Aim	The aim of this module is to equip students with the capacity to record and edit sound.
Learning Outcomes	At the end of this module learners will be able to: • Digitize soun • work with MIDI • incorporate sound to a project
Units	Unit 5.1: MIDI Versus Digital Audio Unit 5.2: Preparing digital audio files Unit 5.3: Preparing MIDI files Unit 5.4: professional sound
Readings	
Activity	**Overview**
	Start the production process

	Assignment 2: record and choose a suitable file format for the various scenes using the tool "Sound Forge" [Mid of week 6]
Module 6	**Images**
Key Concepts	Color, bit maps, vector images
Overview	Understanding natural light and color , Computerized color and color models, Color palettes , Making Still Images, Bitmaps, Bitmap software, Capturing and editing images, Vector drawing, Vector-drawn objects versus bitmaps, 3-D drawing and rendering, Panoramas, Image File Formats **Assignment 3:** design the needed images for climate change topic using the tool Photoshop [Mid of week 7]
Aim	The overriding aim of this module is to learn the processes for editing and working with images
Learning Outcomes	At the end of this module learners will be able to: • work with digital images • work with vector images
Units	Unit 6.1: Understanding natural light and color Unit 6.2: Making Still Images Unit 6.3: Vector-drawn objects versus bitmaps
Readings	A compilation of hands-out
Activity	**Overview**
	Assignment 3: design the needed images for climate change topic using the tool Photoshop [Mid of week 7]

Module 7	Animation
Key Concepts	Cell, computer animation
Overview	The Power of Motion, Principles of Animation, Animation techniques, Cel animation, Computer animation, Kinematics, Morphing, Animation file formats
Aim	The aim of this module is to help students understand and work with animation
Learning Outcomes	At the end of this module learners will be able to: • be able to work with animation • animate simple scenes
Units	Unit 7.1: Power of Motion Unit 7.2: Animation techniques Unit 7.3: Computer animation
Readings	
Activity	**Overview**
	Assignment 4: using Flash animate the scenes designed earlier [end of week 10]

Module 8	Video
Key Concepts	Analog, digital video
Overview	Using Video, Analog versus digital, How Video Works, Broadcast video standards, High Definition Television (HDTV), Integrating Computers and Television, Video color, Working with text and titles, Shooting and Editing

	Video, Recording formats, Digitizing video, Video compression
Aim	The aim of this module is to help students integrate the video into the project and be able to edit and shoot video
Learning Outcomes	At the end of this module learners will be able to: • be able to work with different video file formats • shoot and edit video
Units	Unit 8.1: Analog versus digital Unit 8.2: Video color Unit 8.3: Shooting and Editing Video Unit 8.4: Digitizing video, Video compression
Readings	Windows Movie Maker free online video tutorials from Atomic Learning are available at http://www.atomiclearning.com/moviemaker2. These tutorials are very helpful in learning the various features of Movie Maker. (You will need the QuickTime video player to view the Atomic Learning tutorials. If needed, click on QuickTime to download the latest version.) Ourmedia.org Publish & store your creations- video, audio, text or graphics. Google Video: Upload or download, digital videos of any size or length.
Activity	**Overview** **Assignment 5:** Imagine that you are a multimedia instructor; explain one of the presented topics in this course/ or one of the used tools to your students

	using the Camtasia program to track all your actions and events. [not a group assignment] [end of week 12] **Project:** using the material developed in the assignments (1-4) build a complete seamless project for climate change topic that has been chosen in assignment 0. [end of week 14]

Computer Science and applications Department

Course Syllabus

1001311: Multimedia programming

Hashemite University, Prince Al Hussein Bin Abdullah II for Information Technology, Computer Science

Instructor Information

Instructor: Ibrahim Al-oqily, Dr.
Office Location: IT 238
Telephone: +962 797112343
Office Hours: Sun, Tue, Thur (11:00AM - 1:00 PM)
E-mail: IZALOQILY@HU.EDU.JO
Website: http://staff.hu.edu.jo/ialoqily

Course Identification

Course Number: 1001311

Course Name: Multimedia Programming
Course Location: http://www.hlms.hu.edu.jo
Class Times: Sun, Tue, Thur 9-10:00Am – 12-1:00pm
Prerequisites:
Faculty Web Page: http://www.hu.edu.jo/fac/Default.aspx?facid=67000000

Course Description/Overview

This course teaches the concepts and skills of using text, images, sound, animation, and video to create multimedia projects and applications. Students will learn the basic principles of each media type including digital representation and issues that arise when media are combined. Students will deal with ethical and legal issues, design considerations including usability, hardware and software that enable multimedia, data representation and file types, data storage, data transmission, digitizing and compression techniques. The course provides case studies, particularly related to climate change issues, showing how students, families and citizens can be "empowered" to make their voices heard in the process for building a more sustainable society. The course contains assignments to practice the use of different concepts. The assignments concentrates on developing video-clips dealing with climate change and local/global issues related to sustainable human development. Using participatory techniques, such as focus group discussions, individual interviews and writing scenarios students are involved in gathering evidence from the environment and community members involved in making the participatory videos. Students will be engaged in a self-reflective process assessing the strengths and limitations of participatory video as a catalyst for transforming themselves and society.

Course Learning Objectives

The course is intended to meet the following learning objectives:

5. To equip students with an understanding of the processes and methodologies required for effective design of multimedia artifacts and systems;

6. To provide a framework for classification, capture and effective deployment of the range of multimedia resources by using participatory video and animation as tools to help the community, identify risks and develop climate change adaptation strategies

7. To support the development of skilled and imaginative use of a selection of software tools appropriate to the design, management and deployment of multimedia resources and systems.

8. To learn how to use multimedia projects to raise awareness of the role of some technologies in enabling learners to reflect critically on the rights, roles and responsibilities of an active citizen in preparing for a sustainable future for all

Course Content Learning Outcomes

LO1 : **Knowledge and Understanding** (Objective 1) [taught in lectures]

Having successfully completed this course, you will be able to demonstrate knowledge and understanding of:

- the current key issues in multimedia development
- Specific and detailed knowledge and understanding in a number of chosen topics in the area of multimedia.

LO2 : **Intellectual Skills** (Objective 2) [taught in lectures and re-enforced through the coursework]

Having successfully completed this course, you will be able to:

- analyze, review and critically evaluate the work of peers
- analyze, review and critically evaluate your own work
- explain the inter-relationship of areas of computer science research and the ways in which the convergence of technologies drives the development of Multimedia Systems

LO3 : **Practical Skills** (Objective 3) [taught in lectures and re-enforced through the coursework]

Having successfully completed this course, you will be able to:

- develop and integrate a broad range of skills necessary to develop and understand a multimedia projects

LO4 : **General Transferable Skills** (Objective 4) [taught in lectures and re-enforced through the coursework]

Having successfully completed this course, you will be able to:

- communicate technical information in a written format, and to an agreed academic convention
- communicate technical information in a verbal format
- work collaboratively with others to achieve greater understanding of a technical issue and sustainable environment
- study independently and make personal choice in study

Required Course Texts and Materials

- Vaughan, T. "Multimedia - Making it Work" 8 edition (October 29, 2010), McGraw-Hill, 2008. **ISBN-10:** 0071748466

Optional Course Texts and Materials

- Steinmetz and Nahrstedt, “Multimedia Computing, Communications and Applications,” Pearson Education, Sep 1, 1995
- Anne Cranny-Francis,” MultiMedia: texts and contexts,” Sage Publications Ltd (October 3, 2005) ISBN-10: 076194995X
- Richard E. Mayer, "Multimedia Learning," Cambridge University Press; 2 edition (January 19, 2009), ISBN-10: 0521514126
- Ashraf M. A. Ahmad and Ismail Khalil Ibrahim, "Multimedia Transcoding in Mobile and Wireless Networks," (Jul 25, 2008)

Assignments and Grading Scheme

Project: This term project will be about designing and developing a video or an animation about climate change in Jordan. Using the material developed in the assignments (1-4) you will build a complete seamless project for your story that will be decided in assignment 0. Knowledge and Understanding developed during this course will be used to achieve the project.

Assignment 0: Form a group of 3-4 students. Choose a project and write the plane in accordance of the team skills to achieve it. General Transferable Skills listed in LO4 will be taught and practiced during this assignment.

Assignment 1: choose an effect or a topic in climate change and divide it into several scenes. Decide what media type you will use to deliver each scene. General Transferable Skills listed in LO4 will be taught and practiced during this assignment.

Assignment 2: record and choose a suitable file format for the various scenes using the tool "Sound Forge" Practical Skills listed in LO3 will be demonstrated using this assignment

Assignment 3: design the needed images for climate change topic using the tool Photoshop Practical Skills listed in LO3 will be demonstrated using this assignment

Assignment 4: using Flash animate (or make a short video) the scenes designed earlier Practical Skills listed in LO3 will be demonstrated using this assignment

Assignment 5: Imagine that you are a multimedia instructor; explain one of the presented topics in this course/ or one of the used tools/ or any topic of your choice to your students using the Camtasia program to track all your actions and events. Intellectual Skills listed in LO2 in addition to Practical Skills listed in LO3 will be acquired from this assignment.

Grading System

Letter grades will be awarded based on the following scale.

80-100%: A range (A+,A, A-)

70-80%: B range (B+, B, B-)

60-70%: C range (C+, C, C-)

50-60%: D range (D+, D)

Below 50%: F

These thresholds are not binding. We may lower the thresholds described here depending on the performance of the class. We will not raise the thresholds. We will give an approximate grade breakdown in the middle of the semester, but **you are responsible for keeping track of**

your own grades. If you would like to appeal your grade on any of the assignments or exams, you may do so within **one week** of the assignment or exam being handed back. Your **entire** assignment or exam will be regarded and your grade may go up or down, or it may stay the same

Grading Policy

Assignments	10%
Project	15%
Class attendance/participation	5%
Midterm Exams	20%
Final Exam	50%
Total Points	**100**

Course Policies

Late Assignments

Assignments are due on the posted dates. There is a 20% deduction for late assignment. The deduction becomes 50% if the assignment is two days late. No credit is given after three days. Any exceptions must be arranged at least a day before the assignment is due.

Classroom Protocol

8. Students are expected to read the appropriate sections of the book before each lecture.
9. Please be considerate of your classmates during class.
10. Students are expected to show courtesy and respect toward their classmates.
11. Please come to class on time. If you are late more than 10 minutes then you are not allowed to enter the class.
12. Please make sure that your cellular phone does not interrupt during lecture time, and especially during test time.
13. Please do not carry on side discussions with other students during lecture time.
14. When you have a question, please raise your hand and ask the question so that everyone may benefit from it.

Dissability

Students with special needs should discuss their needs with instructor before the first class to allow for proper arrangements.

Important Dates to Remember

Midterm Exams [during week 9]
Final Exam [during week 16]
Project deadline [end of week 14]

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines
1		What is Multimedia, Defining multimedia, Types of multimedia, Multimedia requirements, Delivering and Using Multimedia, Where to use multimedia? Virtual reality (VR)
2		**Introduction to making multimedia** The Stages of a Project, Hardware, Software, Delivery vehicles, Creativity, Organization
3		**Multimedia Skills** Who are Multimedia Developers? Members of a Multimedia Team, Project manager, Multimedia designer, Interface designer, Writer, Video specialist, Audio specialist, Multimedia programmer, Producer of multimedia for the Web, Team building **Assignment 0:** Form a group of 3-4 students. Choose a project and write the plane in accordance of the team skills to achieve it. [End of the week] This term project will be about climate change
4		**Text**

		Using Text, Using Text in Multimedia, Designing with text, Choosing text fonts, Menus for navigation, Buttons for interaction, HTML documents, Symbols and icons, Animating text, Mapping text across platforms, Font Editing and Design Tools **Assignment 1**: choose an effect or a topic in climate change and divide it into several scenes. Decide what media type you will use to deliver each scene. [End of the week]
5 +6		**Sound** The Power of Sound, Multimedia system sounds, MIDI Versus Digital Audio, Understanding computer audio, Digital audio, Preparing digital audio files, File size versus quality, Editing digital recordings, Making MIDI audio, Audio File Formats, Toward professional sound: The Red Book standard, Copyright issues **Assignment 2:** record and choose a suitable file format for the various scenes using the tool "Sound Forge" [Mid of week 6]
7+8		**Images** Understanding natural light and color , Computerized color and color models, Color palettes , Making Still Images, Bitmaps, Bitmap software, Capturing and editing images, Vector drawing, Vector-drawn objects versus bitmaps, 3-D drawing and rendering, Panoramas, Image File Formats **Assignment 3:** design the needed images for climate change topic using the tool Photoshop [Mid of week 7]
		MidTerm Exam
9+10		**Animation** The Power of Motion, Principles of Animation, Animation techniques, Cel animation, Computer animation, Kinematics, Morphing, Animation

		file formats **Assignment 4:** using Flash animate the scenes designed earlier [end of week 10]
		Project: using the material developed in the assignments (1-4) build a complete seamless project for climate change topic that has been chosen in assignment 0. [end of week 14]
11+12		**Video** Using Video, Analog versus digital, How Video Works, Broadcast video standards, High Definition Television (HDTV), Integrating Computers and Television, Video color, Working with text and titles, Shooting and Editing Video, Recording formats, Digitizing video, Video compression **Assignment 5:** Imagine that you are a multimedia instructor; explain one of the presented topics in this course/ or one of the used tools to your students using the Camtasia program to track all your actions and events. [not a group assignment] [end of week 12]
13		**Hardware, Basic Software tools** The Macintosh platform, The Windows platform, Memory and Storage Devices. Web servers, Web browsers, Plug-ins and delivery vehicles, Web Page Makers and Site Builders
14+15		**Compression Technique (Hand Out)** Sound compression techniques, Image Compression techniques, Video compression techniques
		Final Exam

Course Description/Overview

This course is directed to beginning students of environmental impact assessment (EIA). The main focus is on the fundamental principles and 'good' practices of EIA that are common across EIA systems.

In recognition that EIA is a subject of interest to many disciplines and persons of varied backgrounds, this course is interdisciplinary in perspective and attempts to balance discussion on physical and human environments.

The course is organized in four parts. In each part a number of principles and procedures are introduced, including case study examples and select methods and techniques. Part I introduces the basic principles of EIA, including the aims and objectives of EIA and an overview of the generic EIA process. Part II examines the nature of environmental impacts and common methods and techniques used to support EIA practice. Part III focuses on EIA principles and procedures, from screening, scoping, impact prediction and evaluation to post-decision analysis. Part IV introduces one key area of EIA that is under rapid transition – strategic environmental assessment (SEA) – and demonstrates linkages between it and project-based EIA.

Course Learning Objectives

The major goals of this course are:

1. Provide information and guidance on EIA and SEA good practice as being the most commonly practiced environmental management tools in the world.
2. Explain the concepts, procedures, and tools that are used currently in implementing an integrated approach to impact assessment of development projects, policies, plans, and programs.
3. Provide comprehensive coverage of generic elements of good practice that are internationally accepted and widely applicable.
4. Indicate some of the possible future directions for integrated assessment based on current trends and initiatives.
5. Raise awareness of the importance of the roles that EIA and SEA play in sustainable development and in climate change adaptation policies and in combating global warming.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Explain the terms EIA and SEA and their objectives.
2. Discuss the major drawbacks of EIA and SEA.
3. Participate in conducting an EIA and SEA.
4. Supervise a scoping session for determining the scope of EIA and SEA.
5. Write EIA and SEA draft and final reports.
6. Participate in reviewing the EIA and SEA draft and final reports.
7. Develop a comprehensive:
    a. environmental management plan (EMP)
    b. environmental monitoring plan
    c. environmental contingency and emergency plan
8. Discuss the roles of stakeholders and public in EIA and SEA.
9. Explain the legal (national and international) requirements of EIA and SEA.
10. Demonstrate the importance of EIA and SEA in sustainable development and combating global warming.

Grading Policy

First Exam	20%
Second Exam	20%
Assignments	10%
Attendance and Participation	10%
Final Exam	40%

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than 15% of the classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 10% of the grade.

Disability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Schedule

Week	Topic
1	• Discussion of syllabus and assignments, course requirements and pre-requisites. • The generic EIA process
2	• Aims and objectives of EIA
3 and 4	• Nature and classification of environmental impacts
5 and 6	• Methods supporting EIA practice
7	• National and international legal requirements of EIA
8	• Screening procedures
9	• Scoping procedures
10	• Predicting environmental impacts
11	• Determining impacts significance
12	• Managing project impacts
13	• Post-decision monitoring
14	• SEA principles
15 and 16	• Projects discussions and presentations

Course Modules

Course	Environmental Impact Assessment
Module 1	EIA Principles
Key Concepts	The generic EIA process
Overview	This module introduces the basic principles of EIA, including aims and objectives of EIA and an overview of the generic process EIA process.
Aim	The main aims of this module are to introduce the students to the basic terminology in EIA and its objectives and drawbacks and how the EIA is carried out as a generic process.
Learning Outcomes	At the end of this module the students will be able to discuss: 1. what is meant by EIA 2. the origins and development of EIA 3. the international status of EIA 4. the EIA process 5. the benefits and challenges of EIA
Readings	Chapter 1: Noble B.F. (2009): Introduction to Environmental Impact Assessment: A Guide to Principles and Practices. Canada: Oxford University Press.
Module 2	Foundations of EIA
Key Concepts	Environmental impacts methods used in EIA practice
Overview	This module examines the nature of environmental impacts and common methods and techniques used to support EIA practice.
Aim	The main aims of this module are to introduce students to the

	types of environmental impacts and the methods used to identify, predict, and manage environmental impacts, in addition to the types of publics and how they can be exposed to the EIA
Learning Outcomes	At the end of this module the students will be able to discuss: 1. the differences between environmental effects and impacts 2. different types of environmental impacts 3. different methods used for impact identification and classification, including checklists, matrices, networks, models, GIS, and expert judgment 4. rational for public involvement 5. levels of public involvement 6. elements for successful public involvement
Readings	Chapters 3 and 4: Noble B.F. (2009): Introduction to Environmental Impact Assessment: A Guide to Principles and Practices. Canada: Oxford University Press.
Module 3	EIA Practice
Key Concepts	Screening Scoping impact prediction, evaluation, management, and monitoring
Overview	This module focuses on EIA principles and procedures, from screening, scoping, impact prediction and evaluation to post-decision analysis.
Aim	The main aims of this module are to introduce students to the different stages of carrying out EIA from screening to post-decision monitoring
Learning Outcomes	At the end of this module the students will be able to discuss: 1. screening procedures 2. scoping types and functions

	3. scoping requisites 4. impact prediction 5. basic requirements of impact prediction 6. predicting impacts on the biophysical environment 7. predicting impacts on the human environment 8. challenges to impact prediction 9. determining impact significance 10. managing negative and positive impacts 11. rational for post-decision monitoring 12. requirements for effective monitoring 13. monitoring methods and techniques
Readings	Chapters 5, 6, 7, 8, 9, and 10: Noble B.F. (2009): Introduction to Environmental Impact Assessment: A Guide to Principles and Practices. Canada: Oxford University Press.
Module 4	Advancing Principles and Practices
Key Concepts	SEA principles
Overview	This module introduces SEA and demonstrates the linkage between it and project-based EIA.
Aim	The main aims of this module are to introduce students to the basic concepts of SEA and the future of EIA and SEA
Learning Outcomes	At the end of this module the students will be able to discuss: 1. the basics of SEA 2. aims and objectives of SEA 3. types of SEA 4. SEA framework 5. Future directions of EIA and SEA
Readings	Chapter 12: Noble B.F. (2009): Introduction to Environmental Impact Assessment: A Guide to Principles and Practices. Canada: Oxford University Press.

Course Description:

This course aims to provide students with an overview of the economic decision making process. It helps students test the feasibility of economic projects and introduces methods of preference between different projects. It also aims to improve students' report writing and to help student collect and analyze data efficiently.

Course Objectives: Learning Outcomes:

The main objectives of this course are to help students to understand what economic feasibility studies is all about by providing students with the basic knowledge concerning the main topics in feasibility studies and project appraisal, especially with regard to cost and revenue structure of the firm, financial analysis, managerial analysis, accounting analysis and investors decision making process. This general objective will be achieved through the following learning outcomes:

A- Knowledge and Understanding: the students should be able to:

1- Understand the investors' decision making.
2- Identify the difference between feasibility study and project appraisal.
3- Understand the different levels of economic feasibility studies.
4- Learn the cost and revenue structures of the projects.
5- Learn the relationship between economics, financial, business and accounting analysis.

B- Intellectual Skills: students should be able to:

1- Employ Economic terms and concepts in making rational decisions.
2- Identify the costs and revenue terms and items.
3- Learn how to calculate and determine the economic profit and loss in economic institutions.
4- Compare between different projects in terms of profitability.
5- Identify the all aspects of the firm: legal, environmental, market, technical, financial and social.
6- Learn how to present his work and defends it.

C- Practical skills:

1- Using theory tools to analyze the behavior of firms and individuals.
2- Using the graph, tables, and equations in the analysis of economic variables.

3- Using statistical and financial analysis.
4- Using computer in conducting a preliminary study.

Teaching Methods:

Duration	: 14 weeks, 42 hours
Lectures	: 33lectures plus 60 minutes midterm exam

Course Work Requirements:

Activity	Type	Due date
Homework	. - Prepare market survey for a project; .	2/10/2014
	. - Prepare a preliminary feasibility studies for a project; . - Submit a feasibility study	28/12/2014

Tests and Evaluation:

1. Final exam 40 Points
2. Class Participation & presentation 20 Points
3. Midterm exam (2/12/2014) 20 Points
4. Project 20 Points

Course Contents:

Part one: Investment and Economic Feasibility Studies: Chapter 1: Concepts of Feasibility Studies Chapter 2: Stages of Feasibility Studies and interrelations	6 Lecture
Part two: Aspects of a Feasibility Study Chapter 3: Environmental aspects of the Feasibility Study Chapter 4: Legal aspects of the Feasibility Study Chapter 5: The Marketing aspect of a Feasibility study of a project Chapter 6: The Technical aspect of a Feasibility study of a project Chapter 7: The Financial aspect of a Feasibility study of a project Chapter 8: The Social aspect of a Feasibility study of a project	18 Lectures
Part three: Risk, Evaluation, Forecasting and fixing Chapter 9: Risk and Uncertainty involved in a project Chapter 10: Project Evaluation in existing firm(project) Chapter 11: Performance Forecasting for existing firms (project) Chapter 12: Losing Project Fixing	8 Lectures
Part Four: 1) Case study: Chapter 13 **2) "Production of Interlock Concrete" Case** **3) Using Computer in Feasibility Studies and project evaluation**	4 Lectures
Part Five: Research writing skills	1 Lectures

Part Six: Designing and Writing a Feasibility Study " Presentation"	2 Lectures

Text Book and supporting Material:
Text Book:

- Economic Feasibility Studies and Evaluate Investment Projects, Shokairi Mousa & Osama Salaam, 3rd edition, Massira Publishing, Amman, Jordan 2013.

Supporting Material:

- Feasibility Studies and Project Evaluation, Kadem Nadem Alesawi, Amman, Jordan, 2005.

Note: All students will be provided by a detailed summary, three case studies, and a well-organized feasibility tables.

Good Luck

9. Indicate some of the possible future directions for integrated assessment based on current trends and initiatives.
10. Raise awareness of the importance of the roles that EIA and SEA play in sustainable development and in climate change adaptation policies and in combating global warming.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

11. Explain the terms EIA and SEA and their objectives.

12. Discuss the major drawbacks of EIA and SEA.
13. Participate in conducting an EIA and SEA.
14. Supervise a scoping session for determining the scope of EIA and SEA.
15. Write EIA and SEA draft and final reports.
16. Participate in reviewing the EIA and SEA draft and final reports.
17. Develop a comprehensive:
    a. environmental management plan (EMP)
    b. environmental monitoring plan
    c. environmental contingency and emergency plan
18. Discuss the roles of stakeholders and public in EIA and SEA.
19. Explain the legal (national and international) requirements of EIA and SEA.
20. Demonstrate the importance of EIA and SEA in sustainable development and combating global warming.

Course Resources

Required Course Texts and Materials

Hands-out prepared by the instructor for the class.

Noble B.F. (2009): Introduction to Environmental Impact Assessment: A Guide to Principles and Practices. Canada: Oxford University Press.

Optional Course Texts and Materials

Optional Textbooks:

Glasson J., Therivel R., and Chadwick A. (2012): Introduction to Environmental Impact Assessment. USA: Routledge.

Eccleston C.H. and Doub J.P. (2012): Preparing NEPA Environmental Assessments – A User's Guide to Best Professional Practices. USA: CRC Press.

James D.E. (2011): The Application of Economic Techniques in Environmental Impact Assessment. Netherlands: Springer.

Friedman F.B. (2011): Practical Guide to Environmental Management. USA: Environmental Law Institute.

Optional International Peer-Reviewed and Refereed Journals:

Environmental Impact Assessment Review – Elsevier: http://www.journals.elsevier.com/environmental-impact-assessment-review/

Journal of Environmental Management – Elsevier: http://www.journals.elsevier.com/journal-of-environmental-management/

Environmental Management – Springer: http://www.springer.com/environment/environmental+management/journal/267

Optional International Organizations Websites:

Grading Policy

First Exam	20%
Second Exam	20%
Assignments	10%
Attendance and Participation	10%
Final Exam	40%

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than 15% of the classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 10% of the grade.

Disability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Schedule

Week	Topic

1	• Discussion of syllabus and assignments, course requirements and pre-requisites. • The generic EIA process
2	• Aims and objectives of EIA
3 and 4	• Nature and classification of environmental impacts
5 and 6	• Methods supporting EIA practice
7	• National and international legal requirements of EIA
8	• Screening procedures
9	• Scoping procedures
10	• Predicting environmental impacts
11	• Determining impacts significance
12	• Managing project impacts
13	• Post-decision monitoring
14	• SEA principles
15 and 16	• Projects discussions and presentations

Course Modules

Course	Environmental Impact Assessment
Module 1	EIA Principles
Key Concepts	The generic EIA process
Overview	This module introduces the basic principles of EIA, including aims and objectives of EIA and an overview of the generic process EIA process.
Aim	The main aims of this module are to introduce the students to the basic terminology in EIA and its objectives and drawbacks and

	how the EIA is carried out as a generic process.
Learning Outcomes	At the end of this module the students will be able to discuss: 6. what is meant by EIA 7. the origins and development of EIA 8. the international status of EIA 9. the EIA process 10. the benefits and challenges of EIA
Readings	Chapter 1: Noble B.F. (2009): Introduction to Environmental Impact Assessment: A Guide to Principles and Practices. Canada: Oxford University Press.
Module 2	Foundations of EIA
Key Concepts	Environmental impacts methods used in EIA practice
Overview	This module examines the nature of environmental impacts and common methods and techniques used to support EIA practice.
Aim	The main aims of this module are to introduce students to the types of environmental impacts and the methods used to identify, predict, and manage environmental impacts, in addition to the types of publics and how they can be exposed to the EIA
Learning Outcomes	At the end of this module the students will be able to discuss: 7. the differences between environmental effects and impacts 8. different types of environmental impacts 9. different methods used for impact identification and classification, including checklists, matrices, networks, models, GIS, and expert judgment 10. rational for public involvement 11. levels of public involvement 12. elements for successful public involvement

Readings	Chapters 3 and 4: Noble B.F. (2009): Introduction to Environmental Impact Assessment: A Guide to Principles and Practices. Canada: Oxford University Press.
Module 3	EIA Practice
Key Concepts	Screening Scoping impact prediction, evaluation, management, and monitoring
Overview	This module focuses on EIA principles and procedures, from screening, scoping, impact prediction and evaluation to post-decision analysis.
Aim	The main aims of this module are to introduce students to the different stages of carrying out EIA from screening to post-decision monitoring
Learning Outcomes	At the end of this module the students will be able to discuss: 14. screening procedures 15. scoping types and functions 16. scoping requisites 17. impact prediction 18. basic requirements of impact prediction 19. predicting impacts on the biophysical environment 20. predicting impacts on the human environment 21. challenges to impact prediction 22. determining impact significance 23. managing negative and positive impacts 24. rational for post-decision monitoring 25. requirements for effective monitoring 26. monitoring methods and techniques
Readings	Chapters 5, 6, 7, 8, 9, and 10: Noble B.F. (2009): Introduction to Environmental Impact Assessment: A Guide to Principles and

	Practices. Canada: Oxford University Press.
Module 4	Advancing Principles and Practices
Key Concepts	SEA principles
Overview	This module introduces SEA and demonstrates the linkage between it and project-based EIA.
Aim	The main aims of this module are to introduce students to the basic concepts of SEA and the future of EIA and SEA
Learning Outcomes	At the end of this module the students will be able to discuss: 6. the basics of SEA 7. aims and objectives of SEA 8. types of SEA 9. SEA framework 10. Future directions of EIA and SEA
Readings	Chapter 12: Noble B.F. (2009): Introduction to Environmental Impact Assessment: A Guide to Principles and Practices. Canada: Oxford University Press.

Course	**Climate Change and Global Warming**
Module 1	Introduction to Global Climate Change
Key Concepts	Climate elements, climate change
Overview	The earth has become warmer over the last century. It is reported that the average surface temperature of the earth has increased during the twentieth century by about 0.6° ± 0.2°C. This may seem like a small shift, but although regional and short-term temperatures do fluctuate over a wide range, global temperatures are generally quite stable. In fact, the difference between today's

	average global temperature and the average global temperature during the last Ice Age is only about 5 degrees C. Indeed, it's warmer today around the world than at any time during the past 1000 years, and the warmest years of the previous century have occurred within the past decade.
Aim	The aim of this module is to understand and appreciate climatic changes throughout the globe.
Learning Outcomes	At the end of this module learners will be able to: • Memorize the definition of climate • Name the climate elements • Explain meteorological charts that illustrates climatic data • Appreciate the increase in the mean temperature of the Earth as a planet
Units	Introduction to Global Climate Change
Readings	Cpater one in Bloom text The Discovery of Global Warming by Spencer Weart http://www.aip.org/history/climate/20ctrend.htm Global Climate Change Research Explorer http://www.exploratorium.edu/climate/index.html
Activity	• Power-point slides will be presented • Learners will read chapter one in Bloom text and will access http://www.aip.org/history/climate/20ctrend.htm and http://www.exploratorium.edu/climate/index.html
Module 2	History of Earth's Climate
Key Concepts	Paleoclimatology, geological thermometers, isotopes

Overview	Given that the climate is changing, two questions emerge: First, have such changes happened before in the history of the Earth? And second, what is causing this change? In this module we will examine past climates (paleoclimates) and the forces that caused them to change. This information will set the stage for asking if the same forces that caused past changes are causing climate warming today, and for making predictions about what will happen in the future. From abundant geological evidence, we know that only three hundred and fifty years ago the world was in the depths of a prolonged cold spell called the "Little Ice Age," which lingered for nearly 500 years. Twenty thousand years ago, in the middle of the last glacial period, large continental scale ice sheets covered much of North America, Northern Europe, and Northern Asia. Fifty million years ago, global temperatures were so high that there were no large ice sheets at all.
Aim	The overriding aim of this module is to acquire sound understanding of past climates that prevailed on our planet.
Learning Outcomes	At the end of this module learners will be able to: • Understand what paleoclimatology means • Examine different techniques that are used to study past climates
Units	Chapter 2: History of Earth's Climate
Readings	▪ History of Earth's Climate by Bloom ▪ What is Paleoclimatology? by US NOAA ▪ Earth's Climatic History by Pidwirny

Activity	• Power-point slides will be presented • Learners will read chapter two in Bloom text and will access http://www.ncdc.noaa.gov/paleo/primer.html and http://www.physicalgeography.net/fundamentals/7x.html
Module 3	Causes of Climate Change
Key Concepts	Climate forcings, cyclic forcings, noncyclic forcings, green house effect
Overview	Energy flows in from the sun, much of it in the visible wavelengths, and back out again as long-wave infrared (heat) radiation. An increase in the luminosity of the sun, for example, is a positive forcing that tends to make Earth warmer. A very large volcanic eruption, on the other hand, can increase the aerosols (fine particles) in the lower stratosphere (altitudes of 10–15 miles) that reflect sunlight to space and thus reduce the solar energy delivered to Earth's surface. These examples are natural forcings. Human-made forcings result from, for example, the gases and aerosols produced by fossil fuel burning, and alterations of Earth's surface from various changes in land use, such as the conversion of forests into agricultural land. Those gases that absorb infrared radiation, i.e., the "greenhouse" gases, tend to prevent this heat radiation from escaping to space, leading eventually to a warming of Earth's surface. The observations of human-induced forcings underlie the current concerns about climate change.
Aim	This module aims at identifying cyclic and noncyclic climate forcings.
Learning Outcomes	At the end of this module learners will be able to: • List and explain noncyclic climate forcings • List and explain cyclic climate forcings
Units	Chapter 3 - Causes of Climate Change

Readings	Global Warming Facts and Our Future https://www.koshland-science-museum.org/explore-the-science/earth-lab Causes of Climate Change by US EPA http://www.epa.gov/climatechange/science/causes.html Encyclopedia of Earth: GH effect http://www.eoearth.org/view/article/153146
Activity	• Power-point slides will be presented • Learners will read chapter three in Bloom text and will access https://www.koshland-science-museum.org/explore-the-science/earth-lab, http://www.epa.gov/climatechange/science/causes.html, and http://www.eoearth.org/view/article/153146.
Module 4	World of Tomorrow: Computer Simulation Models
Key Concepts	Modelling, ocean-atmosphere interaction, IPCC, emission scenarios
Overview	The climate is an extremely complex system, whose internal dynamics and future evolution can only be understood through extensive investigations and complicated model computations. An understanding of these natural processes and the implications of man's interference is, however, a prerequisite for preserving the diversity of living conditions on earth. The public and policymakers therefore expect science to provide a reliable basis for climate and environmental protection policy. The earth cannot be experimented with. It is too complex to be reproduced in the laboratory. The only remaining possibility is to simulate it in a computer model.

	How will the climate system react in the future to diverse emissions of greenhouse gases, nitrogen oxides, and other trace substances? How will global warming, the increase in sea level and the change in composition of the upper and lower atmosphere affect living conditions for humans? In order to analyse these impacts, researchers must consider both changes resulting from human activity and those resulting from natural climate and environmental fluctuations, which have historically exerted a heavy stress on societies. The assessment of how the climate in the next century will be affected by the combination of both natural and human factors represents one of the major challenges for science.
Aim	The overriding aim of this module is to understand basic principles in modelling of climate changes.
Learning Outcomes	At the end of this module learners will be able to: • Explain ocean and atmospheric interactions that control the climate • Explain how climate models work • Appreciate the role of the IPCC in studying the climate • Explain emission scenarios of green house gasses
Units	Chapter 4 - World of Tomorrow: Computer Simulation Models
Readings	Simple Models of Climate Change by Weart http://www.aip.org/history/climate/simple.htm GCMs by Weart http://www.aip.org/history/climate/GCM.htm IPCC Chapter on GCMs http://www.ipcc.ch/pdf/assessment-report/ar4/wg1/ar4-wg1-chapter8.pdf

Activity	• Power-point slides will be presented • Learners will read chapter four in Bloom text and will access: http://www.aip.org/history/climate/simple.htm, http://www.aip.org/history/climate/GCM.htm, and http://www.ipcc.ch/pdf/assessment-report/ar4/wg1/ar4-wg1-chapter8.pdf
Module 5	**Biological Impacts of Higher Carbon Dioxide Concentrations**
Key Concepts	Food, plant growing rate, crops yield
Overview	Rising atmospheric concentrations of carbon dioxide could dramatically influence the performance of crops, but experimental results to date have been highly variable. For example, when C3 plants are grown under carbon dioxide enrichment, productivity increases dramatically at first. But, over time, organic nitrogen in the plants decreases and productivity diminishes in soils where nitrate is an important source of this nutrient. We have discovered a phenomenon that provides a relatively simple explanation for the latter responses: in C3 plants, elevated carbon dioxide concentrations inhibit photorespiration, which in turn inhibits shoot nitrate assimilation. Agriculture would benefit from the careful management of nitrogen fertilizers, particularly those that are ammonium based.
Aim	The overriding aim of this module is to list and explain negative impacts of climate change on plant and animal adaptation and crops yield
Learning Outcomes	At the end of this module learners will be able to: • Explain the relation between climate change and adaptation in plants and animals • Explain the climate change impact on crops yield and food production
Units	Chapter 5 – Biological Impacts of Higher Carbon Dioxide Concentrations

Readings	Learners are expected to read Chapter 5 in Bloom textbook
Activity	• Power-point slides will be presented • Learners will read chapter five in Bloom text and will access: http://ucce.ucdavis.edu/files/repositoryfiles/ca6302p67-65646.pdf
Module 6	**Climate Change and the Biosphere**
Key Concepts	Biodiversity
Overview	There is ample evidence that climate change affects biodiversity. According to the Millennium Ecosystem Assessment, climate change is likely to become one of the most significant drivers of biodiversity loss by the end of the century. Climate change is already forcing biodiversity to adapt either through shifting habitat, changing life cycles, or the development of new physical traits. Conserving natural terrestrial, freshwater and marine ecosystems and restoring degraded ecosystems (including their genetic and species diversity) is essential for the overall goals of both the Convention on Biological Diversity and the United Nations Framework Convention on Climate Change because ecosystems play a key role in the global carbon cycle and in adapting to climate change, while also providing a wide range of ecosystem services that are essential for human well-being and the achievement of the Millennium Development Goals.
Aim	The overriding aim of this module is to appreciate the linkage between climate change and biodiversity
Learning Outcomes	At the end of this module learners will be able to: • Explain the impact of climate on ecosystems

	• Explain how different ecosystems would respond to the climate change • Identify negative impacts of climate change on biodiversity
Units	Chapter 6 - Climate Change and the Biosphere
Readings	Encyclopedia of Earth: Biosphere, Ecosystem Disturbance, Species Shifts http://www.eoearth.org/topics/view/54257/
Activity	• Power-point slides will be presented • Learners will read chapter six in Bloom text and will access: http://www.eoearth.org/topics/view/54257/
Module 7	**Mitigation Strategies**
Key Concepts	Mitigation, alternative energy sources
Overview	Climate Change Mitigation refers to efforts to reduce or prevent emission of greenhouse gases. Mitigation can mean using new technologies and renewable energies, making older equipment more energy efficient, or changing management practices or consumer behaviour. It can be as complex as a plan for a new city, or as a simple as improvements to a cook stove design. Efforts underway around the world range from high-tech subway systems to bicycling paths and walkways. Protecting natural carbon sinks like forests and oceans, or creating new sinks through silviculture or green agriculture are also elements of mitigation.
Aim	The overriding aim of this module is to introduce students to different mitigation strategies on climate change
Learning Outcomes	At the end of this module learners will be able to: • Identify the relation between climate change and traditional energy sources • Consider several strategies used to mitigate climate change including using of alternative energy sources, promote solid waste management, and promote sustainable development.

Units	Chapter 7 – Mitigation Strategies: Transportation Chapter 8 – Mitigation Strategies: Electric Power Generation Chapter 9 – Mitigation Strategies: Other Sectors
Readings	Chapters 7 to 9 in Bloom, IPCC Mitigation of Climate Change Report: Transportation,IPCC Mitigation of Climate Change Report, Energy Supply, and IPCC Mitigation of Climate Change Report, Chapt. 6-10
Activity	• Power-point slides will be presented • Learners will read chapters seven to nine in Bloom text and will access: http://www.ipcc.ch/publications_and_data/ar4/wg3/en/ch5.html http://www.ipcc.ch/publications_and_data/ar4/wg3/en/ch4.html http://www.ipcc.ch/publications_and_data/ar4/wg3/en/contents.html
Module 8	**Economics of Global Climate Change**
Key Concepts	Economics of climate change
Overview	Scientists and economists are beginning to grapple with the serious economic and environmental consequences if we fail to respond to the on-going global warming. Negative impacts of climate change, such as damage to property and infrastructure, sea-level rise, floods, droughts, wildfires, and extreme storms, require extensive repair of essential infrastructure such as homes, roads, bridges, railroad tracks, airport runways, power

	lines, dams, levees, and seawalls. Disruptions in daily life related to climate change can mean lost work and school days and harm trade, transportation, agriculture, fisheries, energy production, and tourism. Severe rainfall events and snowstorms can delay planting and harvesting, cause power outages, snarl traffic, delay air travel, and otherwise make it difficult for people to go about their daily business. Climate-related health risks also reduce productivity, such as when extreme heat curtails construction, or when more potent allergies and more air pollution lead to lost work and school days. Mass migration and security threats. Global warming is likely to increase the number of "climate refugees"—people who are forced to leave their homes because of drought, flooding, or other climate-related disasters. Mass movements of people and social disruption may lead to civil unrest, and might even spur military intervention and other unintended consequences. Societies may find ways to prepare for and cope with some climate impacts—provided that we do not let our carbon emissions continue unabated. However, even a partial accounting of these measures suggests that coping is likely to be more costly steps to reduce carbon emissions thereby reducing associated climate impacts. For example, farmers might need to irrigate previously rain-fed areas, cool vulnerable livestock, and manage new or more numerous pests. Local and state governments that taker early steps to ensure that houses are more energy efficient, and build early warning systems for heat waves and disasters and add emergency responders are more likely to cope with extreme events. Governments may also have to build seawalls, contain sewer overflows, and strengthen bridges, subways, and other critical components of the transportation system. Rebuilding after disasters strike is likely to prove even more costly than these preventive measures, studies show. And these costs do not

	include those stemming from lives lost and other irreversible consequences of allowing heat-trapping gases to accumulate unchecked in our atmosphere.
Aim	The overriding aim of this module is to appreciate the massive cost of the climate change.
Learning Outcomes	At the end of this module learners will be able to: • Explain the economic losses associated with global warming including sea level rise, floods, droughts, diseases, refugees, hurricanes, sick leaves. • Discuss required emergency spending to coup up with global warming • Explain the negative impacts of global warming on national and international funding
Units	Chapter 10 – Economics of Global Climate Change
Readings	Chapters 10 in Bloom, The Economics of Climate Change: A Primer by CBO, and Requiem for Kyoto by Nordhaus & Boyer
Activity	• Power-point slides will be presented • Learners will read chapter ten in Bloom text and will access: http://www.cbo.gov/publication/14387 and http://www.econ.yale.edu/~nordhaus/homepage/Kyoto.pdf
Module 9	**Global Climate change and the Law**
Key Concepts	Legislations, policy, international treaties

Overview	Most countries are Parties to the United Nations Framework Convention on Climate Change (UNFCCC). Article 2 of the Convention states its ultimate objective, which is to stabilize the concentration of greenhouse gases in the atmosphere "at a level that would prevent dangerous anthropogenic. The natural, technical, and social sciences can provide information on decisions relating to this objective, e.g., the possible magnitude and rate of future climate changes. However, the IPCC has also concluded that the decision of what constitutes "dangerous" interference requires value judgements, which will vary between different regions of the world. Factors that might affect this decision include the local consequences of climate change impacts, the ability of a particular region to adapt to climate change (adaptive capacity), and the ability of a region to reduce its GHG emissions (mitigative capacity).
Aim	The overriding aim of this module is to introduce students to international treaties that address the climate change.
Learning Outcomes	At the end of this module learners will be able to: • Name and explain local legislations that govern the climatic issues • Name and explain international treaties that are address the global climatic issues
Units	Chapter 11 - Global Climate and the Law
Readings	Chapter eleven in Bloom, and United Nations Framework Convention on Climate Change.
Activity	• Power-point slides will be presented • Learners will read chapter eleven in Bloom text and will access: http://unfccc.int/2860.php
Module 10	**Global Climate Change: The Human Response**

Key Concepts	Mitigation, alternative energy sources
Overview	In order to mitigate the human contribution to global warming, we should reduce carbon dioxide and other greenhouse gas emissions. Controlling emissions is a large, complex, and potentially expensive problem that no single strategy will solve. Strategies include increasing the energy efficiency of our cars, homes, and power; capturing the carbon emitted by power plants and store it underground; producing more energy from renewable fuels; halt deforestation and soil degradation worldwide, while reforesting more areas. Even if we were to stop greenhouse gas emissions today, additional climate change from emissions already in the atmosphere would be inevitable. For this reason, many governments and industries are beginning to adapt policies, disaster response plans, or infrastructure to prepare for anticipated changes. While some adaptations are difficult and expensive, many are relatively inexpensive and offer immediate benefits. For individuals, governments, and businesses, responding to climate change requires understanding and accepting the risks of regional climate change, assessing the immediate and long-term costs and benefits of adaptation strategies, and implementing adaptations that bring the most

	benefits relative to the cost and risk.
Aim	The overriding aim of this module is to highlight feasible strategies in respond to climate change.
Learning Outcomes	At the end of this module learners will be able to: • Highlight main strategies that are believed to minimise the negative consequences of climate change • Identify what individuals, communities, and governments can do in order to slow down the rate of t e climate change.
Units	Chapter 12 – Global Climate Change: The Human Response
Readings	Chapter twelve in Bloom; Global Warming Politics by Shellenberger & Nordhaus; and Welcome to Doomsday by Moyers.

Activity	• Power-point slides will be presented • Learners will read chapter twelve in Bloom text and will access: http://thebreakthrough.org/images/Death_of_Environmentalism.pdf, http://billmoyers.com/2005/02/25/welcome-to-doomsday-march-24-2005/

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Course Number: ??

Climate Change and Global Warming

The Hashemite University, Faculty of Natural Resources and Environment, Department of Water Management and Environment,

Fall Semester, 2014-2015

Instructor Information

Instructor: Dr. Mahmoud Abu-Allaban

Office Location: The Hashemite University Campus
Telephone: Office – +962 -5- 3903333 4567
Office Hours: S M TH 8.00-10.00
E-mail: mlaban@hu.edu.jo
Website:

Course Identification

Course Number: **??**
Course Name: Climate Change and Global Warming
Course Location: University Campus
Class Times: Wednesday 8:30pm – 11:30am
Prerequisites: Basic concepts in math and science
Faculty Web Page:

Course Description/Overview

The purpose of this course is to provide an overview of the climate change and global warming issue, from its theoretical discovery by atmospheric scientists, to its potential effects on the globe, linkages with resource management and sustainable development, and options for response. Climate history of the Earth and background concepts; climate processes; historical and future climate change; global warming; causes of climate change; human effects on climate; health impacts of climate change; ecosystem impacts of climate change. The course considers the rate of climate change, and what we must do to adapt our philosophies, economics, and lifestyle to reduce carbon emissions. The course will also cover the on-going policy debates at the international scale, including responses to the Kyoto Protocol and Copenhagen Accords.

The course will emphasise on modern climate change, anthropogenic forcing and measured and predicted consequences of this forcing. To understand modern climate change and predictions, it is necessary to develop an understanding of natural climate forcing, natural variability and feedbacks in the climate system. Students will be concurrently studying the earth's climate history, and modern climate change; because it is important to put modern climate change into context, both in terms of the timescale and magnitude of the observed and predicted changes. In addition, studying past climate changes gives an insight into how the climate system operates.

Course Learning Objectives

Upon completion of this course students should be able to describe how the Earth's climate system works and summarize general atmosphere circulation patterns, ocean circulation patterns and climate oscillations. Students should be able to illustrate components of the Earth's carbon cycle and quantitatively describe how addition of CO2 to the atmosphere through burning fossil fuels will influence the climate. Importantly, students will gain the scientific basis to analyse and critique policy issues related to global warming.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

70. Define the terms weather and climate and explain the effect they have on daily life;
71. Explain what the 'greenhouse effect' refers to and explain its significance;
72. Examine how changes in the atmosphere affect global climate conditions;
73. Describe the carbon cycle and assess the impact of changes to the cycle; Demonstrate a solid understanding of the climate system;

74. Evaluate the various factors that shape climate;
75. Explain the concept of climate change;
76. Describe the causes of climate change;
77. Examine the effects of climate change;
78. Describe how past climates contribute to our current understanding of climate change;
79. Consider the different viewpoints/perspectives that exist about climate change;
80. Explain the consequences, risks, and uncertainties of climate change;
81. Suggest strategies at a global, national, local and personal level to manage climate change;
82. Examine the effectiveness of climate change management strategies.

Assignments and Grading Scheme

Grading System

Letter grades (from highest to lowest) A+, A, A−, B+, B, B−, C+, C, C−, D+, D, D−, and F are used.

