module students will: * Obtain knowledge on the concept of participatory video. * Plan, develop and prepare a video clip of their volunteering project.
Units	
Readings	Lunch, N. and Lunch C. (2006). Insights into Participatory Video: Published by InsightShare. Available at http://www.insightshare.org/resources/pv-handbook Windows Movie Maker free online video tutorials from Atomic Learning are Lunch, N. and Lunch C. (2006). Insights into Participatory Video: Published by InsightShare. Available at http://www.insightshare.org/resources/pv-handbook

Activity	Overview
	At this stage students shall produce a progress report (4 pages max.) including project title, objectives, accomplished and planned activities, learning tasks, feedbacks and challenges. Plan Your Own participatory video by collecting photos, videos, interviews, text material to be implemented in the video clip.
Module 4	**Video Clip Production, Editing and Presentation**
Key Concepts	Editing a video clip, presentation skills
Overview	When planning a video clip for the volunteering project, students should learn some filming skills along with editing and paying attention to the quality of pictures, sound, lighting, zooming, focusing and text material. The rapid development of multimedia and hypermedia technologies has provided new avenues for merging images, sound, movies and animation together with texts. Digital video production could offer possibilities for advocacy, empowerment and change. An empowering process is where video itself plays an emancipating role and advocacy for "lobbying," "campaigning," and "activism". In this way technology becomes a means to bring about social justice and environmental protection.
Aim	The aim of this module is to involve students in the process of filming and editing the video clip that is assigned to their project.
Learning Outcomes	The learning outcome include: * Applying editing and processing of a video clip. * Presenting video clips and discussion with audience, explaining the challenges and learning experiences of the team.
Units	

Readings	Manual on Movie Maker 2 and other software Mackay, W. E. Video Techniques for Participatory Design: Observation, Brainstorming & Prototyping. Course Description/Overview

This course is an introductory course on computer networks. It introduces the underlying concepts and principles of modern computer networks with emphasis on protocols, architectures, and implementation issues. The main goal of this course is to understand layering in computer networks, understand different protocol stacks (OSI and TCP/IP), understand functions and protocols within a layer, understand how layers fit together and finally understand how the Internet works. The course provides case studies, particularly related to climate change issues, showing how students, families and citizens can be "empowered" to make their voices heard in the process for building a more sustainable society. The course contains focus group discussions, Students will be engaged in a self-reflective process assessing the strengths and limitations of applying climate change concepts.

Course Learning Objectives

The course is intended to meet the following learning objectives:

1. Understanding the underlying concepts and principles of modern computer networks with emphasis on protocols, architectures, and implementation issues.

2. Understanding layering in computer networks.
3. Understanding different protocol stacks and how the Internet works.
4. To learn how to use networks to raise awareness of the role of some technologies in enabling learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for a sustainable future for all

Course Content Learning Outcomes

1. **Knowledge and Understanding** (Objective 1)

   Having successfully completed this course, you will be able to demonstrate knowledge and understanding of:

   - the principles of modern computer networks
   - Specific and detailed knowledge and understanding in a number of chosen topics in the area of computer networks

2. **Intellectual Skills** (Objective 2)

   Having successfully completed this course, you will be able to:

   - analyze, review and critically evaluate the your work and the work of peers
   - explain the inter-relationship of areas of computer science and the ways in which the convergence of technologies drives the development of computer networks and its effects on climate change

3. **Practical Skills** (Objectives 2,3**)**

Having successfully completed this course, you will be able to:

- develop skills necessary to understand different protocols and layering in computer

networks

4. **General Transferable Skills** (Objective 4)

Having successfully completed this course, you will be able to:

- communicate technical information in a written format, and to an agreed academic convention
- communicate technical information in a verbal format
- work collaboratively with others to achieve greater understanding of a technical issue and sustainable environment

Course Resources

Course Website(s)

- https://www.coursera.org/course/comnetworks
- https://class.stanford.edu/courses/Engineering/Networking/Winter2014/about
- http://ocw.mit.edu/courses/electrical-engineering-and-computer-science/6-829-computer-networks-fall-2002/

Required Course Texts and Materials

Data Communications and Networking, Behrouz Forouzan, 4th ed., McGraw-Hill, 2007.

Optional Course Texts and Materials

- Data and Computer Communication, William Stallings, 9th ed., Prentice-Hall 2011.

- Computer Networks, Andrew S. Tanenbaum, 5th ed., Prentice-Hall, 2011.
- Computer Networks and Internets, Douglas E. Comer, 5th ed., Prentice-Hall, 2008.

Assignments and Grading Scheme

Grading System

Letter grades will be awarded based on the following scale.
80-100%: A range (A+,A, A-)
70-80%: B range (B+, B, B-)
60-70%: C range (C+, C, C-)
50-60%: D range (D+, D)
Below 50%: F
These thresholds are not binding. We may lower the thresholds described here depending on the performance of the class. We will not raise the thresholds. We will give an approximate grade breakdown in the middle of the semester, but **you are responsible for keeping track of your own grades.** If you would like to appeal your grade on any of the assignments or exams, you may do so within **one week** of the assignment or exam being handed back. Your **entire** assignment or exam will be regarded and your grade may go up or down, or it may stay the same

Grading Policy

Assignments	25%
Class attendance/participation	5%
Midterm Exams	20%
Final Exam	50%
Total Points	**100**

Course Policies

Late Assignments

Assignments are due on the posted dates. There is a 20% deduction for late assignment. The deduction becomes 50% if the assignment is two days late. No credit is given after three days. Any exceptions must be arranged at least a day before the assignment is due.

Classroom Protocol

1. Students are expected to read the appropriate sections of the book before each lecture.
2. Please be considerate of your classmates during class.
3. Students are expected to show courtesy and respect toward their classmates.
4. Please come to class on time. If you are late more than 10 minutes then you are not allowed to enter the class.
5. Please make sure that your cellular phone does not interrupt during lecture time, and especially during test time.
6. Please do not carry on side discussions with other students during lecture time.
7. When you have a question, please raise your hand and ask the question so that everyone may benefit from it.

Dissability

Students with special needs should discuss their needs with instructor before the first class to allow for proper arrangements.

Important Dates to Remember

Midterm Exams [during week 9]
Final Exam [during week 16]
Project deadline [end of week 14]

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines
1		**Introduction to computer networks**
2		**Network protocols, architectures and applications.** **Assignment** The student should prepare a survey study for the positive and negative effects of networks on climate change and how it relates to networking applications and protocols.
3		**Networks Models**
4		**The Types of the Transmission Media**
5 +6		**Switching Circuits**
7+8		**Data Link Control** **Assignment** This is a programming assignment in which student should develop their own code to implement one of the data link layer protocols. The details of the assignment can be found on the course website
		MidTerm Exam
9+10		**Multiple Access**
11+12		**Connecting LANs, Backbone Networks and Virtual LANs**
13		**Network Layer: Logical Addressing**
14+15		**Vitual circuit switching :Frame Relay and ATM**

		Final Exam

Course Description/Overview

Education is the most effective means that society possesses for confronting the challenges of the future. Indeed, education continuously shapes and reshapes the world of tomorrow. As the world is

facing serious environmental problems that could threaten the existence of all mankind on earth, the course “teaching and learning for a sustainable world” comes to help teachers better prepare future generations on how to deal with various environmental problems and issues. It seeks to help them better understand the complexity of the world around us? How are the problems of our world interconnected, and what does that imply for their solution? What kind of world do we want for the future, within the limits of our Earth’s life support systems? How can we reconcile the requirements of economy, society, and the environment?