Grading Policy

Grades are based on the following:

First Exam	15%
Second Exam	15%
Final Exam	50%
Assignments	10%
Class attendance	10%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Students are expected to attend all classes. You cannot pass the class under any circumstances if you miss more than six classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	21/9/2014	Chapter 1 - Introduction to Global Climate Change *The Discovery of Global Warming* by Spencer Weart *Global Climate Change Research Explorer*
2	28/9/2014	Chapter 2 - History of Earth's Climate *What is Paleoclimatology?* by US NOAA *Earth's Climatic History* by Pidwirny
Eidul-Adha Break (5/12/2014-10/12/2014)		
3	12/10/2014	Chapter 3 - Causes of Climate Change *Global Warming Facts and Our Future* *Causes of Climate Change* by US EPA Encyclopedia of Earth: *GH effect*
4	19/10/2014	Chapter 4 - World of Tomorrow: Computer Simulation Models *Simple Models of Climate Change* by Weart *GCMs* by Weart IPCC *Chapter on GCMs*
5	26/10/2014	Chapter 5 – Biological Impacts of Higher Carbon Dioxide Concentrations *Food Quality* by Bloom

6	2/11/2014	Chapter 6 - Climate Change and the Biosphere Encyclopedia of Earth: *Biosphere*, *Ecosystem Disturbance*, *Species Shifts*

Course Syllabus

Course Number: (**110302238)**

Teaching Methods of Chemistry and Geology Concepts
Hashemite University, Faculty of Educational Sciences, Department of Curricula & Instruction,
Fall Semester, 2014-2015

Instructor Information

Instructor: Dr. Ahmad Qablan
Office Location: Economics Building 241
Telephone: Ext. 5070
Office Hours:
E-mail: ahqablan@gmail.com
Website:

Course Description/Overview

This course intends to help education students to incorporate several contemporary teaching strategies to teach chemistry and geology concepts. Case method teaching can increase students' interests in studying chemistry, concept mapping deepens student understanding, Predict-Observe-Explain (POE) strategy increases the level of classroom interaction, workshops and problem-based learning provide students with an opportunity to acquire effective problem solving techniques, 5E instructional model helps students design and teach their science lessons in an interactive way.

Course Learning Objectives

The overarching goals of this course are: a) to help students understand the constructivist perspective in designing learning experiences. b) Encourage students to link the scientific concepts to relevant environmental and sustainability issues to enable learners to become reflective learners, know their roles and responsibilities of an active citizen, and contribute in maintaining a sustainable future for all; and c) design and deliver their own science lessons in the classroom.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

83. Discuss the various epistemologies of curricula addressing issues of education for sustainability.
84. Connect their science content to the environment and sustainability issues.
85. Develop a lesson plan built according to the 5E instructional model and deliver it in the classroom.
86. Use social media (i.e. Facebook) to communicate with their classmates and contribute in raising their environmental sustainability awareness.
87. Apply recent classroom teaching techniques in their teaching and especially those that enhance students' critical thinking and reflective learning skills.
88. Demonstrate awareness and ability to advocate for sustainability education in their teaching.

Course Resources

Required Course Texts and Materials

- Hands-out prepared by the instructor for the class

- Rodger W. Bybee, Joseph A. Taylor, April Gardner, Pamela Van Scotter, Janet Carlson Powell, Anne Westbrook, and Nancy Landes. (2006). The BSCS 5E Instructional Model: Origins and Effectiveness. A Report Prepared for the Office of Science Education. National Institutes of Health.

- Rodger W. Bybee. (2009). A Commissioned Paper Prepared For A Workshop On Exploring The Intersection Of Science Education And The Development Of 21st Century Skills. The National Academies, Board on Science Education.

- Baodi Gou. (2003). Contemporary teaching strategies in general chemistry. The China Papers.

- UNESCO. (2010). Teaching and Learning for a Sustainable Future.
    - Curriculum Rationale.
    - Across the curriculum.
    - Contemporary issues.
    - Teaching and learning strategies.

- Keeley. Page. (2008). An introduction to formative assessment classroom techniques. Science Formative Assessment: 75 Practical Strategies for Linking Assessment, Instruction, and Learning.

- Keeley. Page. (2008). Integrating FACTS with instruction and learning. Science Formative Assessment: 75 Practical Strategies for Linking Assessment, Instruction, and Learning.

- Keeley. Page. (2008). Get the FACTs! 75 science formative assessment classroom techniques. Science Formative Assessment: 75 Practical Strategies for Linking Assessment, Instruction, and Learning.

Assignments and Grading Scheme

Grading Policy

Grades can be based on the following:

Assignments	20%
Exams	60
Class attendance/participation	20%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than 6 classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 20% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Description/Overview

Education is the most effective means that society possesses for confronting the challenges of the future. Indeed, education continuously shapes and reshapes the world of tomorrow. As the world is facing serious environmental problems that could threaten the existence of all mankind on earth, the course "teaching and learning for a sustainable world" comes to help teachers better prepare future generations on how to deal with various environmental problems and issues. It seeks to help them better understand the complexity of the world around us? How are the problems of our world interconnected, and what does that imply for their solution? What kind of world do we want for the future, within the limits of our Earth's life support systems? How can we reconcile the requirements of economy, society, and the environment?

The course intends to strengthen teachers' capacities to learn diverse ways to reorient their everyday classroom teaching and learning and address the global and local environmental concerns. The course adopts Inquiry-based learning approach as an overall guiding model of learning. Inquiry is most consistent with development of the skills for lifelong learning as it prepares learners to know what to do when the options before them are not clear. Inquiry approach is directed by questions that learners work together to address. Both process and products of learning are assessed.

Course Learning Objectives

Educating for a sustainable future is not so much about a destination as about the process of learning to make decisions that consider the long-term economy, ecology and equity of all communities. Its goal is to build an enduring society, which involves learning how to anticipate the consequences of our actions envision a sustainable future and create the steps needed to achieve the vision. Individuals and societies will perpetually have to make choices. How those choices are made and the information and ethical discernment used in making them will determine whether our visions of a sustainable future are achieved.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

- To develop an appreciation of the scope and purpose of educating for a sustainable future.
- To clarify concepts and themes related to sustainable development and how they can be integrated in all subject areas across the school curriculum.
- To enhance skills for integrating issues of sustainability into a range of school subjects and classroom topics.

- To enhance skills for using a wide range of interactive and learner-centred teaching and learning strategies that underpin the knowledge, critical thinking, values and citizenship objectives implicit in reorienting education towards sustainable development.
- To encourage wider awareness of Information and Communication Technologies (ICTs), the potential of multimedia-based approaches to education and the potential of the Internet as a rich source of educational materials.
- To enhance skills in computer literacy and multimedia education.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		**Course Overview** Discussion of syllabus and assignments, course requirements and prerequisites.
2-4		**Module 1: Introducing ESD**: An introduction to global realities, imperatives for sustainable development and educational issues that form the rationale for Educating for a Sustainable World. The topics that will be explored through this module are: • Exploring global realities • Understanding sustainable development • Reorienting education for a sustainable future
5-8		**Module 2: Sustainable Development across the Curriculum**: An overview of ways in which Educating for a Sustainable Future can be integrated into all areas of the curriculum. The topics that will be explored through this module are: • Sustainable futures across the curriculum • Learning Cycle as a model of inquiry teaching and learning • Supporting strategies to connect between instruction, assessment, and classroom management
9-12		**Module 3: Current Issues:** An illustration of how different curriculum themes may be reoriented to integrate an

		interdisciplinary emphasis on sustainable futures. The topics that will be explored through this module are: • Understanding world hunger • Population & development • Culture for a sustainable future • Women & sustainable development • Sustainable communities
13-16		**Module 4: Teaching & Learning Strategies**: Practical advices on using teaching and learning strategies that can help students achieve the wide range of knowledge, skill and values objectives of Education for Sustainable Development. The topics that will be explored through this module are: • Experiential learning • Storytelling • Inquiry learning • Future Problem Solving • Learning outside the classroom • Community Problem Solving

fall Semester 2014/15

Econometrics (110201327)

SYLLABUS

Dr. Usama Robin alqalawi
Office number: 334 economic and managerial since
Email: urmal-qalawi@hu.edu.jo

Office Hours: .....
Meeting Times:.....

==========

Required Text and Supplements

1- Harris, Jonathan M., and Brian Roach. *Environmental and natural resource economics: A contemporary approach*. ME Sharpe, 2013.
2- Van den Bergh, Jeroen CJM, ed. *Handbook of environmental and resource economics*. Edward Elgar Publishing, 2002

Supporting Material:

Over the Internet**:** see website http://www.gdae.org/environ-econ.

Course Objectives:

This course analyzes the environmental problem from economics perspective. Issues regarding the use of scarce natural resources and its impact on the surrounding environment will extensively covered. The course will cover both general methodological principles and specific applications. We will consider the efficient and reasonable use of society Environmental resources such as the atmosphere, water, land, , and ecological systems.

Grading

The final grade distribution is as follows:

Homework's, Attendance, In-Class Exercises, Quizzes:… . 10 Points
First Midterm: …… (Ch. I and 1-6)… …….. 20 Points
Second Midterm: …… (Ch. I and 8-11)… …….. 20 Points
Project ……. … 10 Points
Final Exam: To be announced …(comprehensive) …… 40 Points
Total:……100 Points

Learning Outcomes:

Knowledge outcomes

- A broad knowledge of environmental problem.
- Theoretical background for the standard methods used in empirical analyses

Skills

- The ability to critically and systematically analyze and evaluate policies and programs.
- Practice environmental and natural resource decision-making.

.

Competence

- ethical commitment
- Ability to analyze and synthesize

Quizzes and Exams:

I will **NOT** accept excuses for missed exams or quizzes. Arrangements of using make-up exam can be made in advance in extraordinary circumstances. No make-up quiz will be held. The final examination will be comprehensive

Homework:

Homework is assigned and graded. Homework problems are to be considered an integral part of the course. It is up to the students to make sure he/she knows how to solve the problems in homework set. The exams will be designed to distinguish students who work out and study the homework problems.

Lectures Schedule

Week (1-6)

- Chapter 1: **Changing Perspectives on the Environment (3 lectures)**

1. Economics and the Environment.
2. A Framework for Environmental Analysis
3. Environmental Microeconomics and Macroeconomics

- Chapter 2 : **Resources, Environment, and Economic Development (3 lectures)**
  1. A Brief History of Economic Growth and the Environment
  2. A Summary of Recent Growth
  3. The Future of Economic Growth and the Environment
  4. Sustainable Development
- Chapter 3 : **The Theory of Environmental Externalities (3 lectures)**
  1. The Theory of Externalities
  2. Welfare Analysis of Externalities
  3. Property Rights and the Environment

- Chapter 4 : **Common Property Resources and Public Goods (3 lectures)**
  1. Common Property, Open Access, and Property Rights
  2. The Environment as a Public Good
  3. The Global Commons
- Chapter 6: **Valuing the Environment**
  1. Total Economic Value
  2. Overview of Valuation Techniques
  3. Cost-Benefit Analysis **(4 lectures**)

- Review **(1 lecture**)
- First Midterm **(1 lecture**)

Week 7- 12

- Chapter 8: **National Income and Environmental Accounting (4 lectures)**
  1. Greening the National Income Accounts
  2. Environmentally-Adjusted Net Domestic Product
  3. Adjusted Net Saving
  4. The Genuine Progress Indicator
  5. The Better Life Index
  6. Environmental Asset Accounts
  7. The Future of Alternative Indicators
- Chapter 9: **Population and the Environment(4 lectures)**
  1. The Dynamics of Population Growth

2. Predicting Future Population Growth
3. The Theory of Demographic Transition
4. Population Growth and Economic Growth
5. Ecological Perspectives on Population Growth
6. Population Policies for the Twenty-First Century

- Chapter 10: **Agriculture, Food and Environment(4 lectures)**
  1. Feeding the World: Population and Food Supply
  2. Trends in Global Food Production
  3. Projections for the Future
  4. Agriculture's Impact on the Environment
  5. Sustainable Agriculture for the Future?
- Chapter 11: **Resources: Scarcity and Abundance (4 lectures)**
  1. The Supply of Non-Renewable Resources
  2. Economic Theory of Non-Renewable Resource Use
  3. Global Scarcity or Increasing Abundance?
  4. Environmental Impacts of Mining
  5. The Potential for Recycling
- **Review (1 lecture**)

- **Second midterm (1 lecture**)

Week 13

- Chapter 12: **Energy: The Great Transition (3 lectures)**
  1. Energy and Economic Systems
  2. Evaluation of Energy Sources
  3. Energy Trends and Projections
  4. Energy Supplies: Fossil Fuels
  5. The Economics of Alternative Energy Futures
  6. Policies for the Great Energy Transition
- **Review (1 lecture**)

Week 14

- **Final Exam**

Classroom Rules

1-Students must show the most respect toward each other and the instructor.
2-Come to class on time , and don't leave early unless permission has been obtained.
3- Students should not carry conversations with each other, or talk to cell phone during class lecture and discussion.
4- Students are not allowed to read non-assigned materials.
5- It's the student responsibility to inform the instructor " **a week** " prior if there is a conflict with an exam.
6- It's the student responsibility to know how to deal with Module.

Course Identification

Course Number: ??
Course Name: Renewable Energy Resources
Course Location: University Campus
Class Times: Wednesday 5:00pm – 8:00am
Prerequisites: Basic concepts in math and science
Faculty Web Page:

Course Description/Overview

Energy plays a dominant role in our modem industrial society. Rapid growth of energy consumption has had a noticeable impact on the climate. This course will address the issues of sources of renewable, energy conversion technologies, air pollution and other environmental effects related to energy extraction and consumption, and finally the important issues of conservation and public policy. The course will also explore society's present needs and future energy demands, and focus on alternate, renewable energy sources such as solar, biofuel, wind power, geothermal, and hydropower. Energy conservation methods will be emphasized.

Course Learning Objectives

Upon the completion of this course students should be familiar with major renewable energy technologies and their implications on the climate systems. Students will understand the principals of solar, wind, hydropower, geothermal, and biomass, and appreciate their roles in reducing atmospheric carbon.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. List and generally explain the main sources of energy and their implications in the climate;

2. Describe the challenges and problems associated with the use of various energy sources, including fossil fuels, with regard to on-going climate change;

3. Discuss remedies and potential solutions to climate change issues associated with fossil fuels;

4. List and describe the primary renewable energy resources and technologies.

5. Convert units of energy—to quantify energy demands and make comparisons among energy uses, resources, and technologies.

6. Collect and organize information on renewable energy technologies as a basis for further analysis and evaluation.

Course Resources

by John Schaeffer.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

Letter grades (from highest to lowest) A+, A, A−, B+, B, B−, C+, C, C−, D+, D, D−, and F are used.

Grading Policy

Grades are based on the following:

First Exam	15%
Second Exam	15%
Final Exam	50%
Assignments	10%
Class attendance	10%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Students are expected to attend all classes. You cannot pass the class under any circumstances if you miss more than six classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics
1	21/9/2014	Introduction to energy systems and resources
2	28/9/2014	Energy efficiency, sustainability & the environment
Eidul-Adha Break (5/12/2014-10/12/2014)		
3	12/10/2014	Quantifying energy & energy arithmetic Heat to motive power
4	19/10/2014	Electricity - a primer Fossil fuels - past, present & future
5	26/10/2014	Remedies & alternatives for fossil fuels CHP/cogeneration Energy efficiency and conservation
6	2/11/2014	Solar - thermal Solar - PV
7	9/11/2014	Green building
8	16/11/2014	Wind – small & large Hydro – small & large Wave & tidal
9	23/11/2014	Geothermal
10	30/11/2014	Biofuel
11	7/12/2014	Biodiesel - uses, production, processes, ethanol - issues & future prospects
12	14/12/2014	Fuel cells

		Transportation - hybrids, flexfuels, fuel cells

CLIMASP COURSE MODULES TEMPLATE

Instructor: **Dr. Theodora De Baz**

Course	**Biological Concepts and Methods of Teaching Biology**
Module 1	**Diversity of Living Organisms:**
Key Concepts	Biodiversity, Taxonomy, Food Chain, Climate Change, Sustainability.
Overview	Asking students what is meant by biodiversity and why the classification procedure helps in understanding biodiversity better. Emphasis will be made on the inter-dependence of the biotic components in our ecosystems: producers, consumers, and decomposers. Questions to be addressed in this module include the following: What are the impacts climate change on plants, animals, aquatic life, and human well-being? Does climate change cause loss among species, and why is it considered as one of the major current threats to biodiversity.
Aim	The main aim of this module is to introduce students to the wide variety of living organisms in a natural habitat, and explore the benefits of biodiversity. Emphasis will be made on the enormous impacts of the environmental conditions that can be collectively coined "climate change" on species diversity and people's livelihoods.
Learning Outcomes	At the end of this module, students will be able to: • Identify and discuss the classification of living organisms. • Explain how plants and animals support each other in the food chains

	or food webs. • Discuss that biodiversity have direct and indirect economic benefits to humans as well as to our ecosystem. • Identify the threats caused by climate change to biodiversity and habitat loss. • Become aware of the over-exploitation of the forest resources through deforestation. • Appreciating the ethical aesthetic values of the different types of ecosystems. • Act as a responsible citizen for preserving the ecosystems for the present and future generations.
Units	Unit 1.1 Monera Unit 1.2 Protista Unit 1.3 Funji: Zygomycota, Ascomycota, Basidiomycota Unit 1.4 Plantae Kingdom: Bryophytes and Ferns, Gymnosperms, Angiosperms: Monocotyledons & Dicotyledons Unit 1.5 Animalia Kingdom: Porifera, Cooelenterate. Platyhelminthes, Nematoda, Annelid, Arthropoda, Mollusca, Echinodermata, Protochordata, Vertbra: Pieces, Amphibia, Reptila, Aves, Mamilla.
Readings	Laurance, W.F. Habitat destruction: death by a thousand cuts Lovejoy, T. E. (2010). Climate Change. In: Sodhi NS, Ehrlich PR, editors. Conservation Biology for All. Great Clarendon Street, Oxford: Oxford University Press. P. 153-162. Climate change Lovejoy, T. & Hannah, L. (2006). Climate Change and Biodiversity. TERI Press. ISBN 81-7993-084-X. Maciver, D., & Dallmeir, F. (2008). Climate Change and Biodiversity in the

	Americans. Symposium held at the Smithsonian Tropical Research Institute, Panama, February 25-29. Online at: www.climatechangeandbiodiversity.ca. Rediscovering Biology: Online Textbook Unit 12, Annerberg Media: Online at:www.learner.org/courses/biology/textbook/biodiv Sodhi, N. S. & Ehrlich, Conserving Biology for All http://www.mongabay.com/conservation-biology-for-all.html
Activity	**Assignment 1: Drawing A Classification Chart** This activity will develop students' skill in organizing their knowledge into a concept map. **Assignment 2: Identifying Food Chains** In small groups, students discuss the connections between species and brainstorm examples of food chains. **Assignment 3:** Writing reports on the fauna and flora in the country, with special emphasis on the trees and wild plants.
Module 2	**Cell and Tissue Structure and Function:**
Key Concepts	The Cell, The Cell Theory, Cytology, Animal Cell, Plant Cell, Animal Tissues, Plant Tissues, Skin Care and protection.
Overview	Students are introduced to the most basic unit of structural organization within living things that consist of many parts, called organelles. The nucleus contains genetic material that determines an organism's chemical and physical characteristics. Cells vary in their shape and function. Similar

	cells working together are collectively called a tissue. Emphasis are also made on the importance of taking good care of our body cells and , and preventing the physical agents such as heat and harmful UV radiation that may damage cells by coagulating their contents. Smoking is another cause of skin damage and premature aging.
Aim	The aim of this module is discuss the anatomy and physiology of the cell/tissue structures and the physiological processes which occur therein within living organisms.
Learning Outcomes	At the end of the module, learners will be able to: • Describe the structure and function of the different cell organelles and how they are assembled. • Describe the different organelles and their functions. • Describe the main types of tissue, their classification, structure, and the physiological processes that occur therein • Practice personal hygienic behaviors
Units	2:1 Cell Theory, Animal and Plants Cells 2:2 Cell Organelles: cell membrane, nucleus and DNA replication; ribosome and protein synthesis; centriole and cell division (mitosis and meiosis); lysosomes and role in phagocytosis ; mitochondria and cellular respiration; golgi apparatus; cytoskeleton and cell motility; endoplasmic reticulum and functions. 2:3 Plant Tissues: Meristematic, Collenchyma, Parenchyma, Sclerenchyma, Xylem, Phloem 2:4 Animal Tissues: Epithelial, Connective, Muscular, Nervous
Readings	Campbell, Reece, Taylor, Simon, Dickey 2009, Biology Concepts and

	Connections, 6th Edition, Pearson [ISBN: 978-0-321-52650-2] Krogh, David 2009, Biology, A Guide to the Natural World, 4th Edition, Pearson [ISBN: 978-0-321-56371-2] Neil A. Campbell, BIOLOGY [ISBN: 0-13-135691-7] Wayne M. Becker... [et al.], The World of the Cell [ISBN: 0805393935]
Activity	Assignment: Writing a report on how to care for our skin and protect it from harmful radiation.
Module 3	**Human Body Systems**
Key Concepts	Human Body Systems: Digestive, Respiratory, Circulatory, Nervous.
Overview	The human body is made up of several organ systems that all work together as a unit to make sure the body keeps functioning. There are ten major organ systems in the body, each of which plays a different role in helping the body work. In this unity four body systems are discussed. The Circulatory system is made up of the heart, blood, and blood vessels. It is concerned with circulating blood to deliver oxygen and nutrients to every part of the body. The purpose of the Digestive System is to turn the food you eat into something useful for the body, and how the body uses this system to digest food so the cells can make energy. The purpose of the Respiratory System is to supply the blood and oxygen to all parts of the body. While the nervous system is the control center in the human body. It receives and interprets stimuli and transmits impulses to organs to coordinate all the body's actions and reactions. A discussion of the impact of climate change on food and nutrition security and global spread of infectious diseases will take place at the end of the unit.
Aim	The main purpose of this module is to present a review of the human body,

	its major systems, and their primary functions. This module contains four units, each with introduction to the structures and functions of that system.
Learning Outcomes	Upon completion of this module, the students should be able to: • Describe the anatomy and physiology of each major body system. • Define common terminology related to the anatomy and physiology of each body system. • Become aware that Climate Change have led to the emergence of large-scale environmental hazards to human health. • Develop an awareness of the impact of climate change has an on food and nutrition security and global spread of infectious diseases. • Acquire the vocabulary associated with the human body systems.
Units	4:1 The Digestive System & Nutrition 4:2 The Respiratory System 4:3 The Circulatory System 4:4 The Nervous System
Readings	Human Anatomy: Human Body Systems http://www. innerbody.com/the-human-body/ Biology: The Human Body, Brightstorm http://www.brightstorm.com/science/biology/the-human-body/

Activity	Students are asked to investigate the impacts of climate change on the community's public health and safety systems, and address the factors that have an effect on young children, older adults and people with medical conditions. (Heat waves can lead to heart strokes and dehydration)
Module 4	**Transfer of Energy: Photosynthesis & Cellular Respiration**
Key Concepts	Photosynthesis, Cellular Respiration,
Overview	Students are introduced to the process of photosynthesis and how usable energy is captured from sunlight by chloroplasts and is stored through the synthesis of sugar from carbon dioxide, and how how chemical energy in food is converted to a form of usable energy (ATP) during the process of Cellular Respiration. A discussion of the role played by photosynthesis in Climate Change mitigation is also discussed.
Aim	The main aim of this module is to compare Photosynthesis to cellular respiration, and explain how both are essential processes in Carbon cycle and transfer of energy in the ecosystem.
Learning Outcomes	At the end of the module, learners will be able to: • Demonstrate knowledge of Photosynthesis • Demonstrate knowledge of Cellular Respiration . • Discuss how Photosynthesis and Cellular Respiration are connected.

	• Understand the significant role photosynthesis plays in Climate Change Mitigation. • Act as a responsible and caring citizen who participates in projects involving planting trees.
Units	3.1 Photosynthesis: Light Absorption Spectrum, 3.2 Cellular Respiration: Aerobic and Anaerobic Respiration. 3.3 Climate Change Mitigation
Readings	Campbell, Reece, Taylor, Simon, Dickey 2009, Biology Concepts and Connections, 6th Edition, Pearson [ISBN: 978-0-321-52650-2] Krogh, David 2009, Biology, A Guide to the Natural World, 4th Edition, Pearson [ISBN: 978-0-321-56371-2] Neil A. Campbell, BIOLOGY [ISBN: 0-13-135691-7] Sodhi, N. S. & Ehrlich, Conserving Biology for All. Online at: http://www.mongabay.com/conservation-biology-for-all.html Wayne M. Becker... [et al.], The World of the Cell [ISBN: 0805393935]
Activity	Conducting an experiment "Photosynthesis and Respiration in Elodea". Students are asked to design an experiment which will allow them demonstrate the changes in carbon dioxide concentration associated with both respiration and photosynthesis in the fresh water plant *Elodea*.
Module 5	**Nature of Science, Teaching & Learning Strategies**
Key Concepts	Nature of Science, Educational Objectives, and Instructional Strategies, Climate Change, Sustainable Development.

Overview	Education is a key strategy for achieving a more sustainable society. Integrating the topic of climate change and related sustainability issues in teaching, support students in developing more holistic and interdisciplinary world views and understanding.
Aim	The aim of this unit is to introduce student to the nature of science, getting acquainted with the three domains of educational objectives, and offer practical advices on using teaching and learning strategies that can help students achieve the wide range of knowledge, skills and values for sustainable development.
Learning Outcomes	At the end of the module, learners will be able to: • Demonstrate knowledge of the nature of science • Discuss the three domains of the educational objectives. • Embrace the Five ESD competencies: To know, to be, to do, to work together, and to transform the world. • Adopt a number of values and attitudes: Preserving nature, concern for the future generations, living in harmony with the environment, and Secure full commitment to sustainable development at the personal, local, national, and global levels • Apply a number of instructional strategies in their teaching • Use scientific thinking processes to conduct investigations. •
Units	Unit 5:1 Nature of Science: Characteristics, Values, Assumptions Unit 5:2 Educational Objectives: Domains: Cognitive, Affective, Psychomotor Unit 5:3 Teaching & Learning Strategies:

	• Storytelling • Inquiry learning • Future Problem Solving • Learning outside the classroom • Community Problem Solving • Experiential learning
Readings	UNESCO. (2010). Teaching and Learning for a Sustainable Future. . Climate Change Education for Sustainable Development, **UNESCO.** Mustante, S. (2011). Teaching Biology for a Sustainable Future. **BioScience, 61** (10), 751. Online at: biosience:oxfordjournals.org/content/61/10/751.full. Robinson, Z. (2011). Teaching Climate Change in Higher Education: Barriers and Opportunities. In Haslett, France & Gedye (Eds.) . Pedagogy of Climate Change. Online at: www.gees.ac.uk/pub/other/pocc/chapter%204.pdf.
Activity	Assignment 1: Students are asked to write an essay about the local and global impact of the scientific discoveries and human activities on the living style of the population, health, and the biosphere. Assignment 2: When discussing the Education Objectives at the Affective Domain, students are asked to give examples of the values and ethics on sustainability that have to be considered, motivated, and sustained.

	Assignment 3: Dividing the class into groups. Each group is asked to introduce a teaching strategy and present a lesson to the class that deals with climate change or an environmental issue.

CLIMASP COURSE SYLLABUS TEMPLATE

Biological Concepts and Methods of Teaching Biology

مفاهيم بيولوجية وطرق تدريسها

Hashemite University

Faculty of Educational Sciences

Department of Curricula & Instruction

First Semester (Fall), 2014/2015

Instructor Information

Instructor: **Dr. Theodora De Baz**

Office Location: Faculty of Educational Sciences, Economics Building Room 139

Telephone: Office – 5 390 3333, Ext. 4211
Office Hours: 1:00 – 2:00 Sunday –Tuesday - Thursday
E-mail: tdebaz@gmail.com

Course Identification

Course Number: **110302130**

Course Name: **Biological Concepts and Methods of Teaching Biology**

Course Location: Economics Building

Class Times: Section 1: Sunday, Tuesday & Thursday 2:00-3:00
Section 2: Monday & Wednesday 8:00-9:30

Faculty Web Page: http://www.hu.edu.jo

Course Description/Overview*

This course will introduce students to the principles of biological sciences, the diversity of living organisms, cells and tissues structure and function, human body systems, nutrition and good health, energy transfer in plants (photosynthesis and cellular respiration), genetics, nature of science, educational objectives, constructivism approach, and methods of teaching theses topics, namely: cooperative learning , concept maps, conceptual change, scientific projects, dry labs, STS, and how the principles of climate change and sustainable development (ESD) could be effectively integrated into the biological concepts and the instructional methods.

Course Learning Objectives

The general objectives of this course are as follows:

1- Classify the Living organisms according to Six-Kingdoms and three-Domain classification systems.
2 - Appreciate the value of diversity
3- Understand the range of local and international issues facing today's global Community.

4- Demonstrate knowledge of the process of Photosynthesis and the significant role it plays in Climate Change Mitigation.
5- Demonstrate knowledge of Cellular Respiration and how chemical energy in food is converted to a form of usable energy (ATP).
6- Compare photosynthesis to cellular respiration, and how both are essential processes in Carbon cycle and transfer of energy in the ecosystem
7- Describe the relation of form, function of cells structures and tissues.
8- Describe the structure and explain the function of human body systems.
9- Describe mechanisms that living organisms use to combat disease.
10- Integrate the principles of Nature of science
11- Employ a variety of effective ESD teaching techniques in presenting scientific concepts.
12- Appreciate the concept of becoming life-long learners and developing competencies in integrating ESD strategies in their teaching

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

A) Demonstrate knowledge of biology concepts.

B) Embrace new behaviours and practices that contribute to becoming responsible active citizens who contribute to building a sustainable world, through adopting values and ethics conductive to climate change and global understanding.

C) Tackle environmental problems and become aware of the issues related to environmental destruction, and how contribute to building a better world.

D) Act as a member of a global community in working individually and collectively towards a better man-nature relationships.

Through applying various pedagogical strategies e.g.: group-work, self reflection, peer discussions on global real life topics or controversial issues, in addition to employing alternative means of assessment, as performance tasks, data gathering assignments, research projects, oral presentations and portfolios.

Assignments and Grading Scheme

- **First Hour Exam (15%)**
- **Second Hour Exam (15%)**
- **Practical Assignments and Attendance (20%)**
- **Final Exam (50%)**

Important Dates to Remember

Course Schedule

Week	Topics
1+2	Diversity of Living Organisms
3	Cell and Tissue Structure and Function
4	Photosynthesis
5	Cellular Respiration

6	**First Hour Exam**
7	Human Body Systems - The Digestive System - The Heart and the Circulatory System
8	Human Body Systems - The Respiratory System - The Nervous System - Nutrition and Health
9	**Second Hour Exam**
10	Nature of Science
11	Educational Objectives
12	Constructivism in Teaching Science
13	Instructional Strategies
14	Instructional Strategies
15	Review
16	**Final Exam**

Course Policies

Attendance is required for all course sessions. Students are expected to participate in all class discussions, small group work, report writing, presentations, and other class activities.

Mobile phones should be turned off. Each student must bring to class his textbook, notebook, and pens, and is responsible for knowing the reading materials assigned, as well as what information was included in the lectures and class discussions. Make-up tests will be given only in the event of valid excuse. Acts of dishonesty include (but not limited to) cheating, plagiarism, and forgery. Plagiarism is defined as the

"unacknowledged use of someone else's work is in effect an attempt to deceive one's reader into thinking it is one's own work". This includes handing in the product of other students, or complete papers and materials from the Internet. Academic dishonesty will impact the continuation of the course and can jeopardize the successful completion of the program.

Course	**Developmental Biology**
Module 1	Introduction to developmental biology
Key Concepts	Embryo, questions of developmental biology, genomic equivalence
Overview	In this module we set the distinction between developmental biology and embryology and introduce the definition of the science and all the progress that has happened for this science since 350 bc. We will also discuss the difference between epigenesis and preformation. One of the most difficult questions of developmental biology is what breaks egg symmetry, we will try to answer the question
Aim	To understand the main questions asked by developmental biologists and the tools used to answer these questions.
Learning Outcomes	At the end of this module learners will be able to: • Understand how a single cell (the fertilized egg) can give rise to an adult • Understand how one adult can give rise to another adult
Units	Unit 1.1 Introduction to Developmental Biology Unit 1.2: Genomic Equivalence Unit 1.3: Cell-Cell Communication
Readings	Developmental Biology, Scott Gilbert, Sinauer Associates Inc., 2010, 9th ed
Activity	**1) Assignments:** 1. What is the role played by cell migration in development? 2. How is the egg symmetry broken?

	2) Role play: 1. Pick your role is with or against epigenesis. Apply your knowledge to your argument 2. Set up a play where each student is a model organism used in the study of developmental biology, each will discuss the role of this organism in the achievements and discoveries **3) Laboratory experiments:** Two weeks of laboratory to examine the tools used in developmental biology such as microscope, Western blotting, PCR, RT-PCR …etc.
Module 2	Sex Determination
Key Concepts	Sex chromosome, SRY region of Y chromosome, Environment
Overview	In this module we will discuss the possible mechanisms to determine the sex of the fetus in the different model organisms with an emphasis on the SRY region in the Y chromosome in humans and its role in sex determination. In addition, we will discuss briefly the role of the environment and climate change in sex determination, since it was found that Y sperms are only generated in alligators in the hot environment.
Aim	To understand the process of sex determination in different model organisms
Learning Outcomes	At the end of this module learners will be able to: • Explain the different mechanisms of sex determination • Discuss the role of SRY region and its relation to infertility and sex characteristics
Units	Unit 2.1: Sex determination

Readings	- Developmental Biology, Scott Gilbert, Sinauer Associates Inc., 2010, 9th ed - www.pubmed.com
Activity	**1) Assignments:** 1. What is the role played by SRY region in development of testis? 2. How does climate change affects gender selection? **2) Visits to in vitro fertilization centre to see real cases of SRY-related infertility and visit to reproduction physiology clinic to see real cases of SRY mutation cases** **3) Laboratory experiments:** PCR, RT-PCR testing of SRY mutation
Module 3	Gametogenesis
Key Concepts	Spermatogenesis, oogenesis, maturation arrest
Overview	This module will cover spermatogenesis in details discussing the anatomy of the male reproductive system, histology of the testis, structure of the seminiferous tubule, the role of the different spermatogenic cells and somatic cells (Sertoli and Lyedig), and the endocrinology and physiology of this process. The same will be done for oogenesis with a focus on the onset and timing of oogenesis and the effects of endocrine disruptors and climate change of the hormonal regulation of gametogenesis
Aim	To examine the process of gametogenesis in males (spermatogenesis) and in females (oogenesis) with a focus on physiology and endocrinology
Learning Outcomes	At the end of this module learners will be able to: • Explain the development of the male and female reproductive systems • Discuss the structure and function of testis and ovary • Explain the process of spermatogenesis and oogenesis

Units	Unit 3.1: Spermatogenesis *Unit 3.2: Oogenesis*
Readings	- Developmental Biology, Scott Gilbert, Sinauer Associates Inc., 2010, 9th ed - www.pubmed.com
Activity	**1) Assignments:** 1. What is the difference between spermatogenesis and oogenesis in terms of timing of onset? 2. How does climate change affects gametogenesis focusing on endocrine disrupters? **2) Role play** **The students will be divided into two groups, one discussing spermatogenesis and the other oogenesis** **3) Laboratory experiments:** - Microscopy: Sections of testis and ovary of mammals will be studied - Seminal fluid analysis
Module 4	Fertilization
Key Concepts	Capacitation, Acrosomal reaction, Zygote, Oocyte activation
Overview	This part will cover fertilization which is the union of egg and sperm that results in the formation of a zygote. The students will study in detail the steps of fertilization which include sperm activation and transport, acrosomal reaction, fusion of the plasma membrane of the gametes, prevention of polyspermy, fusion of the genetic materials of the gametes and oocyte activation. In addition, the students will be introduced to the different modes of fertilization whether internal or external. Finally the students will be introduced briefly to the effects of global warming on

	fertilization.
Aim	This module will cover the process of fertilization in details, exposing the students to different modes of fertilization and the effect of global warming on fertilization
Learning Outcomes	At the end of this module learners will be able to: • Explain the difference between internal and external fertilization • Discuss the steps of fertilization
Units	Unit 4.1: Fertilization
Readings	- Developmental Biology, Scott Gilbert, Sinauer Associates Inc., 2010, 9th ed - www.pubmed.com
Activity	**1) Assignment**: Term paper about in vitro fertilization procedure and a summary of the clinics in Jordan **2) Research proposal:** Write a proposal about the guidelines and laws that should be implemented to govern in vitro fertilization procedures and practices **3) Laboratory experiments:** - Sperm activation and in vitro fertilization of sea urchin oocyte - Visit to in vitro fertilization clinic to watch the procedure of: semen analysis, oocyte pick up, oocyte denudation, insemination and fertilization
Module 5	**Gastrulation**
Key Concepts	Cleavage, Yolk amount and distribution, Cell movement
Overview	This module discusses the different patterns of embryo cleavage and the factors affecting it such as yolk amount and distribution and the position of spindle fiber. In addition, the students will learn about the cell cytoskeleton and the role played by actin filaments and microtubules on

	cell migration and movement during embryo gastrulation.
Aim	To introduce the students to the different patterns of gastrulation employed by model organisms and the different modes of cell migration.
Learning Outcomes	At the end of this module learners will be able to: • Explain the different patterns of cleavage • Discuss the role played by yolk and spindle fiber on cleavage pattern • Explain the different modes of cell migration on gastrulation
Units	Unit 5.1: From zygote to gastrula
Readings	- Developmental Biology, Scott Gilbert, Sinauer Associates Inc., 2010, 9th ed - www.pubmed.com
Activity	**1) Laboratory experiments:** Microscopy: whole mount and cross sections of different organisms gastrula (sea urchin, frog, and chicken)
Module 6	**Early Development in Sea Urchin, Amphibians, Aves, and Mammals**
Key Concepts	Blastopore, blastocoel, archenteron
Overview	This module accumulates all of the students' knowledge of embryogenesis and cell biology to give an over-all picture of the stages between fertilization and gastrula of four model organisms used widely in the studies of developmental biology. We will start with sea urchin since it is the simplest and its early development resembles that of humans. Then we will move to amphibians, the frog as a model, we will focus on the differences between its development and that of sea urchin and the factors that cause this change. We will spend around three weeks studying chick

	development since its grastrulation is similar to that of humans. Finally, we will discuss early stages of human development.
Aim	This module will cover the stages in embryogenesis between fertilization and gastrulation in sea urchin, frog, chicken and humans
Learning Outcomes	At the end of this module learners will be able to: • Apply the knowledge they received in the previous modules to understand the processes between fertilization and gastrulation in 4 model organisms • List the differences between the four model organisms in term of embryogenesis
Units	Unit 6.3: Early development in sea urchin Unit 6.4: Early development in frog Unit 6.5: Early development in chicken Unit 6.6: Early development in human
Readings	- Developmental Biology, Scott Gilbert, Sinauer Associates Inc., 2010, 9th ed - www.pubmed.com
Activity	**1) Assignment:** - Write a term paper about the differences in the four model organisms in term of embryogenesis - Write 2 pages about the choice of model organism to study each phase of embryogenesis **2) Laboratory experiments:** - Microscopy: whole mount and sections of embryos in different stages (cleavage, blastula and gastrula) of sea urchin, frog, and chick
Module 7	**Late Development in Mammals**
Key Concepts	Germ layers, Organogenesis, neurulation
Overview	As biology students are always curious about their own development, the last module will discuss the late stages of human development starting

	with germ layer differentiation to histogenesis to organogenesis. We will be able to cover one system development, the nervous system, a process known as neurulation. We will finish our course with a discussion of how the environment affect nervous system development causing such malformations as spina bifida and anencephaly.
Aim	To understand the processes of germ layer development focusing on nervous system development
Learning Outcomes	At the end of this module learners will be able to: • List the different derivatives of each germ layer • Explain the process of nervous system development
Units	Unit 7.1: Late development in human
Readings	- Developmental Biology, Scott Gilbert, Sinauer Associates Inc., 2010, 9th ed - www.pubmed.com
Activity	**1) Assignment:** Term paper about the development of the three germ layers **2) Role play:** The students will be divided into two groups, one group defending global warming and denying its effects on germ layer development and the other group against global warming. **3) Laboratory experiments:** - Whole mount and sections of human/mammalian neurula - Visit to paediatric clinic and/or OB/GYN clinic witness real cases of nervous system malformation

JORDAN JU

Jerash University

Course Syllabus

College: Agriculture
Department: Food and Nutrition Science

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 607475
Course Name: Community Nutrition
Class Hours: (Times & Days)
Classroom: (Number & Building)

Prerequisites:

✓ **Course Description:**

This course will examine the role of nutrition in promoting, maintaining and improving health in the community. It investigates traditional aspects of the emerging health delivery system, as well as entrepreneurial programs in wellness. Students will study the financial, legislative, political, sociological, and scientific aspects of public and community health.
The overall objective of this course is providing an introduction to the practice of public health nutrition, discussion of significant public health nutrition problems, nutrition polices and physical activities, and nutrition programs available to the community.

✓ **Course Learning Objectives:**

1. Understanding the responsibilities of the community nutritionist
2. Nutrition program planning and evaluation strategies
3. Methods of nutritional assessment and intervention
4. Identification of nutrition programs and policies for various stages of the life cycle
5. Solving nutritional and health problems in a community setting

✓ **Expected Course Outcomes:**

1. Develop interventions to affect change and enhance wellness in diverse individual and groups.
2. Explain the impact of a public policy position on dietetics practice.
3. Explain the impact of health care policy and different health care delivery systems on food and nutrition services.

✓ **Course Resources:** (List the required course texts, course material, recommended websites, and other readings)

1. Reading material consists of handouts/internet websites.
2. Boyle, M. and Holben, D. 2013. Community Nutrition in Action: an entrepreneurial approach (6th edition). N.Y.:Thompson/Wadsworth.
3. http://www.ers.usda.gov/
4. http://www.ers.usda.gov/topics/food-nutrition-assistance/food-security-in-the-us/community-food-security.aspx
5. http://communityhealth.mc.duke.edu/dynamic/assets/ActionGuide.pdf

Part 3: Assignments, Course policies, and Grading Policy

✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to neither do their own work and neither gives nor receive unauthorized assistance.
- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines****: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topics
1	Introduction to Community Nutrition
2	Assessing Community Resources
3	Program Planning for Success
4	Principles of Nutrition Education
5	Marketing Nutrition and Health Promotion
6	Mothers and Infants: Nutrition Assessment, Services and Programs
7	Food Insecurity
8	Children and Adolescents: Nutrition Assessment, Services and Programs
9	Global Food and Nutrition Security: Challenges and Opportunities
10	Healthy Aging: Nutrition Assessment, Services and Programs
11	Public Health Nutrition & the New Nutrition Science
12	The Role of Nutrition in Health Disparities

Week	Topics
13	Introduction to Nutrition Policy
14	Changing Local and County Policies and Environments
15	Continuation
16	Final Exams' week

Part 5: Course Modules

Module 1; Introduction to Community Nutrition	
Key Concepts	Community Nutrition.
Overview	In order for nutrition to impact human health and well-being, it must be applied to human populations through community and population based intervention and education programs. Community nutrition is a modern and comprehensive profession that includes public health nutrition, dietetics/nutrition education, and medical nutrition therapy. Community nutrition deals with a variety of

	food and nutrition issues related to individuals, families, and special groups that have a common link such as place of residence, language, culture, or health issues. This module will introduce students to the field of community nutrition and its role in health and health care. It focuses also on the process and theoretical foundations of nutrition education and the theories, methods and research perspectives applicable to nutrition education. The role of the community nutritionist in determining, delivering and managing community nutrition services is emphasized along with the tools, skills and techniques necessary for developing effective services.
Aim	Enhance students understanding of community nutrition and its role in health care.
Learning Outcomes	At the end of this module students will be able to: 6. Define community nutrition concept **7.** Identify the role of community nutrition in population health.
Units	1. What is community nutrition 2. Public Health and Nutrition 3. Assessing Community Resources 4. Principles of Nutrition Education
Readings	-Boyle, M. and Holben, D. 2013. Community Nutrition in Action: an entrepreneurial approach (6th edition). N.Y.:Thompson/Wadsworth. -http://www.ers.usda.gov/ http://www.jblearning.com/samples/0763747602/47602_ch01_5165.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 2; Role of environment, food, nutrition and lifestyle choices in health promotion and disease prevention.	
Key Concepts	Environment, Nutrition, Health, Disease prevention.

Overview	Public health is the art of preventing diseases and promoting health and efficiency through organized community efforts. It was found that increasing nutrition knowledge and the effect of environment on health can reduce medical care costs and improve the quality of life. This module will focus on the role of environment, food and lifestyle choices that may affect and enhance individual's health by preventing diseases related to environmental changes, malnutrition, and bad lifestyle choices.
Aim	The overall aim of this module is to make students understand the relation between environment, nutrition, and health.
Learning Outcomes	At the end of this module students will be able to: 8. Apply knowledge of the role of environment, food and lifestyle choices to develop interventions to affect change and enhance wellness in diverse individuals and groups.
Lessons	1. Marketing Nutrition and Health Promotion 2. Changing Local and County Policies and Environments 3. Mothers and Infants: Nutrition Assessment, Services and Programs 4. Children and Adolescents: Nutrition Assessment, Services and Programs
Readings	-Boyle, M. and Holben, D. 2013. Community Nutrition in Action: an entrepreneurial approach (6th edition). N.Y.:Thompson/Wadsworth. -http://www.ers.usda.gov/ -http://www.ers.usda.gov/topics/food-nutrition-assistance/food-security-in-the-us/community-food-security.aspx -http://communityhealth.mc.duke.edu/dynamic/assets/ActionGuide.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 3; Fundamentals of Public Policy and Nutrition.	
Key	Public Policy, Nutrition.

Concepts	
Overview	You are what you eat. An old saying that recognizes the critical role that diet has on health. With the goal of improving the nutrition and health of targeted populations local governments have developed and implemented public health policies and programs to prevent nutritional deficiencies by providing nutritious foods, fortifying foods or beverages, and, more recently, limiting the calorie, fat, or sugar content of high-calorie, low-nutrient foods. This module will introduce to students the public policies that used by dietetics to reduce individuals health problems related to their nutrition.
Aim	Enhance students knowledge about public polices used by nutritionists.
Learning Outcomes	At the end of this module students will be able to Explain the impact of a public policy position on dietetics practice.
Units	1. Introduction to Nutrition Policy. 2. Legislative and Regulatory Basis of Dietetics Practice.
Readings	-Boyle, M. and Holben, D. 2013. Community Nutrition in Action: an entrepreneurial approach (6th edition). N.Y.:Thompson/Wadsworth. -http://www.ers.usda.gov/ -http://www.ers.usda.gov/topics/food-nutrition-assistance/food-security-in-the-us/community-food-security.aspx -http://communityhealth.mc.duke.edu/dynamic/assets/ActionGuide.pdf
Activities	Participation in class room, assignments and homework. Reading, group discussion, Giving examples, presentations, quizzes
Module 4; Health Care Systems.	
Key Concepts	Health, System.
Overview	Health care systems' goals are good health for the citizens,

	responsiveness to the expectations of the population, and fair means of funding operations. Progress towards them depends on how systems carry out four vital functions: provision of health care services, resource generation, financing, and stewardship. Other dimensions for the evaluation of health systems include quality, efficiency, acceptability, and health equity. This module will enhance students understanding of the impact of health care systems and policies on food nutrition services.
Aim	Enhance students understanding of the health care systems.
Learning Outcomes	At the end of this module students will be able to: **9.** Explain the impact of health care policy and administration, different health care delivery systems and current reimbursement issues, policies and regulations on food and nutrition services.
Units	1. Public Health Nutrition & the New Nutrition Science 2. The Role of Nutrition in Health Disparities
Readings	-Boyle, M. and Holben, D. 2013. Community Nutrition in Action: an entrepreneurial approach (6th edition). N.Y.:Thompson/Wadsworth. -http://www.ers.usda.gov/ -http://www.ers.usda.gov/topics/food-nutrition-assistance/food-security-in-the-us/community-food-security.aspx -http://communityhealth.mc.duke.edu/dynamic/assets/ActionGuide.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes

Jerash University

Course Syllabus

College: Agriculture
Department: Food and Nutrition Science

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 607475
Course Name: Community Nutrition
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

✓ **Course Description:**

This course will examine the role of nutrition in promoting, maintaining and improving health in the community. It investigates traditional aspects of the emerging health delivery system, as well as entrepreneurial programs in wellness. Students will study the financial, legislative, political, sociological, and scientific aspects of public and community health.
The overall objective of this course is providing an introduction to the practice of public health nutrition, discussion of significant public health nutrition problems, nutrition polices and physical activities, and nutrition programs available to the community.

- ✓ **Course Learning Objectives:**
  6. Understanding the responsibilities of the community nutritionist
  7. Nutrition program planning and evaluation strategies
  8. Methods of nutritional assessment and intervention
  9. Identification of nutrition programs and policies for various stages of the life cycle
  10. Solving nutritional and health problems in a community setting

- ✓ **Expected Course Outcomes:**
  4. Develop interventions to affect change and enhance wellness in diverse individual and groups.
  5. Explain the impact of a public policy position on dietetics practice.
  6. Explain the impact of health care policy and different health care delivery systems on food and nutrition services.

- ✓ **Course Resources:** (List the required course texts, course material, recommended websites, and other readings)
  10. Reading material consists of handouts/internet websites.

11. Boyle, M. and Holben, D. 2013. Community Nutrition in Action: an entrepreneurial approach (6th edition). N.Y.:Thompson/Wadsworth.
12. http://www.ers.usda.gov/
13. http://www.ers.usda.gov/topics/food-nutrition-assistance/food-security-in-the-us/community-food-security.aspx
14. http://communityhealth.mc.duke.edu/dynamic/assets/ActionGuide.pdf

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*
- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to neither do their own work and neither gives nor receive unauthorized assistance.

- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines****: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topics
1	Introduction to Community Nutrition
2	Assessing Community Resources
3	Program Planning for Success
4	Principles of Nutrition Education
5	Marketing Nutrition and Health Promotion
6	Mothers and Infants: Nutrition Assessment, Services and Programs
7	Food Insecurity
8	Children and Adolescents: Nutrition Assessment, Services and Programs
9	Global Food and Nutrition Security: Challenges and Opportunities
10	Healthy Aging: Nutrition Assessment, Services and Programs
11	Public Health Nutrition & the New Nutrition Science
12	The Role of Nutrition in Health Disparities
13	Introduction to Nutrition Policy
14	Changing Local and County Policies and Environments
15	Continuation

Week	Topics
16	Final Exams' week

Part 5: Course Modules

Module 1; Introduction to Community Nutrition	
Key Concepts	Community Nutrition.
Overview	In order for nutrition to impact human health and well-being, it must be applied to human populations through community and population based intervention and education programs. Community nutrition is a modern and comprehensive profession that includes public health nutrition, dietetics/nutrition education, and medical nutrition therapy. Community nutrition deals with a variety of food and nutrition issues related to individuals, families, and special groups that have a common link such as place of residence, language, culture, or health issues.

	This module will introduce students to the field of community nutrition and its role in health and health care. It focuses also on the process and theoretical foundations of nutrition education and the theories, methods and research perspectives applicable to nutrition education. The role of the community nutritionist in determining, delivering and managing community nutrition services is emphasized along with the tools, skills and techniques necessary for developing effective services.
Aim	Enhance students understanding of community nutrition and its role in health care.
Learning Outcomes	At the end of this module students will be able to: 15. Define community nutrition concept **16.** Identify the role of community nutrition in population health.
Units	1. What is community nutrition 2. Public Health and Nutrition 3. Assessing Community Resources 4. Principles of Nutrition Education
Readings	-Boyle, M. and Holben, D. 2013. Community Nutrition in Action: an entrepreneurial approach (6th edition). N.Y.:Thompson/Wadsworth. -http://www.ers.usda.gov/ http://www.jblearning.com/samples/0763747602/47602_ch01_5165.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 2; Role of environment, food, nutrition and lifestyle choices in health promotion and disease prevention.	
Key Concepts	Environment, Nutrition, Health, Disease prevention.
Overview	Public health is the art of preventing diseases and promoting health and efficiency through organized community efforts. It was found that increasing nutrition knowledge and the effect of environment on health

	can reduce medical care costs and improve the quality of life. This module will focus on the role of environment, food and lifestyle choices that may affect and enhance individual's health by preventing diseases related to environmental changes, malnutrition, and bad lifestyle choices.
Aim	The overall aim of this module is to make students understand the relation between environment, nutrition, and health.
Learning Outcomes	At the end of this module students will be able to: 17. Apply knowledge of the role of environment, food and lifestyle choices to develop interventions to affect change and enhance wellness in diverse individuals and groups.
Lessons	1. Marketing Nutrition and Health Promotion 2. Changing Local and County Policies and Environments 3. Mothers and Infants: Nutrition Assessment, Services and Programs 4. Children and Adolescents: Nutrition Assessment, Services and Programs
Readings	-Boyle, M. and Holben, D. 2013. Community Nutrition in Action: an entrepreneurial approach (6th edition). N.Y.:Thompson/Wadsworth. -http://www.ers.usda.gov/ -http://www.ers.usda.gov/topics/food-nutrition-assistance/food-security-in-the-us/community-food-security.aspx -http://communityhealth.mc.duke.edu/dynamic/assets/ActionGuide.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 3; Fundamentals of Public Policy and Nutrition.	
Key Concepts	Public Policy, Nutrition.
Overview	You are what you eat. An old saying that recognizes the critical role that diet has on health. With the goal of improving the nutrition and health of

	targeted populations local governments have developed and implemented public health policies and programs to prevent nutritional deficiencies by providing nutritious foods, fortifying foods or beverages, and, more recently, limiting the calorie, fat, or sugar content of high-calorie, low-nutrient foods. This module will introduce to students the public policies that used by dietetics to reduce individuals health problems related to their nutrition.
Aim	Enhance students knowledge about public polices used by nutritionists.
Learning Outcomes	At the end of this module students will be able to Explain the impact of a public policy position on dietetics practice.
Units	1. Introduction to Nutrition Policy. 2. Legislative and Regulatory Basis of Dietetics Practice.
Readings	-Boyle, M. and Holben, D. 2013. Community Nutrition in Action: an entrepreneurial approach (6th edition). College: Economics and Administrative Science
Department: Banking and Finance

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 206343
Course Name: Economic Development
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

✓ **Course Description:**

One out of five people on this planet lives on less than $1 per day and half the world lives on less than $2 per day. The intention of this course is to explore the causes and correlates of global poverty, and discuss policies used to address it. After a brief introduction to the concept of development, this course will develop the tools that will be used by student, including measurements of poverty and inequality, and a basic understanding of regression analysis.

The global distribution of income and the current debate regarding the sources of this distribution ("institutions" versus "geography") will then be briefly discussed as well as some of the important correlates of poverty – corruption and civil conflict. The next section of the course will focus on the impact of nutrition and education on household welfare, as well as programs intended help increase health and schooling outcomes, the relationship between population growth and economic development, as well as the related topics of environment, climate change effect, and agriculture.
The discussion of agriculture leads naturally into the question of rural to urban and international migration. The last section of the course considers the use of land reform and microfinance as pathways out of poverty.

✓ **Course Learning Objectives:**

- To explain long-term economic growth in developing countries.
- Understand specific topics such as population growth, income distribution, environmental issues and project management as well as policy issues of international cooperation and development.
- Provide a solid base of knowledge on economic theory and analytical skills that will enable students to become experts in economic and social development policies.

✓ **Expected Course Outcomes:**

7. Analyze the local economy and value chains in which local enterprise agglomerations and clusters are inserted
8. Analyze policies and develop instruments that support local businesses
9. The abilities to critically analyze and reform policies, and working collaboratively with international organizations on developmental issues.

✓ **Course Resources:**

19. Reading material consists of handouts/internet websites.
20. Putterman, Louis and David Weil "*Post-1500 Population Flows and the Long Run Determinants* of Economic Growth and Inequality", Quarterly Journal of Economics 125:4, November 2010
21. Understanding Poverty, A. Banerjee, R. Benabou, and D. Mookherjee, editors, Oxford University Press: March 2006.

23. Ray, Debraj. Development Economics. Princeton University Press, 1998.

24. Fullerton and Stavins (1998) "How Economists See the Environment"

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*
- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines****: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topics
1	What is development?
2	Tools: Measuring poverty and inequality Tools: Regression analysis
3	Institutions, geography, and the global distribution of income
4	Barriers to growth I: corruption Barriers to growth II: civil wars
5	Human capital: health
6	Human capital: education
7	Conditional Cash Transfer Programs
8	Population and development
9	Environment and development
10	Agriculture in economic development
11	Migration - rural-urban and international
12	Land and property rights

Week	Topics
13	Microfinance
14	Foreign aid and the role of international development agencies
15	Continuation
16	Final Exams' week

Part 5: Course Modules

Module 1; Introduction: What is development?	
Key Concepts	Development, Poverty, Growth, Income
Overview	Development economics is a branch of economics which deals with economic aspects of the development process in low-income countries. Its focus is not only on methods of promoting economic development, economic growth and structural change but also on improving the potential for the mass of the population, for example, through health and education and workplace conditions, whether through public or private channels. Development economics involves the creation of theories and methods that aid in the determination of policies and practices and can be implemented at either the domestic or international level. Poverty refers to the deprivation of basic human needs, which commonly includes food, water, sanitation, clothing, shelter, health care and education. This module will introduce students to economic development by focusing on the history of development, poverty, and distribution of income.
Aim	Enhance student understanding of economic development.

Learning Outcomes	At the end of this module, students will be able to: 25. Define development economics. 26. Identify the causes of poverty. 27. Apply regression analysis.
Units	1. History, Growth and Development 2. Measuring poverty and inequality 3. Regression analysis 4. Institutions, geography, and the global distribution of income
Readings	- Putterman, Louis and David Weil "*Post-1500 Population Flows and the Long Run Determinants* of Economic Growth and Inequality", Quarterly Journal of Economics 125:4, November 2010 - Understanding Poverty, A. Banerjee, R. Benabou, and D. Mookherjee, editors, Oxford University Press: March 2006. - The Concept of Development" in Handbook of Development Economics vol. 1 - Ray, Debraj. Development Economics. Princeton University Press, 1998.
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 2; Human Capital: Health, and Education	
Key Concepts	Human Capital, Health, Education.
Overview	Human capital is a collective economic view of the human being acting within economies, which is an attempt to capture the social, biological, cultural and psychological complexity as they interact in explicit and/or economic transactions. Many theories explicitly connect investment in human capital development to education, and the role of human capital in economic development, health and reduces diseases, productivity growth, and innovation has frequently been cited as a justification for

	government subsidies for education, health, and job skills training. This module will focus on human capital concept and its relation with health and education.
Aim	Enhance student knowledge about human capital concept.
Learning Outcomes	At the end of this module, students will be able to: 28. Define human capital. 29. Identify the relation between education and health with human capital.
Units	1. Health and Nutrition: Poverty Traps 2. Providing health services and medicines in developing countries 3. Health externalities and randomized experiments 4. Educational Interventions 5. Child Labor
Readings	- Putterman, Louis and David Weil "*Post-1500 Population Flows and the Long Run Determinants* of Economic Growth and Inequality", Quarterly Journal of Economics 125:4, November 2010 - The Concept of Development" in Handbook of Development Economics vol. 1 - Ray, Debraj. Development Economics. Princeton University Press, 1998.
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 3; Effect of Population and Environment on Development	
Key Concepts	Population, Environment.
Overview	Population dynamics, including growth rates, age structure, fertility and mortality, migration and more, influence every aspect of human, social and economic development. Governments need to be able to gather

	information about, track and analyze population trends in order to create and manage sound policies and generate the political will to appropriately address both current and future needs. "The 'environment' is where we live; and development is what we all do in attempting to improve our lot within that abode. The two are inseparable." *Our Common Future.* This module analyses the evolution of such ideas as well as global trends in relation to environment, climate change, and socio economic development, and the relation of growing population and development.
Aim	Enhance student understanding of the relation between population, environment and development.
Learning Outcomes	At the end of this module, students will be able to: 30. Identify the relation between population, environment and development.
Units	1. Population and development 2. Environment and development
Readings	- Putterman, Louis and David Weil "*Post-1500 Population Flows and the Long Run Determinants* of Economic Growth and Inequality", Quarterly Journal of Economics 125:4, November 2010 - The Concept of Development" in Handbook of Development Economics vol. 1 - Ray, Debraj. Development Economics. Princeton University Press, 1998. - Fullerton and Stavins (1998) "How Economists See the Environment
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 4; Agriculture , Land Property in Economic Development	

Key Concepts	Agriculture, Land, Economic.
Overview	Thinking on development has long held that agricultural growth is an important step toward economic development and transformation. The majority of the region population lives in rural areas, where poverty and deprivation are most severe. Since almost all rural households depend directly or indirectly on agriculture, and given the large contribution of the sector to the overall economy, one might expect agriculture to be a key component of growth and development. On the other hand, the ability farmers and others to buy a land and have properties may also affect development. Secure and predictable access to land as a productive resource is a key to the livelihoods of millions of farmers around the world. Secure land tenure enables farmers to invest in long-term improvements to their farms and soils in the expectation that they will reap the benefits of those investments without fear that their land be taken away without a reason. Formal and informal land rights are therefore seen as key to improving the conditions of the poor in developing countries in terms of economic growth, agricultural production, food security, natural resource management, gender-related inequalities, conflict management and local governance processes more generally. This module will focus on the role of agriculture and land property in the development of economics.
Aim	Enhance student knowledge about economic development and its relation with agriculture and land.
Learning Outcomes	At the end of this module, students will be able to: 31. Discuss the relation between agriculture, land property and development.
Units	1. Agriculture in economic development 2. Migration - rural-urban and international

	3. Land and property rights 4. Microfinance
Readings	- Putterman, Louis and David Weil "*Post-1500 Population Flows and the Long Run Determinants* of Economic Growth and Inequality", Quarterly Journal of Economics 125:4, November 2010 - The Concept of Development" in Handbook of Development Economics vol. 1 - Ray, Debraj. Development Economics. Princeton University Press, 1998. http://www.ifpri.org/sites/default/files/pubs/pubs/abstract/153/rr153.pdf

Part 2: Course Information

Course Number: 601432
Course Name: Economic Fruit Crops in Jordan
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

✓ **Course Description:**

Agriculture in Jordan contributed substantially to the economy at the time of Jordan's independence. This course includes an introduction to theoretical and practical aspects in plant growth and development on selected fruit crops that grown in Jordan, with emphasis on scientific name, origin, genetic diversity, and breeding. Discuss the origin and significance of genetic diversity for cultivars and rootstocks.

✓ **Course Learning Objectives:**

1. Environmental factors that affect crop adaptation; growth requirements, morphological, physiological and adaptive traits, plant propagation, dormancy
2. Critical management practices for fruit crop improvement and production

3. Relation between economics and planting fruit crops.

✓ **Expected Course Outcomes:**

10. Students will develop fundamental knowledge on selected Mediterranean fruit crops
11. Become familiar with critical management practices for Mediterranean fruit crop improvement and production

✓ **Course Resources:**

32. Reading material consists of handouts/internet websites.

15	Continuation
16	Final Exams' week

Part 5: Course Modules

Module 1; Introduction: An Ecological Approach to Growing Fruits	
Key Concepts	Ecology, Fruit.
Overview	Biological and social factors are driving the need for new farming practices. Fruit crop ecology is the study of the interactions among the many biological, environmental and management factors that make up and influence fruit production. This module explores growing fruit within a complex web that connects soil, plants, animals, humans, landscapes and the atmosphere. An ecological approach to fruit production recognizes that these factors interact in a changing environment and that it is impossible to change one aspect of a farming system without affecting others. Growers and consumers have benefited greatly from technological advances in fruit production that have increased yields and

	reduced labor costs. There have also been some unexpected environmental and social consequences, such as pesticide resistance, loss of biodiversity; and potential water pollution. Growers and scientists are looking for better ways to work within a healthy system of soils, plants and animals.
Aim	Enhance students understanding of fruit crop farming and its relation ecology.
Learning Outcomes	At the end of this module students will be able to: 37. Define some concepts, like ecology, and fruit crop farming. 38. Understand the relationship between ecology and fruit crop agriculture.
Units	1. Introduction to Fruit Crop Agriculture. 2. Origin, History of Cultivation. 3. The Agricultural Ecosystem. 4. Fresh Fruit Production. 5. Environmental Effects on Insects and Diseases.
Readings	-J. N. Landis. 2002. Fruit Crop Ecology and Management. Michigan State University Extension: Michigan Agricultural Experiment Station. -M. Rieger. 2006. Introduction to Fruit Crops. http://orchard.uvm.edu/uvmapple/hort/AppleHortBasics/Readings/msue_FruitCropEcology.pdf -http://www.fruit-crops.com/chapter1/
Activities	Participation in class room, assignments and homework. Reading, group discussion, Giving examples, presentations, quizzes
Module 2; Economy and Fruit Crops Agriculture	
Key Concepts	Economy, Fruit, Agriculture.
Overview	Agriculture in Jordan contributed substantially to the economy at the

	time of Jordan's independence. Although the agricultural sector's share of Gross national product (GNP) declined in comparison with other sectors of the economy, farming remained economically important and production grew in absolute terms. In the more fertile Jordan River valley, fruits including, tomatoes, melons, bananas and citrus crops often were produced in surplus amounts. Although the country's ultimate agricultural potential was small, economic factors apparently limited production more than environmental constraints It is important to understand the region's overall demographic changes and the economic activity patterns that have evolved over the years. This region is characterized by population declines in its non-metropolitan portions, slow job growth, and comparatively low earnings per job. Economic impacts are estimated using an input-output model of the regional economy. The modeling system accounts for expected transactions among all industries within a region. When a type of industrial activity expands, so do its demands for inputs. When area suppliers increase their sales, they in turn demand more regionally supplied inputs, and so on. This is called a multiplier effect. If we introduce more fruit production, we will introduce more demand for inputs. We must offset those gains by losses to existing agriculture as cropland amounts are considered fixed.
Aim	Enhance students understanding of the relationship between economics and agriculture.
Learning Outcomes	At the end of this module students will be able to: 39. Recognize the effect of agriculture on economy.
Units	1. Socio- economic Baseline 2. Estimating the Regional Economic Impacts. 3. Production and Marketing Strategy.

Readings	-J. N. Landis. 2002. Fruit Crop Ecology and Management. Michigan State University Extension: Michigan Agricultural Experiment Station. -M. Rieger. 2006. Course Syllabus

College: Engineering
Department: Civil Engineering

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)

Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 901408
Course Name: Environmental Engineering
Class Hours: (Times & Days)
Classroom:(Number & Building)
Prerequisites:

✓ **Course Description:**

Students in the class will be introduced to topics relevant to environmental engineering. Topics to be covered in this class include characterization of pollution in air, water, and solid wastes, environmental regulations, and engineering approaches for treatment and remediation of the pollution to meet the regulatory requirements. The students will learn to apply mass balance principles and reaction kinetics in engineering calculations and design of treatment systems. Contemporary issues such as water-energy nexus, climate changes, and emerging contaminants (e.g., engineered nano material, pharmaceuticals and personal care products) and potential solutions for addressing these issues will also be discussed. In laboratory sessions, the students will conduct experiments, collect and analyze data, and interpret the results.

✓ **Course Learning Objectives:**

- Learn risk-based assessment for human health.
- Describe potential exposure routes of pollutants to human.
- Know how to determine the amount of product formed and/or reactants used based on stoichiometry.
- Explain the chemical processes that govern the formation and destruction or removal of air pollutants, principally ozone and particulate matter.
- Understand basic laboratory and field techniques in the measurement of air pollutants.
- Demonstrate an understanding of water standards and regulations and how they relate to international controls
- Understand the importance of water in solving local, regional and international community problems.

✓ Expected Course Outcomes:

- To be familiar with environmental laws, pollution, and engineering approaches to mitigate the pollution.
- Explain current air pollution research in the context of the history of air pollution science.
- Explain the relationships between emissions of different air pollutants from different sources, their atmospheric concentrations, and the impacts that they ultimately cause.
- Explain the factors that influence the transport of pollutants around the world.
- Conduct experiments; collect and analyze data; and interpret the results.
- Understand the public health consequences of water supply and use.
- Evaluate the effectiveness of various types of management practice related to treatment of drinking water.
-

✓ Course Resources:

Text book;

- Peirce. J, Vesilind. A, 2003, Environmental Engineering, 4th Edition, Elsevier- Science Print, USA.

Supplemental readings;

- Danny D Reible. (1998). Fundamentals of environmental engineering.Library of Congress, USA.
- Daniel J. Jacob, Introduction to Atmospheric Chemistry, 1999, Princeton University Press. This book is available for free on the web: http://acmg.seas.harvard.edu/people/faculty/djj/book/index.html
- International *Journal* of *Environmental Engineering*
- *Journal* of *Environmental Engineering* and Science
- *Journal* of *Environmental* Chemical *Engineering*
- *Environmental Engineering* and Management *Journal*
- *The International Journal of Energy and Environmental Engineering.*

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines:*** *Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

14	**Treatment** Processes – System Layout-
15	Revision and students' presentations
16	Final Exam

Part 5: Course Modules

Module 1; Mass Balance	
Key Concepts	Conservation Law, Energy Balance, Chemical Reactors,Physical Systems
Overview	A mass balance, also called a material balance, is an application of conservation of mass to the analysis of physical systems. By accounting for material entering and leaving a system, mass flows can be identified which might have been unknown, or difficult to measure without this technique. The exact conservation law used in the analysis of the system depends on the context of the problem, but all revolve around mass conservation, i.e. that matter cannot disappear or be created spontaneously. Therefore, mass balances are used widely in engineering and environmental analyses. For example, mass balance theory is used to design chemical reactors, to analyze alternative processes to produce chemicals, as well as to model pollution dispersion and other processes of physical systems. Closely related and complementary analysis techniques include the population balance, energy balance and the somewhat more complex entropy balance. These techniques are required for thorough design and analysis of systems such

	as the refrigeration cycle.
Aim	- Identify engineering economic problems that commonly are found in the business world.
Learning Outcomes	- Apply mass balance and reaction kinetics in designing treatment and pollution control systems.
Units	- Basic concepts - Steady- state materials balance - Dynamic balance on a stirred system - Balance on unstirred system
Readings	- Danny D Reible. (1998). Fundamentals of environmental engineering. Library of Congress, USA
Activities	Lab experiments, Field trip, Drill and practice
Module 2; Air Pollution	
Key Concepts	Pollution , Air Quality , Air Laws, Acid Rain
Overview	Air pollution has significant effects on human health and the environment, through interrelated problems of ozone and particulate matter air pollution, acid rain, visibility degradation, mercury ,stratospheric ozone depletion, and climate change. Significant strides have been made in the past few decades to improve our understanding of the sources, chemical transformation, transport ,deposition, and impacts of different pollutants. We now understand that many air pollutants are linked together through complex chemical interdependencies.
Aim	- Explain the chemical processes that govern the formation and destruction or removal of air pollutants, principally

	ozone and particulate matter. - Understand basic laboratory and field techniques in the measurement of air pollutants.
Learning Outcomes	By the end of this course, students will be able to: - Explain current air pollution research in the context of the history of air pollution science. - Explain the relationships between emissions of different air pollutants from different sources, their atmospheric concentrations, and the impacts that they ultimately cause. - Explain the factors that influence the transport of pollutants around the world.
Units	- Control of gaseous pollutants - Control of climate change - Resources of air pollution - air pollution effects - air quality and common laws
Readings	- Daniel J. Jacob, Introduction to Atmospheric Chemistry, 1999, Princeton University Press. This book is available for free on the web: http://acmg.seas.harvard.edu/people/faculty/djj/book/index.html - Peirce. J, Vesilind. A, 2003, Environmental Engineering, 4th Edition, Elsevier- Science Print, USA. Chapter 18,19,20,21.
Activities	Assignments and instructional visits to real sites
Module 3; Risk Assessment	
Key Concepts	Toxicology, Fault Trees, Environmental Assessment, Uncertainty
Overview	In this module we begin by examining the definition of risk in

	the context of engineering, and compare experts' and laymen's approaches to risk assessment. We look at exposure measurement, toxicology, and epidemiology as ways to assess environmental risk in terms of effects on human health and safety; difficulties inherent to such analyses (e.g., cumulative and synergistic effects, uncertainty) are addressed. We also cover tools used to analyze technology and process-related risks, such as failure mode analysis and fault trees.
Aim	- Learn risk-based assessment for human health. - Be able to describe potential exposure routes of pollutants to human.
Learning Outcomes	- Conduct experiments; collect and analyze data; and interpret the results. - Demonstrate an understanding of the application of the risk assessment approach by participation in class discussion and an oral presentation. - Understand how existing toxicological and epidemiologic data can be of use in a risk assessment.
Units	- Use of risk analysis in environmental assessment - Socioeconomic impact assessment - Dose- response evaluation - Probability - Expression of risk - Exposure and latency
Readings	- Peirce. J, Vesilind. A, 2003, Environmental Engineering, 4th Edition, Elsevier- Science Print, USA. Chapter 1,2. - Selected articles from International Journal of Environmental Engineering

Activities	Quiz, Web search, Student Presentation
Module 4; Water Treatment	
Key Concepts	Treatment Process, Overflow Rates
Overview	Water is coming under increasing pressure from demographic and climatic changes. Treatment processes play a key role in delivering safe, reliable supplies of water to households, industry and agriculture and in safeguarding the quality of water in rivers, lakes, aquifers and around coastal areas. Well educated, skilled and experienced graduates are required to operate and manage vital water and wastewater treatment services. The demand for such graduates is already high and will only increase over coming years as environmental standards for water quality increase, and pressures on our water supplies continue to grow. The course gives the technological backgrounds of treatment processes applied for production of drinking water. The treatment processes are demonstrated with laboratory experiments. Study goals: Knowledge of technological basics and design parameters of drinking water treatment processes
Aim	- Demonstrate an understanding of water standards and regulations and how they relate to international controls - Understand the importance of water in solving local, regional and international community problems
Learning Outcomes	By the end of this module, students should be able to: - Understand the public health consequences of water supply and use. - Evaluate the effectiveness of various types of management practice related to treatment of drinking

	water. - Describe the fundamentals of water use, treatment and distribution.
Units	- Coagulation and Flocculation - Filtration - Groundwater Supplies - Surface Water Supplies - Water Transmission
Readings	- Peirce. J, Vesilind. A, 2003, Environmental Engineering, 4th Edition, Elsevier- Science Print, USA. Chapter 1,2. - Selected articles from - Journal of Environmental Engineering and Science
Activities	- Essay, Discussion, Experiment

Course Syllabus

College: Law
Department: Law

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours:
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 501435
Course Name: Environmental Law
Class Hours:
Classroom:
Prerequisites:

✓ **Course Description:**

This course introduces students to international environmental law and considers how international law may be used to facilitate environmental protection. The first part of the course commences with an overview of the international legal system in the context of environmental protection. It, then, discusses the history, development, sources and principles of international environmental law and reviews the role of the UN and other international organizations in the context of environmental protection. Next, it reviews key issues (atmospheric protection, climate change, transboundary water, biodiversity and international forest law) to analyze the creation, implementation and effectiveness of international environmental law.

The second part of the course analyses particularly complex international environmental issues. Using case studies which may include hazardous waste, nuclear energy and biotechnology, it explores damage, liability and dispute settlement in an international environmental context, discusses the role of international litigation, and analyses the relationship between environmental protection and international trade law.

Case Study: The course culminates in a participatory case study, in which you will integrate and apply what you've learned to an actual resource management dilemma.

✓ **Course Learning Objectives:**

- Understand the basics of administrative process in environmental law;
- Overview of major statutes relevant to marine, climate change, biodiversity resource management;
- Learn how to use online databases to retrieve legal materials;
- Become familiar with the structure and function of judicial opinions;
- Gain a deeper understanding of the science-law-policy interface;
- Lay a foundation for further legal studies.

✓ **Expected Course Outcomes:**

12. Fitzmaurice, Malgosia and David Ong and Panos Merkouris. Research Handbook on International Environmental Law. Edward Elgar, 2010

13. to acquire an understanding of the legal, institutional and policy framework which structures and regulates decision-making concerning the environment, using climate change as a case study;

14. to develop a knowledge of the legal concepts, procedures and techniques which have evolved - to subject existing procedures and techniques to critical analysis;

15. To help decision makers and legislators find drastic solutions that mitigate and slow down the effects of climate change.

✓ **Course Resources:**

1. S. Bell, D. McGillivray and O. Pederson, Environmental Law (OUP, 8th ed, 2013).
2. N. Gunningham, "Environmental Law, Regulation and Governance: Shifting Architectures" (2009) 21(2) Journal of Environmental Law 179

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*
- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.
- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines****: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topics
1	Course Introduction: What Is Environmental Law?
2	History and Development of International Environmental Law (IEL)
3	Sources and Principles of IEL
4	NEPA: Judicial Interpretations and Effectiveness
5	Continuation First Exam Due
6	Environmental Impact Statement
7	Continuation
8	Atmospheric Protection
9	Climate Change
10	Water Quality Control
11	International Environmental Litigation Second Exam Due
12	Environmental Law and Policy in Jordan
13	Biodiversity
14	Case Study Presentations
15	Case Study Presentations
16	Evaluation and Assessment Final Exam Due

Part 5: Course Modules

Module 1; What is Environmental Law?	
Key Concepts	Legal doctrines, regulations, environmental lawyer, economics
Overview	Environmental law is a complex area of law that goes far deeper than the protection of the environment. Those who practice environmental law must master more than the relevant legal doctrines, federal and state statutes, regulations, and administrative law principles. They must also be able to analyze public policy, understand economics, science, and the basis behind environmental protection. They must also sift through the bureaucratic and political aspects of environmental law and policy while attempting to litigate for their clients. A successful environmental lawyer can solve environmental problems and see the wider social, economic, and political implications that underlie the environmental law.
Aim	This module aims to teach students to regulate the interaction of humanity and the natural environment, toward the purpose of reducing the impacts of human activity through the power the environmental law can give and allow.
Learning Outcomes	By the end of this module, students will be able to: - increase public concern over the impact of industrial activity on natural resources and human health; - Realize that violations of environmental laws are generally civil offenses, resulting in monetary

	penalties and, perhaps, civil sanctions such as injunction; - Recognize that a sustainable society should be created where environmental loads by human activities are minimized, and this can best be done through enforcing the environmental law.
Unit	International Environmental Law as a System of International Law
Readings	Research Handbook on International Environmental Law
Activities	Reading, analysis, discussion, presentations
Module 2; International Environmental Law	
Key Concepts	International law, environmental law, ozone layer, rain forests
Overview	Growth of international environmental law as a separate area of public international law began in the 1970s with the Stockholm Conference on the Environment in 1972. Since then interest has steadily increased and it is one of the fastest growing areas of international law. Current issues of international concern covered by environmental law include ozone layer depletion and global warming, desertification, destruction of tropical rain forests, marine plastics pollution from ships, international trade in endangered species (i.e. ivory trade), shipment of hazardous wastes to Third World countries, deforestation of Brazil and the Philippines, protection of wetlands, oil spills, transboundary nuclear air pollution (i.e. Chernobyl), dumping of hazardous wastes, groundwater depletion, international trade in pesticides, and acid rain.

	Environmental law is also cutting across other areas of international law, such as commercial/business law, trade, and human rights.
Aim	The aim of this module is to learn about the history and development of international environmental laws and to look into treaties, conventions, agreements and resolutions set by global agencies in order to resolve problems of the environment.
Learning Outcomes	By the end of the module, students will be able to: - Learn about the different issues and problems that concern the environment; - Revise the rules that govern and regulates the use of the environment and constitutionalize that; - Investigate the relationship between the international environmental law and other related fields of commerce, trade, business, and human rights
Unit	Theories and Concepts of International Environmental Law
Readings	Research Handbook on International Environmental Law
Activities	Reading, revision, presentations, reports, lab visits.
Module 3; Environmental law and policy in Jordan	
Key Concepts	Jordan, climate protection law, legislation
Overview	This module highlights the status of climate change and environmental policy in Jordan. Currently there is a set of laws and regulations that govern environmental issues. Environment Protection Law No. 52 of 2006 is the

	primary legislation that organizes the environmental issues in Jordan. There are other regulations that organize specified areas such as water protection, air protection, nature protection and environmental impact. This legislative framework is essential to preserve the environment in Jordan and might affect the investment process in many cases. This suggests that policy makers should pay some attention to the relationship between investment and environmental law and policy.
Aim	This module aims at reconsidering the environmental realities in Jordan, to revise the legislations that help protect the environment, and to help making recommendations about the real needs that decision makers have to take in order to have a sustainable climate and environment.
Learning Outcomes	By the end of this module, students will be able to: - Learn about the various environmental issues that concern Jordan; - Learn about the environmental conventions and agreements Jordan is part of; - Help set the guidelines necessary to draw the successful map for sustainability.
Units	Text Resources (Chapter 8) and above.
Readings	Environmental Protection Law in Jordan
Activities	Readings, Presentations, interviews, quizzes and reports
Module 4; Case Study	
Key Concepts	Resource management, case study, discussion, presentation
Overview	You will have a choice of four case study scenarios based

	on actual resource management dilemmas. All materials needed to do the case study exercise will be given to you in advance; no additional research is required. You'll choose a stakeholder role and spend one class period meeting with the other members of your case study group to discuss the issue. Each group will compile the results of this discussion into a single paper which will serve as the foundation for an in-class presentation. Each group will be graded as a whole for the group paper and presentation, and each student is expected to actively participate.
Aim	This module aims to practice the environmental theory through thoroughly searching for information about a specific issue that concerns the climate and the environment. This activity involves field visits and making interviews and then classroom presentations.
Learning Outcomes	By the end of this module, students will be able to: - Learn about the environmental policies and laws in Jordan; - Practice the environmental theory through field visits; - Be aware and thus raise awareness of decision makers and the public about the dangers of climate and environment exhaustion.
Units	Sections and chapters will be distributed on students prior to the time allocated for this case study activity
Readings	Environmental Law (1,2,4,5,6,7,9)
Activities	Labs, field visits, reports, presentations

Jerash University

Course Syllabus

College: Economics and Administrative Science
Department: Banking and Finance

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: Ec 206310
Course Name: Fiscal and Monetary Policies
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

- ✓ **Course Description:**

The purpose of this course is to introduce students to current issues in macroeconomic policy. It will explore both the theoretical debates and the practical issues faced by policymakers. It will cover a wide range of monetary and fiscal policy topics. It will analyze the policies of central banks and fiscal authorities as they relate to the stability and growth of the macro-economy. Examines the theoretical and empirical literature regarding the conduct of monetary and fiscal policy and applies the tools of economic analysis to understand macroeconomic policy debates.

✓ **Course Learning Objectives:**

- Introduce students to current issues in macroeconomic policy
- Explore both the theoretical debates and the practical issues faced by policymakers
- Examination of monetary and fiscal policies that governments may use to pursue macroeconomic objectives such as steady output growth, high employment, and low inflation.
- Transmission of monetary policy, international comparisons of monetary policy design, theories of fiscal policy, and analysis of the empirical effects of fiscal policy.

✓ **Expected Course Outcomes:**

16. Define key components of the monetary system and fiscal policy.
17. Demonstrate knowledge of the fundamental issues in monetary theory as they related to policy debate.
18. Use monetary theory to analyze how monetary and fiscal policy affects key macroeconomic variables.
19. Demonstrate understanding of theories and the empirical effects of fiscal policy.
20. Access data and conduct statistical analysis as it relates to policy debates.

✓ **Course Resources:**

40. Reading material consists of handouts/internet websites.
41. Greenlaw, S. (2006) Doing Economics: A Guide to Understanding and Carrying Out Economic Research. Boston, MA: Houghton Mifflin.

42. The Economics of Money, Banking and Financial Markets, Frederic S. Mishkin, Seventh Edition, Addison Wesley, 2006
43. Public Finance and Public Policy, Jonathan Gruber, Worth Publishers, 2005
44. Macroeconomics, Olivier Blanchard, Prentice Hall, Fourth Edition, 2006

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to neither do their own work and neither gives nor receive unauthorized assistance.

- ✓ Homework Assignments: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.
- ✓ Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.
- ✓ Cheating: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.
- ✓ Classroom Protocol and Participation Guidelines: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topics
1	Overview of the course Intermediate Macroeconomic Theory
2	The IS/MP/IA Model & The Phillips Curve
3	Continuation
4	Overview of Modern Macroeconomic Theory
5	Monetary Policy Implementation
6	Overview of the Federal Reserve and Monetary Policy in the world
7	Implementation of Monetary Policy
8	Regulatory Functions of the Federal Reserve System
9	Issues and Debates in Monetary Policy Connecting Theory to Practice
10	Rules versus Discretion
11	Central Bank Independence
12	Continuation

Week	Topics
13	Fiscal Policy
14	The Case for and Against Discretionary Fiscal Policy
15	Government Finance and National Savings in the Short Run and the Long Run
16	Final Exams' week

Part 5: Course Modules

Module 1; Introduction: Brief Review on Macro Policy.	
Key Concepts	Macro-economy, Policy.
Overview	Macroeconomics deals with the performance, structure, behavior, and decision-making of an economy as a whole, rather than individual markets. This includes national, regional, and global economies. Macroeconomists develop models that explain the relationship between such factors as national income, output, consumption, unemployment, savings, investment, international trade and finance. In contrast, microeconomics is primarily focused on the actions of individual agents, such as firms and consumers, and how their behavior determines prices and quantities in specific markets. This module will focus on macroeconomics and its theories and policies.
Aim	Enhance Student knowledge about macro policies.
Learning Outcomes	At the end of this module, student will be able to: 45. Discuss the macroeconomic theories.
Units	1. Intermediate Macroeconomic Theory 2. Overview of Modern Macroeconomic Theory.
Readings	- Greenlaw, S. (2006) Doing Economics: A Guide to Understanding and

	Carrying Out Economic Research. Boston, MA: Houghton Mifflin. - The Economics of Money, Banking and Financial Markets, Frederic S. Mishkin, Seventh Edition, Addison Wesley, 2006 - Public Finance and Public Policy, Jonathan Gruber, Worth Publishers, 2005 - Macroeconomics, Olivier Blanchard, Prentice Hall, Fourth Edition, 2006 - Mankiw, N.G. (2006). The Macroeconomist as Scientist and Engineer. *Journal of Economic Perspectives*, *20(*4), 29-46.
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 2; The Monetary Policy	
Key Concepts	Monetary Policy.
Overview	Monetary policy is the process by which the monetary authority of a country controls the supply of money, often targeting a rate of interest for the purpose of promoting economic growth and stability. Monetary policy, to a great extent, is the management of expectations. It rests on the relationship between the rates of interest in an economy, that is, the price at which money can be borrowed, and the total supply of money. Monetary policy uses a variety of tools to control one or both of these, to influence outcomes like economic growth, inflation, exchange rates with other currencies and unemployment. This module will focus on the monetary policies and how it affects the economics.
Aim	Enhance student understanding of the role of monetary policies on economics.
Learning Outcomes	At the end of this module, student will be able to: 46. Define Monetary Policy.

	47. Apply the monetary policies tools.
Units	1. How does monetary policy affect the economy? 2. Tools of Monetary policy 3. Conduct of Monetary Policy: Goals and Targets 4. International Finance and Monetary Policy 5. Monetary Theory
Readings	- Greenlaw, S. (2006) Doing Economics: A Guide to Understanding and Carrying Out Economic Research. Boston, MA: Houghton Mifflin. - The Economics of Money, Banking and Financial Markets, Frederic S. Mishkin, Seventh Edition, Addison Wesley, 2006 - Public Finance and Public Policy, Jonathan Gruber, Worth Publishers, 2005 - Macroeconomics, Olivier Blanchard, Prentice Hall, Fourth Edition, 2006 http://www.ssc.wisc.edu/econ/workshop/Spring%202012/Dedola-imbalances-madison.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 3; Fiscal Policy and The Budget	
Key Concepts	Fiscal, Policy, Budget.
Overview	Fiscal policy is the use of government revenue collection (mainly taxes) and expenditure (spending) to influence the economy. When the government changes the levels of taxation and government spending (budget), it influences aggregate demand and the level of economic activity. Fiscal policy can be used to stabilize the economy over the course of the business cycle. Fiscal policy can be distinguished from monetary policy, in that fiscal policy deals with taxation and

	government spending and is often administered by an executive under laws of a legislature, whereas monetary policy deals with the money supply, lending rates and interest rates and is often administered by a central bank. This module will introduce students to fiscal policy and compare it with other polices.
Aim	Enhance student understanding of fiscal policy.
Learning Outcomes	At the end of this module, student will be able to: 48. Discuss fiscal policy 49. Compare between fiscal and monetary policies.
Units	1. What is the outlook for fiscal policy? 2. Tax Cuts 3. Can fiscal policy be effective in an open economy? 4. Outlook for the Tax System
Readings	- Greenlaw, S. (2006) Doing Economics: A Guide to Understanding and Carrying Out Economic Research. Boston, MA: Houghton Mifflin. - The Economics of Money, Banking and Financial Markets, Frederic S. Mishkin, Seventh Edition, Addison Wesley, 2006 - Public Finance and Public Policy, Jonathan Gruber, Worth Publishers, 2005 - Macroeconomics, Olivier Blanchard, Prentice Hall, Fourth Edition, 2006 http://ntj.tax.org/wwtax/ntjrec.nsf/0/7c24a2cd1543c2d2852567ef0057a8a1/$FILE/v48n3329.pdf -https://www.bostonfed.org/economic/conf/conf49/introduction.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes

Jerash University

Course Syllabus

College: Education
Department: Kindergarten

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 703215
Course Name: Health Education
Class Hours: (Times & Days)
Classroom:(Number & Building)

Prerequisites:

Course Description:

Health Education and environment the key emphasis of the course is to provide students with knowledge and skills to empower them to take care of their health and the health of others and the environment. The success of the course would be determined by students' demonstration of behavior such as practicing good health habits and exhibiting socially responsible behavior. This can be achieved through a variety of learning experiences to present students the opportunity to apply what they have learnt. The course has four modules they are; physical health, nutrition, mental and environmental health.

Course Learning Objectives:

1. Demonstrate the various published definitions of "health."
2. Demonstrate concept of optimal health in developing a personal view of health.
3. Demonstrate the history of national disease prevention and health promotion activities.
4. Demonstrate key risk factors affecting health promotion and longevity.
5. Demonstrate the core foundation areas underlying health education as an applied discipline.
6. Be able to understand a good health practices and habits.
7. Recognize their part in helping to keep the environment safe and clean for everyone's health.

Expected Course Outcomes:

1. Demonstrate opportunities for professional specialization in health education.
2. Demonstrate options for individual credentialing as a professional health educator.
3. Demonstrate development of criteria for ethical professional practice in health education.
4. Demonstrate the increasing role of health informatics and gene research in research and practice.
5. Demonstrate trends potentially affecting health education in the future
6. Use and apply good health practices in the real life situations.
7. Differentiate types of diseases that are potentially harmful to human being health.
8. Managing conflicts as well as relationships during puberty stage.
9. Identify the legislations and regulations regarding environmental issues.

10. Identify significant gaps in the current knowledge base concerning the health effects of environmental agents and identify areas of uncertainty in the risk-assessment process.

Course Resources:

Text book; Moeller, D. W. (1997). *Environmental health* (Revised ed.). Cambridge: Harvard University Press.
Supportive;
- Health education journal (sage publisher)

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*
- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.
- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines:*** *Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topic
1	Course Introduction
2	Physical Health
3	Physical Health treatment
4	Physical Health change
5	Physical Health Assessment
6	Nutrition
7	Life Cycle Nutrition
8	Pregnancy
9	Infant
10	Adult
11	Mental Health

Week	Topic
12	Mental Disorder
13	Values and Ethics
14	Human impact on the environment
15	Environment-human interaction
16	Final Exam

Part 5: Course Modules

Module 1; Physical Health	
Key Concepts	Physical change, Nutrition
Overview	Physical health is critical for overall well-being and is the most visible of the various dimensions of health, which also include social, intellectual, emotional, spiritual and environmental health. Some of the most obvious and serious signs that we are unhealthy appear physically. This module will provide students with an understanding of good health practices and habits such as nutrition, exercise and hygiene which can contribute to good

	physical growth and health. Students are going to recognize the different physical changes one goes through during puberty.
Aim	- Become familiar with research on physical conditions, treatments, and demographic variables in the physical health field - Become familiar with current issues in the field of physical health that affect research and practice - Be able to understand a good health practices and habits
Learning Outcomes	- Applying good health practices in the real life situations. - Conduct hands-on investigations in environmental health in which students gather and analyze data and produce reports in written and oral formats.
Units	- Physical health - The importance physical health - Self confidence - Frustration
Readings	- Selected journals from Health education journal(sage publisher) - Moeller, D. W. (1997). *Environmental health* (Revised ed.). Cambridge: Harvard University Press.
Activities	YouTube, cooperation learning, Assignment, Lab Visits
Module 2; Nutrition	
Key Concepts	Pregnancy, Lactation, Infants, Adolescents, Adults
Overview	This module involves the study of special nutritional needs, physiology, and health concerns of pregnant and lactating women, infants, children, adolescents, adults and older adults. Humans require the same nutrients throughout their lifespan however the amount of specific nutrients varies at different stages

	in the life cycle and varies according to gender, activity level and growth. Certain health conditions and diseases similarly alter nutritional requirements. Course components include readings, activities, and discussions that highlight the relationships between nutrition and physical and psychological growth, development and aging.
Aim	- Discuss, contrast, and evaluate the roles of nutrition and wellness within the complex processes of pregnancy, lactation, child development, growth and aging. - Distinguish, adapt for, and design nutrition and wellness interventions which integrate the social, psychological and physical influences on maternal and child development, growth and aging.
Learning Outcomes	By the end of this module students should be able to: - Understand the role of nutrition and changes in nutritional requirements that occur during the life cycle in humans. - Understand how and why nutrient needs change during each stage of the life cycle. - Identify major areas of nutritional concern in each stage of the life cycle, including the impact of physiological and developmental changes. - Identify nutritional risk factors that may lead to chronic disease through case studies of various stages of the life cycle.
Lessons	- Nutrition through life cycle - Lactation - Childhood - Adolescence - Aging

Readings	- Nutrition throughout the Lifecycle, 4th edition, by Judith E. Brown. Wadsworth Cengage Learning Publishing.
Activities	Case study, Chapter Review, Discussion, Web Search
Module 3; Mental Health	
Key Concepts	Mental Health, Mental Disorder, Values , Ethics
Overview	This module provides an overview of multidimensional factors, perspectives and approaches associated with mental disorder. It surveys major perspectives and reviews the history of the perception of mental disorder in western society. Classification, diagnosis, therapeutic approaches and institutional responses within the context of social work practice, values and ethics are discussed. Medical, legal, and social issues related to mental health and the treatment of people with mental disorders are addressed.
Aim	- Develop a critical understanding of the historical and contemporary perspectives on mental deviance or mental illness - Develop an appreciation of the subjective distress and/or experiences of individuals labeled as mentally deviant or mentally ill
Learning Outcomes	- Develop an awareness of current classification and processing of the mentally disordered - Trace the history and current status of legal insanity, rights of patients, and related legal issues - Learn about the differential effects of mental disorder with regard to sex, age, race and socioeconomic status.
Units	- Mental health - Mental Illness and Society - Concepts Definitions & Types of Mental Illness

Readings	- Gallager, B. J., Sociology of Mental Illness: New Jersey: Prentice-Hall
Activities	Discussions, Reports, Field Trip, Simulation
Module 4; Environmental Health	
Key Concepts	**Environmental Health, Biomarkers, Risk Analysis**
Overview	**Examines health issues, scientific understanding of causes, and possible future approaches to control of the major environmental health problems in industrialized and developing countries. Topics include how the body reacts to environmental pollutants; physical, chemical, and biological agents of environmental contamination; vectors for dissemination (air, water, soil); solid and hazardous waste; susceptible populations; biomarkers and risk analysis; the scientific basis for policy decisions; and emerging global environmental health problems.**
Aim	- Define the major sources and types of environmental agents. - Discuss the transport and fate of these agents in the environment. - Identify the carriers or vectors that promote the transfer of these agents from the environment to the human. - Describe how these agents interact with biological systems, and the mechanisms by which they exert adverse health effects. - Explain and use models for prediction of the magnitude of adverse effects in biological systems. - Identify and define the steps in the risk-assessment and risk-management processes.
Learning Outcomes	- Identify the legislations and regulations regarding

	environmental issues. - Identify significant gaps in the current knowledge base concerning the health effects of environmental agents and identify areas of uncertainty in the risk-assessment process.
Lessons	- Environmental health issues - Environmental health problems - Environmental toxicology
Readings	- Moeller, D. W. (1997). *Environmental health* (Revised ed.). Cambridge: Harvard University Press.
Activities	Project , group work, Simulation, Case Study

College: Economics and Administrative Science
Department: Banking and Finance

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:

E-mail:

Part 2: Course Information

Course Number: Ec 206202
Course Name: Managerial Economics
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

✓ **Course Description:**

Managerial Economics is concerned with the application of economic principles to key management decisions within organizations. It provides guidance to increase value creation within organizations, and allows a better understanding of the external business environment in which organizations operate.

Managerial Economics is fundamentally a unique way of thinking about problems, issues and decisions that managers face in each of the functional areas of their organization. This unique way of thinking stresses the importance of incentives as determinants of human behavior and performance, and emphasizes the consideration of costs and benefits as an efficient method for reaching economic decisions.

✓ **Course Learning Objectives:**

- To increase student company's profitability by applying economic analysis to a wide array of business problems.
- To market environments where decisions are made under full information and with a single layer of strategic reasoning.
- Deals with a single individual and discusses the problem of making decisions when the outcomes are uncertain.

✓ **Expected Course Outcomes:**

21. Compute the relevant costs of any decision.
22. Use marginal analysis to make extent (how much) decisions.

23. Make investment decisions that increase firm value.
24. Set optimal prices and price discriminate.
25. Predict industry-level changes using demand/supply analysis.
26. Make decisions in uncertain environments.