The course intends to strengthen teachers’ capacities to learn diverse ways to reorient their everyday classroom teaching and learning and address the global and local environmental concerns. The course adopts Inquiry-based learning approach as an overall guiding model of learning. Inquiry is most consistent with development of the skills for lifelong learning as it prepares learners to know what to do when the options before them are not clear. Inquiry approach is directed by questions that learners work together to address. Both process and products of learning are assessed.

Course Learning Objectives

Educating for a sustainable future is not so much about a destination as about the process of learning to make decisions that consider the long-term economy, ecology and equity of all communities. Its goal is to build an enduring society, which involves learning how to anticipate the consequences of our actions envision a sustainable future and create the steps needed to achieve the vision. Individuals and societies will perpetually have to make choices. How those choices are made and the information and ethical discernment used in making them will determine whether our visions of a sustainable future are achieved.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

- To develop an appreciation of the scope and purpose of educating for a sustainable future.
- To clarify concepts and themes related to sustainable development and how they can be

integrated in all subject areas across the school curriculum.

- To enhance skills for integrating issues of sustainability into a range of school subjects and classroom topics.
- To enhance skills for using a wide range of interactive and learner-centred teaching and learning strategies that underpin the knowledge, critical thinking, values and citizenship objectives implicit in reorienting education towards sustainable development.
- To encourage wider awareness of Information and Communication Technologies (ICTs), the potential of multimedia-based approaches to education and the potential of the Internet as a rich source of educational materials.
- To enhance skills in computer literacy and multimedia education.

Course Resources

Required Course Texts and Materials

Assignments and Grading Scheme

Grading Policy

Grades can be based on the following:

Assignments	20%
Exams	60
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than 6 classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites.
2-4		**Module 1: Introducing ESD**: An introduction to global realities, imperatives for sustainable development and educational issues that form the rationale for Educating for a Sustainable World. The topics that will be explored through this module are: • Exploring global realities • Understanding sustainable development • Reorienting education for a sustainable future
5-8		**Module 2: Sustainable Development across the Curriculum**: An overview of ways in which Educating for a Sustainable Future can be integrated into all areas of the curriculum. The topics that will be explored through this module are: • Sustainable futures across the curriculum • Learning Cycle as a model of inquiry teaching and learning

		• Supporting strategies to connect between instruction, assessment, and classroom management
9-12		**Module 3: Current Issues:** An illustration of how different curriculum themes may be reoriented to integrate an interdisciplinary emphasis on sustainable futures. The topics that will be explored through this module are: • Understanding world hunger • Population & development • Culture for a sustainable future • Women & sustainable development • Sustainable communities
13-16		**Module 4: Teaching & Learning Strategies**: Practical advices on using teaching and learning strategies that can help students achieve the wide range of knowledge, skill and values objectives of Education for Sustainable Development. The topics that will be explored through this module are: • Experiential learning • Storytelling • Inquiry learning • Future Problem Solving • Learning outside the classroom • Community Problem Solving

Course Modules

Course 1	**Introducing ESD**
Module 1.1	Exploring global realities
Key Concepts	ESD dimensions, interrelationships, empowering people
Overview	This module introduces some of the major issues – the global realities – that need to be addressed in building a sustainable future. As such, it serves as a foundation for the more in-depth studies in following modules. It also highlights the interdependence of these issues and how our daily lives, as

	inhabitants of the world, are related to social, economic and environmental processes. The module demonstrates that changes to the way resources are used are possible, that social and environmental problems can be solved, and that we have the collective capacity to overcome the many problems we face.
Learning Outcomes	At the end of this module learners will be able to: • To develop an understanding of the range of social, economic and environmental issues facing the world today • To develop an understanding of the interrelationships among these different types of issues • To recognise that education can play a key role in empowering people to work for a sustainable future.
Readings	Brown, L.R. *et al*. (Annual) *State of the World Report*, Worldwatch Institute, Washington DC. Reuters.com *State of the World* UN-HABITAT (Annual) *State of the World's Cities*, Earthscan Publications, London. United Nations Children's Fund (Annual) *State of the World's Children Report*, UNICEF, New York. United Nations Development Programme (Annual) *Human Development Report*, Oxford University Press, New York.

	United Nations Environment Programme (Annual) *UNEP Yearbook*, UNEP, Nairobi. United Nations Population Fund (Annual) *State of World Population*, United Nations Publications, New York. World Bank (Annual) *World Bank Development Report*, World Bank, Washington DC. World Bank (Annual) *World Bank Development Indicators*, World Bank, Washington DC. World Resources Institute, United Nations Environment Programme, United Nations Development Programme and World Bank (2008) *World Resources 2008*, Oxford University Press, New York.
Activities	1. Behind the news 2. Exploring the links 3. Acting locally 4. Strategic Questioning 5. Reflection

Module 1.2	Understanding sustainable development

Key Concepts	SD, interpretations of SD, approaches to SD
Overview	This module explores the emerging concept of 'sustainable development' which is now central to the programmes of many governments, businesses, educational institutions and non-government organisations around the world. The module takes an historical approach tracing the widening understanding of sustainable development from the 1980s up to the present day. This history includes landmark international events such as: the 1987 Brundtland Report, the 1992 Earth Summit in Rio de Janiero, the 1997 Rio+5 Conference and the 2000 Millennium Summit in New York, and the 2002 World Summit on Sustainable Development in Johannesburg. Much has been written in academic terms about the meaning of sustainable development and the need to integrate ecological and economic principles into personal and public decision-making. However, there is no agreed definition of the concept and perhaps there is no need for one. This is because sustainable development concerns a process of change and is heavily reliant upon local contexts, needs and interests. Thus, sustainable development is an 'emerging concept' in two ways, first, because it is relatively new and evolves as we learn to grasp its wide implications for all aspects of our lives, and, second, because its meanings emerge and evolve according to local contexts.
Learning Outcomes	At the end of this module learners will be able to: • To develop an understanding of the emerging concept of sustainable development; • To analyse the value base behind a range of different

	interpretations of sustainable development; • To appreciate the differences of approach to sustainable development in countries of the North and the South; and • To develop your own definition of sustainable development.
Readings	_____ (2000) Sustainability: Searching for Solutions, *New Internationalist*, 329, November Issue. AtKisson, A. (1999) *Believing Cassandra: An Optimist Looks at a Pessimist's World*, Chelsea Green, Vermont. Dresner, S. (2002) *The Principles of Sustainability*, Earthscan, London. (1996) *Our Ecological Footprint: Reducing Human Impact on the Earth*, New Society Publishers, Gabriola Island BC, Canada.

	World Commission on Environment and Development (1987) *Our Common Future*, Oxford University Press, Oxford.
Activities	1. What is sustainable development? 2. Dimensions of sustainable development 3. The Millennium Development Goals 4. The World Summit on Sustainable Development 5. The Earth Charter 6. Reflection

Module 1.3	Reorienting education for a sustainable future
Key Concepts	ESD, values, knowledge, skills, reorienting
Overview	Modules 1, 2 established a vision of education as a force for the future in developing the knowledge, commitment and skills needed to address the downward spiral of unsustainable development. This module builds on the ideas for reorienting education towards a sustainable future introduced in these earlier modules. The module reviews the development of the concept of Education for Sustainable Development and illustrates various strategies for reorienting education in the school sector as a key part of the broader process of building a sustainable future.
Learning	At the end of this module learners will be able to:

Outcomes	• To explore the holistic nature of the concepts of 'environment', 'sustainable futures' and 'education for sustainable development'; • To clarify the emerging concept of Education for Sustainable Development; • To appreciate the range of knowledge, value and skill objectives of Education for Sustainable Development; and • To understand the broad scope of actions needed to reorient Education for Sustainable Development.