✓ **Course Resources:**

50. Reading material consists of handouts/internet websites.
51. Froeb, McCann, Managerial Economics: A Problem-Solving Approach, 2nd Edition. (South-Western, 2010).
52. The Economic Way of Thinking by Paul Heyne, Peter J. Boettke and David L. Prychitko, Prentice Hall, 2009 (12th edition).
53. Microeconomics for Manager by David M. Kreps (W.W. Norton, 2004)

Part 3: Assignments, Course policies, and Grading Policy

✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.
- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*

- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*

- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*

- ✓ ***Classroom Protocol and Participation Guidelines****: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topics
1	Intro: What is Managerial Economics?
2	Managerial Economics: The One Lesson of Business Benefits, Costs, and Decisions

Week	Topics
3	Using Economics in Management Decisions, Understanding the Seller's Costs
4	Extent (How Much) Decisions Understanding the Buyer's Demand
5	Investment Decisions: Look Ahead & Reason Back Understanding Markets and Profit Maximizing
6	Simple Pricing
7	Economies of Scale and Scope
8	Understanding Markets and Industry Changes
9	Relationships Between Industries: The Forces Moving Us Towards Long Run Equilibrium
10	Strategy--the Quest to Slow Profit Erosion
11	Using Supply and Demand; Foreign Exchange, Trade, and Bubble
12	More Realistic and Complex Pricing
13	Direct Price Discrimination & Indirect Price Discrimination
14	Presentations
15	Revision
16	Final Exams' week

Part 5: Course Modules

Module 1; The Economic Way of Thinking	
Key Concepts	Economy, Managerial.
Overview	Managerial economics sometimes referred to as business economics and is a branch of economics that applies microeconomic analysis to

	decision methods of businesses or other management units. This module defines the study of economics by describing both what economics *is* and what it *is not.* It introduces the perspective that economic reasoning skills are valuable critical thinking tools and demonstrates how this perspective enhances users' ability to analyze and understand human behavior, the focus of social science inquiry. On the other hand, the module will focus on managerial economics, what is it, and how it would affect economists decisions.
Aim	Enhance student understanding of economics and managerial economics.
Learning Outcomes	At the end of this module, students will be able to: 54. Describe economics by using critical thinking tools 55. Discuss managerial economics and its uses.
Units	1. What is Managerial Economics? 2. The One Lesson of Business 3. Benefits, Costs, and Decisions 4. Using Economics in Management Decisions
Readings	-Froeb, McCann, Managerial Economics: A Problem-Solving Approach, 2nd Edition. (South-Western, 2010). -The Economic Way of Thinking by Paul Heyne, Peter J. Boettke and David L. Prychitko, Prentice Hall, 2009 (12th edition). -Microeconomics for Manager by David M. Kreps (W.W. Norton, 2004). - http://www.comp.nus.edu.sg/~ipng/mecon/sg/01int_sg.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 2; Demand Analysis & Demand Estimation	
Key Concepts	Demand, Analysis, Estimation.

Overview	Demand analysis is a study of sales generated by a good or service to determine the reasons for its success or failure, and how its sales performance can be improved. Demand analysis is used to identify who wants to buy a given product, how much they are likely to pay for it, how many units they might purchase, and other factors that can be used to determine product design, selling cost, and advertising strategy for a product. To estimate how many sales a company will make, demand estimation is a process that is commonly used. With demand estimation, a company can measure how much to produce and make other important decisions. This module will focus on demand analysis and estimation and its application.
Aim	Enhance student knowledge about demand analysis and estimation.
Learning Outcomes	At the end of this module, students will be able to: 56. Define the term demand 57. Apply demand analysis and estimation in different economic situations.
Units	1. Extent (How Much) Decisions 2. Understanding the Buyer's Demand
Readings	-Froeb, McCann, Managerial Economics: A Problem-Solving Approach, 2nd Edition. (South-Western, 2010). -The Economic Way of Thinking by Paul Heyne, Peter J. Boettke and David L. Prychitko, Prentice Hall, 2009 (12th edition). -Microeconomics for Manager by David M. Kreps (W.W. Norton, 2004). https://www.princeton.edu/~deaton/downloads/Demand_Analysis.pdf -http://www.econ.umn.edu/~bajari/metricsappliedsp09/lecture6.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes

Module 3; Profit Maximization and Competitive Markets	
Key Concepts	Profits, Markets.
Overview	Profit maximization is the short run or long run process by which a firm determines the price and output level that returns the greatest profit. A perfectly competitive firm with rising marginal costs maximizes profit by producing up until the point at which marginal cost is equal to marginal revenue. The marginal revenue for a perfectly competitive firm is the market price determined by the intersection of the supply and demand curves. A competitive market is one in which a large numbers of producers compete with each other to satisfy the wants and needs of a large number of consumers. In a competitive market no single producer, or group of producers, and no single consumer, or group of consumers, can dictate how the market operates. Nor can they individually determine the price of goods and services, and how much will be exchanged. This module will introduce students to the concepts of profit maximization and competitive markets.
Aim	Enhance student understanding about profit maximization and competitive markets
Learning Outcomes	At the end of this module, students will be able to: 58. Differentiate between profit maximization and competitive markets
Units	1. Investment Decisions: Look Ahead & Reason Back 2. Understanding Markets and Profit Maximizing 3. Understanding Markets and Industry Changes
Readings	-Froeb, McCann, Managerial Economics: A Problem-Solving Approach, 2nd Edition. (South-Western, 2010). -The Economic Way of Thinking by Paul Heyne, Peter J. Boettke and David L. Prychitko, Prentice Hall, 2009 (12th edition).

	-Microeconomics for Manager by David M. Kreps (W.W. Norton, 2004).
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes
Module 4; Advanced Pricing	
Key Concepts	Pricing.
Overview	Pricing is the process of determining what a company will receive in exchange for its product or service. Pricing factors are manufacturing cost, market place, competition, market condition, brand, and quality of product. It is also a key variable in microeconomics price allocation theory. The manual or automatic process of applying prices to purchase and sales orders, based on factors such as: a fixed amount, quantity break, promotion or sales campaign, specific vendor quote, price prevailing on entry, shipment or invoice date, combination of multiple orders or lines, and many others. Automated systems require more setup and maintenance but may prevent pricing errors. The needs of the consumer can be converted into demand only if the consumer has the willingness and capacity to buy the product. This module will focus on pricing methods and its applications in any economical situation faced by students.
Aim	Enhance student understanding the types of pricing and applications.
Learning Outcomes	At the end of this module, student will be able to: 59. Identify and distinguish between pricing types.
Units	1. Simple Pricing 2. More Realistic and Complex Pricing 3. Direct Price Discrimination 4. Indirect Price Discrimination
Readings	-Froeb, McCann, Managerial Economics: A Problem-Solving Approach, 2nd Edition. (South-Western, 2010).

	-The Economic Way of Thinking by Paul Heyne, Peter J. Boettke and David L. Prychitko, Prentice Hall, 2009 (12th edition). -Microeconomics for Manager by David M. Kreps (W.W. Norton, 2004). -http://www.uk.sagepub.com/upm-data/43169_1.pdf -http://www.saylor.org/site/wp-content/uploads/2012/12/BUS2031.2.2_Pricing-the-product.pdf
Activities	Participation in class room, assignments and homework Reading, group discussion, Giving examples, presentations, quizzes

Jerash University

Course Syllabus

College: Arts
Department: English Language and Translation

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours:
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 108201
Course Name: Scientific Translation
Class Hours:
Classroom:
Prerequisites:

✓ Course Description:

It is unquestionable that English–Arabic scientific translation is increasingly becoming a topic of much concern and importance today. This course highlights the problems that are likely to be encountered in English–Arabic scientific translation and tries to establish certain possible factors which may finally lead to a theory of this sort of translation. It also identifies certain differences that exist between scientific texts and literary ones. The course also proposes a model for English–Arabic scientific translation in further attempts driving at a more extensive study. This course has another dimension that highlights scientific texts related to climate change and environmental issues drawn from the different scientific fields of ecology, zoology, mineralogy, and chemistry.

✓ Course Learning Objectives:

1- Students will improve their skills for developing knowledge translation plans in research through translating scientific texts and focus on texts that are concerned with the environment and sustainability.
2- Students will improve their abilities for communicating research findings to multiple audiences and this shall raise awareness on universal issues of the climate and the environment.
3- Students will improve their understanding and skills related to sharing research knowledge through the media, that is, watching video clips, movies, and TV, then respond to them in translation.
4- Students will develop knowledge and skills related to linking with policy and decision-makers.

✓ Expected Course Outcomes:

1- Able to independently formulate and analyze critically complex scientific and Professional problems, substantiate decisions made, especially when it comes to the issues of ecosystems and environment.
2- Able to work across various disciplines (technical translation, respective technical field, culture studies, etc.);
3- Able to apply knowledge on translation theory and practice;
4- Able to ensure the accuracy of the translation, stylistic cohesion between the source and target text, adequate usage of terminology;
5- Able to establish linguistic and extra linguistic relationships in language use in connection with translation studies, research methods, principles and approaches;
6- Able to acquire skills in analyzing translation, relating semantic and pragmatic aspects of translation with translation methods;
7- Able to conduct scientific research and compile research reports;
· Able to analyse, evaluate and use research literature on translatology;
8- Able to independently make decisions within own scope of responsibilities;
8- Able to evaluate the relevance of one's own professional competences and skills to the profession standard and the requirements of the international labour market;
9- Able to work according to professional ethics principles and associate that with environmental ethics.

✓ Course Resources:

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*
- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines****: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topics
1	Introduction to the course
2	Define, identify, and illustrate the different types of translation.
3	Discuss the various problems faced by translators of scientific texts.
4	Describe the process of translating scientific words.
5	Describe the process of translating scientific phrases and clauses.
6	Describe the process of translating oral and written scientific discourses.
7	Continuation of the same activities First Exam Due
8	Editing Translation Skills
9	Continuation of the same activities
10	Scientific Translation Technology
11	Continuation of the same activities

Week	Topics
	Second Exam Due
12	Audiovisual Scientific Translation
13	Continuation of the same activities
14	Practical Translation
15	Continuation of the same activities
16	Evaluation and Assessment Final Exam

Part 5: Course Modules

Module 1; Scientific Translation: Beginnings	
Key Concepts	Philosophy, vision, and mission. Define translation.
Overview	This module provides students who have no previous experience of specialist translation in science/technology with the opportunity to reach an acceptable professional level of translation competence. It combines regular translation practice in smaller groups throughout course with a background lecture on the underlying principles of science and technology.
Aim	Acquaint students with the definition and nature of scientific translation. Familiarize them with text types that can be classified as scientific. Introduce some of the strategies of doing such type of translation.
Learning Outcomes	By the end of this module, learners are expected to be able

	to define and identify scientific texts and they are expected to apply the strategies.
Units	Introduction The Tradition of Translating in the Western World An Introduction to the Nature of Meaning
Readings	Toward a Science of Translating
Activities	Discussion, group work, presentations
Module 2; Translation Technology	
Key Concepts	Technology, Translation, machine Translation, computer lab
Overview	This module provides an introduction to online resources for translators, from machine translation to terminology-management and translation-memory systems with a view to understanding the tools of the translator's trade and also as a basis for systematic compilation of your own bilingual and multilingual resources and their use in translation. This hands-on module taught in a computer lab with individual workstations for each student also shows you how to import your past translations into a translation-memory system and build your own freelance translator's website.
Aim	Help students better translate scientific, technological, climactic, and environmental texts via the computer.
Learning Outcomes	Be skilful in doing such kind of work. Be professional base work on computers.
Units	Types of Correspondences and Contrasts Techniques of Adjustment Translation Procedures

	Machine Translation
Readings	Toward a Science of Translating
Activities	Lab visits, individual translations, quizzes
Module 3; Practical Translation	
Key Concepts	Scientific, Medical, Technical, climate, environment, sustainability.
Overview	This module provides training in translation methods and techniques in both Arabic and English, pairs and fields of specialization. It is taught through an introductory lecture and through interactive, practical seminars. The module is divided into three distinct blocks: 1) Scientific Translation (to include popular science articles, scientific journal papers, scientific reports, proposals, etc.) that focus on issues of the climate and the environment and how to sustain our environment and stop the harmful and irresponsible activities. 2) Medical Translation (to include healthcare documents, medical reports, clinical case studies, pharmaceutical reports, etc.) 3) Technical Translation (to include user guides, product documentation, patents, technical specifications, institutional documentation, etc.). And to take this knowledge and apply it on such texts from an environment perspective.
Aim	Read and Translate scientific articles and texts. Learn about the environment through doing the translation

Learning Outcomes	Be skilful in doing such kind of work. Be professional base work on computers.
Units	Referential and Emotive Meanings The Dynamic Dimension in Communication The Role of the Translator
Readings	Toward a Science of Translating
Activities	Interactive and practical seminars, individual and group work, discussion, computer-based translation
Module 4; Audiovisual Translation	
Key Concepts	Subtitling, films, environmental and climate aspects
Overview	This module introduces you to Audiovisual Translation (AVT) practices in general, and offers you an in-depth knowledge in the field of subtitling. During the lectures and seminars, you will cover areas such as history and present situation of subtitling, pros and cons of subtitle versus other AVT modes, semiotics of subtitling, conventions used on screen, and economic and professional aspects of AVT. You will develop subtitling skills in a variety of registers and styles by translating texts and programs of an audiovisual nature drawn from various sources (films, corporate videos, documentaries) and covering a broad range of specialized genres and media issues that are concerned with environmental issues. You will produce your own subtitles with appropriate subtitling equipment.
Aim	Translate audiovisual subtitles in films and videos that are mainly interested with scientific and environmental issues
Learning Outcomes	Be skilful in doing such kind of work. Be professional base work on computers.
Unit	Interpreting Theory and Training

Readings	Translation Studies: An Interdisciplinary
Activities	Lab visits, discussion, and group work
Module 5; Translation of Persuasive Texts (Climatic and Environmental Texts)	
Key Concepts	Discourse, cognitive environment, audiovisual, digital
Overview	This module is designed to offer students an overview of issues of discursive organization in texts whose aim is to alter the cognitive environment and behavior of recipients. The main focus is advertising discourse in various forms, from the printed, to the electronic and audiovisual. In addition, it analyzes the effect of the digital internet and its impact on translation
Aim	This module aims to encourage students' select persuasive texts and address the audience of the importance of sustainability.
Learning Outcomes	Focus on Persuasive texts whose main interest in nature and the environment. Publish these translations to help raise awareness about health and environment issues.
Units	Setting the Scene: Page 1-22
Readings	Translation-Mediated Communications in a Digital World: Facing the Challenges of Globalization and Localization.
Activities	Writing, translating, pair work, quizzes

Jerash University

College: Science
Department: Biology

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 302447
Course Name: Biodiversity
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:302345

✓ **Course Description:**

This course examines the meaning of biodiversity, the disciplines associated with conservation biology, including taxonomy, genetics, small population biology, origin of species and biodiversity of the different kingdoms. And the course will focus also in the value of genetic recourses and it is role in sustainable and human life.

✓ **Course Learning Objectives:**

- To study Darwin theory: Descent with Modification
- To know how population evolve
- To know how species arise
- To have an idea about the history of life on earth
- To know the meaning of phylogeny and tree of life
- To study the diversity in the five kingdoms
- To understand the meaning of conservation biology
- To have idea about global change and sustainable development

✓ **Expected Course Outcomes:**

At the end of the course the student must;

27. Explain what Darwin meant by "descent with modification"
28. Define the terms population, species, gene pool, relative fitness, natural selection, and neutral variation
29. Apply the Hardy-Weinberg equation to a population genetics problem
30. Define and discuss the limitations of the four species concepts
31. Describe and provide examples of prezygotic and postzygotic reproductive barriers
32. Describe and suggest evidence for the major events in the history of life on Earth from Earth's origin to 2 billion years ago
33. Explain the importance of the phylogeny and tree of life
34. Know the diversity in Monea kingdom
35. Explain why the kingdom Protista is no longer considered a legitimate taxon
36. Describe four shared characteristics and four distinct characteristics between charophytes and land plants
37. Distinguish between the phylum Bryophyta and bryophytes
38. Explain the diversity within seed plants
39. List the characteristics that distinguish fungi from other multicellular kingdoms
40. List the characteristics that combine to define animals
41. To know that Invertebrates are animals that lack a backbone and they account for 95% of known animal species
42. List the derived traits for: chordates, craniates, vertebrates, gnathostomes, tetrapods, amniotes, birds, mammals, primates, humans
43. Distinguish between conservation biology and restoration biology
44. List the three major threats to biodiversity and give an example of each

45. Explain the importance of bioremediation and biological augmentation of ecosystem processes in restoration efforts
46. Describe the concept of sustainable development
47. Explain the goals of the Sustainable Biosphere Initiative

✓ **Course Resources:**

60. Text; Biology by Mader, 11th, 2012
61. Supportive; Biology by Mader, 11th, 2012
62. Supportive; World Wide Fund for Nature (WWF) website: http://www.wwf.org/

Part 3: Assignments, Course policies, and Grading Policy

✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by

the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

- ✓ Homework Assignments:Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.

- ✓ Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.

- ✓ Cheating: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.

- ✓ Classroom Protocol and Participation Guidelines: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topic	Readings
1	Descent with Modification: A Darwinian View of Life	Chapter 22
2	The Evolution of Populations	Chapter 23
3	The Origin of Species	Chapter 24
4	The History of Life on Earth	Chapter 25
5	Phylogeny and the Tree of Life	Chapter 26
6	Bacteria and Archaea and first exam	Chapter 27
7	Protists	Chapter 28

Week	Topic	Readings
8	Plant Diversity I: How Plants Colonized Land	Chapter 29
9	Plant Diversity II: The Evolution of Seed Plants	Chapter 30
10	Fungi	Chapter 31
11	An Introduction to Animal Diversity and second exam	Chapter 32
12	Invertebrates	Chapter 33
13	Vertebrates	Chapter 34
14	Conservation Biology and Restoration Ecology	Chapter56
15	Revision	
16	Final exams	

Part 5: Course Modules

Module 1; Evolution	
Key Concepts	Mechanisms of evolution
Overview	Endless Forms Most Beautiful The Smallest Unit of Evolution That "Mystery of Mysteries" Lost Worlds
Aim	To have a basic knowledge on mechanisms of evolution
Learning Outcomes	1. Explain what Darwin meant by "descent with modification" 2. Define the terms population, species, gene pool, relative fitness, natural selection, and neutral variation 3. Apply the Hardy-Weinberg equation to a population genetics problem 4. Define and discuss the limitations of the four species

	concepts 5. Describe and provide examples of prezygotic and postzygotic reproductive barriers 6. Describe and suggest evidence for the major events in the history of life on Earth from Earth's origin to 2 billion years ago
Units	Unit one; 1. The Darwinian revolution challenged traditional views of a young Earth inhabited by unchanging species 2. Descent with modification by natural selection explains the adaptations of organisms and the unity and diversity of life 3. Evolution is supported by an overwhelming amount of scientific evidence Unit two; 1. Mutation and sexual reproduction produce the genetic variation that makes evolution possible and Hardy-Weinberg equation 2. Natural selection, genetic drift, and gene flow can alter allele frequencies in a population 3. Natural selection is the only mechanism that consistently causes adaptive evolution Unit three; 1. The biological species concept emphasizes reproductive isolation 2. Speciation can take place with or without geographic separation and hybrid zones 3. Speciation can occur rapidly or slowly and can result from changes in few or many genes

	Unit four; 1. Conditions on early Earth made the origin of life possible and fossil record documents the history of life 2. Key events in life's history include the origins of single-celled and multicelled organisms and the colonization of land 3. The rise and fall of dominant groups reflect continental drift, mass extinctions, and adaptive radiations
Readings	Chapters: 22, 23, 24, 25
Activities	Lectures Group discussion Assignments Quizzes
Module 2; Biological diversity	
Key Concepts	The evolutionary history of biological diversity
Overview	Investigating the Tree of Life Masters of Adaptation Living Small The Greening of Earth Transforming the World Mighty Mushrooms Welcome to Your Kingdom Life Without a Backbone Half a Billion Years of Backbones
Aim	The study of biological diversity in the five kingdoms
Learning Outcomes	1. Explain the importance of the phylogeny and tree of life 2. Know the diversity in Monea kingdom

	3. Explain why the kingdom Protista is no longer considered a legitimate taxon 4. Describe four shared characteristics and four distinct characteristics between charophytes and land plants 5. Distinguish between the phylum Bryophyta and bryophytes 6. Explain the diversity within seed plants 7. List the characteristics that distinguish fungi from other multicellular kingdoms 8. List the characteristics that combine to define animals 9. To know that Invertebrates are animals that lack a backbone and they account for 95% of known animal species 10. List the derived traits for: chordates, craniates, vertebrates, gnathostomes, tetrapods, amniotes, birds, mammals, primates, humans
Units	Unit one; 1. Phylogenies show evolutionary relationships and Phylogenies are inferred from morphological and molecular data 2. Shared characters are used to construct phylogenetic trees and An organism's evolutionary history is documented in its genome 3. Molecular clocks help track evolutionary time and New information continues to revise our understanding of the tree of life 4. Structural and functional adaptations contribute to prokaryotic success, Rapid reproduction, mutation, and genetic recombination promote genetic diversity in

	prokaryotes, and Diverse nutritional and metabolic adaptations have evolved in prokaryotes 5. Molecular systematics is illuminating prokaryotic phylogeny, Prokaryotes play crucial roles in the biosphere, and Prokaryotes have both harmful and beneficial impacts on humans Unit two; 1. Most eukaryotes are single-celled organisms and Excavates include protists with modified mitochondria and protists with unique flagella 2. Chromalveolates may have originated by secondary endosymbiosis and Rhizarians are a diverse group of protists defined by DNA similarities 3. Red algae and green algae are the closest relatives of land plants and Unikonts include protists that are closely related to fungi and animals 4. Land plants evolved from green algae 5. Mosses and other nonvascular plants have life cycles dominated by game 6. Ferns and other seedless vascular plants were the first plants to grow tall 7. Seeds and pollen grains are key adaptations for life on land and Gymnosperms bear “naked” seeds, typically on cones 8. The reproductive adaptations of angiosperms include flowers and fruits 9. Human welfare depends greatly on seed plants Unit three; 1. Fungi are heterotrophs that feed by absorption and Fungi produce spores through sexual or asexual life

	cycles 2. The ancestor of fungi was an aquatic, single-celled, flagellated protest and Fungi have radiated into a diverse set of lineages 3. Fungi play key roles in nutrient cycling, ecological interactions, and human welfare 4. Animal are multicellular, heterotrophic eukaryotes with tissues that develop from embryonic layers and The history of animals spans more than half a billion years 5. Animals can be characterized by “body plans” and New views of animal phylogeny are emerging from molecular data Unit four; 1. Sponges are basal animals that lack true tissues and Cnidarians are an ancient phylum of eumetazoans 2. Lophotrochozoans, a clade identified by molecular data, have the widest range of animal body forms 3. Ecdysozoans are the most species-rich animal group 4. Chordates have a notochord and a dorsal, hollow nerve cord, Craniates are chordates that have a head, and Vertebrates are craniates that have a backbone 5. Gnathostomes are vertebrates that have jaws and Tetrapods are gnathostomes that have limbs 6. Amniotes are tetrapods that have a terrestrially adapted egg and Mammals are amniotes that have hair and produce milk
Readings	Chapters: 26, 27, 28, 29, 30, 31, 32, 33, 34
Activities	Lecturs

	Group discussion Visit to plant and animal labs Assignments Quizzes
Module 3; Ecology	
Key Concepts	Ecology
Overview	The module aims at explaining the importance of bioremediation and biological augmentation of ecosystem processes in restoration efforts
Aim	To have basic things about biological conservation and global change
Learning Outcomes	1. Distinguish between conservation biology and restoration biology 2. List the three major threats to biodiversity and give an example of each 3. Define biodiversity hot spots and explain why they are important 4. Define zoned reserves and explain why they are important 5. Explain the importance of bioremediation and biological augmentation of ecosystem processes in restoration efforts 6. Describe the concept of sustainable development 7. Explain the goals of the Sustainable Biosphere Initiative
Units	1: Restoration ecology and Population conservation 2: Sustainable development
Readings	Chapter 56
Activities	Lecturing

	Group discussion Quizzes Visiting Natural reserve

Part 2: Course Information

Course Number: 302101
Course Name: General Biology
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

✓ **Course Description:**

This course is the prerequisite to most higher courses in biology. An introduction to the fundamental principles of biology, including cell structure, chemistry, and function; genetics; and ecology and climate variation.

✓ **Course Learning Objectives:**

- To develop understanding and appreciation for the basic principles of the science of biology, starting with macromolecules and the cell and ending with ecology.
- To give the student an introduction on restoration which return degraded ecosystems to natural state
- To provide the students with knowledge about sustainable development and the improvement of human life.
- To prepare students for more advanced courses in biology and science, with an understanding of cell processes.
- To provide students with knowledge necessary to help solve problems in biological areas, beginning at the cellular level.
- To introduce students to the scientific method.

✓ **Expected Course Outcomes:**

The successful student will be able to;

48. Differentiate between monomers and polymers
49. Know the structure and function of carbohydrates, lipids, proteins and nucleic acids
50. Describe the characteristics found in all living organisms.
51. Identify the organelles found in the cell and know the function of each.
52. Differentiate between the types of cell transport processes.
53. Differentiate between the light and dark reaction of photosynthesis.
54. Name the environmental factors important to photosynthesis.
55. Know the organelle and site of photosynthesis.
56. Differentiate between the different kinds of respiration occurring in the cell, including the site of respiration and number of ATP molecules produced.
57. Identify the steps in mitosis and explain their importance in cell division.
58. Differentiate between mitosis and meiosis including the number of cell divisions and chromosome numbers.
59. Describe the stages of meiosis I and meiosis II.
60. Set-up and successfully work a monohybrid, dihybrid, test, and sex-linked crosses.

61. Identify dominant, recessive, and incomplete dominant traits in humans.
62. Explain DNA replication.
63. Explain protein synthesis.
64. Distinguish among the following types of ecology: organismal, population, community, ecosystem, and landscape
65. Explain how dispersal may contribute to a species' distribution
66. Distinguish between the following pairs of terms: potential and actual range, biotic and abiotic factors, macroclimate and microclimate patterns
67. Explain how a body of water or mountain range might affect regional climatic conditions
68. Explain how ecologists may estimate the density of a species
69. Explain how limited resources and trade-offs may affect life histories
70. Explain how biotic and abiotic factors may work together to control a population's growth
71. Explain why worldwide agriculture could feed more people if all humans consumed only plant material
72. Describe the four nutrient reservoirs and the processes that transfer the elements between reservoirs
73. Explain the importance of bioremediation and biological augmentation of ecosystem processes in restoration efforts
74. Describe the concept of sustainable development
75. Explain the goals of the Sustainable Biosphere Initiative

- ✓ **Course Resources:**
  63. Text; Biology by Cambpell, 9^{th} , 2011
  64. Support reading; Biology by Mader, 11^{th}, 2012

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Part 4: Course Outline/Schedule

Week	Topic	Readings
1	The chemistry of life	Chapter 5
2	The cell	Chapter 6
3	Membrane structure and function	Chapter 7
4	An introduction to metabolism	Chapter 8
5	Cellular respiration and fermentation and first exam	Chapter 9
6	photosynthesis	Chapter 10
7	The cell cycle	Chapter 12
8	Meiosis and sexual life cycles	Chapter 13
9	Mendel and the gene idea and second exam	Chapter 14
10	An introduction to ecology and the biosphere	Chapter 52
11	Population ecology	Chapter 53
12	Community ecology	Chapter 54
13	Ecosystems and restoration ecology	Chapter 55
14	Conservation biology and global change	Chapter 56
15	Revision	
16	Final exams	

Part 5: Course Modules

Module 1; The chemistry of life	
Key Concepts	The chemistry of life
Overview	All living things are made up of four classes of large biological molecules: carbohydrates, lipids, proteins, and nucleic acids
Aim	The study of macromolecule's structure and function
Learning Outcomes	Differentiate between monomers and polymers Know the structure and function of carbohydrates, lipids, proteins and nucleic acids
Units	1: Macromolecules and Carbohydrates 2: Lipids 3: Proteins and Nucleic acids
Readings	Chapter 5
Activities	Regular class activities Making models for the different classes of large molecules Group discussion Quizzes
Module 2; The cell	
Key Concepts	The cell
Overview	All organisms are made of cells. The cell is the simplest collection of matter that can live. The plasma membrane is the boundary that separates the living cell from its surroundings. The plasma membrane exhibits selective permeability,

	allowing some substances to cross it more easily than others. Living cells require energy from outside sources. Photosynthesis is the process that converts solar energy into chemical energy. The continuity of life is based on the reproduction of cells, or cell division.
Aim	The study of cell types and component The study of metabolism The cell cycle
Learning Outcomes	Describe the characteristics found in all living organisms. Identify the organelles found in the cell and know the function of each. Differentiate between the types of cell transport processes. Differentiate between the light and dark reaction of photosynthesis. Name the environmental factors important to photosynthesis. Know the organelle and site of photosynthesis. Differentiate between the different kinds of respiration occurring in the cell, including the site of respiration and number of ATP molecules produced. Identify the steps in mitosis and explain their importance in cell division.
Units	1: microscope and eukaryotic cells 2: nucleus, ribosome, and endomembrane system 3:mitochondria, chloroplast, cytoskeleton and extracellular components 4: cell membrane component and selective permeability 5: transport through membrane: passive, active, and bulk. 6: law of thermodynamics

	7: free-energy change and ATP 8: enzymes 9: catabolic pathways 10: glycolysis and citric acid cycle 11: citric acid cycle and fermentation first exam 13: photosynthesis and light energy 14: light reactions 15: calvin cycle and C4 and CAM plants 16: mitosis 17: mitotic phase 18: regulation of mitosis
Readings	Chapters: 6, 7, 8, 9, 10, 12
Activities	Lecturing Video films Group discussion Quizzes
Module 3; Genetics	
Key Concepts	Genetics
Overview	Genetics is the scientific study of heredity and variation. What genetic principles account for the passing of traits from parents to offspring? The location of a particular gene can be seen by tagging isolated chromosomes with a fluorescent dye that highlights the gene
Aim	The study of meiosis and introduction to genetics
Learning Outcomes	Differentiate between mitosis and meiosis including the number of cell divisions and chromosome numbers.

	Describe the stages of meiosis I and meiosis II. Set-up and successfully work a monohybrid, dihybrid, test, and sex-linked crosses. Identify dominant, recessive, and incomplete dominant traits in humans. Explain DNA replication. Explain protein synthesis.
Units	1: genes from parents 2: fertilization and meiosis 3: sexual life cycle, genetic variation and evolution 4: Mendel and Mendel's laws 5: Mendel and Mendel's laws 6: chromosomal theory of inheritance
Readings	Chapters: 13, 14
Activities	Group discussion Visit to genetic lab Quizzes
Module 4; Ecology	
Key Concepts	Ecology
Overview	Ecology is the scientific study of the interactions between organisms and the environment Ecology is the scientific study of the interactions between organisms and the environment Ecosystems range from a microcosm, such as an aquarium, to a large area such as a lake or forest Humans are rapidly pushing many species toward extinction
Aim	To know the meaning of ecology and to study the interaction between living and non-living component of ecosystem. The role of sustainable development in human life

Learning Outcomes	1. Distinguish among the following types of ecology: organismal, population, community, ecosystem, and landscape 2. Explain how dispersal may contribute to a species' distribution 3. Distinguish between the following pairs of terms: potential and actual range, biotic and abiotic factors, macroclimate and microclimate patterns 4. Explain how a body of water or mountain range might affect regional climatic conditions 5. Explain how ecologists may estimate the density of a species 6. Explain how limited resources and trade-offs may affect life histories 7. Explain how biotic and abiotic factors may work together to control a population's growth 8. Explain why worldwide agriculture could feed more people if all humans consumed only plant material 9. Describe the four nutrient reservoirs and the processes that transfer the elements between reservoirs 10. Explain the importance of bioremediation and biological augmentation of ecosystem processes in restoration efforts 11. Describe the concept of sustainable development 12. Explain the goals of the Sustainable Biosphere Initiative
Units	1: earth's climates and biomes 2: aquatic biomes and interactions between ecosystem components

	second exam 4: biological processes 5: Life history traits are products of natural selection Lesson 6: factors that regulate population growth are density dependent 7: human population 8: Community interactions 9: Dominant and keystone species 10: Disturbance influences species diversity and composition 11: Physical laws govern energy flow and chemical cycling in ecosystems 12: Human activities 13: Restoration ecology and Population conservation 14: Sustainable development 15: Sustainable development
Readings	Chapters: 52, 53, 54, 55, 56
Activities	Group discussion Quizzes Nature reserves

Jerash University

Course Syllabus

Department: Chemistry

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 301101
Course Name: General chemistry
Class Hours: (Times & Days)
Classroom:(Number & Building)
Prerequisites:

✓ **Course Description:** (Include climate change and sustainability policy concepts)
This course is the prerequisite to higher courses in chemistry. An introduction to the fundamental principles of chemistry, Basic concepts: matter, units of measurements, uncertainty in measurements. Stoichiometery equations, atomic and molecular weights, moles, chemical calculations, Reactions in solution and their calculations, Structure of the atom periodic properties of the elements, Chemical bonding, Gases and green chemistry will be from the main topics in this course.

- **Course Learning Objectives**;
- The course will introduce the student to the world of chemistry, Problem solving, data evaluation, and analysis are stressed. Applications of chemistry to daily life are included.
- Describe and use the scientific method; Use the periodic table.

- Give the electronic configurations of elements; Use formulas; Know 3 basic types of chemical reactions (Acid-base, precipitation, redox).
- Use moles and molarities; understand the 3 states of matter; Work with the ideal gas law; Draw Lewis structures.
- To prepare students for more advanced courses in chemistry and science, with an understanding of chemical processes.
- Give the students basic knowledge about green and environmental chemistry.

✓ **Expected Course Outcomes:**

The successful student will be able to;

76. Know what is meant by scientific method
77. Know the measurement and the metric system
78. Know the significant figures and laboratory calculations.
79. Have a good overview of elements, compound, physical and chemical changes.
80. Know what is meant by atomic mass, molar mass.
81. Know moles and Avogadro's number.
82. Know the chemical reactions and chemical equations.
83. Know the limiting reaction and yield.
84. Differentiate between the precipitation reaction, acid base reaction and oxidation reduction reaction.
85. Define the aqueous solution and solubility.
86. Have an idea about the electromagnetic radiation and Bohr's Theory.
87. Have an introduction to quantum mechanics and quantum number.
88. Know the electron configuration and the building up principle.
89. Know the periodic classification of the elements.
90. Know the periodic variation in physical properties.
91. Know the periodic variation in atomic and ionic radius.
92. Know the periodic variation in ionization energy.
93. Know the periodic variation in electronic affinity.
94. Know the chemical bond types.
95. Differentiate between the covalent and ionic bonds.

96. Know the electronegativity.
97. Writing Lewis structures.
98. Calculate the formal charges of the molecules.
99. Draw the resonance structures of molecules.
100. Know the octet rule and the exceptions.
101. Strengths of covalent bonds.
102. Properties of solutions.
103. Know the colligative properties of solutions.
104. Know the ways of expressing the solution concentrations.
105. Know the acids and bases equilibria and the pH terms.
106. Calculate Ionization constant and the percent ionization.
107. Differentiate between Lewis acids and bases.
108. Write the gas law and the ideal gas equation.
109. Calculate Molecular effusion and diffusion.
110. Know the earth‘s atmosphere.
111. Know outer region of the atmosphere.
112. Know the Ozone in the upper atmosphere.
113. Know the chemistry of the Troposphere.
114. Know the World Ocean and fresh water.
115. Can conclude the GREEN CHEMISTRY meaning.

- ✓ **Course Resources:** (List the required course texts, course material, recommended websites, and other readings) and (Include resources about climate change and sustainability policy concepts)
  65. Text; Chemistry: the central science. By Brown 11th, 2009
  66. General Chemistry: The Essential Concepts. by Raymond Chang, 7th , 2011

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines:*** *Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topic	Readings
1	Introduction; Chemistry world Matter and measurement	Chapter 1
2	Chemistry world ; Atoms, Molecules, and Ions	Chapter 2
3	Chemistry world ; Stoichiometry. Calculations with chemical formula and equations	Chapter 3
4	Reactions; Aqueous reactions and solution stoichiometry	Chapter 4

Week	Topic	Readings
5	Electronic structure of atoms	Chapter 6
6	Electronic structure of atoms	Chapter 6
7	Periodic properties of the elements	Chapter 7
8	Basic concepts of chemical bonding	Chapter 8
9	Molecular geometry and bonding theories	Chapter 9
10	Properties of solutions	Chapter 13
11	Acid_ base equilibrium	Chapter 16
12	Additional aspects of aqueous equilibrium	Chapter 17
13	Gases	Chapter 10
14	Chemistry of the environment	Chapter 18
15	Revision	
16	Final exams	

Part 5: Course Modules

Module 1; Chemistry world	
Key Concepts	Principle of Chemistry world
Overview	The chemistry science come from large part of experimental way
Aim	Data analysis, evaluation and problem solution.
Learning Outcomes	Know the scientific method, measurement and the metric system, dimensional analysis, significant figures and laboratory calculations.
Units	1: Matter and measurement 67. scientific method, measurement and the metric system 68. dimensional analysis

	69. significant figures and laboratory calculations
Readings	Chapter 1
Activities	Regular class activities Group discussion Quizzes Conducting experiments in the laboratory and make the calculations.
Module 2; Chemical reactions	
Key Concepts	Chemical equations and reactions
Overview	To know how to write the chemical equation and predict the products of the reactions, the students have to know the meaning of atomic mass, moles, Avogadro's number, molar mass, empirical formulas, chemical reactions and chemical equations, limiting reagents and yields.
Aim	To study the chemical reactions. To study the atom, molecules and the empirical formula.
Learning Outcomes	Know what is meant by atomic mass, molar mass, moles and Avogadro's number. Differentiate between the chemical reaction and physical reaction. Know the chemical reactions and chemical equations, limiting reaction and yield. Differentiate between the precipitation reaction, acid base reaction and oxidation reduction reaction.
Units	1: brief history of the nation of atoms 2: discover the electrons and the nuclear model of the atom. 3: modern theory of atomic structure including the atomic number, mass number, isotops and atomic weights.

	4: examine the organization the elements into the periodic table 5: discuss the assemblies of atoms called molecules. 6: learn that the atoms can lose or gain electrons to form ions.
Readings	Chapters: 2,6,8,9
Activities	Group discussion Video films Models
Module 3; Stoichiometry	
Key Concepts	Stoichiometry
Overview	Stoichiometry is the area of study that examines the quantities of substances consumed and produced in chemical reaction. It is important to know how they measure the concentration of ozone in the atmosphere, determining the potential yield of gold from ore.
Aim	To have a quantitative information from balanced equation
Learning Outcomes	Know the chemical reactions and chemical equations. Know the limiting reaction and yield. Differentiate between the precipitation reaction, acid base reaction and oxidation reduction reaction.
Units	1: chemical equation 2: combination reactions, decomposition reactions, and combustion reactions 3: use a chemical formula to relate the masses of substances to the number of atoms. 4: quantitative information from balanced equation. 5: the limiting reaction.
Readings	Chapters: 1, 3,

Activities	Group discussion Quizzes
Module 4; Electronic configuration of atom	
Key Concepts	Electronic configuration of atom
Overview	Study the electromagnetic radiation (wave length and frequency) and energy relationship, know the idea of Quantized energy, know the quantum numbers relate to the number and type of orbitals, and recognized the different orbitals shapes. Draw an energy level diagram for the orbitals of many electron atoms. Use the periodic table to write abbreviated electron configuration and determine the number of unpaired electrons in an atom.
Aim	Write the electronic configurations of elements;
Learning Outcomes	Have an introduction to quantum mechanics and quantum number. Know the electron configuration and the building up principle. Know the periodic classification of the elements. Know the periodic variation in physical properties. Know the periodic variation in atomic and ionic radius. Know the periodic variation in ionization energy. Know the periodic variation in electronic affinity. Know the chemical bond types. Differentiate between the covalent and ionic bonds. Know the electronegativity. Writing Lewis structures. Calculate the formal charges of the molecules. Draw the resonance structures of molecules.

	Know the octet rule and the exceptions. Recognized the different orbitals shapes. Draw an energy level diagram for the orbitals of many electron atoms.
Units	1: the light (radiant energy). 2: electromagnetic radiation. 3: line spectra and Bohr model. 4: the wave behavior of matter. 5: Quantum mechanics and atomic orbitals. 6: Representation of orbitals. 7: Many electron atoms. 8 : electron configurations. 9 : Electron configuration and the periodic table.
Readings	Chapters: 2, 6, 7.
Activities	Group discussion Quizzes
Module 5; Gases	
Key Concepts	Gases
Overview	The gases have a large part in chemistry science; the student should start by the distinguishing characteristics of gases with those of liquids and solids. The student has to know about the presser, the gas law, the ideal gas equation, and further application of the ideal gas equation.
Aim	Consider that the gas law can be expressed in terms of its volume, presser, temperature, and the quantity of gas.
Learning Outcomes	Write the gas law and the ideal gas equation. Calculate Molecular effusion and diffusion.

Units	1: compare the distinguishing characteristics of gases with those of liquids and solids. 2: study the gas presser. 3: examine several relationships among volume, presser, temperature, and quantity of gas. 4: ideal gas equation. 5: calculate the density and molar mass of a gas. 6: partial presser of mixture of gases. 7: molecular effusion and diffusion.
Readings	Chapter 10
Activities	Group discussion Quizzes
Module 6; Environment	
Key Concepts	Environment
Overview	Human activities have a large impact on the global warming which is the most urgent environmental problem. Chemistry is often at the heart of this issue. The economic growth of nations depends critically on chemical processes that range from treatment of water supplies to industrial processes.
Aim	Chemistry and environment
Learning Outcomes	Know the earth‘s atmosphere, outer region of the atmosphere, and the Ozone in the upper atmosphere. Know the chemistry of the Troposphere. Know the world ocean and fresh water. Can conclude the GREEN CHEMISTRY meaning.
Units	1: Earth’s atmosphere . 2: Outer region of the atmosphere. 3: Ozone in the upper atmosphere. 4: Chemistry of the Troposphere.

	5: World ocean. 6: Fresh water. 7: Green chemistry.
Readings	Chapter 18
Activities	Group discussion Quizzes

Jerash University

Course Syllabus

College: Science
Department: Physics

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 340101
Course Name: General Physics
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

✓ **Course Description:**

This course is the prerequisite to the higher courses in physics. It offers an Introduction into the *Physics* of the *Climate* Systems and the physical methods to investigate quantitatively different systems in the physical mechanisms behind *climate* Focuses with environmental applications. Explores physical processes that shape and form the environment, studies the forces of nature and the properties of matter.

This course Include: Measurement and system of units, vectors, motion in one and two dimensions, particle dynamics and Newton's laws of motion, work and energy, conservation of energy, dynamics of system of particles, center of mass, conservation of linear momentum, collisions, impulse, rotational kinematics, rotational dynamics, conservation of angular momentum, elasticity, fluids, oscillatory motions, waves and sound, Heat and thermodynamics.

✓ **Course Learning Objectives:**(Include climate change and sustainability policy concepts)

- Distinguish between scalar and vector quantities.
- Calculate vector components and use vector properties to solve problems.
- Understand the physical relationships expressed by equations.
- Describe the motion of objects in one and two dimensions in terms of displacement, velocity, acceleration, and time.
- Draw force diagrams and apply Newton's laws to solve problems involving several forces acting on a system.
- Understand the relationship between work and energy.
- Solve problems utilizing the laws of conservation of energy and momentum.
- Understand the conditions for equilibrium.
- Mathematically describe the relationship between linear and angular quantities.
- Solve problems involving rotational dynamics.

- Understand and apply Archimedes principle and Bernoulli's equation to solve fluid problems.
- Have a clear and logical presentation of the basic concepts and principles of mechanics.
- Understand the concepts and principles through a broad range of interesting applications to the real world.
- Discuss the kinetic theory of gases.
- Solve problems that require understanding temperature changes, thermal expansion, calorimetric theory, and heat transfer.
- Understand the laws of thermodynamics.
- Compare simple harmonic motion with uniform circular motion.
- Describe the characteristics of oscillating systems.
- Understand superposition and interference of waves.
- Describe sound waves in terms of their frequency, wave length, sound level, and velocity.
- Understand the role of basic physics in human life

✓ **Expected Course Outcomes;**

After completion of this course, students will:

1. Apply knowledge of linear motion, forces, energy, and circular motion to explain natural physical processes and related technological advances, especially to climate systems.
2. Use an understanding of algebraic mathematics along with physical principles to effectively solve problems encountered in everyday life, further study in science, and in the professional world.
3. Investigate quantitatively different systems in the physical mechanisms behind climate Focuses with environmental applications.
4. Design experiments and acquire data in order to explore physical principles, effectively communicate results, and critically evaluate related scientific studies.
5. Assess the contributions of physics to our evolving understanding of global change and sustainability while placing the development of physics in its historical and cultural context.
6. Attain knowledge about the Green-house effect and the solar energy.
7. Explain how man affects the environment and how and why the temperature of the Earth is increasing and how the sea level rise.

✓ **Course Resources:**

- Text; Physics for Scientists and Engineers, by Serway and Jewett, 7^{th} Edition.

- Fundamentals of Physics, by Halliday, Resnick, and Walker.
- Physics for Scientists and Engineers with Modern Physics, Douglas C. Giancoli

Part 3: Assignments, Course policies, and Grading Policy

✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines:*** *Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topic	Readings
1	Motion in One Dimension	Chapter2
2	Motion in Two Dimension	Chapter3
3	Vectors	Chapter4
4	The Laws of Motion	Chapter5
5	Energy and conservation of energy	Chapter 7, 8
6	Linear Momentum and Collisions	Chapter 9
7	Rotation of a Rigid Object About a Fixed Axis and angular momentum	Chapters, 10, 11

Week	Topic	Readings
8	Static Equilibrium and Elasticity	Chapter12
9	Universal Gravitation	Chapter13
10	Fluid Mechanics	Chapter14
11	Oscillatory Motion and wave motion	Chapters 15,16
12	Sound Waves	Chapters 17, 18
13	Temperature and Thermodynamics	Chapters 19,20
14	The Kinetic Theory of Gases	Chapters 21, 22
15	Revision	
16	Final Exam	

Part 5: Course Modules

Module 1; Mechanics	
Key Concepts	**mechanics**
Overview	Classical mechanics is of vital importance to students from all disciplines. It is highly successful in describing the motions of different objects, such as planets, Mechanics deal with Kinematics which includes position, velocity, acceleration, dynamics, and Newton's laws of motion, work, kinetic energy, energy and momentum conservation, rotational motion, conservation of angular momentum.
Aim	• Distinguish between scalar and vector quantities. • Calculate vector components and use vector properties to solve problems. • Understand the physical relationships expressed by equations. • Describe the motion of objects in one and two dimensions in

	terms of displacement, velocity, acceleration, and time. • Draw force diagrams and apply Newton's laws to solve problems involving several forces acting on a system. • Understand the relationship between work and energy. • Solve problems utilizing the laws of conservation of energy and momentum. • Understand the conditions for equilibrium. • Mathematically describe the relationship between linear and angular quantities. • Solve problems involving rotational dynamics.
Learning Outcomes	Apply knowledge of linear motion, forces, energy, and circular motion to explain natural physical processes and related technological advances, especially to climate systems. Use an understanding of algebraic mathematics along with physical principles to effectively solve problems encountered in everyday life, further study in science, and in the professional world. Investigate quantitatively different systems in the physical mechanisms behind climate Focuses with environmental applications.
Units	1: Physics and measurements; - Position, Velocity, and Speed, instantaneous velocity and speed, acceleration. - One-Dimensional Motion with Constant Acceleration, Freely Falling Objects. - Coordinate Systems, Vector and Scalar Quantities and Some Properties of Vectors. - Components of a Vector and Unit Vectors - The Position, Velocity, and Acceleration Vectors - In two-Dimensional Motion with Constant Acceleration

	- Projectile Motion - Uniform Circular Motion and Tangential and Radial Acceleration 2: The Concept of Force, Newton's First Law and Inertial Frames; - Mass, Newton's Second and Third Laws, The Gravitational Force and Weight. - Applications of Newton's Laws. - Forces of Friction. - Work Done by a Constant Force, the Scalar Product of Two Vectors. - Work Done by a Varying Force. 3: Kinetic Energy and the Work–Kinetic Energy Theorem; - The Non-isolated System-Conservation of Energy and Situations Involving Kinetic Friction. - Potential Energy of a System, The Isolated System-Conservation of Mechanical Energy. 4: Conservative and Non-conservative Forces and Changes in Mechanical Energy for non-conservative Forces. Exam 1 5: Linear Momentum and Its Conservation, Impulse and Momentum; - Collisions in One Dimension - Two-Dimensional Collisions 6: The Center of Mass, Motion of a System of Particles. - Angular Position, Velocity, and Acceleration - Rotational Motion with Constant Angular Acceleration. - Angular and Linear Quantities, Rotational Kinetic Energy - Calculation of Moments of Inertia, Torque and Relationship Between Torque and Angular Acceleration - Work, Power, and Energy in Rotational Motion, Rolling

	Motion of a Rigid Object. - Angular Momentum, Angular Momentum of a Rotating Rigid Object and Conservation of Angular Momentum. 7: Newton's Law of Universal Gravitation, Measuring the Gravitational Constant, Free-Fall Acceleration and the Gravitational Force. - Kepler's Laws and the Motion of Planets, The Gravitational Field - Gravitational Potential Energy, Energy Considerations in Planetary and Satellite Motion
Readings	Chapters 1,2,3,4,5,,7,8,910,11,12,13
Activities	Lecturing, group discussions, Simple experiments, discussions, Exercises and home works 5 minutes seminars about certain subjects Quizzes
Module 2; Fluids	
Key Concepts	Fluid
Overview	A fluid is a collection of molecules that are randomly arranged and held together by weak cohesive forces and by forces exerted by the walls of a container. Both liquids and gases are fluids. First, we consider the mechanics of a fluid at rest-that is, fluid statics. We then treat the mechanics of fluids in motion-that is, fluid dynamics.
Aim	To study the fluid statics, fluid dynamics.
Learning Outcomes	Will explore the buoyant force that supports these balloons and other floating objects.
Units	1:-Pressure, Variation of Pressure with Depth, Pressure Measurements.

	2:-Buoyant Forces and Archimedes's Principle 3:-Fluid Dynamics Bernoulli's Equation and Other Applications of Fluid Dynamics
Readings	Chapter 14
Activities	Lecturing, group discussions, Exercises and home works 5 minutes seminars about certain subjects Quizzes
Module 3; Oscillatory motion and Waves	
Key Concepts	Oscillatory motion and Waves
Overview	A special type of motion called periodic motion. This is a repeating motion of an object in which the object Continues to return to a given position after a fixed time interval. A special case of periodic motion is called simple harmonic motion. All periodic motions can be modeled as combinations of simple harmonic motions. Simple harmonic motion also forms the basis for our understanding of mechanical waves. Sound waves, seismic waves, waves on stretched strings, and water waves are all produced by some source of oscillation. The concepts of electromagnetic waves and how they propagate through space.
Aim	To study vibrations and the concepts of waves.
Learning Outcomes	-understand and describe simple harmonic motion (SHM). -Able to derive the equations of motions for physical systems that undergo SHM
Units	1:- Mathematical Representation of Simple Harmonic Motion 2:-The Pendulum, Damped Oscillations and Forced Oscillations 3:- Sinusoidal Waves, the Speed of Waves on Strings, reflection and transmission and rate of Energy Transfer by

	Sinusoidal Waves on Strings 4:-Speed of Sound Waves, Periodic Sound Waves Intensity of Periodic Sound Waves. 5:-Exam 2 The Doppler Effect 6:-Superposition and Interference 7:- Standing Waves, Standing Waves in a String Fixed at Both Ends 8:-Resonance, Beats: Interference in Time and Non-sinusoidal Wave Patterns
Readings	Chapter15,16,17,18
Activities	Lecturing, group discussions, Simple experiments on simple pendulum and waves Exercises and home works 5 minutes seminars about certain subjects Quizzes
Module 4; Thermodynamics	
Key Concepts	Heat, Thermodynamics
Overview	The study of thermodynamics involves Situations in which the temperature or state (solid, liquid, gas) of a system changes due to energy transfers. Thermodynamics is very successful in explaining the bulk properties of matter and the correlation between these properties and the mechanics of atoms and molecules.
Aim	To study Temperature and Thermodynamics Laws.
Learning Outcomes	-Explain heat transformation. -Give knowledge about the Green-house effect and the solar energy. -Explain how man affects the environment and how and why the

	temperature of the Earth is increasing
Units	Heat and Thermodynamics 1. Temperature, Heat, Heat Transfer. 2. Ideal Gas Law. 3. First Law of Thermodynamics including Calorimetric and Phase Changes 4. Heat Engines and Second Law of Thermodynamics
Readings	Chapters 19,20,21,22
Activities	Lecturing, group discussions, Simple experiments on simple pendulum and waves Exercises and home works 5 minutes seminars about certain subjects Quizzes

Jerash University

Course Syllabus

College: Economics and Administration Sciences
Department: Accounting

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)

Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 203499
Course Name: Graduation project
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

✓ **Course Description:**

All students are required to complete a graduation project as part of their graduation requirements. The project may be completed during the student's t third or fourth year. This course enables students to develop a professional project under the supervision of a faculty member. Students work independently, but are provided guidance on a one-on-one basis by the faculty member. The professional project requires definition of a problem statement or research question, and synthesis and integration of information from a multitude of sources. The problem statement or research question must address the Jordanian priorities in scientific research which include: water, energy, renewable energy, climate change, environments and sustainable development.

- **Course Learning Objectives:**
- To give the student basic principles about scientific research.
- To improve students skills in using electronic databases.
- To learn the students the right way to write a report.
- To discuss with the students the Jordanian scientific research priorities.
- Orientation of the students to write graduation reports in Jordanian scientific research priorities which include: water, energy, renewable energy, climate change, environments and sustainable development

✓ **Expected Course Outcomes:**

At the end of the course:

116. The students must have good knowledge in scientific research including identifying problems**.**

117. The students will be able to search in electronic databases.

118. The students know how to do literature review survey**.**

119. The students now how to write a scientific report or proposal**.**

120. The students must know the Jordanian scientific research priorities which include: energy, water, environmental and climate change**.**

121. The students must have the necessary skills to start real project for solving one of the problems in Jordan.

122. The students must finish a professional report addressing one of the Jordanian scientific research priorities.

123. The students must be able to present the project in scientific way

70. Course Resources:

71. No specific text book.
72. Internet, Scientific websites.
73. Library books.
74. Scientific papers

Part 3: Assignments, Course policies, and Grading Policy

✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)

First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.
- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*

- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*

- ✓ ***Classroom Protocol and Participation Guidelines:*** *Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topic

Week	Topic
1	Importance of scientific research
2	Databases
3	Scientific approach for writing reports
4	Identifying problems
5	Library visiting
6	Jordanian priorities in scientific research which include: energy, water, environment and sustainable development
7	Jordanian priorities in scientific research which include: energy, water, environment and sustainable development
8	Selecting topics for each student concerning Jordanian priorities
9	Guiding students during developing their projects
10	Guiding students during developing their projects
11	Guiding students during developing their projects
12	Guiding students during developing their projects
13	Discussing projects
14	Discussing projects
15	Discussing projects
16	Discussing projects

Part 5: Course Modules

Module 1; Research

Key Concepts	Scientific research
Overview	This part of the course is dedicated to improve the skills of the student in the following topics: • Importance of scientific research. • Databases • Scientific approach for writing reports • Identifying problems
Aim	To introduce the students to the world of scientific research
Learning Outcomes	• The students must have good knowledge in scientific research including identifying problems. • The students will be able to search in electronic databases. • The students know how to do literature review survey. • The students now how to write a scientific report or proposal.
Units	1. Importance of scientific research 2. Scientific research methodology 3. Scientific approach for writing reports 4. Databases
Readings	*********
Activities	Lectures Library visits Visiting one of the Jordanian scientific research centers
Module 2; Jordanian scientific research priorities	
Key Concepts	Jordanian scientific research priorities
Overview	In this module the student must go in details about the Jordanian priorities problem

Aim	The aim of this part of the course is to draw the attention of the students to the Jordanian problems and encourage them to find solutions for these problems
Learning Outcomes	• The students must know the Jordanian scientific research priorities which include: energy, water, environmental and climate change. • The students must have the necessary skills to start real project for solving one of the problems in Jordan.
Units	1. Jordanian priorities in scientific research which include: energy, water, environment and sustainable development 2. Topics for each student concerning Jordanian priorities 3. Guiding students during developing their projects
Readings	*********
Activities	Lectures Library visits Visiting one of the Jordanian scientific research centers
Module 3; Graduation Projects	
Key Concepts	Discussing projects
Overview	The students must present their projects through seminars. Each student will have from 20 to 30 minutes to present his work
Aim	Share the results, discussion, and conclusion
Learning Outcomes	• The students must finish a professional report addressing one of the Jordanian scientific research priorities. • The students must be able to present the project in

	scientific way
Units	**********
Readings	**********
Activities	Seminars Preparing soft and hard copies of the projects

Jerash University

Course Syllabus

College: Science
Department: Physics

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number:

340203
Course Name: SPECIAL TOPICS IN MEDICAL PHYSICS

Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

✓ **Course Description:**

Applications of physics to medicine and medical instrumentation; topics include: biomechanics, sound and hearing, noise pollution, pressure and motion of fluids, heat and temperature, global warming, electricity and magnetism in the body, electromagnetic pollution, biological effects of light, luminous pollution, use of ionizing radiation in diagnosis and therapy, radiation safety, medical instrumentation.

✓ **Course Learning Objectives:**

- Develop basic understanding of medical physics concepts.
- Develop problem-solving and critical-thinking skills.
- Learn to integrate and apply various physics concepts to real-life medical physics problems.
- Develop scientific communication skills.
- Understand the mechanical and anatomical principles that govern human motion and develop the ability to link the structure of the human body with its function from a mechanical perspective.
- Apply mathematical, computational and experimental methods in solving physical problems.
- Be able to evaluate quality of information gathered from varied sources
- Translate scientific knowledge and methods into innovations in materials science, medicine, and economics.
- Employ scientific skills and knowledge for the improvement of human life and the preservation of the environment such as climate- change and sustainability policy concepts.
- Understand the causes of negative environmental impact and give solutions to reduce them focusing on climate change and different kinds of pollutions.
- Understand the principles of protection from radiation and how to deal safely with radiations and their instruments.

✓ **Expected Course Outcomes:**

124. Describe the translation motion and rotational motion and he concept of degrees of freedom of movement.
125. Describe Levers and joints of human musculoskeletal system.
126. Identify the human body's equilibrium conditions and their impact on disease formation.

127. Identify basic principles involved in sensors instrumentation, mechanisms of different sensors, their classification, regulation and ethical use.
128. Describe motion with precise, well-defined mechanical and anatomical terminology.
129. Understand and quantify linear and angular characteristics of motion**.**
130. Understand the quantitative relationships between angular and linear motion characteristics of a rotating body.
131. Understand and quantify the cause and effect relationship between force and linear and angular motion of the body**.**
132. Describe the human body's equilibrium conditions and their impact on disease formation
133. Characterize of static flow, using coefficients of surface tension and viscosity**.**
134. Describe liquid and gas flow.
135. Use Bernoulli and Poises formulas to calculate: circulatory diseases and blood flow**.**
136. Define the basic properties of the physics of sound**.**
137. Describe the mechanism of human hearing.
138. Explain the use of physics of ultrasound and Doppler Effect in medical imaging**.**
139. Explain the effect of Noise pollution on human body**.**
140. Explain the physics of optics including reflection, refraction and their implications in use of mirrors, lenses and fiber optics**.**
141. Describe the basics of endoscopes, Laparoscopes and Phototherapy**.**
142. Describe the mechanism of physics of vision and the use of lenses in correction of the most common human vision problems**.**
143. Explain the use of UV and IR spectra in medical applications.
144. Talk about the light pollution and how to reduce it**.**
145. Define LASER**.**
146. Describe the physical concepts of LASER**.**
147. Explain the usage of LASER in medical physics**.**
148. Explain the concepts of RF coils and calculating the magnetic field gradients**.**
149. Calculate magnetic field signals by using Fourier transformation.
150. Have a good basic knowledge of Magnetic Resonance Imaging and Spectroscopy**.**
151. Understand the principles and main technical aspects of Magnetic Resonance Imaging and Spectroscopy**.**
152. Understand the basic image processing (and identify its need) and image analysis techniques**.**
153. Describe the behavior of magnetic moments in an applied magnetic field**.**
154. Explain operating principles of alpha, beta and gamma**.**
155. Explain the meaning of dosimetry**.**

156. Describe the applications of ionizing radiations in medicine**.**
157. To describe the various types of ionizing radiation**.**
158. Understand and sketch the interactions of radiation particles with atoms in tissue**.**
159. Describe the physical-chemical events which follow an ionizing event, in terms of spatial distribution and the time scale**.**
160. Describe the biological impact on living cells and tissue at the DNA, cellular, organ, and whole animal levels. Predict the expected radiobiological outcome, when presented with the ambient conditions of irradiation (e.g. energy, dose, dose rate/fractionation, oxygen level, drugs).
161. Understand the concepts of Imaging System and Telemetry and the various Therapeutic Equipment used in Medicine**.**
162. Describe the basic principles and concepts of radiation protection and safety**.**
163. Explain the radiation health and safety requirements of federal and state regulatory agencies**.**
164. To become aware of safety precautions when using radiation and be familiar with the government agencies related to the radiation exposure limits**.**
165. Discuss, examine and evaluate the radiation therapies**.**
166. Explain the importance and objectives of medical instruments and sensors in medicine**.**
167. Identify the underlying physics principles and relate them to mechanisms of a number of biomedical instruments**.**
168. Apply basic medical instruments principles to real world problems in clinical engineering, medical device design, and troubleshoot basic medical instrumentation**.**
169. Discuss the measurement of physiological parameters**.**

- 11. Radiobiology for the Radiologist, E. Hall and A. Giaccia (6th edition) Part 3: Assignments, Course policies, and Grading Policy

Part 3: Assignments, Course policies, and Grading Policy

✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

- ✓ Homework Assignments: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.
- ✓ Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.
- ✓ Cheating: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.
- ✓ ***Classroom Protocol and Participation Guidelines****: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topic	Readings
1	Biomechanics Newton's laws and torque	McGinnis, P. M. (1999). Biomechanics of sport and exercise.Champaign, IL: Human and Class notes
2	Biodynamic of movements Applications from human activity	McGinnis, P. M. (1999). Biomechanics of sport and exercise. Champaign, IL: Human Kinetics.
3	Pressure Liquids and gases biomechanics.	Class notes and medical physics M. Hollins, Ch.6 Principles of Mechanics and Biomechanics By Frank Bell, Ch.8
4	Hearing Sound and Ultrasound physics and clinical	Class notes and

Week	Topic	Readings
		medical physics M. Hollins, Ch.3,8 S.Amador. Physics in Modern Medicine. 2003
5	Biological effects of light And optics	Class notes and medical physics M. Hollins, Ch.2,7
6	LASER and its application in medical physics	Class notes and Amador S. Physics in Modern Medicine. 2003
7	Electricity and magnetism	Class notes and medical physics M. Hollins, Ch.5
8	Magnetic resonance imaging and spectroscopy	Magnetic Resonance Imaging: Physical Principles and Sequence Design, by E. M. Haacke, R. W. Brown, M. R. Thompson, and R. Venkatesan, John Wiley & Sons, Inc, 1999. and class notes
9	Ionizing radiation in diagnosis and therapy	Radiation, People and the Environment, IAEA and class notes
10	Nuclear medicine	Radiobiology for the Radiologist, E. Hall and A. Giaccia (6th edition) and class notes
11	Use of X-rays for diagnosis	The Essential Physics of Medical Imaging by J.E. Bushberg, J.A. Seibert, E.M. Leidholdt JR, and J.M. Boone, Published 2nd Edition 2002 by Lippncott Williams &Wilkens and class notes
12	Radiotherapy Radiation Protection	Review of Radiation Oncology Physics: A Handbook for Teachers and Students Ch.16, class notes.

Week	Topic	Readings
13	Radiation safety	Radiation safety training manual, class notes. Radiation safety handbook. Class notes.
14	Medical instrumentation	Lecture medical physics M. Hollins, Ch.4
15	Revision	
16	Final Exam	

Part 5: Course Modules

Module 1; Biomechanics	
Key Concepts	**Biomechanics**
Overview	Biomedical is to introduce students to concepts of mechanics as they apply to human movement, particularly those pertaining to exercise, sport, and physical activity.
Aim	To have good understanding of mechanical and anatomical principles that govern human motion and develop the ability to link the structure of the human body with its function from a mechanical perspective.
Learning Outcomes	1. Describe motion with well define mechanical and anatomical terminology. 2. Apply the laws of angular and linear motion to the motions of human body. 3. Apply Newton's laws to the linear and rotational motion of the

	body. 4. Describe the translation motion and rotational motion and he concept of degrees of freedom of movement. Can describe Levers and joints of human musculoskeletal system. **5.** Describe the human body's equilibrium conditions and their impact on disease formation.
Units	Unit one; • Linear and angular kinematics • Forces and Torque. • Static equilibrium, free body diagram • Linear kinetics; inertia; mass; force; pressure. • Center of mass; Vertical jumping • Dynamics, Rotational Inertia • Techniques in 2d and 3D thatare used to analyze movement Unit two; • The Skelton. • Muscle • Stress, Strain and stiffness of biological materials • Strength and toughness of biomaterials
Readings	McGinnis, P. M. (1999). Biomechanics of sport and exercise. Champaign, IL: Human Kinetics and class notes.
Activities	Lectures Exercises and home works 5 minutes seminars about certain subjects, Quizzes
Module 2; Fluid dynamics	
Key Concepts	Pressure, Liquids and gases biomechanics.

Overview	Fluid dynamics in human body is the study of the motion of fluids (both liquid and gases) in human body. Tension static and viscosity and a number of interdisciplinary applications. The pressure and buoyancy that water can provide to a variety of problems that patients can have**.**
Aim	To simplify the method of moving fluid (liquid and gases) in human body. To gain the main principles of hydrostatics that governs the equilibrium of fluid and resistance of moving fluid.
Learning Outcomes	1. Characterize the static flow by using coefficients of surface tension and viscosity. 2. Describe liquid and gas flow. 3. Use Bernoulli and Poises formulas to calculate: circulatory diseases and blood flow.
Units	Unit one; • Visco-elasticity in biomaterials • Dynamics of moving systems • Adhesion • Surface tension and life under pressure • Fluid properties. Unit two; • Bernoulli's principle • Drag and Reynolds numbers • Shape and drag • Tube Flow and Blood flow First Exam
Readings	Class notes and medical physics M. Hollins Ch.6 Principles of Mechanics and Biomechanics By Frank Bell Ch.8

	Principles of Mechanics and Biomechanics, Frank Bell.
Activities	Lectures Exercises and home works 5 minutes seminars about certain subjects and discussions Quizzes
Module 3; Hearing Sound	
Key Concepts	Hearing Sound and Ultrasound physics and clinical
Overview	Mechanical oscillations and waves. Wave forms. Sound. Acoustics. Hearing, the mathematical description. Ultrasound and infrasound, their application in medicine; Ultrasonography and Dopplerography. Noise and its effects on the human body.
Aim	To compare sound waves that can be hearing from ultrasound waves, to recognize the mechanism of hearing in human body. To describe the use of physics of ultrasound and Doppler effect in medical imaging.
Learning Outcomes	Define the basic properties of the physics of sound. Describe the mechanism of human hearing. Explain the use of physics of ultrasound and Doppler effect in medical imaging. Explain the effect of Noise pollution on human body.
Units	Unit one; • Waves and their properties. • Sound waves physics. • Physics of hearing. • Ultrasonic Sound. Unit two; • The Doppler Effect. • Applications of sound in Medicine.

	• The effect of Noise pollution on human body.
Readings	Class notes and medical physics, M. Hollins,Ch.3,8 Amador S. Physics in Modern Medicine. 2003
Activities	Lectures Exercises and home works 5 minutes seminars about certain subjects and discussions and Quizzes.
Module 4; Light and optics	
Key Concepts	Biological effects of light and optics
Overview	Basics of bio-optics. Electromagnetic oscillations and waves. Optical wavelength range: UV and IR spectra and their biological effects on the human body. The light pollution.
Aim	Describe the physics of optics including reflection, refraction and their implications in use of mirrors, lenses and fiber optics**.**
Learning Outcomes	Explain the physics of optics including reflection, refraction and their implications in use of mirrors, lenses and fiber optics. Describe the basics of Endoscopes , Laparoscopes and Phototherapy Describe the mechanism of physics of vision and the use of lenses in correction of the most common human vision problems. Explain the use of UV and IR spectra in medical applications Talk about the light pollution and how to reduce it.
Units	Unit one; • Light and its properties(reflection and refraction) • Fiber optics • Medical applications : Endoscope, Laparoscope and

	Phototherapy Unit two; • Thin Lenses • The Physics of Vision, human Eye • Angular Magnification and Magnifying Glass and Common Vision Defects Unit three; • Electromagnetic Radiation • EM Radiation and Medical Application • Light pollution and how to decrease it.
Readings	Class notes and medical physics, M. Hollins,Ch.2,7 Amador S. Physics in Modern Medicine. 2003
Activities	Lectures Exercises and home works 5 minutes seminars about certain subjects and discussions Quizzes
Module 5; LASER	
Key Concepts	LASER and its application in medical physics
Overview	Lasers. Laser operating principles. Laser types. Laser effects on tissues. The use of lasers in medicine and cosmetology. Medicine laser safety classes. Principles of photo dynamics therapy.
Aim	To recognize LASER and its applications in medicine
Learning Outcomes	Define LASER. Describe the physical concepts of LASER. Explain the usage of LASER in medical physics.
Units	Unit one; • Basic Physics of Laser • Laser Properties • The Helium – Neon Model

	• The Ruby Laser • Other Lasers Unit two; • Medical applications : Laser surgery on the Eye and in Dermatology • Questions and problems • Clinical applications of Laser
Readings	Amador S. Physics in Modern Medicine. 2003and class notes.
Activities	Exercises and home works 5 minutes seminars about certain subjects and discussions, quizzes.
Module 6; Electricity	
Key Concepts	Electricity and magnetism
Overview	The human body's physical fields, their types and use in the medical diagnostics. Electrocardiography. Electroencephalography. Electromyography. Electrooculography. Magnetic field. Magnetocardiography. Magnetoencephalography. Magnetooculography. Human in the surrounding physical fields. Earth's magnetic field effects on the human body. Natural and artificial sources of electromagnetic field and their impact on the human body. The EM pollution.
Aim	To understand the electricity and magnetism inside the body and the effect of electricity and magnetic fields flow outside the body on the body as well as the usage of electrical and magnetic fields in medicine and EM pollution.
Learning Outcomes	Explain the electricity and magnetism inside the human body. Discuss the effects of outside electrical and magnetic fields on human body. Explain the structure and operational principles of medical equipment and direction of further

	development.
Units	Unit one; • Electricity within the body • Effect of electricity on human body, Electrical shock, electrical burn. • Electromyogram (EMG), Electrical potential in the heart (ECG), EEG,ERG ,EOG and MCG Unit two; • Biopotentials of the heart, Electrodes: Amplifiers, Electro surgery. • Magnetic resonance imaging and spectroscopy. • Safety in using EM instruments.
Readings	Class notes and medical physics,M. Hollins,Ch.5
Activities	Lectures, Exercises and home works, 5 minutes seminars about certain subjects and discussions and Quizzes.
Module 7; Magnetic Resonance Imaging and Spectroscopy in Living Systems	
Key Concepts	Magnetic Resonance Imaging, Spectroscopy, Living Systems
Overview	Theory of nuclear magnetic resonance imaging and spectroscopy is necessary to understand current methods for visualizing the structure of cells, tissues, whole animals, and humans with a focus on living systems. Also current methods allow the monitoring of biochemical processes in cells suspensions, whole animals, and humans using in vivo MR spectroscopy.
Aim	To provide students with knowledge necessary to apply modern methods of MR imaging and spectroscopy in vivo to solve research problems.
Learning Outcomes	Explain the concepts of RF coils and calculating the magnetic field gradients. Calculate magnetic field signals by using Fourier transformation.

	Have a good basic knowledge of Magnetic Resonance Imaging and Spectroscopy. Understand the principles and main technical aspects of Magnetic Resonance Imaging and Spectroscopy. Understand the basic image processing (and identify its need) and image analysis techniques. Describe the behavior of magnetic moments in an applied magnetic field.
Units	Unit one; • Behavior of magnetic moments in an applied magnetic field. • RF coils and magnetic field gradients. Unit two; • Relaxation and magnetic-field-strength dependence Signal detection and Fourier transformation • Multiple RF pulses, echoes, and one-dimensional imaging, Image contrast: SNR, relaxation, and flow Diffusion weighted imaging, Functional magnetic resonance imaging, Basic quantum description of NMR, Chemical shift and scalar coupling, Chemical-shift-selective and spectroscopic imaging, Localized MR spectroscopy and adiabatic excitation, Measurement of physiological parameters; pH and reaction rates
Readings	Magnetic Resonance Imaging: Physical Principles and Sequence Design, by E. M. Haacke, R. W. Brown, M. R. Thompson, and R. Venkatesan, John Wiley & Sons, Inc, 1999. and he Essential Physics of Medical Imaging by J.E. Bushberg, J.A. Seibert, E.M. Leidholdt

	JR, and J.M. Boone, Published 2nd Edition 2002 by Lippncott Williams &Wilkens. class notes
Activities	Exercises and home works, 5 minutes seminars about certain subjects and discussions and quizzes.
Module 8; Ionizing radiation	
Key Concepts	Radiation, Ionizing
Overview	Ionizing radiation is a type of energy released by atoms in the form of electromagnetic waves or particles. People are exposed to natural sources of ionizing radiation as in soil vegetation and human made sources as x-ray and medical devices. Ionization radiation has two very different uses in medicine for diagnosis and therapy. Both are intended benefits and risk, as with any use of radiation, the benefit must outweigh the risk.
Aim	To provide the students with the basis of radiation therapy and diagnostic imaging g studies. To explores the fundamentals of interaction between ionizing radiation and matter. Also, provide student with comprehensive knowledge of radiation therapy physics.
Learning Outcomes	Explain operating principles of alpha, beta and gamma**.** Explain the meaning of dosimetry. Describe the applications of ionizing radiations in medicine. To describe the various types of ionizing radiation. Understand and sketch the interactions of radiation particles with atoms in tissue. Describe the physical-chemical events which follow an ionizing event, in terms of spatial distribution and the time scale. Describe the biological impact on living cells and tissue at the DNA, cellular, organ, and whole animal levels. Predict the expected radiobiological outcome, when

	presented with the ambient conditions of irradiation (e.g. energy, dose, dose rate/fractionation, oxygen level, drugs).
Units	Unit One; • Ionizing Radiation • Basic Radiation Physics • Nuclear medicine Physics Unit Two; • Radiation Quantities and Units • Dose Rate Effect. • Radiation Therapy**.**
Readings	1- Radiation, People and the Environment, IAEA 2- Radiobiology for the Radiologist, E. Hall and A. Giaccia (6th edition) and class notes
Activities	Lectures, Exercises and home works, 5 minutes seminars about certain subjects and discussions and quizzes.
Module 9; Medical imaging	
Key Concepts	Medical imaging
Overview	Medical imaging is the technique of creating visual representation of the interior of a body for clinical analysis and medical interview.
Aim	Describes in details the X-ray and Computed Tomography ionizing medical imaging modalities. It also introduces medical image processing and image quality evaluation techniques. Introduce types of radiology and Physical and mathematical basics of computer tomography.
Learning Outcomes	Define the fundamentals of digital image processing Define the key factors that affect image quality List, define, and explain an ionizing imaging system and break it down into its components and physical principles, for each of the imaging modalities covered (X-ray

	Radiography and X-ray computed tomography) Describe basic components of the nuclear medicine imaging equipments such Gamma Camera, SPECT, and PET in addition to the image reconstruction techniques. Describe basic components of the non-ionizing medical imaging equipments such MRI and US Describe published scientific articles that relate to medical imaging and be able to communicate their understanding in a professional manner be able to search, read, understand, and articulate the contents of scientific articles in the field of medical imaging**.**
Units	Unit One; • Introduction to Digital Image Processing • Introduction to Medical Imaging and Computers in Medical Imaging Unit Two; • Diagnostic Radiographic Imaging • X-ray Computed Tomography Imaging – CT Unit Three; • LessonNuclear Medicine Imaging – NM
Readings	The Essential Physics of Medical Imaging by J.E. Bushberg, J.A. Seibert, E.M. Leidholdt JR, and J.M. Boone, Published 2nd Edition 2002 by Lippncott Williams &Wilkens.
Activities	Exercises and home works, 5 minutes seminars about certain subjects and discussions and quizzes.
Module 10; Radiation Therapy protection and safety	
Key Concepts	Radiation Therapy, protection, safety
Overview	There are three essential methods to minimize external

	exposure to radiation:- time, distance and shielding
Aim	Providing the students with basic principles and concepts of radiation protection and safety as well as radiation health and safety requirements of federal and state regulatory agencies. To identify students with the specific responsibilities of radiation therapies.
Learning Outcomes	Describe the basic principles and concepts of radiation protection and safety. Explain the radiation health and safety requirements of federal and state regulatory agencies. Discuss, examine and evaluate the radiation therapies. To become aware of safety precautions when using radiation and be familiar with the government agencies related to the radiation exposure limits.
Units	Unit One; Radioactivity and activity Unit Two; Safety doses. Unit Three; Radiation Safety and Radiation safety for X-Ray Units
Readings	Radiation safety training manual, class notes. Radiation safety handbook. Physics: A Handbook for Teachers and Students Ch.16, class notes.
Activities	Lectures, Exercises and home works, 5 minutes seminars about certain subjects and discussions and quizzes.
Module 11; Medical instrumentation	
Key Concepts	Medical instrumentation
Overview	Medical instrumentation deals with various systems of the human physiology, signals of biological origin obtained from these systems, biosensors, transducers, bio-electrodes

	used to acquire such signals, and amplifiers for measuring bio-potentials. Electrical safety of medical devices; measurements of the blood pressure, blood flow, respiratory system, laboratory equipment, medical imaging, and bioethics will also be discussed.
Aim	To learn the physiology of the human body and the Instrumentation related to Biomedical Systems. To introduce student to basic biomedical technology. So that student can understand, design and evaluate systems and devices that can measure, test and/or acquire biological information from the human body.
Learning Outcomes	0. Explain the importance and objectives of medical instruments and sensors in medicine and identify the underlying physics principles and relate them to mechanisms of a number of biomedical instruments. 1. Apply basic medical instruments principles to real world problems in clinical engineering, medical device design, and troubleshoot basic medical instrumentation. 2. Discuss the measurement of physiological parameters. **3.** Understand the concepts of Imaging System and Telemetry ad the various Therapeutic Equipments used in Medicine.
Units	Unit One; Basic concepts components of Biomedical system. Unit Two; Measurements of Physiological Parameters Imaging System and Telemetry. Unit Three; Assisting and Therapeutic Equipments.
Readings	1. Medical physics,M. Hollins,Ch.4

	2. Lesilie Cromwell, Fred J.Weibell,ErichA. Pfeiffer, ”Bio-Medical Instrumentatio and Measurements” II edition, Pearson Education,2002/PHI 3. R.S.Khandpur,”Handbook of Bio-Medical Instrumentation” Tata McGraw Hill Publishing Co.Ltd.2003.
Activities	Lectures, Exercises and home works, 5 minutes seminars about certain subjects and discussions and quizzes.

Jerash University

Course Syllabus

College: Science
Department: Biology

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 302222
Course Name: Economic Plants
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:302221

Course Description:

A survey of economically important plants and their products. The history of plant use, plants in folklore and medicine, fermentation and viticulture, domestication of plants, and forestry are the major topics covered. Chemical, structural and nutritional aspects of plant products are also discussed along with the importance of plant in facing global warming and their role in sustainable development.

Course Learning Objectives:

- To develop basic knowledge about the relationship between plants and people
- To have an idea on plant biology
- To know that plants are a source of food, fibers, beverages, medicine, toxic and wood and other products
- To understand the role of plants in the environment

Expected Course Outcomes:

The successful student must be able to understand that:

1. Angiosperms, also called flowering plants, supply humanity with the essentials of life.
2. All living organisms have the capacity to grow and reproduce, the ability to respond, the ability to evolve and adapt, a metabolism, an organized structure, and organic composition.
3. Plant systematic has its origins in the classical works of Theophrastus of ancient Greece, who is generally regarded as the Father of Botany.
4. Linnaeus, a Swedish botanist of the eighteenth century, is credited with the creation of the binomial, or scientific name.
5. The taxonomic hierarchy includes the major ranks: kingdom, division (phylum), class, order, family, genus, and species.
6. Biologists have wrestled with the concept of the species; the biological concept describes a species as a group of interbreeding populations, reproductively isolated from other populations.

7. Charles Darwin and his theory of evolution by natural selection irrevocably changed the way biologists viewed species.
8. Currently biologists accept the Six-Kingdom System of classification.
9. The Kingdom Planate contains land plants, which manufacture their own food through photosynthesis and retain a multicellular embryo within the female gametangium.
10. Some plants, such as mosses, hornworts, and liverworts, have a dominant gametophyte generation.
11. All vascular plants have a dominant sporophyte. Four divisions of vascular plants do not form seeds.
12. The seed plants are currently the dominant vegetation in the world.
13. The first human societies were based on a foraging lifestyle, gathering wild plants and hunting animals for food.
14. The archeological record indicates that, at least in some parts of the world, certain groups began to shift from the nomadic, foraging lifestyle to the sedentary one of agriculture.
15. The earliest agricultural settlements, approximately 11,500 years old, have been found in the Far East along the Yellow and Yangtze River valleys.
16. Domesticated plants and animals are genetically different from their wild relatives because they have been shaped by artificial selection.
17. Because domesticated plants have been modified greatly from their wild ancestors after thousands of years of artificial selection, it has often been difficult to pinpoint their area of origin.
18. Grasses are members of the family Phocaea.
19. Wheat is one of the most widely cultivated crops in the world and is one of the oldest domesticated plants.
20. Corn, a New World native, was the dietary staple of many Native American tribes before European explorers arrived in America.
21. Rice feeds more people worldwide than any other crop, and it is the only crop grown exclusively for human food.
22. Other economically important grains include rye, triticale, oats, barley, sorghum, and millet.
23. Legumes are members of the Fabaceae, or bean family, and include several important food crops: peas, beans, soybeans, and peanuts.
24. The high protein content of many legumes is due to their association with nitrogen-fixing bacteria in their roots.
25. Dozens of types of peas and beans are valued for their high protein content.
26. The peanut (Arachis hypogea) has a South American origin and is unusual in that the plant itself "plants" its seed pods in the soil.
27. The protein content of soybean (Glycine max) is one of the highest of all crops.
28. Legumes are also valued as forage crops and as "green manure" to enhance soil fertility.
29. The search for new crops has uncovered several relatively unknown legumes.
30. Many plants store large quantities of starch in underground structures that are modified stems or roots.
31. Native to the highlands of South America, the potato was the dietary staple of the ancient Incan civilization and was introduced to Europe in the sixteenth century.

32. Sweet potatoes are storage roots of a plant in the morning glory family and are unrelated to the white potato.
33. Cassava is a tuberous root that is another important starchy staple vital to the food supply of millions in the tropics.
34. Other underground crops include yams and taro, which are important staples in tropical areas, especially the South Pacific islands.
35. Approximately 20% of the world's population receives insufficient food to meet daily nutritional requirements.
36. The loss of genetic diversity in crop plants and their wild ancestors because of monocultural practices is a serious concern to plant breeders.
37. Sustainable agriculture is a movement away from the instability of current monocultural practices to a more environmentally sound approach in which crops are harvested without degradation to the environment.
38. Germplasm is the genetic information encoded within a plant; it is the raw material of the plant breeder, and without it, the creation of new varieties is impossible.
39. Although there are approximately 50,000 species of edible plants, only three domesticated crops provide over 50% of the calories from plants in the human diet.
40. Biotechnology is being used along with traditional breeding to develop high-yielding and disease resistant cultivars.
41. The first genetically engineered plant was approved for commercial marketing in 1994, and by 2001, 60% to 70% of the processed foods in U.S. markets contained at least one ingredient from a genetically modified plant.
42. Caffeine and caffeinelike alkaloids have a stimulating effect on the central nervous system.
43. Coffee is obtained from the seeds of Coffeaarabica, a tree native to Ethiopia.
44. Tea, made from dried tip leaves of Camellia sinensis, is the world's most popular beverage.
45. The seeds of Theobroma cacao are the source of both a beverage and a confection, cocoa and chocolate.
46. The kola tree, native to West Africa, is the source of a caffeine beverage that has been consumed increasingly since the twentieth century.
47. The characteristic scents of aromatic plants, such as herbs and spices, are due to volatile substances called essential oils, which can be extracted to obtain the essence of the plant.
48. The history of spices is the history of domination of the spice-rich lands by various European powers.
49. Herbs are usually the aromatic leaves of plants from temperate regions.
50. Herbal dyes were one of the main sources of color in the ancient world, replaced by synthetic dyes only in the latter half of the nineteenth century.
51. In addition to food and drink, plants furnish society with the raw materials to provide shelter, clothing, and paper.
52. Linen, made from bast fibers of flax (Linumusitatissimum), was the cloth of choice for many ancient civilizations.
53. Other bast fibers that have been used to make cloth are ramie, jute (burlap), and hemp.
54. Bark is another material that has been used to make cloth and paper.

55. Wood and wood products supply construction materials and fuel to much of the world population.
56. In industrialized nations, approximately 50% of the harvested wood goes into wood pulp, with the majority of pulp used in the manufacture of paper.
57. Bamboo is a treelike member of the grass family with a long history of use in construction, furniture, baskets, screens, carpets, paper, and food.
58. From the earliest civilizations, native plants have supplied medicinal compounds.
59. Alkaloids and glycosides have been identified as the therapeutically important components of most medicinal plants.
60. Digitalis, the primary treatment for several heart ailments, is derived from foxglove, a biennial in the snapdragon family.
61. Today, aspirin is purely synthetic, but it is based on traditional remedies from willow bark.
62. Quinine, the active alkaloid in the bark of Cinchona trees, has been used for centuries in the treatment of malaria.
63. In 1952, the alkaloid reserpine was isolated from the roots of Rauwolfiaserpentina, a plant used by Hindu healers for thousands of years.
64. The sap of Aloe vera contains several glycosides that are used to treat minor burns and cuts.
65. Ephedrine and pseudoephedrine, alkaloids from various species of Ephedra, are found in prescription and over-the-counter decongestants.
66. Active compounds from several plants have become standard treatment for various forms of cancer, and researchers continue to look for and develop new anticancer compounds.
67. The use of psychoactive plants in human society dates back millennia.
68. The opium poppy (Papaversomniferum) is the source of a milky latex from the green capsules that, when dried, becomes crude opium.
69. Heroin is a semisynthetic derivative of morphine and the most strongly addictive of all the opiates.
70. Marijuana (Cannabis sativa) has an equally long history as a hallucinogen in India.
71. Cocaine is derived from the leaves of the coca plant (Erythroxylum coca), a shrub native to South America.
72. The most addictive drug in widespread use is nicotine, the major alkaloid in tobacco (Nicotiana spp.), and native to the New World.
73. The use of peyote (Lophophorawilliamsii) has long been associated with sacred rituals of many Indian tribes in Mexico.
74. Poisonous and allergy plants are known to adversely affect the health of humans and other animals.
75. Many plants in the natural environment and those in the garden or house are poisonous.
76. White snakeroot, locoweed, Indian hellebore, and St. John’s wort are plants that have been implicated in the poisoning deaths of livestock.
77. Plants can cause mechanical injury by puncturing the skin via thorns, barbs, or spines.
78. Plant toxins have become an important source in the search for natural insecticides.

79. Allergies are hypersensitivity diseases caused by the immune system's response to harmless substances such as ragweed pollen or mold spores.
80. Pollen from ragweed plants is the most important cause of allergic rhinitis in North America.
81. In addition to pollen from ragweed, pollen from hundreds of seed plants is known to trigger respiratory allergies.
82. The most common cause of contact dermatitis is poison ivy, a widespread climbing shrub in North America.
83. Food allergies can produce gastrointestinal symptoms, dermatitis, hives, or respiratory symptoms.
84. The ecosystem is the functional unit of study of the environment.
85. Ecological niche is the functional role an organism plays in the ecosystem.
86. Biological magnification is the transfer and concentration of a toxic substance as it is passed along a food chain.
87. Human impact on the carbon cycle has resulted in the greenhouse effect, in which the buildup of CO2 acts as a heat trap warming Earth's lower atmosphere. Global warming is likely to cause a shift in agricultural regions and in the range of many species of plants and animals.
88. Ecological succession is the gradual progression of orderly and predictable changes that may occur in ecosystems over time. The end point of ecological succession is the climax community.
89. Biomes are large, terrestrial regions recognizable by their distinctive vegetation and animal life.
90. The strategy of extractive reserves is an attempt to preserve the tropical rain forest from destructive exploitation by developing economic markets for a renewable harvest of natural products such as natural rubber, chicle, Brazil nuts, and vegetable ivory.
91. Several methods of forest management are currently in practice: clear-cutting, strip-cutting, whole-tree harvesting, shelterwood, selective cutting, and short rotation.

Course Resources:

75. Text book; Plants and society by Levetin and McMahon, 4th, 2006

Part 3: Assignments, Course policies, and Grading Policy

Exams: *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

Grade Components:

Component	Grade

Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

Homework Assignments: *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*

Late Policy: *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*

Cheating: *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*

Classroom Protocol and Participation Guidelines: *Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topic	Readings
1	Plants in Our Lives Plant Systematic and Evolution	Chapter 1 Chapter 8
2	Plant Systematic and Evolution Diversity of Plant Life	Chapter 8 Chapter 9
3	Origins of Agriculture	Chapter 11
4	The Grasses	Chapter 12
5	Legumes	Chapter 13
6	Starchy Staples and first exam	Chapter 14
7	Feeding A Hungry World	Chapter 15
8	Stimulating Beverages	Chapter 16
9	Herbs and Spices	Chapter 17
10	Materials: Cloth, Paper, and Wood	Chapter 18
11	Medicinal Plants and second exam	Chapter 19
12	Psychoactive Plants	Chapter 20
13	Poisonous and Allergy Plants	Chapter 21
14	Plant Ecology	Chapter 26
15	Plant Ecology	Chapter 26
16	Final exams	

Part 5: Course Modules

Module 1; BOTANICAL CONNECTIONS TO OUR LIVES	
Key Concepts	PLANTS, SOCIETY
Overview	Module 1 stresses the overall importance of plants in everyday life. The properties of life and an introduction to chemistry are

	included. Flowering and non-flowering plants, algae, and fungi are introduced. The diversity and applications of photochemicals is also presented.
Aim	To understand the importance of plants in our life
Learning Outcomes	The successful student must be able to understand that: 1. Angiosperms, also called flowering plants, supply humanity with the essentials of life. 2. All living organisms have the capacity to grow and reproduce, the ability to respond, the ability to evolve and adapt, a metabolism, an organized structure, and organic composition. 3. Nine elements (carbon, oxygen, hydrogen, nitrogen, potassium, magnesium, calcium, phosphorus, and sulfur) make up 99.5% of living matter.
Units	1. PLANTS AND HUMAN SOCIETY 2. FUNDAMENTAL PROPERTIES OF LIFE 3. CHEMISTRY OF LIFE
Readings	Chapter 1 IN THE TEXT
Activities	Group discussion Assignments Quizzes
Module 2; BOTANICAL PRINCIPLES	
Key Concepts	Plant Life, Botanical Principles
Overview	This module addresses basic botany. Chapters cover plant structure from the cellular level through the mature plant. Reproduction, including mitosis and meiosis and the life cycle of flowering plants, is discussed in a separate chapter. Other chapters cover genetics, evolution, plant physiology, plant

	systematics, and plant diversity. Some of the economic aspects of plants discussed in this unit are the importance of vegetables and fruits, the connection between sugar and slavery, plant essential oils and perfumes, phytoremediation, the applications of palynology, and species conservation.
Aim	To have a revision on systematic and evolution
Learning Outcomes	The successful student must be able to understand that: 1. Plant systematic has its origins in the classical works of Theophrastus of ancient Greece, who is generally regarded as the Father of Botany. 2. Linnaeus, a Swedish botanist of the eighteenth century, is credited with the creation of the binomial, or scientific name. 3. The taxonomic hierarchy includes the major ranks: kingdom, division (phylum), class, order, family, genus, and species. 4. Biologists have wrestled with the concept of the species; the biological concept describes a species as a group of interbreeding populations, reproductively isolated from other populations. 5. Charles Darwin and his theory of evolution by natural selection irrevocably changed the way biologists viewed species. 6. Currently biologists accept the Six-Kingdom System of classification. 7. The Kingdom Planate contains land plants, which manufacture their own food through photosynthesis and retain a multicellular embryo within the female gametangium.

	8. Some plants, such as mosses, hornworts, and liverworts, have a dominant gametophyte generation. 9. All vascular plants have a dominant sporophyte. Four divisions of vascular plants do not form seeds. 10. The seed plants are currently the dominant vegetation in the world.
Units	1. EARLY HISTORY OF CLASSIFICATION 2. HOW PLANTS ARE NAMED 3. TAXONOMIC HIERARCHY 4. THE INFLUENCE OF DARWIN'S THEORY OF EVOLUTION 5. THE SIX-KINGDOM SYSTEM 6. SURVEY OF THE PLANT KINGDOM
Readings	Chapters: 8, and 9 in the text book.
Activities	Group discussion Assignments Documentary films Quizzes
Module 3; PLANTS AS A SOURCE OF FOOD	
Key Concepts	Plants, Food
Overview	This module describes the major food crops. It begins with a chapter on the requirements for human nutrition and continues with a chapter on the origin of agriculture. Other chapters cover the grasses, the legumes, and starchy staples. The unit ends with a chapter on the Green Revolution, the loss of genetic diversity, the search for alternative crops, and the controversial development of transgenic crops.
Aim	Studying the use of different plant as food source

Learning Outcomes	The successful student must be able to understand that: 1. The first human societies were based on a foraging lifestyle, gathering wild plants and hunting animals for food. 2. The archeological record indicates that, at least in some parts of the world, certain groups began to shift from the nomadic, foraging lifestyle to the sedentary one of agriculture. 3. The earliest agricultural settlements, approximately 11,500 years old, have been found in the Far East along the Yellow and Yangtze River valleys. 4. Domesticated plants and animals are genetically different from their wild relatives because they have been shaped by artificial selection. 5. Because domesticated plants have been modified greatly from their wild ancestors after thousands of years of artificial selection, it has often been difficult to pinpoint their area of origin. 6. Grasses are members of the family Phocaea. 7. Wheat is one of the most widely cultivated crops in the world and is one of the oldest domesticated plants. 8. Corn, a New World native, was the dietary staple of many Native American tribes before European explorers arrived in America. 9. Rice feeds more people worldwide than any other crop, and it is the only crop grown exclusively for human food. 10. Other economically important grains include rye, triticale, oats, barley, sorghum, and millet. 11. Legumes are members of the Fabaceae, or bean family,

	and include several important food crops: peas, beans, soybeans, and peanuts. 12. The high protein content of many legumes is due to their association with nitrogen-fixing bacteria in their roots. 13. Dozens of types of peas and beans are valued for their high protein content. 14. The peanut (Arachis hypogea) has a South American origin and is unusual in that the plant itself "plants" its seed pods in the soil. 15. The protein content of soybean (Glycine max) is one of the highest of all crops. 16. Legumes are also valued as forage crops and as "green manure" to enhance soil fertility. 17. The search for new crops has uncovered several relatively unknown legumes. 18. Many plants store large quantities of starch in underground structures that are modified stems or roots. 19. Native to the highlands of South America, the potato was the dietary staple of the ancient Incan civilization and was introduced to Europe in the sixteenth century. 20. Sweet potatoes are storage roots of a plant in the morning glory family and are unrelated to the white potato. 21. Cassava is a tuberous root that is another important starchy staple vital to the food supply of millions in the tropics. 22. Other underground crops include yams and taro, which are important staples in tropical areas, especially the South Pacific islands.

	23. Approximately 20% of the world's population receives insufficient food to meet daily nutritional requirements. 24. The loss of genetic diversity in crop plants and their wild ancestors because of monocultural practices is a serious concern to plant breeders. 25. Sustainable agriculture is a movement away from the instability of current monocultural practices to a more environmentally sound approach in which crops are harvested without degradation to the environment. 26. Germplasm is the genetic information encoded within a plant; it is the raw material of the plant breeder, and without it, the creation of new varieties is impossible. 27. Although there are approximately 50,000 species of edible plants, only three domesticated crops provide over 50% of the calories from plants in the human diet. 28. Biotechnology is being used along with traditional breeding to develop high-yielding and disease resistant cultivars. 29. The first genetically engineered plant was approved for commercial marketing in 1994, and by 2001, 60% to 70% of the processed foods in U.S. markets contained at least one ingredient from a genetically modified plant.
Units	1. FORAGING SOCIETIES AND THEIR DIETS 2. AGRICULTURE: REVOLUTION OR EVOLUTION? 3. BREEDING FOR CROP IMPROVEMENT 4. THE GREEN REVOLUTION 5. GENETIC DIVERSITY 6. ALTERNATIVE CROPS: THE SEARCH FOR NEW FOODS

	7. BIOTECHNOLOGY
Readings	Chapters: 11, 12, 13, 14, and 15 in the text book.
Activities	Group discussion Assignments Documentary films Quizzes
Module 4; PLANTS PRODUCTS	
Key Concepts	Commercial Products, Plants
Overview	This module covers other crops that provide us with consumable products such as beverages, herbs and spices, and materials such as cloth, paper, and wood. The historical origin and societal impact of these crops are explored.
Aim	To understand the importance of plant products
Learning Outcomes	The successful student must be able to understand that: 1. Caffeine and caffeine like alkaloids have a stimulating effect on the central nervous system. 2. Coffee is obtained from the seeds of Coffee Arabica, a tree native to Ethiopia. 3. Tea, made from dried tip leaves of Camellia Sinensis, is the world's most popular beverage. 4. The seeds of Theobroma cacao are the source of both a beverage and a confection, cocoa and chocolate. 5. The kola tree, native to West Africa, is the source of a caffeine beverage that has been consumed increasingly since the twentieth century. 6. The characteristic scents of aromatic plants, such as herbs and spices, are due to volatile substances called essential oils, which can be extracted to obtain the essence of the plant.