Activities	1. An holistic vision 2. Education for Sustainable Development 3. Reorienting education 4. The objectives of education for a sustainable future 5. Reflection

Module 2	**Sustainable Development across the Curriculum**
Module 2.1	Sustainable futures across the curriculum
Key Concepts	Formal and information curriculum, interdisciplinary, reorienting
Overview	Education for Sustainable Development involves a comprehensive approach to educational reform. It extends beyond the boundaries of individual school subjects and requires the attention of teachers, educational administrators, planners and curriculum agencies. Integrating the objectives, concepts and learning experiences of Education for Sustainable Development into syllabuses and teaching programmes is an important part of such reform, indeed: A basic premise of education for sustainability is that just as there is a wholeness and interdependence to life in all its forms, so must there be a unity and wholeness to efforts to understand it and ensure its continuation. This calls for both interdisciplinary inquiry and action. It does not, of course, imply an end to work within traditional disciplines. A

	disciplinary focus is often helpful, even necessary, in allowing the depth of inquiry needed for major breakthroughs and discoveries.
Learning Outcomes	At the end of this module learners will be able to: • To appreciate the importance of both the formal and informal curriculum in promoting Education for Sustainable Development; • To understand ways in which general educational objectives, interdisciplinary teaching methods, different subjects and various celebrations in the school calendar may be used to help reorient the curriculum of a school towards sustainability; and • To promote across-the-curriculum approaches to Education for Sustainable Development.
Readings	Breiting, S. and Meyer, M. and Morgensen, F. (2005) *Quality Criteria for ESD-Schools: Guidelines to Enhance the Quality of Education for Sustainable Development*, EU-COMENIUS 3 network 'School Development through Environmental Education' (SEED). (Eds) (2006) *Creating Sustainable Environments in Our Schools*, Trentham Books, Stoke-on-Trent, Staffordshire.
Activities	1. What is the curriculum? 2. Interdisciplinary teaching and learning 3. Integrating through educational objectives 4. Infusing through learning experiences in all subject areas 5. Celebrations in the school calendar 6. Reflection

Module	Learning Cycle as a model of inquiry teaching and learning

2.2	
Key Concepts	Learning cycle, exploration, explanation, elaboration, evaluation
Overview	The Learning Cycle model has five phases: engagement, exploration, explanation, elaboration, and evaluation. In the engagement phase, teacher or a curriculum task accesses the learners' prior knowledge and helps them become engaged in a new concept through the use of short activities that promote curiosity and elicit prior knowledge. The activity should make connections between past and present learning experiences, expose prior conceptions, and organize students' thinking toward the learning outcomes of current activities. Exploration experiences provide students with a common base of activities within which current concepts (i.e., misconceptions), processes, and skills are identified and conceptual change is facilitated. Learners may complete lab activities that help them use prior knowledge to generate new ideas, explore questions and possibilities, and design and conduct a preliminary investigation. The explanation phase focuses students' attention on a particular aspect of their engagement and exploration experiences and provides opportunities to demonstrate their conceptual understanding, process skills, or behaviours. This phase also provides opportunities for teachers to directly introduce a concept, process, or skill. Learners explain their understanding of the concept. An explanation from the teacher or the curriculum may guide them toward a deeper understanding, which is a critical part of this phase. In the elaboration phase, teachers challenge and extend students' conceptual understanding and skills. Through new experiences, the students develop deeper and broader understanding, more information,

	and adequate skills. Students apply their understanding of the concept by conducting additional activities. The evaluation phase encourages students to assess their understanding and abilities and provides opportunities for teachers to evaluate student progress toward achieving the educational objectives.
Learning Outcomes	At the end of this module learners will be able to: • Know the 5 phases of the learning cycle and how to use them in designing their lessons. • Understand ways in which environment can be introduced in the lesson in the elaboration phase. • Promote across-the-curriculum the learning cycle approach to Education for Sustainable Development.

	strategy for enhancing the use of formal operational thought by beginning college physics students. *Dissertation Abstracts International* 38(7): 3903A.
Activities	1. Bernoli's principle. 2. Animal behaviour. 3. Water pollution. 4. E-Government.

Module 2.3	Supporting strategies to connect between instruction, assessment, and classroom management
Key Concepts	Techniques, constructivism, 21st century skills
Overview	This module builds on the previous module that introduced the 5 stages of learning cycle. During each stage of the learning cycle, teachers can utilize several strategies to guide their students' learning to examine their prior knowledge and conceptions. Once ideas are revealed, students have an opportunity to explore their ideas, arguing about and testing them in process. When students see that their existing ideas do not fully match their findings, a disequilibrium cognitive state result, which opens the door to the construction of new scientific ideas. When students reach the stage where they develop the formal scientific understandings and patterns of reasoning that help them make

	sense of phenomena being studied, they are encouraged to extend their learning and apply their ideas to a new situation or context (Keeley, 2008). Throughout the various stages of the learning cycle, teachers design and monitor instruction so that students become increasingly conscious of their own and others' ideas. They gain confidence in their ability to learn, apply concepts to new situations, and construct evidence-based argument (Lawson, 2000). Teachers orchestrate student learning in different ways at different stages, encouraging a classroom climate where ideas are openly generated and sufficient time is allowed for sense making and construction of new knowledge. All the while they are facilitating students' construction of new ideas, teachers are formatively assessing by monitoring students' changing conceptions and adapting their teaching and assessment strategies to match their students' needs.
Learning Outcomes	At the end of this module learners will be able to: • Know various classroom techniques that can be used to teach their lessons. • Design their lesson plans utilizing some of the classroom techniques they learned. • Investigate how each technique works and the educational advantage that each technique can offer.
Readings	• Keeley, P. (2008). *Science formative assessment: 75 Practical strategies for linking assessment, instruction, and learning*. California:

	Corwin Pres. • Lipton, L., & Wellman, B. (1998). *Pathways to understanding: Patterns and practices in the learning-focused classroom*. Sherman, CT: Mira Via. • Lord, T. & Orkwiszewski, T. (2006). Activities	1. Multiculturalism. 2. Electrical circuits.

Module 3	**Current Issues**
Module 3.1	Understanding world hunger
Key Concepts	Causes of hunger, population
Overview	The focus of the module is on the concept of 'food security' and strategies through which this may be attained. As such, the module acts as an introduction to the study of sustainable agriculture in Module 15. The new understanding about population discussed in Module 13 indicated that older traditional views about 'over-population' need to be reviewed. Uncritical

	views about overpopulation are often associated with images of 'famine', 'world hunger' and 'the starving millions'. While these images can be tragically real in times of severe drought, repression and war, they tend to create images of dependency that are not always correct. The relationship between hunger and population levels is not a simple one. For example, population densities in the Netherlands and Singapore are among the highest in the world but few people would say they are over-populated. As a result, many people are asking questions like "What criteria should be used to define overpopulation – and overpopulated in relation to what?" "Why are we growing food for export when local people are hungry?" These questions indicate that we need to take more account of the processes that cause hunger and famine. These processes are also explained in this module.
Learning Outcomes	At the end of this module learners will be able to: • To distinguish between the symptoms and the root causes of hunger and population pressure on food resources; • To better understand perspectives from the South on issues related to population, hunger and food security; and • To appreciate issues and dilemmas in teaching about population and hunger.