	7. The history of spices is the history of domination of the spice-rich lands by various European powers. 8. Herbs are usually the aromatic leaves of plants from temperate regions. 9. Herbal dyes were one of the main sources of color in the ancient world, replaced by synthetic dyes only in the latter half of the nineteenth century. 10. In addition to food and drink, plants furnish society with the raw materials to provide shelter, clothing, and paper. 11. Linen, made from fibers of flax (Linumusitatissimum), was the cloth of choice for many ancient civilizations. 12. Other fibers that have been used to make cloth are ramie, jute (burlap), and hemp. 13. Bark is another material that has been used to make cloth and paper. 14. Wood and wood products supply construction materials and fuel to much of the world population. 15. In industrialized nations, approximately 50% of the harvested wood goes into wood pulp, with the majority of pulp used in the manufacture of paper. 16. Bamboo is a treelike member of the grass family with a long history of use in construction, furniture, baskets, screens, carpets, paper, and food.
Lessons	PHYSIOLOGICAL EFFECTS OF CAFFEINE COFFEE, TEA, and CHOCOLATE COCA-COLA: AN "ALL-AMERICAN" DRINK OTHER CAFFEINE BEVERAGES ESSENTIAL OILS HISTORY OF SPICES

	SPICES, and HERBS FIBERS WOOD ANDWOOD PRODUCTS PAPER and BAMBOO
Readings	Chapters: 16, 17, and 18
Activities	Group discussion Assignments Documentary films Quizzes
Module 5; PLANTS AND HUMAN HEALTH	
Key Concepts	Plants, Human Health
Overview	This module introduces students to the historical foundations of Western medicine, the practice of herbal medicine, and the chemistry of secondary plant products. Descriptions of the plants that provide us with medicinal products and psychoactive drugs are discussed. The unit also covers the ubiquitous poisonous and allergy plants in our environment.
Aim	To know the role of plants in the human health
Learning Outcomes	The successful student must be able to understand that: 1. From the earliest civilizations, native plants have supplied medicinal compounds. 2. Alkaloids and glycosides have been identified as the therapeutically important components of most medicinal plants. 3. Digitalis, the primary treatment for several heart ailments, is derived from foxglove, a biennial in the snapdragon family. 4. Today, aspirin is purely synthetic, but it is based on traditional remedies from willow bark.

	5. Quinine, the active alkaloid in the bark of Cinchona trees, has been used for centuries in the treatment of malaria. 6. In 1952, the alkaloid reserpine was isolated from the roots of Rauwolfiaserpentina, a plant used by Hindu healers for thousands of years. 7. The sap of Aloe vera contains several glycosides that are used to treat minor burns and cuts. 8. Ephedrine and pseudoephedrine, alkaloids from various species of Ephedra, are found in prescription and over-the-counter decongestants. 9. Active compounds from several plants have become standard treatment for various forms of cancer, and researchers continue to look for and develop new anticancer compounds. 10. The use of psychoactive plants in human society dates back millennia. 11. The opium poppy (Papaversomniferum) is the source of amilky latex from the green capsules that, when dried, becomes crude opium. 12. Heroin is a semisynthetic derivative of morphine and the most strongly addictive of all the opiates. 13. Marijuana (Cannabis sativa) has an equally long history as a hallucinogen in India. 14. Cocaine is derived from the leaves of the coca plant (Erythroxylum coca), a shrub native to South America. 15. The most addictive drug in widespread use is nicotine, the major alkaloid in tobacco (Nicotiana spp.), and native to the New World. 16. The use of peyote (Lophophorawilliamsii) has long

	been associated with sacred rituals of many Indian tribes in Mexico. 17. Poisonous and allergy plants are known to adversely affect the health of humans and other animals. 18. Many plants in the natural environment and those in the garden or house are poisonous. 19. White snakeroot, locoweed, Indian hellebore, and St. John's wort are plants that have been implicated in the poisoning deaths of livestock. 20. Plants can cause mechanical injury by puncturing the skin via thorns, barbs, or spines. 21. Plant toxins have become an important source in the search for natural insecticides. 22. Allergies are hypersensitivity diseases caused by the immune system's response to harmless substances such as ragweed pollen or mold spores. 23. Pollen from ragweed plants is the most important cause of allergic rhinitis in North America. 24. In addition to pollen from ragweed, pollen from hundreds of seed plants is known to trigger respiratory allergies. 25. The most common cause of contact dermatitis is poison ivy, a widespread climbing shrub in North America. 26. Food allergies can produce gastrointestinal symptoms, dermatitis, hives, or respiratory symptoms.
Units	1. HISTORY OF PLANTS IN MEDICINE 2. ACTIVE PRINCIPLES IN PLANTS 3. MEDICINAL PLANTS 4. NOTABLE POISONOUS PLANTS

	5. PLANTS THAT CAUSE MECHANICAL INJURY 6. INSECTICIDES FROM PLANTS 7. ALLERGY PLANTS
Readings	Chapters: 19, 20, and 21 in the text book.
Activities	Group discussion Assignments Documentary films Quizzes
Module 6; PLANTS AND THE ENVIRONMENT	
Key Concepts	Plants, Environment
Overview	This module is an introduction to the principles of ecology: the ecosystem, niches, food chains, biogeochemical cycles, and ecological succession. The major biomes of the world are discussed, with an emphasis on the economic value of certain desert plants and the strategy of extractive reserves in the rain forest. The problems associated with rising levels of the greenhouse gas CO_2 and the environmental consequences of global warming are addressed.
Aim	To understand the role of the plant in the ecosystem
Learning Outcomes	The successful student must be able to understand that: 1. The ecosystem is the functional unit of study of the environment. 2. Ecological niche is the functional role an organism plays in the ecosystem. 3. Biological magnification is the transfer and concentration of a toxic substance as it is passed along a food chain. 4. Human impact on the carbon cycle has resulted in the greenhouse effect, in which the buildup of CO2 acts as a

	heat trap warming Earth's lower atmosphere. Global warming is likely to cause a shift in agricultural regions and in the range of many species of plants and animals. 5. Ecological succession is the gradual progression of orderly and predictable changes that may occur in ecosystems over time. The end point of ecological succession is the climax community. 6. Biomes are large, terrestrial regions recognizable by their distinctive vegetation and animal life. 7. The strategy of extractive reserves is an attempt to preserve the tropical rain forest from destructive exploitation by developing economic markets for a renewable harvest of natural products such as natural rubber, chicle, Brazil nuts, and vegetable ivory. 8. Several methods of forest management are currently in practice: clear-cutting, strip-cutting, whole-tree harvesting, shelter wood, selective cutting, and short rotation.
Units	1. THE ECOSYSTEM 2. BIOGEOCHEMICAL CYCLING 3. ECOLOGICAL SUCCESSION 4. THE GREENWORLD: BIOMES
Readings	Chapter 26 in the text book.
Activities	Group discussion Assignments Documentary films Quizzes

Jerash University

Course Syllabus

College: Science
Department: Chemistry

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 301361
Course Name: Environmental chemistry
Class Hours: (Times & Days)
Classroom:(Number & Building)
Prerequisites:

✓ **Course Description:**

This course is pivoted at analysis of the environment, analysis of major and minor constituents in air, water, earth and living matter, sampling strategies. The course will discuss in details the importance of the environmental chemistry, basic properties of chemical, transformation and degradation of chemical pollutants in the environment, toxicity of the environmental pollutants, chemistry of water pollutants, chemistry of atmospheric pollutants and the best use of resources to reduce pollutants.

✓ **Course Learning Objectives**

- The course will introduce the student to the role and importance of the environmental chemistry.
- Knowing the basic properties of chemical.
- Transformation and degradation of chemical pollutants in the environment.
- Toxicity of the environmental pollutants.
- Chemistry of water pollutants.
- Chemistry of atmospheric pollutants.
- To know the relationship between pollutant and human

✓ **Expected Course Outcomes:**

The successful student will be able to

174. Understand what is meant by;
    - Environmental chemistry.
    - Elementary cycle.
2. Know the characteristics of the atmosphere.
3. Identify and solve problems related to sources of pollution.
    - Types and effects of water pollution.
    - Types and effects of air pollution.
    - Types and effects of soil pollution.
4. Understand and apply water treatment procedures.
5. Identify composition of solid wastes.

6. Use the chemical and physical instrumentation in environmental science.

✓ **Course Resources:**

76. Environmental Chemistry. By Stanley Manahan9th, 2009
77. Principles of environmental chemistry by J. Girard, Jones and Bartlett, Publisher.
78. Selected web sites.

Part 3: Assignments, Course policies, and Grading Policy

✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book.They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.
- ✓ ***Homework Assignments:*** *Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*
- ✓ ***Late Policy:*** *The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*
- ✓ ***Cheating:*** *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*
- ✓ ***Classroom Protocol and Participation Guidelines****: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topic	Readings
1	Introduction	Chapter 1
2	Concepts of elementary cycles	Chapter 1
3	Concepts of elementary cycles	Chapter 1
4	Characteristics of the atmosphere	Chapter 9
5	Water pollution	Chapter 7
6	Air pollution	Chapter 11,12
7	Soil pollution	Chapter 15
8	Waste water treatment	Chapter 8
9	Composition of solid waste	Chapter 15,16,19,20
10	Physical parameter relevant to water analysis.	Chapter 9,24

Week	Topic	Readings
11	Chemical parameters in water chemistry and analysis.	Chapter 9
12	Biochemical parameters in water chemistry and analysis.	Chapter 6,21
13	Chemical instrumentation in environmental science.	Chapter 10,25
14	Physical instrumentation in environmental science.	Chapter 10,27
15	Revision	
16	Final exams	

Part 5: Course Modules

Module 1; Natural cycles and atmospheric chemistry	
Key Concepts	Natural cycles, Atmospheric chemistry
Overview	The chemistry of elements is very useful to understand the environmental issues, the elementary cycles such as oxygen and carbon is one of the most important natural processes.
Aim	Elementary cycles and characteristic of atmosphere.
Learning Outcomes	Know the matter and matter cycles, and the composition of atmosphere.
Units	1: Matter and cycles of matter. 2: endogenic and exogenic cycles. 3: The carbon cycle.

	4: The nitrogen cycle. 5: The Oxygen cycle. 6:The phosphorus cycle. 7: The sulfur cycle. 8:The Oxygen cycle
Readings	Chapter 1
Activities	Group discussion. Quizzes.
Module 2; Sources, types and effects of environmental pollution	
Key Concepts	Environmental pollution, Water, air, and land pollution.
Overview	The demands of increasing population with the desire of most people for a higher material standard of living are resulting in worldwide pollution on a massive scale. Environmental pollution can be divided among the categories of water, air, and land pollution.
Aim	To study the definition of pollutants. To study the contaminants which are classified as pollutants? To study the sources of pollutants.
Learning Outcomes	1. Identification of the pollution of various spheres of the environment. 2. Try to solve the problems pose from technology and the solution it offers. 3. Adopt agricultural practices that have resulted in intensive cultivation of land. 4.
Units	1: elemental pollution. 2: heavy metals. 3: metalloids.

	4: inorganic species. 5: organically bound metals and metalloids. 6: organic pollutants.
Readings	Chapters: 1,8
Activities	Lectures Group discussion Quizzes
Module 3; Waste management	
Key Concepts	Waste management
Overview	The nature and sources of hazardous wastes and their environmental chemistry has been pointed as the major problem these days.
Aim	To deal with means for minimizing waste, utilizing material that might go into wastes, and treating and disposing of wastes.
Learning Outcomes	Apply environmental chemistry to hazardous waste management to develop measure by which chemical waste can be minimized, recycled, treated, and disposed.
Units	1: waste reduction and minimization. 2: Recycling. 3: physical methods of waste treatment. 4: chemical treatment. 5: photolytic reactions. 6: thermal treatment methods. 7: biodegradation of wastes.
Readings	Chapters: 15,16,19,20.
Activities	Lectures Group discussion

	Quizzes
Module 4; Water chemistry and analysis	
Key Concepts	Water chemistry
Overview	Globally, problems with quantity and quality of water supply remain and in some respects are becoming more serious. These problems include increased water use due to population growth, contamination of drinking water by improperly discarded hazardous wastes, and destruction of Wildlife by water pollution.
Aim	Understand Water treatment and analysis of elements.
Learning Outcomes	1. Identify sources, properties, and uses of Water. 2. Consider water in rivers, lakes, estuaries, oceans, and underground, as well as the phenomena that determine the distribution and circulation of chemical species in natural waters.
Units	1: water quality and quantity. 2: the properties of water, a unique substance. 3: the characteristics of bodies of water. 4: aquatic life. 5: gases in water. 6: water acidity and carbon dioxide in water. 7: alkalinity. 8: calcium and other metals in water.
Readings	Chapters: 2, 3, 6, 7.
Activities	Lectures Group discussion Quizzes
Module 5; Chemical and physical instrumentation in environmental sciences.	
Key Concepts	Chemical instrumentation in environmental sciences.

	Physical instrumentation in environmental sciences.
Overview	Scientists understanding of the environmental can only are as good as their knowledge of the identities and quantities of pollutants and other chemical species in water, air, soil and biological systems. Therefore state of the art techniques of chemical analysis are essential to environmental chemistry.
Aim	Consider the new and improves analytical technique that enable detection of much lower levels of chemical species and vastly increased data throughput.
Learning Outcomes	1. Apply general aspects of environmental chemical analysis. 2. Use major techniques that are used to determine a wide range of analyses.
Units	1: classical methods. 2: spectro photometric methods. 3: electrochemical methods of analysis. 4: chromatography. 5: mass spectrometry. 6: analysis of water samples. 7: automated water analyses.
Readings	Chapter 10,24,25,27
Activities	Lectures Group discussion Quizzes

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 301356
Course Name: Pollution and industrial safe
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

Course Description:
This course studies of the fate of chemicals in the air, water, and soil, and their impact on human health and the natural environment. Topics will include water pollution and water treatment, greenhouse gases and ozone layer destruction, sources and management of hazardous wastes.

Course Learning Objectives:

- To know what are pollutants, the main types of environmental pollution, its sources and effects.
- Understand the chemistry and effects of acid rain.
- Understand the properties and chemistry of greenhouse gases.
- Global warming and its effects.
- The course will introduce the student to the meaning of pollution.
- The fate of chemicals in the air, water, and soil.
- The impact of chemicals on the human and the natural environment.
- Water pollution and water treatments.
- Greenhouse gases and their impact.
- Ozone layer and its functions.
- Depletion of ozone layer and its implications.
- Sources and management of hazardous wastes.

Expected Course Outcomes:

175. Understand the relationship between the environment and the chemistry.
176. Identify what the air pollution is?
177. Be familiar of greenhouse effect.
178. Determine the effect of Ozone depletion.
179. Define Smog.
180. Consider the effect of dissolved oxygen in water.
181. Identify types of water pollution and apply treatment process.
182. Identify types of soil pollution and apply treatment process.
183. Know how to deal with wastes.
184. Apply principles of Green chemistry.

Course Resources:

79. Chemistry of the environment, Bailey, R. A., 2002, Second Edition
80. Chemistry and man's environment (Fuller, Edward C).

81. Introduction to chemistry of the environment (Bailey, Ronald Albert)

Part 3: Assignments, Course policies, and Grading Policy

Exams: *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

Grade Components:

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.
Homework Assignments: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.
Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.

Cheating: *Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*

Classroom Protocol and Participation Guidelines*: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topic	Readings
1	Introduction to environmental chemistry	Chapter 1
2	Air pollution	Chapter 2,6
3	Acid deposition	Chapter 11
4	Greenhouse effect	Chapter 3
5	Ozone depletion	Chapter 5
6	Smog	Chapter 5
7	Dissolved oxygen in water	Chapter 3,10
8	Water pollution and treatment	Chapter 9,11
9	Soil	Chapter 12
10	Waste	Chapter 16
11	Photochemistry	Chapter 4,5
12	Green chemistry	Chapter 13, 14

Week	Topic	Readings
13	Green chemistry	Chapter 13, 14
14	Green chemistry	Chapter 13, 14
15	Revision	
16	Final exam	

Part 5: Course Modules

Module 1; Environmental chemistry	
Key Concepts	Environment, chemistry
Overview	All the environmental issues are related directly to chemistry in one way or other, to know the pollutants types and the hazards concentration of the several types of molecules. The pollutants could be natural or manmade but its hazards are the same. It will cause the depletion of ozone layer
Aim	To know what the pollutants are.
Learning Outcomes	All the chemicals are pollutants at high concentration, but some of them are very toxic even at very low concentration, the student must differentiate between both types of pollutants as well as determining the reactions that cause the depletion of ozone layer.
Units	1: introduction to environmental chemistry. 2: greenhouse effect 3: Smog 4: Ozone depletion.

	5: photochemistry.
Readings	Chapters, 1,2,3,4,5,6
Activities	Lecturing Video films Group discussion Quizzes
Module 2; Water Pollution	
Key Concepts	Water, pollution
Overview	The most important issue now is water pollution, because of the huge reduction of drinking water sources recyclable water is very important for agriculture and industrial processes. To solve any type of problem it is important to know the type and hazards of the pollutants in water.
Aim	Water pollution and water treatment
Learning Outcomes	1. Identify water pollution, groundwater pollution, 2. Measure elements cause pollution; 3. Control pollution.
Units	1. Categories of pollution. 2. Ground water pollution. 3. Causes of pollution 4. Thermal pollution. 5. Transport and chemical reaction of water pollutants. 6. Measurements including sampling, chemical testing and physical testing. 7. Control of pollution. 8. Industrial waste water. 9. Agriculture waste water.
Readings	chapter 2,6,9,11,12

Activities	Lecturing Video films Group discussion Quizzes
Module 3; Soil Pollution	
Key Concepts	Soil pollution
Overview	Soil pollution comes from coal ash, sewage, pesticides and herbicides, it affects the health by several ways, and the student has to know the cleanup options.
Aim	Soil pollution and cleanup options
Learning Outcomes	1. Identify sources of the soil pollution 2. Apply cleanup options, 3. Combat health effects of this type of pollution.
Units	1: coal ash. 2: Sewage. 3: pesticides and herbicides. 4: health effects 5: cleanup options.
Readings	Chapter 12,16
Activities	Lecturing Video films Group discussion Quizzes

Jerash University

Course Syllabus

College: Science
Department: Mathematics

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 303211
Course Name: Principles in statistics
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

Course Description:

This course is the prerequisite to higher courses in statistics and probability. An introduction to the fundamental principles of statistics, describing data, probability and probability distributions (discrete and continuous), estimation and testing hypotheses. An introduction to probability and statistics with emphasis on applications in forestry and environmental sciences. The course content will be limited to the fundamental of basic statistics and its applications.

Course Learning Objectives;

- To develop understanding and appreciation for the basic principles of the statistics and probability.
- To develop understanding for the probability, discrete probability distributions and continuous probability distributions.
- To prepare students for more advanced courses in statistics and probability.
- To provide students with knowledge necessary to help solve real problems, special using estimation and testing hypotheses techniques.
- To understand basic statistical techniques by looking at examples in environment, climate change, and sustainable development.

Expected Course Outcomes;

The successful student will be able to

185. Classify variables into several types, and how measurements or data are generated.
186. Describe data sets using dotplots, pie charts, bar charts, line charts, relative frequency histograms and stem and leaf plots.
187. Differentiate between univariate and bivariate data.
188. Use numerical measures to construct a mental picture of the data.
189. Know the measures of center, measures of relative standing and measures of variability.
190. Apply Tchebysheff'sTheorem and the Empirical Rule on different data.
191. Identify the possible relationships between the Bivariate data.
192. Describe the Bivariate data using scatterplots, side-by-side pie charts, side-by-side bar charts and stacked bar charts.
193. Using the probability as a statistical tool.
194. Create probability distributions that serve as models for discrete and continuous random variables.
195. Know the binomial probability distribution and use the tables of cumulative binomial probabilities.
196. Know the normal probability distribution and use the tables of standard normal distribution probabilities.
197. Differentiate between parameters and statistics.
198. Describe the behavior of sample statistics in repeated sampling
199. Estimating the population parameters.

200. Know the concept of a statistical test of hypothesis and use it in different applications.
201. Examine some more advanced statistical techniques that are dealt with more fully in environment, climate change, and sustainable development.

Course Resources:

82. Introduction to Probability and Statistics by William Mendenhall, Robert J. Beaver & Barbara M. Beaver, 13th ,2009. (*Textbook*)
83. Elementary Statistics, Step by Step Approach by Allan G. Bluman, 2007.*(Reference)*
84. Introduction to Statistics by J. S. Milton and J. J. Meteer. D. C. Health and Company, 1986. *(Reference)*
85.

Part 3: Assignments, Course policies, and Grading Policy

✓ **Exams:** There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.

✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

- ✓ **Homework Assignments:** Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.

- ✓ **Late Policy:** The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.

- ✓ **Cheating:** Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.

- ✓ **Classroom Protocol and Participation Guidelines:** Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topic	Readings
1	Describing Data with Graphs	Chapter 1: 1.1, 1.2, 1.3
2	Describing Data with Graphs	1.4, 1.5
3	Describing Data with Numerical Measures	Chapter 2: 2.1, 2.2, 2.3, 2.4
4	Describing Data with Numerical Measures	2.5, 2.6, 2.7
5	Describing Bivariate Data	Chapter 3: 3.1, 3.2, 3.3, 3.4
6	Probability and Probability Distributions	Chapter 4: 4.1, 4.2, 4.3

Week	Topic	Readings
7	Probability and Probability Distributions	4.5, 4.6, 4.8
8	Several Useful Discrete Distributions	Chapter 5: 5.2
9	The Normal Probability Distribution	Chapter 6: 6.1, 6.2
10	The Normal Probability Distribution	6.3
11	Sampling Distributions	Chapter 7: 7.1, 7.2, 7.3
12	Sampling Distributions	7.4, 7.5, 7.6
13	Large-Sample Estimation	Chapter 8: 8.1, 8.2, 8.3
14	Large-Sample Estimation	8.4, 8.5
15	Large Tests of Hypotheses	Chapter 9: 9.1, 9.2, 9.3
16	Looking at examples in environment, climate change, and sustainable development.	

Part 5: Course Modules

Module 1; Statistics	
Key Concepts	Statistics
Overview	Statistics is a branch of mathematic. Many sets of measurements are samples selected from larger populations. Other sets constitute the entire population, as in a national census. Graphs are extremely useful for the visual description of a data set. It is better to use numerical

	measures to construct a mental picture of the data. Sometimes the data that are collected consist of observations for two variables on the same experimental unit.
Aim	To describe the data using the graphs and numerical measures
Learning Outcomes	1. Classify variables into several types, and how measurements or data are generated. 2. Use graphs to describe data sets. 3. Apply numerical measures to construct a mental picture of the data. 4. Identify the possible relationships between the Bivariate data.
Units	1: Describing data with graphs 2: Describing data with numerical measures 3: Describing Bivariate data
Readings	Chapters: 1, 2, 3
Activities	Lecturing Group discussion Quizzes
Module 2; Probability	
Key Concepts	Probability
Overview	How can you use sample data to draw conclusions about the sampled populations? The variables can be redefined as random variables, whose values depend on the chance selection of the elements in the sample. Using probability as a tool, you can create probability distributions that serve as models for discrete random variables, and you can describe these random variables using a mean and standard deviation. The discrete

	random variables are often used to describe the number of occurrences of a specified event in a fixed number of trials or a fixed unit of time or space. The normal probability distribution plays a central role in statistical inference.
Aim	Understand probability, discrete probability distributions and continuous probability distributions.
Learning Outcomes	1. Use probability as a statistical tool. 2. Create probability distributions that serve as models for discrete and continuous random variables. 3. Use the tables of cumulative binomial probabilities. 4. Use the tables of standard normal distribution probabilities.
Units	1: Probability and probability distributions 2: Several useful discrete distributions 3: The normal probability distribution
Readings	Chapters: 4, 5, 6
Activities	Lecturing Group discussion Quizzes
Module 3; Estimation and hypothesis testing	
Key Concepts	Estimation, hypothesis testing
Overview	The sample statistics are used to make inferences about the corresponding population parameters. The Central Limit Theorem and the sampling distributions play a key role in evaluating the reliability of the estimates. The sampling distributions of are used to construct large sample tests concerning the values of population parameters of interest to the experimenter.

Aim	To estimate the population parameters and make the statistical test of hypothesis.
Learning Outcomes	1. Differentiate between parameters and statistics. 2. Describe the behavior of sample statistics in repeated sampling. 3. Estimating the population parameters. 4. Apply the concept of a statistical test of hypothesis and use it in different applications.
Units	1: sampling distributions 2: large-sample estimation 3: large-sample tests of hypotheses
Readings	Chapters: 7, 8, 9
Activities	Lecturing Group discussion Quizzes
Module 4; Statistical Applications on Environment	
Key Concepts	Statistical applications, environment, climate change, and sustainable development.
Overview	An introduction to probability and statistics with emphasis on applications in forestry and environmental sciences. Includes methods of graphical analysis, introduction of common probability distributions, and hypothesis testing.
Aim	To apply basic statistical techniques at examples in environment, climate change, and sustainable development.
Learning Outcomes	Examine some more advanced statistical techniques that are dealt with more fully in environment, climate change, and sustainable development.
Units	Will be on statistics applications on environmental issues.
Readings	********

Activities	Lecturing (Mostly by students) Term papers Group discussion Quizzes

Jerash University

Course Syllabus

College: Science
Department: Mathematics

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 303335
Course Name: Statistical Methods

Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites: Probability Theorem (303335)

✓ **Course Description:**

This course is an introduction to some statistical inference concerning large-sample estimation, large-sample tests of Hypotheses, parameters of two populations, Regression and correlation, Experimental designs, Categorical data, and Nonparametric statistics. An introduction to probability and statistics with emphasis on applications in environment, climate change, and sustainable development. Includes methods of graphical analysis, introduction of common probability distributions, and hypothesis testing.

✓ **Course Learning Objectives:**

- To provide students with knowledge necessary to help solve real problems, special using estimation and testing hypotheses techniques.
- To provide students with knowledge necessary to differentiate between inference from small sample and inference from large sample.
- To provide the students with knowledge about the analysis of variance and the regression.
- To provide the students with knowledge about the nonparametric statistics including different tests.
- To understand statistical inference techniques by looking at examples in environment, climate change, and sustainable development.

✓ **Expected Course Outcomes;**

The successful student will be able to;

202. Describe the behavior of sample statistics in repeated sampling.
203. Estimating the population parameters.
204. Know the concept of a statistical test of hypothesis and use it in different applications.
205. Differentiate between inference from small sample and inference from large sample.

206. Justify the normality of the estimators using the central limit theorem.
207. Determine how the different experimental factors affect the average response using the analysis of variance technique.
208. Analysis of variance for linear regression.
209. Estimation and prediction using the fitted line.
210. Testing the usefulness of the linear regression mode.
211. Know methods for analyzing categorical data.
212. Comparing several multinomial populations.
213. A test of specified cell probabilities.
214. Comparing populations for the many types of data using several statistical tests.
215. Differentiate between parametric and nonparametric tests.
216. Apply different tests in different applications.
217. Examine some advanced statistical (statistical inference) techniques that are dealt with more fully in other forestry and the environmental sciences.

✓ **Course Resources:**

86. Introduction to Probability and Statistics by William Mendenhall, Robert J. Beaver & Barbara M. Beaver, 13th, 2009. *(Textbook)*
87. An Introduction to Statistical Methods and Data Analysis, R. Lyman Ott&Micheal T. Longnecker. *(Reference)*
88. Statistical Methods, George W. Snedecor&William G. Cochran. *(Reference)*
89. Statistical Methods, Rudolf J. Freund, Donna Mohr&William J. Wilson. *(Reference)*

Part 3: Assignments, Course policies, and Grading Policy

- ✓ ***Exams:*** *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

- ✓ ***Grade Components:***

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

- ✓ **Grading Policy:** In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

- ✓ **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

- ✓ **Homework Assignments:** Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.

- ✓ **Late Policy:** The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.

- ✓ **Cheating:** Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.

- ✓ **Classroom Protocol and Participation Guidelines:** Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topic	Readings
1	Large-Sample Estimation	Chapter 8: 8.1-8.4
2		8.5-8.9
3	Large-Sample Tests of Hypotheses	Chapter 9: 9.1-9.4
4	Large-Sample Tests of Hypotheses	9.5-9.7
5	Inference from Small Sample	Chapter 10: 10.1-10.5
6	Inference from Small Sample	10.6-10.8
7	The Analysis of Variance	Chapter 11: 11.1-11.4
8	The Analysis of Variance	11.5-11.8
9	The Analysis of Variance	11.9-11.12
10	Linear Regression and Correlation	Chapter 12: 12.1-12.4
11	Linear Regression and Correlation	12.5-12.8
12	Analysis of Categorical Data	Chapter 14: 14.1-14.4

Week	Topic	Readings
13	Analysis of Categorical Data	14.5-14.7
14	Nonparametric Statistics	Chapter 15: 15.1-15.5
15	Nonparametric Statistics	15.6-15.9
16	Looking at examples in environment, climate change, and sustainable development.	

Part 5: Course Modules

Module 1; Estimation and hypothesis testing	
Key Concepts	Estimation, hypothesis testing
Overview	The sample statistics are used to make inferences about the corresponding population parameters. The Central Limit Theorem and the sampling distributions play a key role in evaluating the reliability of the estimates. The sampling distributions of are used to construct large sample tests concerning the values of population parameters of interest to the experimenter.
Aim	To estimate the population parameters and make the statistical test of hypothesis.
Learning Outcomes	1. Describe the behavior of sample statistics in repeated sampling. 2. Estimate population parameters. 3. Apply the concept of a statistical test of hypothesis and use it in different applications. 4. Differentiate between inference from small sample

	and inference from large sample. 5. Justify the normality of the estimators using the central limit theorem.
Units	1: large-sample estimation 2: large-sample tests of hypotheses 3: Inference from Small Sample
Readings	Chapters: 8, 9, 10
Activities	Lecturing Group discussion Quizzes
Module 2; Analysis of Variance (ANOVA)	
Key Concepts	Analysis of Variance (ANOVA)
Overview	The quantity of information contained in a sample is affected by various factors that the experimenter may or may not be able to control. By measuring both y and x for each experimental unit, thereby generating bi-variate data, you can use the information provided by x to estimate the average value of y and to predict values of y for pre assigned values of x. Many types of surveys and experiments result in qualitative rather than quantitative response variables, so that the responses can be classified but not quantified. Data from these experiments consist of the count or number of observations that fall into each of the response categories included in the experiment.
Aim	To determine how the different experimental factors affect the average response.
Learning Outcomes	1. Determine how the different experimental factors

	affect the average response using the analysis of variance technique. 2. Practice Analysis of Variance for linear regression. 3. Apply estimation and prediction using the fitted line. 4. Test the usefulness of the linear regression mode. 5. Compare several multinomial populations. 6. Apply test of specified cell probabilities.
Units	1: the analysis of variance 2: linear regression and correlation 3: analysis of categorical data
Readings	Chapters: 11, 12, 14
Activities	Lecturing Group discussion Quizzes
Module 3; Nonparametric Statistics	
Key Concepts	Nonparametric Statistics methods
Overview	Some experiments generate responses that can be ordered or ranked, but the actual value of the response cannot be measured numerically except with an arbitrary scale that you might create. How can you analyze these types of data? When data do not appear to satisfy the normality assumption and similar assumptions, an alternative method of analysis can be used (nonparametric statistical methods).
Aim	To present several statistical tests for comparing populations for the many types of data
Learning Outcomes	1. Comparing populations for the many types of data using several statistical tests.

	2. Differentiate between parametric and nonparametric tests. 3. Apply different tests in different applications.
Lessons	Lesson 1: the nonparametric statistics
Readings	Chapter 15
Activities	Lecturing Group discussion Quizzes
Module 4; Statistical Applications in Climate Change	
Key Concepts	Statistical applications, Environment, Climate Change, and Sustainable development.
Overview	Statistical methods with emphasis on applications in forestry and environmental sciences. Includes methods of graphical analysis, introduction of common probability distributions, and hypothesis testing.
Aim	To understand statistical inference techniques by looking at examples in environment, climate change, and sustainable development.
Learning Outcomes	Examine some advanced statistical (statistical inference) techniques that are dealt with more fully in Climate Change and environmental sciences.
Units	Discussion
Readings	*********

Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 603116
Course Name: Climate Change and Sustainable Policy
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites: No prerequisites.

Course Description:

Climate change is increasingly recognized as a critical challenge to ecological health, human well-being and future sustainable development. The interaction between society and climate is among the important considerations pertinent to the quest of nations for sustainable development. This course tries to incorporate the developments in the domain of climate change with respect to human influences on climate, the consequences of climate change, climate change conventions and protocols and adjustment possibilities. The students will be enlightened with knowledge on the impact of climate change on terrestrial and aquatic ecosystems. The potential threats of climate change on sectors like agriculture, forest, fisheries, livestock and natural resources are detailed in the course. The students will be capacitated with the response options to the climate change like mitigation and adaptation strategies. This course focuses primarily on these two potential responses to climate change: mitigation and adaption. In the course students will engage in the major debates around options for dealing with the climate problem with an emphasis on both behavioral and technological aspects of the climate change problem. The critical issues on the relationship between climate policy and sustainable development will be discussed. The stakeholders and institutions that drive change toward climate change and sustainable development will be identified.

Course Learning Objectives:

- To provide knowledge to the students on Climate Change Science and challenges to Sustainable Development.
- To equip the students with appropriate tools and techniques for interpreting the impacts of climate change, and evaluating & implementing measures that reduce vulnerability of systems.
- To empower the students with the mitigation and adaptation strategies against climate change.
- To understand the critical issues on the relationship between climate policy and sustainable development.
- Identify major stakeholders and institutions that drive change toward climate change and sustainable development.

Expected Course Outcomes:

Upon completion of this course students will be able to:

218. Gain a general understanding of the issues of Climate Change and Sustainable Development.
219. Understand and critically assess the concepts of climate change and sustainability.
220. Understand and analyze how to address climate change and sustainability.
221. Understand and critically analyze methods for measuring sustainability and climate change initiatives.
222. Evaluate the effectiveness of sustainability and climate change policies.
223. Understand national policy needed to support climate change efforts.

Course Resources:

There is no single text for this course. Readings will come from a variety of articles, books and reports including reports on Climate Change and sustainability issues. The following may be helpful.

1. Archer, "The Perturbed Carbon Cycle."
2. Schneider, "What Is 'Dangerous' Climate Change?".
3. Forster et al., "Changes in Atmospheric Constituents and in Radiative Forcing."
4. Kolbert, "The Curse of Akkad."
5. Surowiecki, "Better and Better: The Myth of Inevitable Progress."
6. Pew, "The Causes of Global Climate Change."
7. Pacala and Socolow, "Stabilization Wedges: Solving the Climate Problem for the Next 50 Years with Current Technologies."
8. Grübler, Technology and Global Change. Chapter on Technology Concepts and Definitions
9. Enkvist, Nauclér, and Rosander, "A Cost Curve for Greenhouse Gas Reduction."
10. Delucchi and Jacobson, "Providing All Global Energy with Wind, Water, and Solar Power, Part II: Reliability, System and Transmission Costs, and Policies."
11. Schneider et al., "Assessing Key Vulnerabilities and the Risk from Climate Change."
12. Morgan et al., "Why Conventional Tools for Policy Analysis Are Often Inadequate for Problems of Global Change."
13. Eakin and Luers, "Assessing the Vulnerability of Social-Environmental Systems."

Part 3: Assignments, Course policies, and Grading Policy

Exams: *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

Grade Components:

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.
Homework Assignments: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.
Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.
Cheating: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.

Classroom Protocol and Participation Guidelines: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topic
1	Introduction to climate science, climate change, and sustainability relations.
2	Introduction to climate science, climate change, and sustainability relations.
3	Greenhouse Gas Cycles.
4	The Climate System / Climate Policy.
5	The Climate System / Climate Policy.
6	Overview of Climate Change Impacts and Vulnerability.
7	Overview of Climate Change Impacts and Vulnerability.
8	From Vulnerability to Adaptation.
9	From Vulnerability to Adaptation.
10	Economics of Carbon Mitigation.
11	Economics of Carbon Mitigation.
12	Carbon Policies.
13	Carbon Policies.
14	Economics of Carbon Mitigation.
15	Economics of Carbon Mitigation.
16	Revision and Final Exam.

Part 5: Course Modules

Module 1; Climate Science and sustainability	
Key Concepts	Climate, Climate Change, Sustainability
Overview	This module provides a general overview of climate science and climate change impacts, highlighting the current state of knowledge and remaining uncertainties about climate change and sustainable development.
Aims	1. To review of the syllabus, introduction, short discussion of climate science and climate change impacts and associated environmental problems. 2. To provide a basic understanding of the global cycles of greenhouse gases. 3. To provide a basic understanding of the workings of the global climate system. 4. To develop an understanding of the complexity surrounding the public debate on climate change and the role of science therein.
Learning Outcomes	224. Gain a general understanding of the issues of Climate Change and Sustainable Development. 225. Understand and critically assess the concepts of climate change and sustainability.
Units	1. Introduction to climate science, climate change, and sustainability relations. 2. Greenhouse Gas Cycles. 3. The Climate System / Climate Policy Discussion.
Readings	1. Archer, "The Perturbed Carbon Cycle." 2. Schneider, "What Is 'Dangerous' Climate Change?". 3. Forster et al., "Changes in Atmospheric Constituents and

	in Radiative Forcing." 4. Kolbert, "The Curse of Akkad." 5. Surowiecki, "Better and Better: The Myth of Inevitable Progress." 6. Pew, "The Causes of Global Climate Change."
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. 5. Climate interactive exercise; this exercise is based on an interactive tool developed at MIT and available at www.climateinteractive.org
Module 2; Climate Change: Impacts, Vulnerability and Adaptation.	
Key Concepts	Impacts, Vulnerability, Adaptation
Overview	This module focuses on the Climate change wide-ranging effects on the environment, and on socio-economic and related sectors, including water resources, agriculture and food security, human health, terrestrial ecosystems and biodiversity and coastal zones. The module highlighted the actions to mitigate

	climate change and to adapt to its impacts.
Aims	1. To review the evidence regarding the types of impacts expected under different climate change scenarios. 2. To understand vulnerability as a conceptual framework for discussing and measuring climate change impacts. 3. To understand measures to be taken to face climate change negative impacts. 4. To understand measures to be taken to adapt to climate change. 5. To understand the concepts relating vulnerability to adaptation, the determinants of adaptive capacity, and planning for adaptation.
Learning Outcomes	226. Understand and analyze how to address climate change and sustainability. 227. Understand and critically analyze methods for measuring sustainability and climate change initiatives. 228. Adopt measures to face and to adapt to climate change negative impacts.
Units	1. Overview of Climate Change Impacts and Vulnerability. 2. From Vulnerability to Adaptation.
Readings	1. Schneider et al., "Assessing Key Vulnerabilities and the Risk from Climate Change." 2. Morgan et al., "Why Conventional Tools for Policy Analysis Are Often Inadequate for Problems of Global Change." 3. Eakin and Luers, "Assessing the Vulnerability of Social-Environmental Systems." 4. Füssel and Klein, "Climate Change Vulnerability Assessments: An Evolution of Conceptual Thinking."

Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 3; Carbon Management	
Key Concepts	Greenhouse Gas, Technology**,** Energy

Overview	Carbon management is at the heart of tackling climate change and has rapidly become a central part of the global business environment. As businesses and organizations become more conscious of environmental risks, carbon management gains a more crucial role in performance management, as well as corporate social responsibility (CSR). By tracking their carbon footprint, or the overall impact they have on the global climate in terms of the total amount of greenhouse gases produced, businesses and organizations are making noticeable improvements. Carbon management allows companies to recognize areas for reduction in emissions and potential energy efficiency projects. This module provides a broad and integrated understanding of carbon management.
Aims	1. Learning the fundamentals of technological change and an overview of the technical options for Greenhouse Gas (GHG) reduction. 2. To provide an overview of long-term energy modeling and its limitations.
Learning Outcomes	• Practicing the mitigation and adaptation strategies against climate change. • Clear identification of the climate policy and sustainable development. • Urge major stakeholders and institutions to drive change toward climate change and sustainable development.
Units	1. Technological Change and Understanding Technology Options. 2. Modeling Energy Futures.
Readings	1. Pacala and Socolow, "Stabilization Wedges:

	Solving the Climate Problem for the Next 50 Years with Current Technologies." 2. Grübler, Technology and Global Change. Chapter on Technology Concepts and Definitions 3. Enkvist, Nauclér, and Rosander, "A Cost Curve for Greenhouse Gas Reduction." 4. Delucchi and Jacobson, "Providing All Global Energy with Wind, Water, and Solar Power, Part II: Reliability, System and Transmission Costs, and Policies."
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 4; Carbon Economics	
Key Concepts	Carbon Mitigation, Carbon Economics,
Overview	Carbon plays an important role in energy generation and thus functioning of the entire world. With its growth, carbon has brought about higher pollution and global warming. As a result, the world today is trying to reach a future in which the amount

	of carbon used (the carbon footprint) is less**.**
Aims	1. To review the evidence regarding the costs and benefits of carbon mitigation and the methodological issues surrounding models and cost estimates, as well as, issues around pricing carbon. 2. To review some issues (at various scales) that impacts the ability of societies to take action on climate change. 3. To discuss policy options and realities related to carbon economics.
Learning Outcomes	229. Evaluation of the effectiveness of sustainability and climate change policies. 230. Understand national policy needed to support climate change efforts.
Units	1. Economics of Carbon Mitigation. 2. Carbon Policies.
Readings	1. Stern, "The Economics of Climate Change." 2. Nordhaus, "ECONOMICS: Critical Assumptions in the Stern Review on Climate Change." 3. Pindyck, *Climate Change Policy: What Do the Models Tell Us?*.
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in

	terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.

Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 601115
Course Name: Environmental science
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites: No prerequisites.

Course Description:

The environment impacts our way of life in many aspects (e.g., food and fiber production, resources for building shelter and infrastructure, water supplies, etc.). Adverse impacts to this environment affect the well-being of humans and other living organisms. Therefore, it is essential that students understand natural environmental systems, physical and social causes of environmental problems, and strategies to mitigate or manage these issues. The goal of the course is to provide students with the scientific principles, concepts, and methodologies required to understand the interrelationships of the natural world, to identify and analyze environmental problems both natural and human-made, to evaluate the relative risks associated with these problems, to examine alternative solutions for resolving and/or preventing them. Environmental Science is an interdisciplinary subject which draws on the content of several disciplines to offer a balanced scientific and holistic perspective of environmental issues. It provides knowledge, skills and attitudes to identify, prevent and solve environmental problems and thereby prepares students for ultimate careers in diverse fields of relevance to environmental management and to sustainable development. This course provides a specific knowledge base of the environment and which facilitates the development of related skills and attitudes.

Course Learning Objectives:

- Stimulate interest in the environment
- Develop an understanding of the interdisciplinary and holistic nature of the environment.
- Develop knowledge and understanding of environmental issues and principles and the ability to apply these to environmental management.
- Develop the ability to collect, collate, analyze and interpret environmental data and to communicate environmental information and ideas logically.

- Provide an understanding of interactions between people and the environment.
- Increase an awareness of the importance of living in harmony with the environment.
- Recognize and evaluate the socio-economic, political and ethical issues in Environmental Science.
- Foster positive attitudes, values and commitment to identify, solve, and prevent environmental problems.
- Develop an understanding of how natural resources and the environment affect quality of life and the quest for sustainable development.

Expected Course Outcomes:

Upon completion of this course students will be able to:

1. Define terms and concepts related to environment.
2. Analyze and discuss different environmental situations.
3. Evaluate and justify options (for the use of resources).
4. Compare and contrast alternative solutions to environmental problems.
5. Select techniques and methodologies appropriate to different environmental situations.
6. Suggest possible solutions to specific environmental problems.
7. Draw inferences from environmental data.

The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topic
1	Introduction to Environmental science, Our Earth
2	Environmental Systems

Week	Topic
3	Biological populations and communities, Ecological niches,
4	Interactions among species and species diversity,
5	Ecological pyramids,
6	Biodiversity and Loss of biodiversity,
7	Natural biogeochemical cycles
8	Water and Land Resources
9	Feeding the World
10	Nonrenewable Energy Sources
11	Achieving Energy Sustainability
12	Human Health and Environmental Risks
13	Global Change
14	Pollution and Atmospheric Change
15	Sustainability, Economics, and Equity
16	Revision and Final Exam.

Part 5: Course Modules

Module 1; Environmental Science	
Key Concepts	Environmental Science, Environmental Systems,
Overview	Environmental Science focuses on the application of biological, chemical, and physical principles to the study of the physical environment and the solution of environmental problems, including subjects such as abating or controlling environmental pollution and degradation; the interaction between human society and the natural environment; and natural resources management.
Aims	1. Develop an understanding of environmental science. 2. Provide the knowledge needed to make informed

	decisions regarding environmental issues. 3. Learn to make positive impacts on the environment.
Learning Outcomes	1. Understand the natural environment and its relationships with human activities. 2. Characterize and analyze human impacts on the environment. 3. Integrate facts, concepts, and methods from multiple disciplines and apply to environmental problems.
Units	4. Introduction to Environmental science, 5. Our Earth 6. Environmental Systems
Readings	• Text book, chapter 1 & 2 • Raven, P.H., and L.R. Berg. 2006. Environment. 6th Edition. John Wiley & Sons, Hoboken, N.J. Sold at the University Bookstore - chapter 1. • The recommended Websites.
Activities	6. Conduct study visits, to identify species diversity. 7. Visit to an ecosystem to identify and quantify human use of its components. 8. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 9. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures.

	10. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 2; The Living World.	
Key Concepts	Populations, Species, Ecosystems, Biogeochemical cycles, Biodiversity
Overview	This module will assess on the fact that the earth is one interconnected system**.** The living world on earth plays a critical role in environmental issues. Environmental problems have a cultural and social context, and human survival depends upon developing practices that achieve sustainable systems.
Aims	1. To understand the basic ecological concepts; 2. To understand the processes that govern the interactions of organisms with the biotic and abiotic components of their environment; 3. To differentiate between key ecological terms and concepts; 4. To outline the importance of biogeochemical cycles; 5. To analyze the relationship between species diversity and ecosystem stability;
Learning Outcomes	• Identifying factors affecting population growth in a natural ecosystem; • Evaluating human interactions within natural ecosystems; • Investigating at least one ecosystems in a territory

Units	1. Biological populations and communities, 2. Ecological niches, 3. Interactions among species and species diversity, 4. Ecological pyramids, 5. Biodiversity, 6. Natural biogeochemical cycles 7. Loss of biodiversity,
Readings	• Text book, chapter 3,5, & 6 • Barron A., Environmental Science, 2013, 5th ed. by Thorpe, Gary. • Withgott and Scott Brennan. 2011. Environment: The Science behind the Stories 4th edition, by Jay, Pearson/Benjamin Cummings, New York. (ISBN: 978-0-321-71534-0). An electronic version of the book is available for purchase at http://www.mypearsonstore.com/.
Activities	5. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 6. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 7. Field visits. 8. The students will also be asked to write critical summaries on the lectures content

Module 3; Natural Resources	
Key Concepts	**Natural Resources.**
Overview	Our natural resources are our assets whose prudent and sustainable use is necessary for the well being of humans and other living other organisms. Unfortunately, the continuous and ever increasing demand for basic items of survival and technological developments have caused us to explore and exploit all possible natural resources. As individuals we tend to consume resources without giving a thought to conservation or harmful impact of over use or careless consumption.
Aims	1. To be aware of the major 'natural resources'. 2. To understand the factors affecting natural resource use and the environmental impacts of their use. 3. To be aware of measures and tools available for sustainable use and conservation of natural resources. 4. To understand the value of natural resources. 5. To understand the concept of ecological sustainability and implications for natural resource use. 6. To understand the environmental impacts and threats to agricultural systems. 7. To understand environmental impacts of provision and the use of energy. 8. To explain the importance of energy to society. 9. To discuss various methods of energy conservation and improving efficiency.
Learning Outcomes	• Differentiating between renewable and non-renewable natural resources and exhaustible and inexhaustible resources. • Differentiate between the consumptive and non-

	consumptive use of natural resources. • Identifying the major categories of natural resources. • Evaluating factors affecting natural resource use. • Justifying the need for natural resource conservation. • Describing measures and tools available for natural resource management and conservation. • Adopt environmentally sustainable practices in agricultural systems. • Appreciate the advantages of using renewable energy sources. • Evaluate the use of renewable energy.
Units	1. Water Resources 2. Land 3. Feeding the World 4. Nonrenewable Energy Sources 5. Achieving Energy Sustainability
Readings	• Text book, chapter 7,8, & 10. • Withgott and Scott Brennan. 2011. Environment: The Science behind the Stories 4th edition, by Jay, Pearson/Benjamin Cummings, New York. (ISBN: 978-0-321-71534-0). An electronic version of the book is available for purchase at http://www.mypearsonstore.com/. • Cunningham, W.P., Cunningham, M.A. & Saigo, B. 2000. Environmental Science, a Global Concern. (8th edition). McGraw-Hill (Boston). • www.wri.org/wri/biodiv • www.earthwatch.org • www.canari.org

	• www.panda.org
Activities	5. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 6. Visits to or lectures by representatives of natural resource agencies. 7. The students will also be asked to write critical summaries on the lectures content. 8. For each unit the students will submit an individual reflection paper of approximately 1000 words. 9. View videos and slides of natural resource management activities and protected areas. 10. Invite guest lecturers to discuss issues in agriculture. 11. Conduct field trips to compare productivity of different farms. 12. Conduct research on renewable energy systems used in the country. 13. Invite guest lecturers to discuss renewable energy.
Module 4; Pollution of the Environment	
Key Concepts	Atmospheric Pollution, Water Pollution, Land Pollution, Noise pollution
Overview	Pollution is the introduction of contaminants into the natural environment that causes adverse change.[1] Pollution can take the form of chemical substances or energy, such as noise, heat or light. Pollutants, the components of pollution, can be either foreign substances/energies or naturally occurring contaminants. Forms of pollution, impacts, methods to deal with pollution, and pollution pathways will be discussed in this

	module.
Aims	1. To be aware of the major types and sources of pollution. 2. To understand the environmental impacts of pollution. 3. To understand the methods available for monitoring, analyzing and mitigating pollution and its environmental impacts. 4. To describe the various pathways of pollution in the ecosystem and the biosphere.
Learning Outcomes	• Outline causes of pollution. • Analyzing a methodology to determine the performance and cost of pollution control techniques. • Evaluating air quality management and analyzing the causes and effects of pollution. • Comparing the environmental effects of pollution on humankind, and the plant and animal kingdoms. • Contrasting how pollution is controlled through modern technology, pollution prevention and economics. • Classifying various air pollution control methods and the costs to implement those controls.
Units	1. Pollution and Atmospheric Change. 2. Global Change
Readings	G. Tyler Miller. 2007, Living in the Environment, 13th Edition; 1. Ch 19 Water Pollution 2. Ch 21 Solid and Hazardous Waste 3. Ch 17 Air and Air Pollution 4. Ch 18 Climate Change and Ozone Loss
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course

	examiner) and invited lecturers. 2. Assign students to investigate and categorize local pollution problems. 3. Assign students to conduct home audit for sources and categories of pollutants. 4. Assign students to monitor individual waste production on a weekly basis. 5. Conduct field studies on the collection and disposal of garbage. 6. Collect information on industries and their potential to produce pollution. 7. Conduct field studies on industries or factories and analysis of their processes with respect to developing waste reduction strategies. 8. The students will also be asked to write critical summaries on the lectures content. 9. For each unit the students will submit an individual reflection paper of approximately 1000 words. 10. Invite guest lecturers to discuss issues in pollution.