Activities	1. Hunger and malnutrition in the world 2. The root causes of hunger 3. Food First Fundamentals 4. Towards food security for all 5. Reflection

Module 3.2	Population & development
Key Concepts	Global Population Dynamics, human rights
Overview	The topic of Population and Development can be among the most difficult to teach. This is because population issues are related to so many other topics, such as demography, economics, urbanisation, gender, religion, politics, food and nutrition, health and human rights to name just a few. This can make it hard

	to decide where to start, and how to plan a balanced sequence of concepts and themes to match the developmental needs and interests of primary and secondary school students. Population and Development is also a sensitive topic to teach: it involves a consideration of family planning issues – and there are important religious and political views about this in many countries. Teachers also have personal views on these matters, and it is important to be aware of professionally ethical ways of teaching a sensitive topic such as Population and Development. One activity in the module on values education helps clarify appropriate principles for doing this.
Learning Outcomes	At the end of this module learners will be able to: • To recognise major trends and issues in global population dynamics; • To clarify the importance of population issues in relation to sustainable development; • To appreciate the significance of the 'new understanding' of the dynamic population-environment-development interrelationship; • To recognise the significance of gender and human rights in population issues; and • To identify challenges, opportunities and resources for teaching about Population and Development.
Readings	Brown, L., Gardner, G. and Halweilm, B. (1999) *Beyond Malthus: Nineteen*

	Dimensions of the Population Challenge, W.W. Norton, New York. Chapman, A., Morgan, R. Smith and Petersen, R. (eds) (1999) *Consumption, Population, and Sustainability : Perspectives from Science and Religion*, Island Press, Washington DC. GuzmÃ¡n, J.M., Martine, G., McGranahan, G., Schensul, D. and Tacoli, C. (2009) *Population Dynamics and Climate Change*, UNFPA and IIED. Lutz, W., Sanderson, W.C. and Scherbov, S. UNFPA (Annual) *The State of the World Population Annual Report*, United Nations Population Fund, New York. UNFPA and WEDO (2009) *Climate Change Connections. A Resource Kit on Climate, Population and Gender*.
Activities	1. Global population patterns and trends 2. Understanding population growth rates

	3. Population and sustainable development 4. A new understanding of population and development 5. Social development and human rights 6. Reflection

Module 3.3	Culture for a sustainable future
Key Concepts	Relationship between culture, religion and sustainable living
Overview	Our cultural values, which often include particular religious beliefs, shape our way of living and acting in the world. The principles for living sustainably that flow from these and other cultural and religious beliefs vary between groups and countries. They have also changed over time as circumstances demand. Despite this diversity, many principles for living sustainably are shared, not only among indigenous peoples, but also between different religious traditions. This module explores the role of culture and religion in providing guidance on ways of living sustainably. It also provides activities which analyse the place of these themes in the school curriculum.
Learning Outcomes	At the end of this module learners will be able to: • To develop an understanding of the relationship between culture, religion and sustainable living;

	• To explore the principles for sustainable living encouraged in a chosen religion and in a case study from Nepal; • To analyse the relevance and applicability of principles of sustainable living in the Nepal case study; and • To encourage reflection on the contribution of religious education in Education for Sustainable Development.

(eds) (2000) • Confucianism – Tucker, M.E. and Berthrong, J. (eds) (1998) • Daoism – Girardot, N.J., Xiaogan, L. and Miller, J. (eds) (2001) • Hinduism – Chapple, C.K. and Tucker, M.E. (eds) (2000) • Indigenous Traditions – Grim, J. (ed) (2001) • Islam – Foltz, R., Denny, F. and Baharuddin, A. (eds) (2003) • Jainism – Chapple, C.K. (ed) (2002) • Judaism – Tirosh-Samuelson, H. (ed) (2002) • Shinto – Bernard, R. (ed) (2004)
Activities	1. Defining religion and culture 2. Values and principles 3. A case study: Annapurna, Nepal 4. Culture and development 5. Reflection

Module 4	**Teaching & Learning Strategies**
Module 4.1	Experiential learning
Key Concepts	student-centred learning, teaching through experiential approaches
Overview	At the heart of all learning is the way we process our experiences, especially our critical reflections on our experiences. This module introduces experiential education as a key approach to student-centred learning for a sustainable future. Experiential learning engages students in critical thinking, problem solving and decision making in contexts that are personally relevant to them. This approach to learning also involves making opportunities for debriefing and consolidation of ideas and skills through feedback, reflection, and the application of the ideas and skills to new situations.
Learning Outcomes	At the end of this module learners will be able to: • To appreciate the value of student-centred experiential learning; • To analyse the elements of experiential learning; • To develop guidelines for teaching through experiential approaches; and • To relate experiential learning to education for sustainable futures.
Readings	Baker, A.C., Jensen, P.J. and Kolb, D.A. (2002) *Conversational learning: an experiential approach to knowledge creation*, Greenwood Publishing Group. Beard, C. and Wilson, J.P. (eds) (2002) *The power of experiential learning: a*

Whitaker, P. (1995) *Managing to Learn: Aspects of Reflecting and Experiential*

	Learning in Schools, Cassell, London.
Activities	1. Characteristics of experiential learning 2. The experiential learning process 3. Analysing the experiential learning process 4. Understanding the importance of debriefing 5. Reflection

Module 4.2	Storytelling
Key Concepts	Story appreciations, locating and telling stories
Overview	Everyone loves a good story – especially the young people we teach. In fact, being able to tell a story in an interesting and compelling way is an important teaching skill. This is because a good story is not only entertaining but is capable of holding student attention while they learn important concepts, attitudes and skills. In her book, *Earthtales: Storytelling in Times of Change*, Alida Gersie (1992) notes that storytelling relates to current concerns about our future because most stories focus on the Earth, how it was created, and the problems that can arise when we forget the importance of living in harmony with it and each other.
Learning Outcomes	At the end of this module learners will be able to: • To develop an appreciation of stories as educational resources,

	especially as sources of teaching themes that support Education for Sustainable Developments; • To develop skills in locating and telling stories as part of a teaching programme; and • To develop strategies for integrating storytelling approaches into teaching units to achieve the objectives of Education for Sustainable Development.
Readings	Atherton J.S. (2009) Learning and Teaching – Stories, tales and myths in teaching [On-line], UK. Beddes, R. and Johnson C. (2008) *Storytelling: storytelling for children aged 2 to 5*, User Friendly Resources. Wright, A. (1995) *Storytelling with children*, Oxford University Press.
Activities	1. Telling a story 2. The value of stories 3. Finding and telling good stories 4. Using indigenous stories 5. Using success stories 6. Reflection

Module 4.3	Inquiry learning
Key Concepts	Inquiry based learning, planning skills
Overview	The development of thinking and problem solving skills is an important objective of Education for Sustainable Development, especially given the urgency of problems facing the world today. These skills can be taught and enhanced through enquiry learning. Enquiry learning is a learner-centred approach that emphasises higher order thinking skills. It may take several forms, including analysis, problem solving, discovery and creative activities, both in the classroom and the community. Most importantly, in enquiry learning students are responsible for processing the data they are working with in order to reach their own conclusions. This module clarifies the characteristics of enquiry learning and illustrates strategies for teaching through enquiry-based approaches.
Learning Outcomes	At the end of this module learners will be able to: • To develop an understanding of enquiry-based teaching and learning strategies; • To develop skills in planning for enquiry-based learning; and • To illustrate ways of evaluating enquiry-based teaching and learning.