College: Agriculture
Department: Agricultural Economics and Extension

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 603372
Course Name: Environmental Economics
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

Course Description:
At this course, analytical tools, particularly benefit-cost analysis, will be explained and applied to problems with environmental dimensions. This course will focus on the role of the environment in the theory and practice of economics. Criteria and strategies used in the development and implementation of environmental policies will be defined and summarized. the theory of externalities and market failure will provide the basis for applying microeconomic concepts to the study of environmental improvement. Theoretical and policy formulations will be pursued with respect to environmental management issues. The overall objective of this course is to consider the efficient and equitable use of society's scarce environmental resources. Use of these resources will be considered in this course from four perspectives: the market allocation, efficient allocations, equitable allocations, and government attempts to achieve a more efficient and equitable allocation. This course combines theoretical analysis with

discussions on specific environmental policies as applied to water, air pollution, energy, climate change, sustainability and human health issues.

Course Learning Objectives:

- Orient students with topics in Environmental Economics.
- Equipping students with economic methods and tools to analyze basic environmental issues.
- To apply economic theory to the study of environmental issues.
- To identify and critically evaluate alternative environmental policy instruments.
- To discuss the importance of economic theory in the allocation of scarce natural resources.
- To identify the underlying failures that give rise to environmental problems, and possible solutions to these problems.
- To assess the range of economic principles and theory used by economists to solve economic problems generic to the fields of environmental and natural resource economics.

Expected Course Outcomes:

By the end of the course students will;

231. Learn that environmental economics is a subset of economics concerned with the efficient allocation of environmental resources.
232. Learn that economic activity has an impact on the environment, which in turn, affects both welfare and the performance of the economy.
233. Analyze basic environmental issues with economic methods and tools.
234. Explain the principles of economics that are relevant to understanding how individuals make decisions about consumption and production activities.
235. Developed a sufficient basis in microeconomics to provide a foundation for their work on environmental issues.
236. Practice in using economic principles to solve relevant analytical problems related to environmental issues

Grade Components:

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%

Second Exam	20%
Final Exam	50%
Total	100%

Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to neither do their own work and neither gives nor receive unauthorized assistance.

Homework Assignments: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.

Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.

Cheating: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.

Classroom Protocol and Participation Guidelines: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topics

Week	Topics
1	What is Environmental Economics?
2	Origins and scope of environmental economics.
3	Links between the economy and the environment.
4	Environmental Analysis.
5	Environmental policy instruments.
6	Environmental policy instruments.
7	Economics of Environmental Quality.
8	Environmental policy instruments.
9	Economics of environmental liability
10	economics of environmental liability
11	Environmental Impact Analysis
12	Environmental Impact Analysis
13	Regulatory Policy vs. Economic Incentives
14	Environment Protection laws in Jordan
15	The nature of climate problem, Mitigation Costs, Cost-Benefit Analysis
16	Final Exams' week

Part 5: Course Modules

Module 1; Economics and the Environment	
Key Concepts	Environment, Resources, Economics
Overview	This module will introduce students to the main concepts dealing with environmental economics. Environmental economics is the subset of economics that is concerned with the efficient allocation of environmental resources; it takes into consideration issues such as the conservation and valuation of natural resources, pollution control, waste management and

	recycling.
Aims	1. Enhance students understanding of economics and environment relations. 2. Equipping students with economic methods and tools to analyze basic environmental issues.
Learning Outcomes	At the end of this module students will be able to: - Define environmental economics - Understand that economic activity has an impact on the environment.
Units	1. What is Environmental Economics? 2. Origins and scope of environmental economics. 3. Links between the economy and the environment.
Readings	1. Field, Barry C. and Martha K. Field. 2009. Environmental Economics, 5th edition. San Francisco, CA: McGraw-Hill. 2. A. H. Farghali. 2007. Environment and Sustainable Policy. Cairo University. 3. N. Hanley, J. F. Shogren and B. White.1997. Environmental Economics, In Theory and Practice. 4. http://www.enviroliteracy.org/
Activities	11. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 12. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change

	both in terms of policy as in terms of measures. 13. The students will also be asked to write critical summaries on the lectures content. 14. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 2; Environmental Economic Analysis	
Key Concepts	Environment, Economic, Analysis
Overview	Economic analysis has a definite role to play in informing decision makers about the desirability of going ahead with an investment project designed to improve environmental quality. It is also important to use economic analysis to decide how far to go in preventing environmental damages caused by investment projects whose purpose is not purely environmental. This module will focus on the main aspects helping making those decisions to improve environmental quality.
Aim	The overall aim of this module is to make students understand the process of economical analysis regarding the environmental issues.
Learning Outcomes	At the end of this module students will be able to: - Design and evaluate environmental policies. - Use environmental policy instruments - Analyze basic environmental issues with economic methods and tools.
Units	1. Environmental Analysis. 2. Environmental policy instruments. 3. Economics of Environmental Quality.
Readings	1. Field, Barry C. and Martha K. Field. 2009. Environmental Economics, 5th edition. San Francisco, CA: McGraw-Hill.

	2. A. H. Farghali. 2007. Environment and Sustainable Policy. Cairo University. 3. N. Hanley, J. F. Shogren and B. White.1997. Environmental Economics, In Theory and Practice. 4. http://www.enviroliteracy.org/ 5. Keohane and Olmstead, 2007. Markets and the Environment (Island Press,) 6. Kolstad CD. 2011. Intermediate Environmental Economics, International 2nd edn. Oxford University Press, Oxford. 7. Matthew Kahn, Fundamentals of Environmental Economics: Solving Urban Pollution Problems (Kindle Edition, available from Amazon.com at $2. The RFF Reader in Environmental and Resource Policy (Wallace Oates Editor, 2nd edition 2006, RFF Press.
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.

Module 3; Environmental Policy	
Key Concepts	Environment, Policy.
Overview	Environmental regulation in most countries has traditionally relied on command-and-control policies in which regulators – typically the government – set standards or limits and apply them uniformly to a broad category of sources. There are three types of command-and-control mechanisms that regulators can choose to implement: ambient, emissions, or technology standards. It is believed by many that the primary advantage of using command-and control mechanisms is that they provide a clear outcome. It is also comparatively simple to monitor fulfillment since regulators only have to make sure that the standard has been met.At this module, environmental policy and the causes of natural resources pollution and some solutions to this problem will be discussed.
Aim	Enhance students understanding of environmental policies and its uses.
Learning Outcomes	At the end of this module students will be able to: - Discuss environmental policies and regulations - Discuss the issue of resources pollution and suggests solutions.
Units	1. Criteria for Evaluating Environmental Policies. 2. Environmental policy instruments. 4. Economics of Environmental Quality. 3. Environment Protection laws in Jordan
Readings	1. Baumol WJ, Oates W. 1988. The Theory of Environmental Policy, 2nd edn. Cambridge University Press, Cambridge. 2. Charles Kolstad, 2010. Environmental Economics.

	Oxford University Press, 1st edition 2000, or 2nd edition. 3. A. H. Farghali. 2007. Environment and Sustainable Policy. Cairo University. 4. Fullerton D., and R. Stavins. 1998. "How do economists really think about the environment?"Published in Nature 395: 6701. Earlier version is available as RFF Discussion Paper 98-29. 5. http://www.rff.org/Documents/RFF-DP-98-29.pdf 6. Keohane and Olmstead, 2007. Markets and the Environment (Island Press,) 7. Kolstad CD. 2011. Intermediate Environmental Economics, International 2nd edn.Oxford University Press, Oxford.
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 4; **Climate Change Economics**	

Key Concepts	Climate change, Economics
Overview	The Economics of climate is critical to our understanding of how best to address this difficult issue. Economic analyses play a critical role in consideration of climate change policies. Identifying, assessing and communicating the implications of economic uncertainty and knowledge gaps remain a major challenge – for example - in characterization of long-term technology change and valuation of non-market impacts. Climate Change Economics can provide an important forum to consider fundamental economic issues that will enhance understanding and improve climate policy deliberations.
Aim	1. Overview of the science of climate change. 2. Considering the economic implications of climate change.
Learning Outcomes	• Initial assessment of economic responses to climate risks and opportunities. • Develop an idea about costs and benefits of climate risks and adaptation to them. • Development of adaptive governance approaches to managing risk and uncertainty.
Units	1. The Nature of the Climate Problem. 2. Mitigation Costs. 3. Cost-Benefit Analysis.
Readings	1. Aldy, J. E. and R. N. Stavins (2007). Architectures for Agreement: Addressing Global Climate Change in the Post-Kyoto World. Cambridge: Cambridge University Press; 2. Maslin, M. (2004). Global Warming: a Very Short Introduction. Oxford: Oxford University Press. 3. Stern, N. (2007). TheEconomics of Climate Change: the Stern Review. Cambridge: Cambridge University Press;
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor

	(course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.

Jerash University

Course Syllabus

College: Agriculture
Department: Agricultural Economics and Extension

Part 1: Instructor Information

Instructor Name:
Office Location:

Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 603352
Course Name: Resources Economics
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

Course Description:

The course covers economic analysis of natural resource use and conservation, includes analyses of the use of fuel, forest, marine and biodiversity resources. This course introduces students to the principles, reasoning, and techniques required to set-up and solve allocation problems, under different social objectives. In this course, the economic tools developed are applied to renewable resources, exhaustible resources, water, pollution, marine resources, climate change, conservation planning, and other contemporary problems. This course aim to enhance students learning the basic principles and tools required to analyze natural and non-natural resource management problems. The overall objective of this course is evaluating natural resource use in terms of efficiency and sustainability, and designing regulations for correcting inefficient and unsustainable resource market.

Course Learning Objectives:

- Learn basic economic principles governing the allocation of various categories of scarce natural/environmental resources among competing uses
- Gain experience with basic analytical tools useful for applying these principles to real world allocation problems

Expected Course Outcomes:

237. Students will learn about renewable resources, exhaustible resources.
238. Students will be able to solve allocation problems, under different social objectives.

239. They will understand the relationship between climate change and economical resources.

Course Resources:

There is no required textbook. Various reading will be handed out during the semester. The following resources may be helpful;

1. Conrad, J. 1999. Resource Economics. Cambridge University Press.
2. Roger Perman, Yue Ma, James McGilvray, and Michael Common. 2003. *Natural Resource and Environmental Economics*, third edition. Pearson Addison Wesley.
3. Conrad, J. 1999. Resource Economics. Cambridge University Press.
4. http://dutraeconomicus.files.wordpress.com/2014/01/roger-perman-yue-ma-michael-common-david-maddison-james-mcgilvray-natural-resource-and-environmental-economics-3rd-edition-2003.pdf.
5. http://www.eolss.net/sample-chapters/c13/e6-29-04-07.pdf
6. http://glisaclimate.org/media/HRWC%20Natural%20Resources.pdf
7. http://www.fsl.orst.edu/lulcd/Publicationsalpha_files/Alig_2011_gtr837.pdf

Part 3: Assignments, Course policies, and Grading Policy

Exams: *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

Grade Components:

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

Homework Assignments: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.

Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.

Cheating: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.

Classroom Protocol and Participation Guidelines: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topics
1	Introduction to Resources Economics
2	Economic foundations for resources uses

Week	Topics
3	Ownership of Agricultural Lands
4	Ownership of Lands by Rent
5	Economical Return of Land
6	Fundamentals of renewable resource economics
7	Water Resources Water allocation, markets, pricing, and conservation
8	Human Resources
9	Resources Maintenance
10	Fundamentals of non-renewable resource economics Optimal Depletion, Fossil Fuels, Natural Gas, Mineral resources
11	Handling risk, uncertainty, and sensitivity
12	Non-renewable resources and stock pollutants: dynamics and regulation
13	Ecosystem services and Ecosystem Based Management
14	The impact of climate change on natural resources - Ecological and Behavioral Responses of Wildlife to Climate Change - Impacts of Climate Change on Wildlife Habitat
15	Continuation
16	Final Exam

Part 5: Course Modules

Module 1; Modeling, Definitions, and Resource Allocation	
Key Concepts	Resources Economics, Resources
Overview	Economics has long been concerned with the efficient use of its scarce natural resources. At the start of the twentieth-century, economics started to

	treat natural resources as something more distinct than just as a free factor of production. Today, natural resource economics continues to expand on these early insights by developing theories that help explain how people and societies choose to manage and use their limited resources, both non-renewable resources like minerals and fossil fuels, and renewable resources like fisheries and forests. This module will introduce students to the definition of economical resources and its distribution and importance.
Aim	Enhance students understanding of resources economics.
Learning Outcomes	At the end of this module students will be able to: 95. Know the definition of resources economics. 96. Identify renewable and non-renewable resources.
Units	1. Introduction to Resources Economics 2. Economic foundations for resources uses 3. Ownership of Agricultural Lands 4. Ownership of Lands by Rent 5. Economical Return of Land
Readings	1. Roger Perman, Yue Ma, James McGilvray, and Michael Common. 2003. *Natural Resource and Environmental Economics*, third edition. Pearson Addison Wesley. 2. Conrad, J. 1999. Resource Economics. Cambridge University Press. 3. http://www.eolss.net/sample-chapters/c13/e6-29-04-07.pdf
Activities	15. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 16. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 17. The students will also be asked to write critical summaries on the

	lectures content. 18. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 2; Renewable Resource Economics	
Key Concepts	Renewable resources
Overview	A renewable resource is a natural resource, such as fisheries and forests, which can replenish with the passage of time, either through biological reproduction or other naturally recurring processes. Renewable resources are a part of earth natural environment and the largest components of its ecosphere. Renewable resources may be the source of power for renewable energy. However, if the rate at which the resource is consumed exceeds its renewal rate, renewal and sustainability will not be ensured. The term renewable resource also describes systems like sustainable agriculture and water resources. Sustainable harvesting of renewable resources (i.e., maintaining a positive renewal rate) can reduce air pollution, soil contamination, and land degradation. Economic theory suggests an efficient harvest should balance the marginal benefits one can get elsewhere in the economy with the extra growth of the resource and the cost savings from not harvesting the resource. This module will focus on getting this resources and the importance of saving renewable resources from depletion.
Aim	The overall aim of this module is to enhance students' knowledge about renewable resources and its efficient uses.
Learning Outcomes	At the end of this module students will be able to: 1. Identify renewable resource. 2. Use resources efficiently.
Units	1. Fundamentals of renewable resource economics. 2. Water Resources. 3. Water allocation, markets, pricing, and conservation.

	4. Human resources
Readings	1. Perman, R., Ma, Y., McGilvray, J and Common, M (2003). Natural Resource and Environmental Economics. 3rd edition, 2. Roger Perman, Yue Ma, James McGilvray, and Michael Common. 2003. *Natural Resource and Environmental Economics*, third edition. Pearson Addison Wesley. 3. http://www.eolss.net/sample-chapters/c13/e6-29-04-07.pdf
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 3; Non-renewable Resource Economics	
Key Concepts	Non-renewable resources
Overview	A non-renewable resource (also called a finite resource) is a resource that does not renew itself at a sufficient rate for sustainable economic extraction in meaningful human time-frames. Such resources will eventually be exhausted which include the fossil fuels, such as coal, oil, and natural gas; and mineral resources, such as iron ore and gold. This module focuses on the economic theory of efficient extraction, measures of resource scarcity, and energy supply and demand.
Aim	The aim of this module is to enhance students' knowledge about non-

	renewable resources and its efficient uses.
Learning Outcomes	At the end of this module students will be able to: 1. Identify non renewable resource. 2. Use non renewable resources efficiently.
Units	1. Fundamentals of non-renewable resource economics 2. Optimal Depletion 3. Fossil Fuels 4. Natural Gas 5. Mineral resources 6. Non-renewable resources and stock pollutants: dynamics and regulation
Readings	1. Conrad, J. 1999. Resource Economics. Cambridge University Press. 2. Roger Perman, Yue Ma, James McGilvray, and Michael Common. 2003. *Natural Resource and Environmental Economics*, third edition. Pearson Addison Wesley. 3. http://dutraeconomicus.files.wordpress.com/2014/01/roger-perman-yue-ma-michael-common-david-maddison-james-mcgilvray-natural-resource-and-environmental-economics-3rd-edition-2003.pdf. 4. http://www.eolss.net/sample-chapters/c13/e6-29-04-07.pdf
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper

	of approximately 1000 words.
Module 4; Climate Change and Natural Resources	
Key Concepts	Climate Change, Resources.
Overview	Climate change may refer to a change in average weather conditions, or in the time variation of weather around longer-term average conditions. It was found that climate has impacts on natural resources and associated ecosystems, land use and values, and human communities. This Module will focus of the effect of climate change on natural resources and how to manage and reduce this effect.
Aim	Enhance students understanding of climate change and its impacts on natural resources.
Learning Outcomes	At the end of this module students will be able to be familiar with climate change impacts on natural resources and provide solutions.
Units	1. Ecosystem services and Ecosystem Based Management 2. Ecological and Behavioral Responses of Wildlife to Climate Change 3. Impacts of Climate Change on Wildlife Habitat
Readings	1. Perman, R., Ma, Y., McGilvray, J and Common, M (2003). Natural Resource and Environmental Economics. 3rd edition, 2. Roger Perman, Yue Ma, James McGilvray, and Michael Common. 2003. *Natural Resource and Environmental Economics*, third edition. Pearson Addison Wesley. 3. http://glisaclimate.org/media/HRWC%20Natural%20Resources.pdf 4. http://www.fsl.orst.edu/lulcd/Publicationsalpha_files/Alig_2011_gtr837.pdf
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are

	held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.

Jerash University

Course Syllabus

College: Economics and Administrative Sciences

Department: Business Administration

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours:
Office Telephone:

E-mail:

Part 2: Course Information

Course Number: 206107
Course Name: Introduction to Economics
Class Hours:
Classroom:
Prerequisites:

Course Description:

This course is an introductory course that introduces you to basic economic concepts and rigorous applications and the economic way of thinking. You will also learn how to analyze government policy for the individual markets (MICROECONOMICS) and government policy at the national level (MACROECONOMICS), including fiscal and monetary policies. MICROECONOMICS topics will include market models of supply and demand, market structures and competition, efficiency, and equilibrium. MACROECONOMICS topics will cover the national economy models, measurement, economic growth, international trade and finance. The second module of this course, analyzes the effects of climate change on economy.

Course Learning Objectives:

1. Demonstrate intermediate knowledge of microeconomics/managerial economics. Intermediate microeconomics and managerial economics require students to analyze microeconomic problems and issues through an analytical and quantitative approach. Students will understand the theory of choice, cost analysis, resource allocation, and market structure.
2. Demonstrate intermediate knowledge of macroeconomic theory. Intermediate macroeconomics requires students to analyze macroeconomic problems and issues through an analytical and quantitative approach.
3. Demonstrate basic analytical and quantitative skills required to address economic questions. Students need to be at least at a beginning level in calculus to understand basic and applied economic theory. They also need an understanding of statistics that prepares them to use multivariable single regression models. Students should know how to apply these techniques to address basic economic questions. Other analytical skills also enhance the student's economic skill set and are taught in the appropriate field course.

4. Demonstrate an ability to effectively communicate the use of economic concepts and principles to address economic problems (especially current economic issues).
5. Understand the effects of climate change on economy.

Expected Course Outcomes:

1. Students should be equipped with some tools and methods of economic analysis that will serve as the basis for a more advanced course of study in microeconomic theory.
2. The non-specialist economics student should have a good introduction to the fundamental principles of microeconomics.
3. Both specialist and non-specialist economics students should be able to use the concepts to which they are introduced to facilitate analysis of the functioning of the micro-economy.

Course Resources:

1. Economics, 10th edition (2012), by Michael Parkin. Pearson Publisher.
2. Mankiw, N. Gregory (2009). Essentials of Economics (5th Edition).
3. Economics by Walter Wessels. Eleventh (3th) Edition. New York: Barron, 2000.
4. Climate Change Threatens Economic Growth-UN Report. How should Investors React?, available at: http://www.forbes.com/sites/mikescott/2014/04/03/climate-change-threatens-economic-growth-un-report-how-should-investors-react/

Part 3: Assignments, Course policies, and Grading Policy

***Exams**: There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

***Grade Components**:*

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%

Second Exam	20%
Final Exam	50%
Total	100%

Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.
Homework Assignments*: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.*

Late Policy*: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.*

Cheating*: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.*

Classroom Protocol and Participation Guidelines*: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.*

Part 4: Course Outline/Schedule

Week	Topics
1	Introduction;

Week	Topics
	• Principles of Economics
2	Basic Concepts; • Principles of Economics
3	Basic Concepts; • Types of Economies
4	Basic Concepts; • Thinking like an Economist
5	Basic Concepts; • scarcity
6	Climate Change and Economy; • Climate Change • effects of climate change • effects of climate change on economy
7	Climate Change and Economy; • effects of climate change on economy
8	Utility**;** • Supply
9	Utility**;** • Demand
10	Utility**;** • Total Utility • Marginal Utility
11	Utility; • Diminishing marginal utility
12	Microeconomics; • Price determination

Week	Topics
	• Consumers behavior
13	Microeconomics; • Consumers behavior
14	Continuation
15	Evaluation and Assessment
16	Final Exams' week

Part 5: Course Modules

Module 1; Types and Principles of Economies	
Key Concepts	Traditional, Command, Market, Mixed, investment, individuals, consumers, government
Overview	Societies have developed different broad economic approaches to manage their resources. Economists generally recognize four basic types of economic systems—traditional, command, market, and mixed—but they don't completely agree on the question of which system best addresses the challenge of the scarcity of resources. Therefore, this module discusses theses types and negotiates the most efficient one.
Aim	This module aims to introduce the basic concepts and types of economics to the students. It also aims to address the challenge of scarcity and how individuals and nations face such limitations of their resources.
Learning Outcomes	By the end of this module, students will be able to: 97. Understand the different types of economies; 98. Learn examples of some countries that apply these types;

	99. Try to judge the best economic system in a modern society; 100. Differentiate between the traditional and the mixed economic system and show that the mixed one fits the modern society.
Units	1. Principles of Economics 2. Types of economies 3. Thinking like an Economist 4. scarcity
Readings	• Mankiw, N. Gregory (2009). Essentials of Economics (5th Edition).
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. 5. firms' visits, **6.** reports, 7. Quizzes

Module 2; Climate Change and Economy	
Key Concepts	Climate Change, economy, global warming, environment, carbon dioxide, ecosystems
Overview	This module argues that climate change is having an impact on every ecosystem from the equator to the poles. It suggests that most effects of warming the climate are negative and will get worse. It talks of "extreme weather events leading to breakdown of…critical services such as electricity, water supply and health and emergency services" and it sounds the alarm about "the breakdown of food systems, linked to warming." Therefore, this module analyzes the effects of climate change on economy.
Aim	The aim of this module is to study the effects of climate change on the economy, individuals, nations, and ecosystems. It can cause harm to the coastal cities through expansion of water by heating, harm to seawater through absorption of carbon dioxide and many other problems and such problems can negatively affect the economy and destroy it.
Learning Outcomes	By the end of this module, students will be able to: 101. Realize the amount of danger and risk climate change has on economy and on the environment; 102. Put into analysis the problems climate change can cause to individuals, nations, and communities; 103. Realize that global warming can cause many extinctions; 104. Realize that it can cause diseases and poverty to humanity.
Units	1. Climate Change

	2. General effects of climate change 3. Effects of climate change on economy
Readings	• Climate Change Threatens Economic Growth-UN Report. How should Investors React?, available at: http://www.forbes.com/sites/mikescott/2014/04/03/climate-change-threatens-economic-growth-un-report-how-should-investors-react/
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. **5.** Reports, 6. Quizzes
Module 3; Utility and Economics	
Key Concepts	Supply, demand, utility, marginal, diminishing marginal utility, satisfaction, addition
Overview	Underlying the laws of demand and supply is the concept of

	utility, which represents the advantage or fulfillment a person receives from consuming a good or service. Utility, then, explains how individuals and economies aim to gain optimal satisfaction in dealing with scarcity. This module studies types of utility and their relation to demand and consumption. The law of diminishing marginal utility helps economists understand the law of demand and the negative sloping demand curve. The less of something you have, the more satisfaction you gain from each additional unit you consume; the marginal utility you gain from that product is therefore higher, giving you a higher willingness to pay more for it. Prices are lower at a higher quantity demanded because your additional satisfaction diminishes as you demand more.
Aim	To be familiar with concepts of; Supply, demand, utility, marginal, diminishing marginal utility, satisfaction, addition
Learning Outcomes	By the end of this module, students will be able to: 105. Understand the meaning of utility and its relation to demand and supply principles; 106. Understand the meaning of total utility and marginal utility and the relationships between them; 107. Apply these concepts to the market available examples.
Units	1. Supply 2. Demand 3. Total Utility 4. Marginal Utility 5. Diminishing marginal utility
Readings	• Mankiw, N. Gregory (2009). Essentials of Economics (5th Edition).

Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. 5. Reports, 6. Quizzes
Module 4; Microeconomics	
Key Concepts	Decision makers, behaviors, micro- level
108. Overview	This module studies the behavior of individuals and small impacting organizations in making decisions on the allocation of limited resources. Typically, it can be said to apply to markets where goods or services are bought and sold. Microeconomics examines how these decisions and behaviors affect the supply and demand for goods and services, which determines prices, and how prices, in turn, determine the quantity supplied and quantity demanded of goods and services. Such process plays a significant role in determining

	and keeping the balance in the market milieu.
109. Aim	This module aims to explain the meaning and application of microeconomics principles in the market. It reflects the freedom of the individual and private sector to play a role in the market supply and demand to make profits.
110. Learning Outcomes	By the end of this module, students will be able to: 111. Understand the principles of microeconomics; 112. Distinguish between micro-economics and macroeconomics; 113. Make connections between policy, market, and decision makers. 114. Understand the chain of economics; something is linked and will eventually affect the other principle of economics.
115. Units	1. Consumers behavior 2. Price determination
116. Readings	1. Economics, 10th edition (2012), by Michael Parkin. Pearson Publisher. 2. Mankiw, N. Gregory (2009). Essentials of Economics (5th Edition). 3. Economics by Walter Wessels. Eleventh (3th) Edition. New York: Barron, 2000.
117. Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the

	acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. 5. Reports, 6. Quizzes

Jerash University

Course Syllabus

College:
Department:

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)

Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 102108
Course Name: Computer Skills
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites: No prerequisites.

Course Description:

This is an introductory course in basic computer use. It covers computer hardware and software fundamentals (including the use of Windows), key productivity applications (including word processing, spreadsheets, and presentations systems).In this course, students are introduced to a Windows-based operating system, the Internet, and to word processing, PowerPoint and spreadsheet applications. Students will learn basic computer concepts and terminology, use a personal computer, and develop competency in accessing, inputting, retrieving, storing, sending, and presenting information. Applications studied are Microsoft Windows, Word, Excel, PowerPoint, and Internet. Using computer models to understand Global Climate Change will be addressed in the last model of this course.

Course Learning Objectives:

1. Describe the parts of a computer.
2. Learn about computer hardware/software and develop working knowledge of computer terminology.
3. Identify and use window components.
4. Use the parts of the computer correctly.
5. Perform basic computer tasks in a Windows environment.
6. Navigate a webpage.
7. Perform basic file management tasks.

Expected Course Outcomes:

Upon completion of this course students will be able to:

1. Identify computer hardware and peripheral devices
2. Familiar with software applications
3. Practice file management
4. Accomplish creating basic documents, worksheets, presentations.
5. Distinguish the advantages and disadvantages of networks
6. Experience working with email and recognize email netiquette
7. Explore the Web and how to conduct research
8. Identify computer risks and safety
9. Use Windows desktop features, including managing files and directories.
10. Locate and organize information using a web browser.
11. Use a word processing package to draft, format, save and print memos, letters and reports.
12. Develop critical thinking skills in the use of information and communication technologies (ICT).
13. Employ self-directed strategies to learn new features of software packages and other technology.

Course Resources:

1. Bangia R., 2008. Computer Fundamentals and Information Technology. Firewall Media. New Delhi- India. 978-81-318-0296-0.
2. Bouwer, L. M., and others (2004). Adaptation and Funding in Climate Change Policies. In Kok and de Coninck:173-201.
3. Gupta, J. (1997). Th e Climate Change Convention and Developing Countries: From Confl ict to Consensus? Boston/London: Kluwer Academic Publ.
4. Heemst, J. van, and V. Bayangos (2004). Poverty and Climate Change. In: Kok M.T.J. and H.C. de Coninck, 2004: 21-52.
5. Michaelowa, A., and M. Dutschke (2000). *Climate Policy and Development: Flexible Instruments and Developing Countries*. Cheltenham, UK: Edward Elgar.
6. Munasinghe, M., and R. Swart (1999). Climate Change and its Linkage with Development, Equity and Sustainability. Proceedings of the IPCC Expert Meeting, Colombo, 27-29 April 1999. Paris: IPCC, WMO.
7. Williams B., 1995. Using Information Technology: A Practical Introduction to Computers & Communications. Irwin Publishing. Chicago- USA. ISSN 0-256-15350-7.

8. www. Climateprediction.net
9. Vermaat, M. Discovering Computers. 2010. Cengage Learning. Boston – USA. ISSN 978-0-495-80638-7.

Part 3: Assignments, Course policies, and Grading Policy

Exams: *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

Grade Components:

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

Homework Assignments: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.

Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.

Cheating: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.

Classroom Protocol and Participation Guidelines: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topic
1	Introduction, Computer Basics,
2	Hardware,
3	Windows,
4	File Management,
5	Word Processing
6	Spreadsheets
7	Spreadsheets
8	Spreadsheets
9	PowerPoint
10	PowerPoint
11	PowerPoint
12	Internet and Web Basics,
13	Internet and Web Basics,
14	Security and Protection,
15	Computer Maintenance,
16	Revision and Final Exam.

Part 5: Course Modules

Module 1; Computer Basics	
Key Concepts	Desktop computer, Keyboard, Mouse, Monitor, Software, Hardware.
Overview	The basics of computers set the foundation for everything else students are going to learn. Today it is often assumed that people know these basics, however in an introductory course it is good to ensure these basics are introduced.
Aims	4. Identify the basic parts of a desktop computer. 5. Identify different types of computers 6. Identify basic parts of the Windows operating 7. To handle mouse and keyboard basics. 8. To be customized with windows programs. 9. Identify computer hardware and peripheral devices. 10. To be familiar with software applications.
Learning Outcomes	Upon completion of this module students should be able to: 1. Be familiar with different types of computers. 2. Be familiar with basic parts of a desktop computer. 3. Be customized with windows programs. 4. Be familiar with software applications.
Units	7. Types of computers. 8. Parts of a desktop computer. 9. Peripheral devices. 10. Software & Hardware.
Readings	Bangia R., 2008. Computer Fundamentals and Information Technology. Firewall Media. New Delhi- India. 978-81-318-0296-0.

Activities	1. Identify each major part of a computer. 2. Describe the function of each part. 3. Discuss how to hold and use the mouse. 4. Discuss what students see on the desktop. 5. Show how to find and open typing program. 6. Show how to use typing lessons and games. 7. Use Microsoft Paint to show how to find, open and close a program, to identify the menu bar and icons and to practice with the mouse. 8. Close all programs and ask them to find and open Paint by themselves.
Module 2; Windows and File Management.	
Key Concepts	Window features, Menu bars, Tool bars, Task bar.
Overview	The term Windows collectively describes any or all of several generations of Microsoft operating system products. Windows allows you to organize folders and files in a file hierarchy, imitating the way you store paper documents in real folders. File management is organizing and keeping track of files and folders, helping you stay organized. Using the file management tools, you can save files in folders with appropriate names for easy identification, quickly and easily create new folders so you can reorganize information and delete files and folders that you no longer need. You can also search for a file when you cannot remember where you stored it, create shortcuts to files and folders for quick and easy access, and even compress files and folders to save space.
Aims	1. Understand what is meant by window. 2. Show windows features (minimize, resize, exit, click & drag). 3. Learn how to use the basic parts, tools and rules in the Windows environment; - Menu bar (drop down arrow). - Tool bar (icons) (roll cursor over to ID). - Scrolling.

	4. Use multiple ways to do same thing (menu, icon, keyboard) 5. Know how computers store files. 6. Know how to; - Insert and remove flash drive. - Save files as a new file, - Save an existing file. - Use My Computer to find flash drive and find files.
Learning Outcomes	Upon completion of this module students should be able to ; 1. Customize windows applications. 2. Know how they would use formatting. 3. Manage files successfully.
Units	1. Windows. 2. File Management.
Readings	1. Williams B., 1995. Using Information Technology: A Practical Introduction to Computers & Communications. Irwin Publishing. Chicago- USA. ISSN 0-256-15350-7. 2. Vermaat, M. Discovering Computers. 2010. Cengage Learning. Boston – USA. ISSN 978-0-495-80638-7.
Activities	1. Minimize, resize, exit buttons; click & drag, resize with cursor. 2. Click to see the options. 3. Roll cursor over icon for name. 4. Show Minimize and Restore with Task bar. 5. Move scroll bar with click, click & drag and arrows. 6. Resize, minimize and restore a window. 7. Monitor the students as the do the activity on their own. 8. Have a casual quiz at the end of class … name a function and ask them which key to us

Module 3; Word processing	
Key Concepts	Word**,** Document, Microsoft Word**,** Formatting
Overview	Using a computer to create, edit, and print documents, of all computer applications, word processing is the most common. Word processing **means** writing, editing, and production of documents, asletters, reports, and books, through the use of acomputer program or a complete computer system designed to facilitate rapid and efficient manipulation of text.
Aims	1. Learn how to open Word (icon, Start menu, All Programs) 2. Identify what is a "document" 3. Using cursor with text (how to position, different types of cursor) 4. Review menu bar and tool bar 5. Using keyboard with text (arrows, backspace, delete, tab, shift, space, enter keys) 6. Highlighting text (click & drag, full line from margin, edit/select all) 7. Be familiar with; formatting commands (Bold/Italicize/Underline, show as "on/off" icons) - Font size, Font type (review drop down arrow) - Text color, Text highlight (review drop down arrow) - Alignment (left, center, right) 8. Practice typing and use of the special function keys and cursors.
Learning Outcomes	Upon completion of this module students should be able to apply word applications.
Units	1. Word Introduction. 2. Review Windows and Word. 3. Word Formatting Commands
Readings	1. Williams B., 1995. Using Information Technology: A Practical Introduction to Computers & Communications. Irwin Publishing.

	Chicago- USA. ISSN 0-256-15350-7. 2. Vermaat, M. Discovering Computers. 2010. Cengage Learning. Boston – USA. ISSN 978-0-495-80638-7.
Activities	1. Introduce Microsoft Word 2007/2010. 2. Introduce Word menu and tool bars. 3. Show how to use menus, icons and special function keys. 4. Show how to open/close Word, add text and use special function keys. 5. Compare Word documents to paper (what's the same and what's different) 6. Write a list of the special keys on the board. 7. Use Menu: click for option; Icon: roll cursor over for id 8. Explain I-beam cursor vs. vertical bar cursor (pointer vs. insertion point); show how cursor changes appearance in the margin (white arrow) 9. Insert text or new lines, how to highlight text and how to erase text. 10. Monitor the students as the do the activity on their own. 11. Have a casual quiz at the end of class … name a function and ask them which key to use.
Module 4; Spreadsheets, PowerPoint, Internet and Web Basics,	
Key Concepts	Excel, PowerPoint, Internet, Web
Overview	This module offers students a brief introduction to; 1. Microsoft Excel, which is a database program that can be used for office work, budgeting, and organization. 2. PowerPoint which is considered a basic and most staple tool to effective presentations. 3. Internet which is very famous nowadays for satisfying people with various services related to various different fields.

Aims	1. To understand; - What is Excel? - What is a Spreadsheet? - How to format cells? 2. To be familiar with Spreadsheet vocabulary. 3. To understand how to navigation and how to enter data in Excel. 4. To deal with basic equations in Excel. 5. To understand; - What is PowerPoint? 6. To identify Parts of PowerPoint Screen. 7. To know how to insert texts and pictures in a PowerPoint slide. 8. Acquire a basic understanding of advanced PowerPoint practices. 9. To understand; - What is the Internet? - What is a Web Browser? - What are Links and navigation bars? - What is a website address or URL? 10. To know how to use the website address/URL in the address bar). 11. To learn how to use the basic functions of a browser. 12. To avoid the major pitfalls and risks found online and to protect their computers with antivirus software. 13. T o be familiar with basic computer maintenance operations.
Learning Outcomes	1. Accomplish creating basic worksheets, presentations. 2. Use the basic functions of a browser and explore the Web. 3. Identify computer risks and safety.
Units	1. Spreadsheets 2. PowerPoint 3. Internet and Web Basics, 4. Security and Protection, 5. Computer Maintenance,

Readings	1. Williams B., 1995. Using Information Technology: A Practical Introduction to Computers & Communications. Irwin Publishing. Chicago- USA. ISSN 0-256-15350-7. 2. Vermaat, M. Discovering Computers. 2010. Cengage Learning. Boston – USA. ISSN 978-0-495-80638-7.
Activities	1. Create a worksheet. 2. Create a presentation. 3. Practice applications and learned skills on both Excel and PowerPoint programs. 4. Give students an introduction to how to find information on the web. 5. Start a web browser (Google, Mozilla Firefox or Internet Explorer 6. Getting to Google (toolbars, search box, other Google features) 7. Pick a topic to search for (e.g. recipes, used cars, news, SAF or SFNM) 8. See Google results page (3 components of result: link, content, URL) 9. Open a web browser and navigate to Google.com. 10. Do an example search. 11. Look at the results page. 12. Select a result and click on it. 13. Search for something else "Cars"
Module 5; Computer and Climate Change.	
Key Concepts	Climate Change
Overview	Global Climate Change (GCC) is probably the most complex challenge ever faced by humans and in its entirety well beyond the comprehension by the human mind. The tool best suited to gaining a comprehension of the various individual elements, and their interactions, is computer modeling. Computer

	models have been invaluable as we begin to understand GCC, and have generally provided excellent and accurate predictions,
Aims	1. To understand what is Climate Change. 2. To identify climate change impacts. 3. To understand how computers help answer questions about how climate change is affecting our world, 4. To understand how computers help us predict the climate.
Learning Outcomes	Upon completion of this module students should be able to familiar with the importance of computer applications in predicting climate changes and in understanding how climate change is affecting our world.
Units	1. Climate change. 2. Overview of climate computer modeling
Readings	1. Bouwer, L. M., and others (2004). Adaptation and Funding in Climate Change Policies. In Kok and de Coninck:173-201. 2. Gupta, J. (1997). Th e Climate Change Convention and Developing Countries: From Confl ict to Consensus? Boston/London: Kluwer Academic Publ. 3. Heemst, J. van, and V. Bayangos (2004). Poverty and Climate Change. In: Kok M.T.J. and H.C. de Coninck, 2004: 21-52. 4. Michaelowa, A., and M. Dutschke (2000). Climate Policy and Development: Flexible Instruments and Developing Countries. Cheltenham, UK: Edward Elgar. 5. Munasinghe, M., and R. Swart (1999). Climate Change and its Linkage with Development, Equity and Sustainability. Proceedings of the IPCC Expert Meeting, Colombo, 27-29 April 1999. Paris: IPCC, WMO. 6. www. Climateprediction.net
Activities	• A series of short lecture videos for each section. Videos will have

	embedded quizzes. • Optional reading assignments associated with each section. • Homework problems and quizzes, several of which rely on computer simulations of climate models. • Forum discussions. (These are optional, but encouraged.) • Final project on analyzing climate data.

Jerash University

Course Syllabus

College: Economics and Administrative Sciences
Department: Business Administration

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours:
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 206107
Course Name: Knowledge Management
Class Hours:
Classroom:
Prerequisites:

Course Description:

This course presents a management concept of sustainable innovation management in commercial and governmental organizations. It provides answers to the question how people, teams, projects, companies and governments can create value and competitive advantage by adopting sustainability as a key driver for their innovation processes. A paradigm shift is happening at this moment. Where over the past decades firms were focused on creating shareholder value, the creation of a 'shared value' is now gaining terrain: leading management scholars like Peter Senge and Michael Porter are describing how companies create value by including all stakeholders in their firm's strategies. New strategies are centered on respect for the environment, employees, and other stakeholders as to create positive self-reinforcing cycles of value creation. This requires fundamentally different management models in which collaboration with a wide array of stakeholders is essential. Sustainability is hence no longer a story of wishful thinking or environmental activists; it is at the core of corporate strategy and decision making. Moreover, growth in sustainable markets as renewable energy, organic food, and e.g. fair trade products is double digit year after year. Sustainability is not a fashion or an attempt of firms to 'look good,' empirical evidence suggest that proper sustainability management improves firm performance and creates new entrepreneurial opportunities in rapidly growing markets.

Course Learning Objectives:

1. Increase awareness of the importance of sustainability for future business professionals;
2. Increase understanding of how companies, public, and government are interrelated in addressing and solving sustainability issues,
3. Explore how sustainable innovation can be managed.

Expected Course Outcomes:

By the end of this course, students will be able to;

1. Understand that sustainable innovation is crucial to counter the challenges our societies are facing: energy without CO2 emissions, access to water and food, reliable banks, affordable elderly care, climate resilient cities. All fields require a structural rethinking of existing systems, and introduction of new products, services, and structures to make a sustainable future possible.
2. Benefit of knowledge and apply it to new innovations in order to help sustain the climate and the environment. New and existing firms, companies, stakeholders, and the government will take such knowledge and innovations into consideration and fund such projects.
3. Explain how managers develop sustainability strategy; how they gain support for sustainability initiatives; and how they evaluate sustainability performance in their organizations;
4. Analyze work processes and operations in order to understand how to improve resource efficiency and limit and environmental impact;
5. Identify models for financing and evaluating the economic performance of sustainability initiatives;
6. Discover the importance of varied stakeholder interests, inside and outside of organizations, in the formulation of sustainability initiatives;
7. Synthesize, apply and communicate sustainability knowledge to solve environmental problems.

16	Final Exams

Part 5: Course Modules

Module 1; Sustainable Business Management	
Key Concepts	**Sustainability, environment, management, business, organizations**
Overview	Sustainability is being able to endure and survive in an environment into the future. In terms of business, sustainability management is about incorporating social, economic and environmental factors into your business decisions. It involves placing an emphasis on future, long term goals for your business rather than focusing on short term profits. Currently, the focus of sustainability management has been placed on the importance of environmental sustainability. Environmental sustainability is an increasingly important aspect of modern business management, as market pressure from regulators and consumers holds organizations accountable for their actions. Responsible businesses are congratulated and improve their image

	as leaders in the field.
Aim	The aim of this module is to teach students to manage business sustainability that can be more competitive, more adaptable, and more profitable. Also, this module aims to raise awareness of business holders and investors to reduce its negative impact on society and increase its positive influence.
Learning Outcomes	1. Identify and avoid future costs associated with unsustainable business practices, such as dumping industrial waste into the environment. 2. Plan for changes in consumer expectations and allow them to capitalize on emerging markets and industries. 3. Introduce new business management concepts such as corporate social responsibility and business ethics.
Units	1. Introduction: Overview of the course. 2. Sustainable Business Management. 3. Approaches to the Integration of Sustainability
Readings	**1.** Barbier, Edward and Markendya, Anil. 2013. A New Blueprint for a Green Economy. New York: Routledge. **2.** Johnston, Sadhu A., Parzen, Julia and Nicholas, Steve. 2013. The Guide to Greening Cities. Island Press: Washington DC. **3.** http://www.environmentalleader.com **4.** http://grist.org **5.** http://www.sustainablebrands.com **6.** http://www.csrwire.com **7.** http://www.unep.org/newscentre
Activities	19. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and

	invited lecturers. 20. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 21. The students will also be asked to write critical summaries on the lectures content. 22. For each unit the students will submit an individual reflection paper of approximately 1000 words. 23. firms' visits, 24. reports, 25. quizzes
Module 2; Climate Change Adaptation and Business	
Key Concepts	Climate change, Adaptation, Resilience, business, challenges, companies
Overview	This module illustrates how businesses are to respond effectively to climate change risks and impacts on growing economies. For to adapt for a green economy makes the business well-connected to the company needs and strategic plan of production in order to have a green community and to satisfy consumers. So, this module discusses the challenges these companies confront in their attempts of incorporating sustainable development strategies into their business plans. The connection between green economy and business investment will be discussed too.
Aims	This module aims at inspiring and informing companies to adapt to climate change;

	1. Engage business makers to support business contributions to climate change adaptation in order to have a more resilient community; 2. To give a good example for other companies and organizations to become partners to those communities suffering from climate change risks and impacts.
Learning Outcomes	By the end of this module, students will be able to: 1. Raise awareness of companies and organizations to take part in adapting to climate change; 2. Realize that greening business and economy are associated with the demand of the market, 3. Encourage the government to support the private sector in facilitating for climate change mitigation and resilience.
Units	1. The Making of Greener Products 2. Low - Carbon Transportation 3. Sustainable Agriculture
Readings	**1.** Bossink, B.A.G., 2012. Eco-innovation and Sustainability Management. New York: Routledge. **2.** Barbier, Edward and Markendya, Anil. 2013. A New Blueprint for a Green Economy. New York: Routledge. **3.** Johnston, Sadhu A., Parzen, Julia and Nicholas, Steve. 2013. The Guide to Greening Cities. Island Press: Washington DC. **4.** http://www2.epa.gov/newsroom **5.** http://www.doi.gov/customcf/DOI/doi_rss .cfm **6.** http://climatepolicyinitiative.org
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers.

	2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. 5. firms' visits, 6. reports, 7. Quizzes
Module 3; Sustainability Strategies	
Key Concepts	Sustainability, strategies, integration, collaboration, reporting, innovation, eco-strategies
Overview	This module highlights the strategies that should by applied by companies and the government in order to achieve sustainability. Corporate sustainability strategies can aim to take advantage of sustainable revenue opportunities, while protecting the value of business against increasing energy costs, the costs of meeting regulatory requirements, changes in the way customers perceive brands and products. Not all eco-strategies can be incorporated into a company's Eco-portfolio immediately. The widely practiced strategies include: Innovation, Collaboration, Process Improvement and Sustainability reporting.