Activities	1. A spinning world 2. Recognising enquiry-based learning 3. Mapping Pollution: An example of enquiry learning 4. A model for enquiry learning 5. Reflection

Module 4.4	Future Problem Solving
Key Concepts	futures perspective, Future Problem Solving strategy
Overview	Future Problem Solving is a strategy for helping students develop skills for analysing a problem. Working through a six step process can help them decide – from a futures perspective – what should be done about a problem. The six steps are: • Identifying possible causes and effects of a problem • Identifying the underlying problem • Brainstorming potential solutions • Developing criteria for evaluating solutions • Evaluating all solutions to determine the best one • Developing an action plan As well as developing problem solving skills, this teaching strategy also helps students to develop an interest in the future and improve their research, group

	work and communication skills. The problem chosen to illustrate the Future Problem Solving strategy in this module is waste management, a problem that is becoming increasingly serious because the amount of waste is growing all around the world. Solutions to the problems of both solid and chemical waste are considered in this module.
Learning Outcomes	At the end of this module learners will be able to: • To appreciate the importance of integrating a futures perspective • To develop expertise in using Future Problem Solving as a teaching strategy • To plan ways of using the Future Problem Solving strategy when teaching other topics
Readings	_____ (1997) Trash – Heaps of Trouble, *New Internationalist*, No. 295. _____ (1999) Hazardous Waste, *Our Planet*, No. 104. Barrett,T., MacLabhrainn, I. and Fallon, H. Activities	1. Fantasy voyage 2. Waste problems 3. Future Problem Solving 4. Reflectionhttp://www.unesco.org/education/tlsf/mods/theme_d/mod23.html?panel=5 - top

Module 4.5	Learning outside the classroom
Key Concepts	risk management, strategies for teaching and learning outside the classroom
Overview	This module provides examples of ways that learning outside the classroom can be used to facilitate Education for Sustainable Development. This includes short visits into the school grounds and local community, as well as visits to farms, factories, offices, neighbourhood science centres and natural settings such as a forest, a beach or a national park. Providing students with high quality learning activities in relevant situations

	beyond the walls of the classroom is vital for helping students appreciate their first hand experiences from a variety of different perspectives. Experiences outside the classroom also enhances learning by providing students with opportunities to practice skills of enquiry, values analysis and clarification and problem solving in everyday situations. However, taking students outside the classroom requires careful planning of the learning activities and attention to the health and safety risks that might be faced. This module provides guidance on these aspects of planning for learning outside the classroom.
Learning Outcomes	At the end of this module learners will be able to: • To develop an awareness of the positive impact that experiences outside the classroom can have on Education for Sustainable Development; • To develop an understanding of the planning, organisation and risk management required for teaching and learning outside the classroom; and • To identify appropriate strategies for teaching and learning outside the classroom.
Readings	_____ (2000) Focus on Fieldwork: Special Issue, *Teaching Geography*, 25(2). Department for Education and Employment (1998) *Health and Safety of Pupils on Educational Visits*, HMSO, London. Department for Education and Skills (2006) Learning Outside the Classroom

Activities	1. Learning in the local area 2. Approaches to learning outside the classroom 3. Planning for learning outside the classroom 4. Risk management 5. Reflectionhttp://www.unesco.org/education/tlsf/mods/theme_d/mod23.html?panel=5 - top

Module 4.6	Community Problem Solving
Key Concepts	Community Problem Solving, learning strategies
Overview	This module introduces Community Problem Solving as a teaching and learning strategy. As such, it is the 'practical' application module that builds on the ideas for citizenship education developed in Module 7. It also draws on the ideas about experiential, enquiry and values education, Future Problem Solving and learning outside the classroom in other modules. Community Problem Solving provides students with an opportunity to practice the skills that are needed to participate in finding solutions to the local issues that concern them. This helps to develop the important citizenship objectives of learning for a sustainable future and integrates skills – for both students and teachers – of using experiential and enquiry-based strategies. It also integrates skills in the planning of values clarification and values analysis with the possible solutions so students can take action to help achieve a sustainable future.
Learning Outcomes	At the end of this module learners will be able to: • To develop an understanding of Community Problem Solving, especially as it may be used in education for sustainable futures. • To identify the skills students need to participate in Community Problem Solving. • To explore questions and issues that may be encountered when

	teaching through Community Problem Solving. • To identify teaching and learning strategies that may be used as part of a Community Problem Solving project.
Readings	Barrett,T., MacLabhrainn, I. and Fallon, H. (eds) (2005) *Handbook of Enquiry and Problem-based Learning. Course Syllabus

Course No.: (107751)
No. of credit hours: 3
Sustainable Development in the Arab World
Hashemite University, Faculty of Arts, Department of Humanities & Social Sciences,
Fall Semester, 2014-2015

Instructor Information

Instructor: Dr. Yahya A. Ali
Office Location: Arts 307
Telephone: Ext. 4453
Office Hours: Thu, 11-1PM & by appointment
E-mail: ykali@hu.edu.jo
Website:

Course Description/Overview:

This course reviews the concept of sustainable development including the three pillars of sustainable development: economic, environmental and social aspects. The course focuses on the basic concepts of economic development based on the assessment of the cost and benefit, and its practical application. Moreover, the course examines the role of individuals, governments, and the public and private sectors in addition to the multilateral donor institutions. The determinants of activation models of sustainable development will be specified and discussed. The course focuses on issues of sustainable development in the Arab world, including population, sustainable consumption, institutional response and growth management.

Course Learning Objectives

This course aims to achieve the following objectives:
1. identify the economic and social indicators for sustainable development
2. identify some of the terminology used in this area and its implications.
3. study and analyze the strategies of sustainable development.
4. recognize the importance of sustainable development in the Arab World.
5. determine the impacts of population and natural resources on the development process.
6. identify practical ways to achieve sustainable development.

Course requirements:
1. Submit a research paper discusses and analyzes a topic chosen by the student within the main themes of the course in coordination with the instructor.
The student has to submit a proposal of his research paper in the fourth week of the season.

A date will be set to view the paper during the last two weeks of the season.
2. There will be a discussion and analysis of a topic from the course's topics by two students every week and this activity will be clarified in the class. The results of the discussion and analysis should be submitted the day before the date of the next class.
3. Participation and debate is an essential part in the evaluation.

Course content:

Week	**Topic**
1 & 2	• Introduction and organization of work throughout the semester • A general introduction on sustainable development
3	• Concepts and terminology • Environmental challenges and their influence in Arab countries • Challenges of economic security • Occupation and military intervention and its impact on humans and the environment • Energy, water, population, natural resources and development
4	• Presentations of proposals
5	• Development and environment
6	• Security and development
7	• Globalization and sustainable development
8	• Strategies of sustainable development
9	• Economic and social indicators of sustainable development

10	• The need for sustainable development in the Arab countries
11	• Biodiversity, ozone layer, climate change
12	• Solid waste and hazardous waste
13	• Environmental Impact Assessment and Environmental Management
14	• Media and environmental awareness
15	• Research paper presentation
16	• Research paper presentation

Evaluation:

Course work	%
Research paper	30
Weekly commentaries	20
Participation	10
Final Exam	40
Total	100

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than 2 classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 10% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course	Environmental Spatial and Temporal Variability
Module 1	**Regionalized variable**
Key Concepts	Spatial and temporal variability
Overview	Students are asked to distinguish between non-regionalized and regionalized

	variables. Question raise upon why environmental properties vary from space to another and with time? And how can we estimate these variations? Is there a concept governing their variance? Is it booming independence of time and space? What are the nature and governing forces that may lead to such variabilities? The group discussions will let understand the various types of existing variables and how to characterize and explore these variables. However, the word "curriculum" means more things.
Aim	The overriding aim of this module is to improve student's capability to understand various terminologies used for regionalized variables and the theories behind their existence. Students should be able to provide tools to characters these variabilites depending on variable type using various tests and hypotheses.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different types of regionalized variables. • Capable to characterise any variable using measures of central tendency, measures of dispersion, measures of shape, outliers, probability distributions, and test of normality.
Units	Unit 1.1: Theories of Statistics, Unit 1.2: Observations and variables, Unit 1.3: Data presentation of one variable, two variables, three variables, and Unit 1.4: Regionalized variables. Unit 1.5: Population and sampling theory. Unit 1.6: measures of central tendency, dispersion, and shape. Unit 1.7: Identification of outliers and testing of normality.
Readings	1. Donald Nielsen. 2003. Spatial and Temporal Statistics. Sampling Field Soils and Their Vegetation. GeoEcology, Germany. 2. John C. Davis. 2002. Statistics and data analysis in geology. Wiley, John & Sons, Incorporated.
Activity	**Overview**

	Assignment 1.2: Reflect on statistical theory 1. Provide ten examples on each type of variables within a class room? 2. How can you determine the type of presentation required? (3-4 paragraphs). 3. What your opinion about the following statement “discoveries are always made from outliers”. Assignment 1.2: Practical application using the provided set of data. Test the normality of the system? What is the measures of central tendency suggests in this data? Can you find any outlier within the set of data? If the outlier was neglected, can you state the normality status.
Module 2	**Data Exploration and Mining**
Key Concepts	Spatial and temporal Modeling

Overview	Students are introduced to varous avialable modeling techniques starting from simple linear regression, curve fitting, advance data mining technqiues (e.g. decision trees, multi-linear models, screening, partitionning, cluster, and artificial neural netowrk). Question raised is why there are many models available in nature? Does the existance of each entitiy (its growth or decay) varies by entity type? Or its interaction with nature is different? Questions raised in terms of how can we decide which model is the most appropriate. In answers to these questions, students are introduced to conept of model capability in terms of root mean square error (RMSE), coefficient of determination, and the confidence interval of current and future predictions. The choose of best model will initially depend on the data type and category followed by best model capability of prediction.
Aim	The overriding aim of this module is to provide advance modelling techniques that is used internationally to predict current and future magnitudes and trends in nature.
Learning Outcomes	At the end of this module learners will be able to: • Explore most familiar models used in statistics. • Understand the nature of each model category and the benefit of each model. • Improve their computer skills using advance modelling programs as JMP from SAS.
Units	Unit 2.1: regression model analyses. Unit 2.2: curve (non-linear) fitting. Unit 2.3: advance data mining technqiues Unit 2.4 The prediction capability Unit 2.5 Selection of best model

Readings	1. Donald Nielsen. 2003. Spatial and Temporal Statistics. Sampling Field Soils and Their Vegetation. GeoEcology, Germany. 2. Hands-out prepared by the instructor for the class 3. JMP help file, 2008. SAS, USA.
Activity	**Overview**
	Assignment 2.1: Improving skills using attached set of data: 1. test of all of the following models for the set of data; simple linear regression, curve fitting, advance data mining technqiues (e.g. decision trees, multi-linear models, screening, partitionning, cluster, and artificial neural netowrk). 2. Conduct testing for the model prediction capability? What can you interfere? 3. IF you have to choose between these models, which model you will select and why? 4. If the modeler is interested in simple modeling, can you decide what are the limitations of the application of such model? Assignment 2.2: Compare the models introduced in this course with other models in literature and/or within different faculties. What do you suggest? Do you think most applied models are linear or non-linear, and why?
Module 3	**Spatial and temporal modeling and interpolation**
Key Concepts	**Autocorrelogram and semivariogram, estimation and interpolation, IWD, Kriging, ARIMA.**

Overview	Students are introduced in distinguishing between correlation and semivariance, taking into account the variation with distance. Students are also introduced on how to characterize a regionalized variable. Questions raised are how many Autocorrelograms and variograms exist in nature? Do these tools provide indication of environmental facotrs governing the distribution of the tested property? Practical application will demonstrate various spatial characterization of actual tested properties in the country. Similarly, students are questioned on how to quantify the spatial extent of the property in nature prom known measured points to estimate non-measured points. In a group discussion, students will encage in various theories and practical applications of each interpolation techniques and questions raised on the limitation of each theory. Theories of weighting factors, corner point technique, inverse distance technique, variogram weighting factor technique, punctual kriging, block kriging, universal kriging, indicator kriging, practical examples. If a temporal variable is used, can these variables be tested as spatial or regionalized variables? How can we test temporal variables? Students are engagaed in new terminologies of time scale variability, choosing the best fit, ARIMA, Seasonal ARIMA, with temporal applications of actual data sets. Questions may raise the difficulty to have a property that is both spatial and temporally variable. How can we test and predict such a variable? Is there any model that incorporate regionalized and temporal variables?
Aim	This module aims to have advance understand of modelling of both regionalized and temporal variables. Characterizing the nature governing their spatial and temporal distribution and theories for quantification the magnitude of existence using advance interpolation and extrapolation techniques.

Learning Outcomes	At the end of this module learners will be able to: • Distinguish between regionalized and temporal variables • Characterize the spatial dependence and direction of influence of spatial property. • Able to define best semivariogram model that govern its spatial behaviour. • Determine the best theory to interpolate and extrapolate the magnitude of existence. • Predict the temporal variability of a property with emphasis of future prediction.
Units	Unit 3.1: Autocorrelation analysis Unit 3.2: Autocorrelation and correlograms Unit 3.3: Estimation, interpolation and extrapolation Unit 3.4: Temporal Analyses and ARIMA. Unit 3.5: Importance of spatial and temporal prediction as a EIA tool.
Readings	1. Donald Nielsen. 2003. Spatial and Temporal Statistics. Sampling Field Soils and Their Vegetation. GeoEcology, Germany. 2. Isobel Clark. Practical Geostatisitcs. 3. John C. Davis. 2002. Statistics and data analysis in geology. Wiley, John & Sons, Incorporated. 4. Wellmer, F.W. 1998. Statistical Evaluations in Exploration for Mineral Deposits. Springer, Berlin. 5. Soil Science Society of America (SSSA). 1996. Applications of GIS to the Modeling of Non-Point Source Pollutants in the Vadose Zone. Special Publication Number 48. Madison, Wisconsin, USA.
Activity	**Overview** Assignment 3.1: Practical applications for environmental pollution for both land and groundwater from several point and non-point sources. 1. Using the attached data, can you characterize the spatial and temporal

	extent and behavior of the pollution in the study area? 2. Can you decide what factors that may cause such spatial distribution? 3. Using appropriate interpolation techniques, can you estimate the extent of the pollution at the basin? And how can you control such pollution? *4.* In term of pollution reserve calculation, can you predict various scenarios if adaptive plans are used? Assignment 3.2: Environmental sustainability Can you provide at least 4 national and international studies that implies the use of spatial and temporal modeling for EIA and Environmental sustainability? Discuss the theories used by each case, from your stand point can you define he advantages and weaknesses of the models used?
Module 4	**Climate Change and Modeling**
Key Concepts	climate change impacts, vulnerability assessment, and future prediction for strategic planning
Overview	Worldwide, climate change is consider one of the major threat that may affect a country with risks degrees varies spatially and temporally according to human abuse of nature. Students are initially overviewed of Climate Change Variability with emphasis on actual evidences. Questions raised on how the GHGs may interact with any environmental property on earth? How can we test the effect of these gases on climatic variability? What are the expected impacts of climate change and how it vary from one place to another? In accordance to above, students are introduced to IPCC and UNFCCC and associated protocols and COP meetings. The students are introduced to all national communication reports issued to the context of UNFCCC. Students are viewed with climate change modelling Techniques, Climate Models and their Evaluation, Global and Regional Climate Projections, and Applications in Climate Change Modelling. Questions raised on how these models vary from introduced models? What are the uncertenity levels

	associated with these models and how can why reduce these assocatiated errors?, In addition, in a group discussion, students are allowed to integrate the knowledge of all management practices taken over other classes to provide several adaptation and Mitigation of Climate Change. Question raised on how can we deiced on which measure to use? IS there a criteria applicable for BMP. And finally, how do these models and prediction as a decision tools can be useful for Capacity Development for Innovation, formulating legislations and policies, and how can they be integrated into strategic planning and action plans that ensures sustainable environmental development of the country?
Aim	This module aims to understand the capability of the modelling concepts to derive adaptation and mitigation plans and formulation into policies and strategies based on sustainability issues.
Learning Outcomes	At the end of this module learners will be able to: • Understand the science behind the climate change and weather variability. • Able to define and prioritize adaptation and mitigation measures based on existing impacts. • Able to use the modelling concept to have a decision tools for future scenarios that govern the existing historic variability. • Capable to formulate according to climatic scenarios and adaptation scenarios the appropriate strategic planning for sustainable development.
Units	Unit 4.1: Overview of Climate Change Variability *Unit 4.2:* Climate change Impacts Unit 4.3: climate change modelling Techniques Unit 4.4: Global and Regional Climate Projections Unit 4.5: Adaptation and Mitigation of Climate Change, Unit 4.6: Capacity Development and strategic maninstreamin.

National Strategy And Action Plan To Combat Desertification (2006). The Hashemite Kingdom Of Jordan, Ministry OF ENVIRONMENT. http://ag.arizona.edu/oals/IALC/jordansoils/_html/NAP.pdf
Activity	**Overview** *Assignment 4.1: Taking Climate Change Threat Seriously* 25. Looking over 1st and 2nd national communications to climate change to UNFCCC, can you define what are the degree of uncertainty associated in applied models used to derive future scenarios and predictions? 26. If RCM are used instead of GCM, how do you think the adaptation plans might be changed? 27. Test another parameter that wasn't introduced in these communications, can you suggest better recommendations? 28. Looking over desertification in Jordan, can you suggest s synergetic themes between climate change and desertification adaptation and mitigation options? Looking over 1st communication of Jordan to UNCD and the strategic plan, can you reference the modelling categories

used? And how can you improve these models?

Assignment 4.2: Practical application from current weather data to set future 3rd national communication.

1. Use the available data to interpret the extent of spatial and temporal variability of weather data to inform about possible impacts of climate change on various sectors (agriculture, water, energy, transportation, health, etc).
2. IF RCM is used following IPCC 2013, can you determine best adaptation and mitigation plans (look at attached pdf files)?
3. How can formulate the national climate change policy into effective strategic plan taking further step in what is called NAPA?

Course Syllabus

Course Number: 111202411
Environmental Spatial and Temporal Variability

The Hashemite University, Faculty of Natural Resources and Environment,
Department of Land Management and Environment,
Spring Semester, 2014-2015

Instructor Information

Instructor:	Dr. Mohammed Ibrahim Al-Qinna
Office Location:	Geological Building, 110
Telephone:	Office +962 5 3903333 Ext. 5122
Office Hours:	Tuesday 14.30- 17.00, Wednsday 14.00 – 16.00
E-mail:	Qinna@hu.edu.jo
Website:	http://staff.hu.edu.jo/qinna

Course Identification

Course Number:	111202411
Course Name:	Environmental Spatial and Temporal Variability
Course Location:	University Campus
Class Times:	Sunday and Tuesday 12:00pm – 13:00pm
Prerequisites:	Environmental Science (111203231) and GIS (111203243)
Faculty Web Page:	http://www.hu.edu.jo

Course Description/Overview

The course aims to introduce students to the concept of regionalized variables and the available international modelling approaches used to quantify these variabilities. In addition, the course aims in educating the students with the concept of interpolation using kriging techniques and future prediction using advance mathematical modelling techniques as ARIMA.

The course also aims to educate and train students on the cabailities of the spatial and temporal models to be implemented as an environmental impact assessment technqiue to any risk that may threat either natural or human entities. With emphasis on policy oriented research, the course aims in providing various skills to ensure proper land, water, and environmental management planning and sustainable development through practical applications for various measures obtained from governmental and research institutional units.

In order to increase the awareness of the students of the climate change threats to the fragile environmental systems of the country (including land, water, and biodiversity), the course concentrate on climate change and overviews the climatic variability in all its associated components providing evidencing of climate variability. also, the section overviews the capability of the spatial and temporal modelling to access climate change impacts (e.g. drought, floods, etc), to estimate the vulnerability of the targeted systems, and to provide adaptation and mitigation options and measures that facilitate further sustainable development of the country towards equitable climate-compatibility.

Final section focuses on importance of modeling in mainstreaming policies and strategies at both national and international levels with issues related to climate change and sustainable human development. Finally, the course provides analysis and interpretation of large-scale variability and observed climate change, identifying trend analyses and description of atmosphere Behavior with overviews of numerical modeling and numerical weather prediction as GCM, RCM, stochastic models, and downscaling. Using participatory techniques, such as focus group discussions and individual interviews students are involved in gathering and identifying further challenges, limitations, obstacles and barriers to achieve the sustainability of the country various natural systems.

Course Learning Objectives

The overarching goals of this course are: a) to provide several approaches to model, estimate, and predict future spatial and temporal variability using simple and advanced statistical and data mining techniques; b) raise awareness of the students on climate change vulnerability and the capability of spatial and temporal models for future planning, sustainable management, and strategic development; and c) use available statistical tools to conduct environmental impact assessments for any system, and to identify and quantify threats, risks and constrains allocated within the environmental entity.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

60. Distinguish between statistical methodologies and approaches to analyse the regionalized variable spatially and temporally based on the data types.
61. Use the available softwares to derive and conduct environmental impact assessment for any system, and to quantify threats, risks and constrains allocated within the environmental entity.
62. Improve intellectual and practical skills through practical applications of actual national and international case studies.
63. Improve the awareness of the modelling and its vital role in estimating the impacts and vulnerability assessments of the system for climate change threats.
64. Improve and broaden students knowledge towards the importance of spatial tools to mainstream climate change policy and strategy

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following:

First Hour Exam	10%
Second Hour Exam	10%
Laboratory	15%
Assignments	10
Final Hour Exam	50%
Total	100

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Topics	*Week*
Introduction Theories of Statistics, observations, variables, data presentation, one variable, two variables, three variables, regionalized variables.	1

Data Exploration Introduction, population and sampling theory, concepts and types of variables, measures of central tendency, measures of dispersion, measures of shape, outliers, probability distributions, test of normality.	2
Data Analyses Introduction, regression model analyses, curve fitting, criteria for choosing the "best fit", nonlinear estimation, advance data mining technqiues, practical examples.	3-4
Correlogram and Semi-variogram Autocorrelation analysis, idealized correlograms, correlation length, correlation shape, Moran I test, Fundamental principle of semi-variance, semi-variogram analysis and its components, semi-variograms models, practical applications.	5-6
The Volume-Variance Relationship Regularization, semivariograms for core samples, volume variance calculations, grade/tonnage curves, applications.	7-8
Estimation, interpolation and extrapolation Introduction to the weighting factors, corner point technique, inverse distance technique, variogram weighting factor technique, punctual kriging, block kriging, universal kriging, indicator kriging, practical examples.	9-10
Temporal Analysis Definition of time scale variability, choosing the best fit, ARIMA, Seasonal ARIMA, practical applications.	10-11

Climate Change and Modeling Overview of Climate Change Variability, Climate change Impacts, climate change modelling Techniques, Climate Models and their Evaluation, Global and Regional Climate Projections, Applications in Climate Change Modelling, Adaptation and Mitigation of Climate Change, Capacity Development for Innovation, practical applications using local and international case studies.	16

Course Description/Overview

The course aims to introduce students to the concept of regionalized variables and the available international modelling approaches used to quantify these variabilities. In addition, the course aims in educating the students with the concept of interpolation using kriging techniques and future prediction using advance mathematical modelling techniques as ARIMA.

The course also aims to educate and train students on the cabailities of the spatial and temporal models to be implemented as an environmental impact assessment technqiue to any risk that may threat either natural or human entities. With emphasis on policy oriented research, the course aims in providing various skills to ensure proper land, water, and environmental management planning and sustainable development through practical applications for various measures obtained from governmental and research institutional units.

In order to increase the awareness of the students of the climate change threats to the fragile environmental systems of the country (including land, water, and biodiversity), the course concentrate on climate change and overviews the climatic variability in all its associated components providing evidencing of climate variability. also, the section overviews the capability of the spatial and temporal modelling to access climate change impacts (e.g. drought, floods, etc), to estimate the vulnerability of the targeted systems, and to provide adaptation and mitigation options and measures that facilitate further sustainable development of the country towards

equitable climate-compatibility.

Final section focuses on importance of modeling in mainstreaming policies and strategies at both national and international levels with issues related to climate change and sustainable human development. Finally, the course provides analysis and interpretation of large-scale variability and observed climate change, identifying trend analyses and description of atmosphere Behavior with overviews of numerical modeling and numerical weather prediction as GCM, RCM, stochastic models, and downscaling. Using participatory techniques, such as focus group discussions and individual interviews students are involved in gathering and identifying further challenges, limitations, obstacles and barriers to achieve the sustainability of the country various natural systems.

Course Learning Objectives

The overarching goals of this course are: a) to provide several approaches to model, estimate, and predict future spatial and temporal variability using simple and advanced statistical and data mining techniques; b) raise awareness of the students on climate change vulnerability and the capability of spatial and temporal models for future planning, sustainable management, and strategic development; and c) use available statistical tools to conduct environmental impact assessments for any system, and to identify and quantify threats, risks and constrains allocated within the environmental entity.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

65. Distinguish between statistical methodologies and approaches to analyse the regionalized variable spatially and temporally based on the data types.
66. Use the available softwares to derive and conduct environmental impact assessment for any system, and to quantify threats, risks and constrains allocated within the environmental

entity.

67. Improve intellectual and practical skills through practical applications of actual national and international case studies.
68. Improve the awareness of the modelling and its vital role in estimating the impacts and vulnerability assessments of the system for climate change threats.
69. Improve and broaden students knowledge towards the importance of spatial tools to mainstream climate change policy and strategy

Assignments and Grading Scheme

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following:

First Hour Exam	10%
Second Hour Exam	10%
Laboratory	15%
Assignments	10
Final Hour Exam	50%
Total	100

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Topics	*Week*
Introduction Theories of Statistics, observations, variables, data presentation, one variable, two variables, three variables, regionalized variables.	1
Data Exploration Introduction, population and sampling theory, concepts and types of variables, measures of central tendency, measures of dispersion, measures of shape, outliers, probability distributions, test of normality.	2

Data Analyses Introduction, regression model analyses, curve fitting, criteria for choosing the "best fit", nonlinear estimation, advance data mining technqiues, practical examples.	3-4
Correlogram and Semi-variogram Autocorrelation analysis, idealized correlograms, correlation length, correlation shape, Moran I test, Fundamental principle of semi-variance, semi-variogram analysis and its components, semi-variograms models, practical applications.	5-6
The Volume-Variance Relationship Regularization, semivariograms for core samples, volume variance calculations, grade/tonnage curves, applications.	7-8
Estimation, interpolation and extrapolation Introduction to the weighting factors, corner point technique, inverse distance technique, variogram weighting factor technique, punctual kriging, block kriging, universal kriging, indicator kriging, practical examples.	9-10
Temporal Analysis Definition of time scale variability, choosing the best fit, ARIMA, Seasonal ARIMA, applications	10-11
Climate change Overview of Climate Change Variability, Climate change Impacts, climate change modelling Techniques, Climate Models and their Evaluation, Global and Regional Climate Projections, Applications in Climate Change Modelling, Adaptation and Mitigation of Climate Change, Capacity Development for	16

Innovation, practical applications using local and international case studies.	

Course	**Multimedia programming**
Module 1	Course overview
Key Concepts	What is Multimedia, Defining multimedia, Types of multimedia, Multimedia requirements, Delivering and Using Multimedia, Where to use multimedia
Overview	This module will provide a general introduction to multimedia. There will be a focus on the opportunities that the multimedia provides. This module will also explain how multimedia will be used to address none technological concepts such as climate change.
Aim	The overriding aim of this module is to turn students able to understand what is multimedia and what its strengths and limitations.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the strengths and limitations of multimedia • Discuss how technology can contribute to sustainability
Units	Unit 1.1 Defining multimedia Unit 1.2: Types of multimedia Unit 1.3: Delivering and Using Multimedia Unit 1.4: Where to use multimedia
Readings	
Activity	**Overview** Reflecting Upon the use of multimedia to address climate change in Jordan, and globally.

Module 2	**making multimedia**
Key Concepts	The Stages of a Project, Hardware, Software, Delivery vehicles, Creativity, Organization
Overview	In this module the different stages of a multimedia project is explained and discussed. The needed hardware and software to develop the project is also discussed. Then the importance of creativity and organizational skills are presented
Aim	The aim of this module is to Enhances understandings of the processes and practices of developing a multimedia project
Learning Outcomes	At the end of this module learners will be able to: • Understand the stages of a multimedia project • Understand the processes of making a multimedia project and its requirments
Units	Unit 2.1: Stages of a Project. Unit 2.2: Hardware, Software tools. Unit 2.3: Delivery vehicles Unit 2.4: Organizational and creativity skills
Readings	
Activity	Discuss the stages of a multimedia project about climate change
Module 3	**Multimedia Skills**

Key Concepts	Members of a Multimedia Team
Overview	Who are Multimedia Developers? Members of a Multimedia Team, Project manager, Multimedia designer, Interface designer, Writer, Video specialist, Audio specialist, Multimedia programmer, Producer of multimedia for the Web, Team building
Aim	This module aims at identifying the various skills that the multimedia project team should hold.
Learning Outcomes	At the end of this module learners will be able to: • Be able to identify different skills needed for a project
Units	Unit 3.1: Members of a Multimedia Team *Unit 3.2:* Project manager Unit 3.3: *Designers* Unit 3.4: Video specialist, Audio specialist Unit 3.5: Producer of multimedia for the Web
Readings	
Activity	**Overview** *Assignment 0: building a team an choosing a topic* Form a group of 3-4 students. Choose a project and write the plane in accordance of the team skills to achieve it. [End of the week] This term project will be about climate change This assignment will be described in a paper (maximum 2 pages) comprised of the climate change topic description.

Module 4	Text
Key Concepts	Using Text in Multimedia
Overview	Using Text, Using Text in Multimedia, Designing with text, Choosing text fonts, Menus for navigation, Buttons for interaction, HTML documents, Symbols and icons, Animating text, Mapping text across platforms, Font Editing and Design Tools
Aim	The overriding aim of this module is to explore the use of text in a multimedia project
Learning Outcomes	At the end of this module learners will be able to: • Demonstrate knowledge on the concept of Mapping text across platforms • Be able to develop using Font Editing and Design Tools
Units	Unit 3.1: Using Text in Multimedia Unit 3.2: Designing with text Unit 3.3: Mapping text across platforms Unit 3.4: Font Editing and Design Tools
Readings	
Activity	**Overview**
	Assignment 1: choose an effect or a topic in climate change and divide it into several scenes, plane the story board. Decide what media type you will use to deliver each scene. [End of the week] Assignment : Using the WWW search for participatory video clips addressing climate change with particular to your own theme chosen.

Module 5	**sound**
Key Concepts	Digital sound, MIDI sound
Overview	The Power of Sound, Multimedia system sounds, MIDI Versus Digital Audio, Understanding computer audio, Digital audio, Preparing digital audio files, File size versus quality, Editing digital recordings, Making MIDI audio, Audio File Formats, Toward professional sound: The Red Book standard, Copyright issues