Aims	1. To share knowledge and to propel innovation; 2. To draw attention of companies to change their products and services toward less waste production and sustainable best practices; 3. To integrate the best new processes of sustainability
Learning Outcomes	By the end of this module, students will be able to: 1. Realize the importance of involving stakeholders and individuals in business management and decision making toward sustainability; 2. Share knowledge about sustainability between corporations, individuals, and government; 3. Learn how to apply sustainability strategies for having a greener universe.
Lessons	1. Sustainability 2. Sustainability Strategies 3. Building Sustainable Communities 4. eco-strategies
Readings	1. Bossink, B.A.G., 2012. Eco-innovation and Sustainability Management. New York: Routledge. 2. Barbier, Edward and Markendya, Anil. 2013. A New Blueprint for a Green Economy. New York: Routledge. 3. Johnston, Sadhu A., Parzen, Julia and Nicholas, Steve. 2013. The Guide to Greening Cities. Island Press: Washington DC. 4. Shah, Jigar. 2013. Creating Climate Wealth: Unlocking the Impact Economy." ICOSA: Denver Colorado. 5. http://www.nrdc.org/policy 6. http://www.edf.org/blog 7. http://www2.epa.gov/newsroom

	8. http://www.doi.gov/customcf/DOI/doi_rss .cfm 9. http://climatepolicyinitiative.org 10. http://www.guardian.co.uk/environment
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. 5. firms' visits,
Module 4; Sustainable Investing	
Key Concepts	Investing, long-term, commitment, responsible, clean, social
Overview	Sustainable investing describes an approach to investing driven by the long-term economic, environmental, and social risks and opportunities facing the global economy. What distinguishes this approach from other approaches of investing is the conviction of its commitment to systematically integrate environmental, social, and economic factors

	within the choices of assets and the implementation of policy. It is a comprehensive approach that is responsible, clean, social, and sustainable.
Aim	The aim of this module is to draw the attention of students of the possibility of having a sustainable investing in case it becomes systematically responsible, clean, and social in the sense that it cares for the outcome and its environmental values.
Learning Outcomes	By the end of this module, students will be able to: 1. Draw attention of companies and organizations to adopt sustainable investing; 2. Share knowledge of sustainable investing development and to propel innovation; **3.** Characterize the aspects of sustainable investing and try to convince companies to have such programs.
Units	Sustainable Investing
Readings	1. Barbier, Edward and Markendya, Anil. 2013. A New Blueprint for a Green Economy. New York: Routledge. 2. Johnston, Sadhu A., Parzen, Julia and Nicholas, Steve. 2013. The Guide to Greening Cities. Island Press: Washington DC. 3. Shah, Jigar. 2013. Creating Climate Wealth: Unlocking the Impact Economy." ICOSA: Denver Colorado. 4. http://www.nrdc.org/policy 5. http://www.edf.org/blog 6. http://www2.epa.gov/newsroom
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers.

	2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. 5. firms' visits, 6. reports, 7. quizzes

Jerash University

Course Syllabus

College: Agriculture
Department: Animal Production and Protection

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 602491
Course Name: Practical Agriculture/ Animal Production
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites:

Course Description:

The purpose of this course is to provide an overview of animal agriculture with a focus on practical and management practices related to the health, husbandry, feeding, breeding, climate change effect, and marketing of beef and dairy cattle, small ruminants, poultry, and alternative agricultural species. This will be accomplished through lectures and hands-on experiences during field visits and laboratory sessions. Live animals will be used during laboratories in accordance with law regulations, and all laboratories will be conducted with respect for the animals. The overall objective of this course is to provide practical skills to students that will model them into professionals that will provide technical expertise that helps in reduces risk to producers of different operational sizes and enhances environmental quality. Climate change risks on farm animals' production will be addressed through the last module of this course.

Course Learning Objectives:

- Demonstrate an understanding of livestock production in Jordan
- Know the biology of animals and its interactions with the environment and climate change
- Understand how the inputs and processes interact in animal production systems
- Understand the technologies used in producing and marketing animal and animal products

Expected Course Outcomes:

240. Student will be able to observe &/or perform routine livestock management practices as well as physical examinations
241. Understand how various management practices impact animal health, welfare, and productivity in order to attain optimum production level that conserve resources and lead to sustainability.
242. Identify and locate resources related to animal science and agriculture
243. The ability to use facts, concepts, principles in real life situations and situations related to environment and climate change.
244. The ability to analyze and interpret animal related situations in the farm, and make reasoned judgments and recommendations.

Course Resources:

118. Reading material consists of handouts/internet websites.
119. Scientific Farm Animal Production, 10th ed., 2012. Thomas G. Field Pearson Prentice Hall
120. Principles of animal production, 1995 by Shakeb Abdraheem, and Waleed Lobbade. University of Al-Quds.

Part 3: Assignments, Course policies, and Grading Policy

Exams: *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

Grade Components:

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.

Homework Assignments: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.

Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.

Cheating: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.

Classroom Protocol and Participation Guidelines: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topics
1	1. Introduction; 2. Morphology & Physiology; 121. Ruminant versus pseudo-ruminant 122. Structure and functions of the digestive system of a bird.
2	Practical Activities (Faculty Farm)
3	Nutrition; - Feed and feed rations; constituents and their sources, and roles in animal nutrition - Essential components of a balanced ration - Poultry Rations: 1. starter; 2. finisher; 3. Layer feed.
4	1. Rotational grazing, zero grazing, continuous grazing. 2. Supplementary feeding, concentrate, silage, hay.
5	Practical Activities (Faculty Farm)
6	Animal Housing;

Week	Topics
	1. Farm Design and Management 2. Appropriate materials used in construction of animal housing.
7	Animal Housing; Safety, security, cleaning, sanitation, ventilation, protection from elements.
8	Practical Activities (Faculty Farm)
9	Animal Breeding and Reproduction; 1. Breeding and cross-breeding: heterosis, disease resistance, improved production. 2. Artificial insemination; frozen semen; oestrus synchronization. 3. Natural and artificial incubation. 4. Significance of biotechnology or genetic engineering (artificial alteration of the genetic composition of the organisms); benefits and concerns including ethical and religious.
10	Management Practices; 1. Brooding, feeding, immunization, debeaking in layers. 2. Include feeding, cannibalism, sanitation. 3. Birds and large animals Health
11	Practical Activities (Faculty Farm)
12	Management Practices; Handling Large Ruminants; - Dairy Cattle - Beef Cattle
13	Practical Activities (Faculty Farm)
14	Management Practices; Handling Small Ruminants - Sheep - Goats
15	Animal Products; - Eggs, meat, milk, manure ….

Week	Topics
	- Climate change impacts on farm animals products.
16	Final Exams' week

Part 5: Course Modules

Module 1; MORPHOLOGY AND PHYSIOLOGY	
Key Concepts	Farm Animals, Physiology, Morphology
Overview	At this module students will relate the structure of the digestive system of a bird to its functions, also identify the parts of the digestive system of ruminant and non-ruminant animals. Students will be able to explain the functions of the parts of the digestive system of ruminant and non-ruminant animals, and describe the process of digestion in ruminant and non- ruminant animals. On the other hand, they will relate the structure of the parts of an egg to its function in different bird types.
Aim	Enhance students understanding of farm animals' physiology and morphology.
Learning Outcomes	At the end of this module students will be able to: 123. Identify digestive system of animals and egg formation.
Units	1. Structure and functions of the digestive system of a bird. 2. Ruminant versus pseudo-ruminant
Readings	**124.** Scientific Farm Animal Production, 10th ed.,

	2012. Thomas G. Field Pearson Prentice Hall 125. Principles of animal production, 1995 by Shakeb Abdraheem, and Waleed Lobbade. University of Al-Quds.
Practical Activities	126. Examine and identify the parts of the digestive system of a bird. 127. View preserved parts of the digestive system of ruminant and non-ruminant animals in the lab. 128. Observation of the internal and external parts of an egg.
Module 2; ANIMAL NUTRITION	
Key Concepts	Nutrients, Feed, Feeding
Overview	This module will provide students with information about animal nutrition, the will identify the sources of carbohydrates, proteins, fats, minerals and vitamins; explain 'balanced ration'. They will also select appropriate rations for each stage of growth of broilers and layers; calculate Feed Conversion Ratio (FCR) and explain the importance of FCR. This module also will focus of large animal feeding systems, it will describe systems of grazing; state the advantages and disadvantages of different grazing systems; explain the importance of forages(grasses and legumes) in livestock feeding, and describe the measures used to feed ruminants when forage is unavailable.
Aim	Enhance students understanding of farm animals' feeding systems.
Learning Outcomes	At the end of this module students will be able to: 129. Identify feeding system and feed components that offered to animals.
Units	1. Feed and feed rations; constituents and their sources, and roles in animal nutrition

	2. Essential components of a balanced ration 3. Rations in birds include: (a) starter; (b) finisher; (c) Layer feed. 4. Rotational grazing, zero grazing, continuous grazing. 5. Supplementary feeding, concentrate, silage, hay.
Readings	**130.** Scientific Farm Animal Production, 10th ed., 2012. Thomas G. Field Pearson Prentice Hall 131. Principles of animal production, 1995 by Shakeb Abdraheem, and Waleed Lobbade. University of Al-Quds.
Practical Activities	132. Use simple food tests to identify carbohydrates, proteins and fats. 133. Examine samples of different feedstuffs. 134. Examine labels from commercial ration and identify the components. 135. Visit a feed mill. 136. Develop a portfolio on broiler and egg production. 137. Calculate Feed Conversion Ratio. 138. Maintenance of small grass and legume plots. Identify, collect and mount forage plants.
Module 3; HOUSING	
Key Concepts	Housing
Overview	At this module students will explain the principles that govern housing requirements for farm animals and describe the housing and space requirements for broilers, layers and rabbits. Also students will be able to explain the factors to be considered in the sitting and establishment of a farm.
Aim	Enhance student's knowledge about housing systems.

Learning Outcomes	At the end of this module students will be able to: 139. Identify housing systems for the different types of animals
Units	1. Farm Design and Management 2. Safety, security, cleaning, sanitation, ventilation, protection from elements. 3. Appropriate materials used in construction of animal housing.
Readings	**140.** Scientific Farm Animal Production, 10th ed., 2012. Thomas G. Field Pearson Prentice Hall 141. Principles of animal production, 1995 by Shakeb Abdraheem, and Waleed Lobbade. University of Al-Quds.
Practical Activities	142. Visits of different farms with different housing systems.
Module 4; ANIMAL BREEDING AND REPRODUCTION	
Key Concepts	Breeding, Reproduction.
Overview	This module will introduce students to the breeds of each class of animals commonly reared in Jordan, Also explain different breeding systems in animal production and explain the advantages of cross-breeding. It will also focus on the process of artificial insemination (AI) in farm animals and evaluate the use of A.I. in farm animals. Differentiate among the terms: a. ovulation; b. fertilization; c. gestation; d. estrous cycle; e. kindling, f. parturition. Also it will describe the process of egg formation and incubation in poultry, and explain genetic engineering in livestock production.
Aim	Enhance student knowledge about the reproduction system and animal breeding.

Learning Outcomes	At the end of this module students will be able to: 143. Identify animals breeds 144. Apply AI and define reproduction procedure in farm animals.
Units	1. Breeding and cross-breeding: heterosis, disease resistance, improved production. 2. Artificial insemination; frozen semen; oestrus synchronization. 3. Natural and artificial incubation. 4. The significance of biotechnology or genetic engineering (artificial alteration of the genetic composition of the organisms); benefits and concerns including ethical and religious.
Readings	**145.** Scientific Farm Animal Production, 10th ed., 2012. Thomas G. Field Pearson Prentice Hall 146. Principles of animal production, 1995 by Shakeb Abdraheem, and Waleed Lobbade. University of Al-Quds.
Practical Activities	147. Identify Signs of heat in farm animals. 148. Apply AI 149. Experiment with small scale incubators. 150. Visit to hatcheries.
Module 5; MANAGEMENT PRACTICES	
Key Concepts	Management Practices.
Overview	This module will describe the management practices associated with the care of baby chicks and explain the management practices associated with rearing broilers, layers and rear a number of broilers per term (about 2000 birds). It will also describe the general signs of illness in farm animals; identify pests and diseases of poultry and rabbits; describe the symptoms of pests and diseases infestation in poultry. Also student

	will determine the prevention, control and cure of pests and diseases in poultry and large animals.
Aim	Enhance students understanding of raising poultry and reduce management problems.
Learning Outcomes	At the end of this module students will be able to: 151. Rear a group of birds and large and small ruminants.
Units	1. Brooding, feeding, immunization, debeaking in layers. 2. Include feeding, cannibalism, sanitation. 3. **Birds and large animals Health** 4. **Handling Large Ruminants;** 5. Handling Small Ruminants
Readings	**152.** Scientific Farm Animal Production, 10th ed., 2012. Thomas G. Field Pearson Prentice Hall 153. Principles of animal production, 1995 by Shakeb Abdraheem, and Waleed Lobbade. University of Al-Quds.
Practical Activities	154. Conduct management practices in rearing broilers, layers and rabbits. 155. Rear rabbits and a batch of broilers and layers. 156. Prepare a cost analysis for a batch of broilers.
Module 6; ANIMAL PRODUCTS	
Key Concepts	Production, Products, climate change impacts
Overview	This module introduces a list of principal farm animal products and by-products including those derived from offal. Also students will determine the dressing percentage of different farm animals; and determine the most appropriate age to slaughter broilers. Climate change risks on farm animals' production will be addressed in this module.
Aim	Enhance student understanding of animal products and

	realizing of climate change risks on these products.
Learning Outcomes	At the end of this module students will be able to: 157. Deal with animal products.
Units	1. Egg production, milk processing and preservation, honey production, wax, bee bread and royal jelly. 2. Importance of fish as a source of protein for human nutrition and livestock feed. 3. Eggs – dried eggs, shell as fertilizer, handicraft, calcium supplements for bird. 4. Meat – cured meat (sausage, ham, and bologna). 5. Milk – cheese, yogurt. 6. Manure – biogas. 7. Economic age, weight and time to slaughter animals, live weight versus carcass weight. 8. Processes from egg collection stage to when the egg reaches the consumer. 9. Climate change impacts on farm animals products.
Readings	**158.** Scientific Farm Animal Production, 10th ed., 2012. Thomas G. Field Pearson Prentice Hall 159. Principles of animal production, 1995 by Shakeb Abdraheem, and Waleed Lobbade. University of Al-Quds.
Practical Activities	160. Identification of meat cuts and carcass quality. 161. Visit to milk processing facility. 162. Calculation of dressing percentage of broilers. 163. Slaughter and dress broilers. 164. Conduct marketing strategies to sell broilers. 165. Collect, clean, sort, grade and pack eggs.

Jerash University

Course Syllabus

College: Arts
Department: English Language and Translation

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours:
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 102108
Course Name: Communication Skills in English Language
Class Hours:
Classroom:
Prerequisites:

Course Description:

This course helps student become more adept at discovering and generating meaning, in developing and refining their self-awareness as learners, in expanding their repertoires of reading and writing strategies, and in developing their abilities as purposeful readers and writers. The course offers a content based approach where all four skills of speaking, listening, reading and writing are integrated to foster various speaking opportunities. Since the main focus of the course is on speaking, the listening, reading and writing tasks serve as springboard to either generate or to complement speaking. The emphasis put on variety, language skills and the balance between input and practice throughout the course help students become more confident, autonomous and competent speakers of English. Also

attention is given to issues of organization and surface-level elements of academic writing. Students use reading, writing, and speaking to learn about important universal issues such as climate and the environment (Global Warming, energy, pollution, deforestation, carbon dioxide, etc.; and they compose relatively simple texts to communicate with real readers (self, classmates, and teacher) about this issue.

Course Learning Objectives:

- The main objectives of the course are to:

- provide material for the students to learn pronunciation of the English sounds, to learn to read, write, and to know the fundamentals of English grammar and vocabulary;
- develop the students' reading skills to enable them to skim an adapted text for main idea, to scan an adapted text for specific information, to interpret an adapted text for inferences;
- develop the students' writing skills to enable them to respond to input applying information to a specified task, to elicit, to select, to summarize information in essays (140-160 words);
- develop the students' listening skills to enable them to understand and apply specific information from the input (within the framework of Breakthrough level);
- develop the students' speaking skills to enable them to use general, social and professional language (within the framework of Breakthrough level);
- develop the students' general capacity to a level that enables them to use English in their professional and academic environment (within the framework of Breakthrough level).

Expected Course Outcomes:

- The course aims at developing a wide range of skills:

- Language Development, which involves grammar and extensive vocabulary learning.
- Writing skills, which have a specific focus on literacy and short essays, memoranda, and notes on issues of the climate and environment.
- Reading which involves studying instructional business-related texts.
- Listening which includes comprehension of gist and detailed information.
- Communication skills which cover communication situations (within the framework of Breakthrough level).

Course Resources:

- Cotton D., Falvey D., Kent S. Market Leader. *Intermediate Business English*. Longman, 2001.
- Tillitt, Bruce and Mary Bruder. *Speaking Naturally: Communication Skills in American English.* Cambridge, 1985.
- Evans V., Dooley J. Upstream. *Intermediate workbook*. Express Publishing. 2002.
- Evans V., Dooley J. Upstream. *Grammar*. Express Publishing. 2002.
- Nelson, Thomas. *English Skills: Book 5.* Cheltenham: John Jackman, 1994.

Part 3: Assignments, Course policies, and Grading Policy

- **Exams:** There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.

- **Grade Components:**

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%

Total	100%

- **Grading Policy**: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.
- **Course Policies:** All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to do their own work and neither gives nor receive unauthorized assistance.
- **Homework Assignments:** Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.
- **Late Policy:** The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.
- **Cheating:** Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.
- **Classroom Protocol and Participation Guidelines:** Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topics
1	Introduction into the course: Basics
2	Basics of English Skills
3	Sentence Order
4	Word Order
5	Sentence Types
6	Speaking and Conversation
7	Practicing Speaking
8	Listening Skills
9	Practicing Listening
10	Reading
11	Writing
12	Practicing Reading
13	Practicing Writing
14	Text Types
15	Evaluation and Assessment
16	Evaluation and Assessment

Part 5: Course Modules

Module 1; Basics of English Skills	
Key Concepts	Reading, writing, sentence types, word order, expression
Overview	The students learn to pronounce, read and write. They

	acquire their knowledge of fundamental grammatical structures and functions (e.g. sentence types, tenses, voice, parts of speech, word order, expressing possibility, obligation, necessity, prohibition, criticism; expressing preferences, making assumptions; asking for/ refusing/giving permission; making offers, suggestions, etc.) They acquire their fundamental vocabulary to fulfill the above mentioned functions in roles, topics, and discussions that are related to climate, environment and sustainability. The focus, in this module, is on rainforests and how to protect them.
Aim	This module aims at teaching students the basics of communication skills. It also aims at opening topics and discussions related to issues of the climate and environment.
Learning Outcomes	By the end of this module, students will be able to: - Express ideas and thoughts about protecting the rainforests of the Amazon and cliffs under attack. - Put words in the right order. - Distinguish sentence types through the text. - Learn about the fundamental grammatical structures and functions. - Expressing possibility, obligation, preferences and assumptions.
Units	Units related to; 1. Basics of English Skills 2. Sentence Order 3. Word Order
Readings	• Nelson, Thomas. *English Skills: Book 5.* Cheltenham:

	John Jackman, 1994.
Activities	26. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 27. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 28. The students will also be asked to write critical summaries on the lectures content. 29. For each unit the students will submit an individual reflection paper of approximately 1000 words. 30. firms' visits, **31.** reports, 32. Quizzes 33. Reading, writing, expressing, **34.** video-movie watching
Module 2; Conversation and Speaking	
Key Concepts	Speaking, conversation, vocabulary, topics
Overview	The students are taught to be able to converse on different topics (people, jobs, places to visit, festivals/celebrations, disasters/accidents, eating habits, sports/hobbies, environment, climate, sustainability, education,

	entertainment, transport, crime, etc.).
Aim	This module aims at developing the skill of speaking and conversing through communicating with one another on different topics.
Learning Outcomes	By the end of this module, students are expected to: - Express permission, refusal, acceptance, request, suggestion, objection, etc. - Converse with other students on different topics. - Use grammatical structures and functions properly.
Units	Units related to; 1. Sentence Types 2. Speaking and Conversation 3. Practicing Speaking
Readings	• Cotton D., Falvey D., Kent S. Market Leader. *Intermediate Business English*. Longman, 2001. • Tillitt, Bruce and Mary Bruder. *Speaking Naturally: Communication Skills in American English.* Cambridge, 1985.
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the

	mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. 5. firms' visits, **6.** reports, 7. Quizzes 8. Reading, writing, expressing, 9. video-movie watching
Module 3; Listening Skills	
Key Concepts	Listening, focus, interaction, environment, climate
Overview	The students learn to understand spoken language. Listening texts include monologues and interacting speakers. They are taught to focus on understanding the gist, the main points, look for details or specific information, and deduce the meaning. They will watch and listen to video clips about climate, the environment and examples on sustainability. This activity will be done in the lab.
Aim	This module aims at improving the skill of listening to dialogues, situations, and clips on nature, climate and the environment, and developing understanding the main points.
Learning Outcomes	By the end of this module, students are to: - Understand listening to different topics and situations.

	- Learn about the different topics and issues of the climate and environment through listening. - Show attention, understanding, or agreement while listening
Units	Units related to; 1. Listening Skills 2. Practicing Listening
Readings	• Cotton D., Falvey D., Kent S. Market Leader. *Intermediate Business English*. Longman, 2001.
Activities	8. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 9. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 10. The students will also be asked to write critical summaries on the lectures content. 11. For each unit the students will submit an individual reflection paper of approximately 1000 words. 12. firms' visits, **13.** reports, 14. Quizzes 15. Reading, writing, expressing,

	16. video-movie watching
Module 4; Reading and Writing	
Key Concepts	Strategies, text structure, text types, writing
Overview	The students are offered adapted/instructional reading material and are encouraged to learn to use different strategies for different reading purposes: identifying the main points in a text, looking for detail, locating specific information in a text, understanding a text structure, etc. The students are expected to learn to produce written texts of various types: formal / informal / transactional letters, argumentative essays (expressing opinions, for and against), narration (story writing), memoranda and notes. The texts chosen for these skills will mainly focus on issues of the climate and the environment and sustainability.
Aim	This module aims at developing the reading comprehension and writing skills of the students on issues of the climate, environment, and sustainability.
Learning Outcomes	By the end of this module, students are expected to: - Read texts of different topics and special weight will be given to texts dealing with climate and environment issues and sustainability. - Write paragraphs and essays on such topics.
Units	1. Reading 2. Writing
Readings	• Cotton D., Falvey D., Kent S. Market Leader. *Intermediate Business English*. Longman, 2001.
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are

	held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words. 5. firms' visits, **6.** reports, 7. Quizzes 8. Reading, writing, expressing, 9. video-movie watching

Jerash University

Course Syllabus

College: Agriculture
Department: Animal Production and Protection

Part 1: Instructor Information

Instructor Name:
Office Location:
Office Hours: (Times & Days)
Office Telephone:
E-mail:

Part 2: Course Information

Course Number: 602340
Course Name: Animal Environment
Class Hours: (Times & Days)
Classroom: (Number & Building)
Prerequisites: Ag 602201

Course Description:

The course shows the aspects of effects of environmental factors on physiological processes in farm animals. General responses to heat stress, thermo-neutral zone, heat and cold stress, thermoregulation, behavioral responses, homeostasis, welfare and role of genotype. Acclimatization and adaptation, health, economic losses and measurements of heat stress effects, also the effect of climate change on animal performance.

The overall objective of this course understands farm animals (Cattle, Sheep, Goat and Poultry) environmental needs and biological responses to the environments which is essential for providing good animal care and maintaining optimum performance.

Course Learning Objectives:

1. To develop a basic understanding of animal physiological responses to the environment and how these responses influence health, performance and well-being
2. To acquire principles of thermal biology of farm animals to the environment with special focus on heat stress.
3. To develop the ability to relate principles of thermal biology to problems of farm animal management caused by adverse environments under sever climate conditions.
4. To develop an advanced understanding of the environmental needs of farm animals.
5. To develop science-based recommendations for farm animals management in variable climate conditions.

Expected Course Outcomes:

1. Students will learn the biological and physiological mechanisms by which animals adapt to their environment
2. How to manage livestock and other domestic animals under various climate conditions.
3. Understanding the adaptation methods used by animals to cope with climate changes.

Course Resources:

There is no required textbook. Various reading will be handed out during the semester. The following resources may be helpful;

166. Ewing, S., Lay, D. and Von Borell, E. 1998. Farm Animal Well-Being: Stress Physiology, Animal Behavior and Environmental Design.
167. Letra, N (Ed). 2009. Interaction between Climate and Animal Environments.
168. R. J. Collier with J. L. Collier (Ed). 2012. Environmental Physiology of Livestock.

179. http://www.gulfofmaine.org/state-of-the-gulf/docs/climate-change-and-its-effects-on-ecosystems-habitats-and-biota.pdf

Part 3: Assignments, Course policies, and Grading Policy

Exams: *There will be first, second, and final exams. Exams will be closed book. They will cover material from text, lecture, sections, the readings, and projects. In particular, students are likely to do poorly on the exams and in the course if they do not do their share of the homework and assignments.*

Grade Components:

Component	Grade
Homework & assignments	10% (4x2.5%)
First Exam	20%
Second Exam	20%
Final Exam	50%
Total	100%

Grading Policy: In order to receive credit for the course, students must complete 100% of the course activities with satisfactory responses and spend the required minimum time in the course. If an assignment is found to be unsatisfactory, the student must revise and re-submit by the due date given by the instructor. Course activities are comprised of discussion board postings, readings, study groups, activities and short quizzes.

Course Policies: All students must be honest and forthright in their academic studies. To falsify the results of one's research, to steal the words or ideas of another, to cheat on an assignment, or to allow or assist another to commit these acts corrupts the educational process. Students are expected to neither do their own work and neither gives nor receive unauthorized assistance.

Homework Assignments: Homework assignments are due 30 minutes before lecture (unless otherwise noted) on the due date.

Late Policy: The policy is simple: no slip dates. If assignments are late, they are penalized as follows: < 24 hours late, you lose 10% of the assignments grade; < 48 hours, 20%; < 72 hours, 40%. More than three days late, you can no longer hand-in the assignment.

Cheating: Copying other people's solution sets, Google safaris, or from any other sources is strictly prohibited.

Classroom Protocol and Participation Guidelines: Students are expected to come to ALL classes. They are expected to arrive on time and stay until the class period ends. If they know that they have to leave early, they should notify the instructor before class starts. They cannot pass the class under any circumstances if they miss ten classes. The instructor expects and encourages class participation, and it counts for 10% of students' grade.

Part 4: Course Outline/Schedule

Week	Topics
1	**-** Introduction - Terminology-Glossary of terms for environmental physiology
2	- Physical properties of heat and temperature - Homeostasis
3	**-** Animals Environments - Environmental physical factors
4	- Optimal animal environment - Animal welfare
5	**-** Thermo neutral zone
6	- Heat stress - General responses of animal to heat stress
7	Thermoregulation

Week	Topics
	- Heat loss - Heat gain - Body heat production
8	- Heat balance - Insulation behavior
9	- Effects of heat stress on certain physiological parameters - Rectal temperature - Respiratory rate - Heart rate
10	- Evaporative water loss - Heat production - Feed intake - Water intake
11	- Environmental adaptation and acclimatization
12	- Environment and animal health
13	- Economic losses due to heat stress - Effects of heat stress on farm animal performance
14	- Management strategies to reduce heat stress in farm animals
15	Climate change and animal performance-
16	Final Exam

Part 5: Course Modules

Module 1; Animals responses to the environment	
Key	Farm animals, environment

Concepts	
Overview	This module introduces the students to the main concepts concerning domestic animals and how they react to different environments, and how to manage livestock and other domestic animals under various environmental conditions It gives an introduction about domestic animals (species, origins, where and how to rise them). Adaptation to different environments and climate change in the areas where animals grow and live (Environmental adaptation and acclimatization).
Aim	Enhance students understanding of the environmental changes and how it may affect domestic animals responses.
Learning Outcomes	At the end of this module students will be able to: 1. Identify how different species needs suitable environment to survive and live. 2. Understanding the adaptation methods used by animals to cope with environmental changes.
Units	1. Introduction 2. Terminology-Glossary of terms for environmental physiology 3. Physical properties of heat and temperature 4. Homeostasis
Readings	1. Philip, C. and Piggins, D. (Ed). 1992. Farm Animals and the Environment. 2. http://jajo66.files.wordpress.com/2010/10/environmental-physiology-of-animals.pdf 3. http://labspace.open.ac.uk/file.php/5850/!via/oucontent/course/338/s324_4_bk2_ch1.pdf
Activities	35. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers.

	36. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 37. The students will also be asked to write critical summaries on the lectures content. 38. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 2; Thermoregulation	
Key Concepts	Heat loss, Heat gain, Body heat production, Heat balance, Insulation behavior
Overview	This module will focus on the ability of domestic animals on keeping its body temperature within certain boundaries, even when the surrounding temperature is very different. It will give students a full understanding of some important concepts lay underneath the subject of thermoregulation such as body heat loss, gain, production and balance, also how animals use insulation behavior to protect themselves from changes in the temperature outside and surrounding of its body.
Aim	The overall aim of this module is to make students understand the subject of thermoregulation in animals in different weathers and conditions surrounding them.
Learning Outcomes	At the end of this module students will be able to: 1. Differentiate between body heat loss, gain, production and balance. 2. Identify temperature regulation methods used by animals to protect themselves from temperature changes.

Units	1. Animals Environments 2. Environmental physical factors 3. Optimal animal environment 4. Animal welfare 5. Thermo neutral zone 6. Thermoregulation
Readings	1. R. J. Collier with J. L. Collier (Ed). 2012. Environmental Physiology of Livestock. 2. Ewing, S., Lay, D. and Von Borell, E. 1998. Farm Animal Well-Being: Stress Physiology, Animal Behavior and Environmental Design. 3. http://www.umassk12.net/ipy/sess09/Thermoregulation%20article.pdf 4. http://www.biologymad.com/resources/A2%20Homeostasis.pdf 5. http://www.fvet.uba.ar/areas/fisica/articulos_cient_divulgacion/The_development_of_the_concepts_of_homeothermy_and_thermoregulation.pdf
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content.

	4. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 3; Effects of environment on animal	
Key Concepts	Nutrition, Feed intake, Water intake, Body weight gain and loss, Environment
Overview	Nutrition is an important subject in animal science; therefore this module will focus on showing students how different environments affect animal nutrition and performance. The module will focus on the main nutrients needed by animals in different physiological situations during its life span. It will also concentrate on how changing environment affecting feed and water intake, and body gain.
Aim	Enhance students understanding of the relationship between nutrition and environmental changes.
Learning Outcomes	At the end of this module students will be able to: 1. Recognize nutrients requirement for animals. 2. The effect of different environments and climates on animal physiology.
Units	1. Heat stress 2. General responses of animal to heat stress 3. Heat balance 4. Insulation behavior 5. Effects of heat stress on certain physiological parameters
Readings	1. Philip, C. and Piggins, D. (Ed). 1992. Farm Animals and the Environment. 2. http://aas.bf.uni-lj.si/zootehnika/supl/3-2012/PDF/3-2012-41-49.pdf 3. https://www.okcareertech.org/educators/cimc/new-products/clusters/ag-cluster/pdf-files/ag2student.pdf

Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 4; Environment and animal health	
Key Concepts	Health, Diseases, Environment
Overview	A relationship between animal health and economic losses was found to be positive, furthermore, constant changing of environment may affect animal health by reducing their ability to adaptation and fight different diseases. This module will concentrate on the relationship between environment and animal health by showing the main causes of diseases and the possible ways of protecting animals from getting sick and by that reduces the economical losses that may be caused during the process.
Aim	Enhance students' awareness of animal diseases and disorders that may be caused by changing climate conditions.
Learning Outcomes	At the end of this module students will be able to: 1. Discuss the effect of heat stress on animal health. 2. Knowing different diseases caused by environmental changes

Units	1. Respiratory rate 2. Heart rate 3. Evaporative water loss 4. Heat production 5. Feed intake 6. Water intake
Readings	1. R. J. Collier with J. L. Collier (Ed). 2012 Environmental Physiology of Livestock. 2. http://www.fao.org/docrep/014/i2415e/i2415e00.pdf
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.
Module 5; Effect of climate changes on animal performance	
Key Concepts	Climate change, performance
Overview	Our climate is changing, both naturally and due to human exploitation. There is undeniable evidence that animals, birds and plants are being affected by climate change and global warming in both their distribution

	and behavior, which could cause a quarter of land animals, birdlife and plants to become extinct. This module will give students an idea about climate change and how it affects domestic animals. It will also introduce students to the climate change problem and encourage them to discuss some solutions that may reduce it.
Aim	Enhance students' awareness about climate change issue and its effect on domestic animals
Learning Outcomes	At the end of this module students will be able to: 1. Identify the main causes of climate change problem 2. Discuss some solutions to the problem
Units	1. Environmental adaptation and acclimatization. 2. Economic losses due to heat stress. 3. Effects of heat stress on farm animal performance. 4. Management strategies to reduce heat stress in farm animals. 5. Climate change and animal performance.
Readings	1. Letra, N (Ed). 2009. Interaction between Climate and Animal Environments. 2. http://www.apa.org/pubs/journals/releases/amp-66-4-265.pdf 3. http://www.gulfofmaine.org/state-of-the-gulf/docs/climate-change-and-its-effects-on-ecosystems-habitats-and-biota.pdf
Activities	1. Seminars / Lectures; a series of lectures and seminars will provide guidance in the understanding of the course topic. The lectures are held by the main instructor (course examiner) and invited lecturers. 2. Group exam task with presentation; with the acquired understanding achieved through the course, the students will be ready for a group task exam. The objective of this group exam task is to verify the understanding of key mechanisms in the

	mitigation of climate change both in terms of policy as in terms of measures. 3. The students will also be asked to write critical summaries on the lectures content. 4. For each unit the students will submit an individual reflection paper of approximately 1000 words.

JORDAN UOJ

Course Syllabus

0935473 Environmental Engineering

University of Jordan, Faculty of Engineering & Technology,

Chemical Engineering Department

Fall Semester, 2014-2015

Instructor Information

Instructor: Dr. Ahmad M. AbuYaghi
Office Location: University Campus, Engineering Building, 2nd Floor
Office Telephone: +962 6 535 5000 Ext. 22906
Office Hours: Mon Wed 9:30- 11:00am
E-mail: ahmad.ay55@gmail.com
Faculty Website: http://www2.ju.edu.jo/sites/Academic/abuyaghi/default.aspx

Course Identification

Course Number: **0935473**
Course Name: Environmental Engineering
Course Location: University Campus
Class Times: Mon Wed 11:00am- 12:30pm
Prerequisites: 0955342 Solid Particulates

Course Description/Overview

Environmental Engineering uses environmental science principles, along with engineering concepts and techniques (design, operation and maintenance of engineering units, structures or equipment) to assess the impacts of societal activities on the environment and the impact of environment on people as well as to protect both

human and environmental health. Environmental Engineering is a multidisciplinary area that requires a sound background in various subjects of pure and applied sciences covering both technical and social aspects to deal with the quality and availability of environmental resources.The catalog description of the course is as follows:

Concepts and terminology.Sources and impacts of water pollutants. Conventional water and wastewater treatment processes: Sedimentation, flocculation, softening, filtration, disinfection and biological systems. Sources and impacts of air pollutants. Air pollution control through gas cleaning devices: cyclones and wet scrubbers. Solid waste classification, handling and ultimate disposal.

Course Objectives

The overarching goals of this course are providing students with exposure to the main topics in environmental engineering in a multidisciplinary learning approach that integrates air, water and soil pollution covering issues of from scientific, engineering and management perspectives.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Be familiar with major environmental laws, regulations, standards and ethics.
2. Understand the environmental quality parameters and how to measure and communicate them.
3. Describe the major pollutants of environment as well as their sources, effects, measurement and expression.
4. Select and design basic processes and techniques for water treatment, waste management and pollution control.
5. Appreciate the role and responsibility of engineers in sustainable development .
6. Work in team.

3. Hand-outs prepared by the instructor.

Optional Course Texts and Materials

http\\:

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

Assignments	10
Group Project	10
Midterm Exam	30
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time.Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion.According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses. No makeup for classwork.

Course Schedule

Week	Date	Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)

1	15/9/2014	**Course Overview** Discussion of syllabus and evaluation tools, Course requirements and policy, Course Introduction: Concepts and terminology
2	22/9	Overview of ecological andenvironmental systems:Water, Air and solid waste management
3-4	29/9, 6/10	Environmental ethics, laws, regulations and standards. Environmental impact assessment and sustainability policy.
5-6	13/10, 20/10	Water treatment,water pollution and water quality management Classwork #1
7-9	27/10, 3/11, 10/11	Environmental Microbiology,selection, design and operation of municipal wastewater treatment systems: suspended and attached growth processes, nutrient removal Classwork #2, Midterm Exam
10-11	17/11, 24/11	Air pollution and meteorology, climate change, global, regional and local effects
12	1/12, 8/12	Gas and particulate pollutants sources, effects, dispersion and control. Classwork #3
13-14	8/12, 15/12	Solid waste management including waste minimization, processing, recycling, recovery and ultimate disposal Classwork #4
15	22/12	Introduction to hazardous waste Term Project Submission
16	29/12	Environmental management in Jordan: discussion of policy, practice and case studies in light of what have been learned from course

Course Identification

Course Number: **0905475**

Course Name: Air Pollution

Course Location: University Campus

Class Times:

Prerequisites: 0905421

Course Description/Overview

Air pollution has significant effects on human health and the environment, through interrelated problems of ozone and particulate matter air pollution, acid rain, visibility degradation, mercury, stratospheric ozone depletion, and climate change. Significant strides have been made in the past few decades to improve our understanding of the sources, chemical transformation, transport, deposition, and impacts of different pollutants. We now understand that many air pollutants are linked together through complex chemical interdependencies. The catalog description of the course is as follows:

Air pollution: sources, dispersion and effects of air pollutants. Topics include emission factors, emission inventory, air pollution meteorology, air chemistry, air quality modeling, impact assessment, source and ambient monitoring, regional control strategies

Course Objectives

The overarching goals of this course are providing students with:

1. Basic understanding of meteorology and its relation to air pollution
2. Understanding of air pollution, its sources, origins, and ultimate fate.
3. Understanding of the local, regional, and global impacts of air pollution.
4. Fundamental understanding of the concepts of dispersion modeling and dissipation of pollutants in the atmosphere
5. Develop the skills needed to successfully design air pollution control equipment.
6. Become familiar with the regulatory apparatus concerning air quality.
7. Enhance the ability of students for life-long learning and communication skills

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Demonstrate appreciation of the role of air stability classifications in air pollution
2. Demonstrate ability to identify the major sources and sinks of air pollutants
3. Understand the key chemical transformations of air pollution
4. explore several regional and global air pollution problems
5. Demonstrate ability to model the dispersion of air pollutant and evaluate hazards associated with a process facility
6. apply knowledge from general science and engineering courses tounderstand and solve problems in air pollution control

7. Describe engineering solutions to air pollution problems
8. gain insight to the reasons for environmental law and air quality standards
9. Enhance students' skills through intensive use of available data resources and short projects with written and oral presentations

Course Resources

Course Website(s)

Required Course Texts and Materials

4. Nicholas P. Cheremisinoff, Handbook of air pollution prevention and control, 2002.
5. Instructor Handouts.

Optional Course Texts and Materials

1. Daniel A. Vallero, Fundamentals of Air Pollution, 4th edition
2. Davis, M.L. and Cornwell, D.A. "Introduction to Environmental Engineering", McGraw-Hill, N.Y., 4th edition or later.

Chemical Engineering Department

..... Semester, 2014-2015

Instructor Information

Instructor: Dr. Motasim Saidan
Office Location: University Campus, Engineering Building, 2nd Floor
Office Telephone: +962 6 535 5000 Ext. 22893
Office Hours:
E-mail: m.saidan@ju.edu.jo
Faculty Website: http://www2.ju.edu.jo/sites/Academic/

Course Identification

Course Number: **0935475**
Course Name: Air Pollution
Course Location: University Campus
Class Times:
Prerequisites: 0905421

Course Description/Overview

The catalog description of the course is as follows:

This course examines methods of managing solid and hazardous waste, with an emphasis on pollution prevention. Topics covered include relevant local and international legislation, recycling, incineration, landfill operations.

Course Objectives

The overarching goals of this course are providing students with basic knowledge and understanding on solid waste types, characteristics, processing, and disposal as well as other management issues including policy and economy.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Gaining knowledge in solid waste concepts, definitions, and components
2. Basic understanding ofintegrated solid waste management.
3. Fundamental understanding of landfill design
4. Model developing of biogas potential production from the landfill
5. Develop the skills needed to successfully design waste collection and collection routing .
6. Become familiar with the regulatory apparatus concerning waste management and policy.

Course Resources

Required Course Texts and Materials

6. William Worrell & P.AarneVesilind, Solid Waste Engineering, 2012.
7. George Tchobanoglous, Handbook of Solid Waste Management, 2002
8. Instructor Handouts.

Optional Course Texts and Materials

3. Davis, M.L. and Cornwell, D.A. “Introduction to Environmental Engineering”, McGraw-Hill, N.Y., 4th edition or later.

http\\:

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

Homework	5
Projects	15
Midterm Exam	30
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time.Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion.According to University regulations; the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses.

Course Schedule

Week	Date	Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)
1		Introduction and Syllabus;Solid waste definition, concepts
2		Solid waste chemical, physical and biological characterization
3-4		Solid waste generation and quantities
5-6		Solid waste collection and routings
7-9		Processing for resource and energy recovery
10-11		Biochemical processes: aerobic, anaerobic and composting
12-13		Landfills: Planning, siting, design
14		Landfill Leachate and groundwater contamination
15		LFG and biogas potential production; mathematical modeling
16		Socio-economic assessment of SWM systems in Jordan: Questionnaire designing and data gathering, assessment and reporting

Course Syllabus

0905599 Project (Final Year Capstone Course)
University of Jordan, Faculty of Engineering & Technology,
Chemical Engineering Department
Fall Semester, 2014-2015

Instructor Information

Instructor:	All faculty members
Office Location:	University Campus, Engineering Building, 2nd Floor
Office Telephone:	+962 6 535 5000
Office Hours:	
E-mail:	
Faculty Website:	http://www2.ju.edu.jo/sites/Academic/

Course Identification

Course Number:	0905599
Course Name:	Project
Course Location:	University Campus
Class Times:	
Prerequisites:	Completion of 121 Credit Hours out of 165

Course Description/Overview

Final year project is gives a diverse experience to engineering students to bridge his academic knowledge with his future career. The projects are of theoretical, design-based nature. In some non-conventional projects, a minor experimental experience is possible. The project is conducted over two semesters as Project (1) and Project (2). The students go through a major design experience with different facets of professional issues including economic,environmental, sustainability,ethical, health and safety considerations.

A group of students perform flowsheet synthesis and/or selection for a chemical process including material and energy balances for the selected process (Project 1). Each student performs a detailed study of a chemical engineering problem from the selected process chosen in Project (1). The final report submitted by the group should include mass and energy balances, process flow diagram and detailed design of one or more items of equipment and other equivalent tasks.

Course Objectives

The objectives of the capstone course are:

1. Applying the methodology of design by utilizing the knowledge gained from past fundamental courses.
2. Applying time management fundamentals and cost effectiveness.
3. Implementing effective communication both orally and in writing.
4. Practicing effective team work management.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

Course Resources

Course Website(s)

11.

Optional Course Texts and Materials

http\\:

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

Advisor(s) Evaluation	25
Final Report	35
Final Exam (Oral presentation and defence before a committee)	40
Total Points	**100**

Course Policy

There should be a weekly meeting attended by students and advisor(s) to plan, manage and follow up project activities. Absence of students from these meetings will certainly affect the advisor(s) evaluation grade.

Course Schedule: Project (1) One Credit Hour

Week	**Date**	**Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)**
1-2		Course syllabus, policy and orientation of students
3-4		Problem definition and theoretical background of project
5-6		Literature survey
7-8		Process flow sheet selection or synthesis
9-12		Process Analysis, Mass and energy balances
13-14		Interim report writing; Lab testing (as needed)
15-16		Preparation for Project (2)

Course Schedule*: Project (2) Two Credit Hours

Week	Date	Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)
1-4		Design of equipment or units
5-6		Economic feasibility and costing
7		Piping, instrumentation and process control
8-9		Pollution control and waste management
10-11		Health and safety issues
12		Plant layout
13-15		Final Report writing
16		Presentation and final Exam

*overlaps do exist among these activities, particularly report writing.

Course Syllabus

0905471 Energy Conservation & Management

University of Jordan, Faculty of Engineering & Technology,
Chemical Engineering Department
……. Semester, 2014-2015

Instructor Information

Instructor: Dr. Y. Al-Khraisha
Office Location: University Campus, Engineering Building, 2nd Floor
Office Telephone: +962 6 535 5000
Office Hours:
E-mail: khraisha@ju.edu.jo

Faculty Website: http://www2.ju.edu.jo/sites/Academic/

Course Identification

Course Number: 0905471
Course Name: EnergyConservation & Management
Course Location: University Campus
Class Times:
Prerequisites: 0905371 Fuel and Energy

Course Description/Overview

Review of energy sources and their applications. Energy auditing. Energy conservation in industrial and commercial sectors. Choice of fuel. Waste heat recovery systems. Energy economics and economic use of electricity. Process integration for efficient use of electricity. Process integration for efficient use of energy including energy cogeneration, selection of heat transfer equipment and enhancement of heat transfer.

Course Objectives

To save environment and reduce dependency on fossil fuel energy, more and more energy ha to be produced from renewable. Judicious use of energy, through energy conservation measures is a vital step in this regard. There is scope for energy saving in residential sector, industries and commercial establishments. New technologies and new products are coming up in the market, for energy saving. Knowledge of thermodynamic principles, usage of thermal insulation in buildings, lighting devices and new electric motor, is important. Energy-audit is an important tool to achieve the goal.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Understand concepts and principles of energy conservation and management.
2. carry out energy accounting and balancing.
3. suggest methodologies for energy savings.

Course Resources

Midterm Exam	30
Second Exam	10
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time.Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion. According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses only.

Course Schedule

Week	**Date**	**Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)**
1-2		Course Overview. Review of energy sources and their applications.
3		Energy auditing.
4-5		Energy conservation in industrial and commercial sectors.
6-7		Waste heat recovery systems.
8-9		Energy economics and economic use of electricity
10-12		Process integration for efficient use of electricity.

13-15		Process integration for efficient use of energy including energy cogeneration selection of heat transfer equipment and enhancement of heat transfer.
16		Impact of energy conservation on environment

Course Syllabus

0905474 Waste Water Treatment

University of Jordan, Faculty of Engineering & Technology,

Chemical Engineering Department

…… Semester, 2014-2015

Instructor Information

Instructor: Dr. Ahmad M. AbuYaghi

Office Location: University Campus, Engineering Building, 2nd Floor

Office Telephone: +962 6 535 5000 Ext. 22906

Office Hours:

E-mail: ahmad.ay55@gmail.com

Faculty Website: http://www2.ju.edu.jo/sites/Academic/abuyaghi/default.aspx

Course Identification

Course Number: 0935474

Course Name: Waste Water Treatment

Course Location: University Campus

Class Times:

Prerequisites: 0955473

Course Description/Overview

Course Objectives

This course provides a multidisciplinary learning of both conventional and modern technology of wastewater treatment covering both municipal and industrial applications. Major aim is to present the fundamental operations and processes that are used in wastewater treatment introducing problem-solving concepts and tools.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Understand the role of application of physics, chemistry, microbiology and math in the characterization and treatment of wastewaters.
2. Understand the purpose, operation, mechanisms and basic design principles of common wastewater treatment processes.
3. Work in team to solve problems of wastewater characterization and treatment.

Course Resources

Course Website(s)

Required Course Texts and Materials

1. Metcalf & Eddy, Inc. Wastewater Engineering: Treatment & Reuse, McGraw-Hill, N.Y., 4th ed., 2003.
2. Davis, M. L. and Cornwell, D. A. Introduction to Environmental Engineering, 4nd Ed., McGraw-Hill, New York (2013).
3. Eckenfelder, W. Industrial Water Pollution Control, McGraw-Hill, N.Y., 1989.
4. Hand-outs prepared by the instructor.

Optional Course Texts and Materials

http\\:

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time.Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion. According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses.

Course Schedule

Week	**Date**	**Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)**
1		***Introduction: Overview of water pollutants***
2		***Water and wastewater quality standards and regulations***
3-4		***Characterization of municipal and industrial wastewaters***
5-7		***Conventional primary and secondary (biological) treatment***
8-10		***Tertiary (advanced) treatment of municipal wastewater***

11-14		***Management and treatment of industrial wastewaters; study of equalization, flotation, chemical precipitation, adsorption, membrane separation and land application.***
15		***Sludge handling and disposal***
16		***Water reuse and enviornmental impact assessment***

Course Syllabus

0905542 Water Desalination

University of Jordan, Faculty of Engineering & Technology,
Chemical Engineering Department
……. Semester, 2014-2015

Instructor Information

Instructor: Dr. Mohammed R. Qtaishat
Office Location: University Campus, Engineering Building, 2nd Floor
Office Telephone: +962 6 535 5000 Ext.
Office Hours:
E-mail: mrasool78@yahoo.com
Faculty Website:

Course Identification

Course Number: **0905542**
Course Name: Water Desalination
Course Location: University Campus
Class Times:
Prerequisites: 0955442 Heat and Mass transfer Operations

Course Description/Overview

Water desalination is one of the most important research fields nowadays, Jordan is ranked 4th among the poorest countries with fresh water resources. As a result, it is of great importance to introduce the Jordanian students to the desalination field stressing the fact that it is considered the most suitable solution for the nation's water crisis.

Course Objectives

To familiarize the students with various aspects of water desalination and desalination processes. The different technologies of thermal and membrane desalination are studied in addition to thermodynamic, heat transfer and mass transfer principles related to these technologies. Issues related to environmental impact and materials selection are also presented.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Understand the fundamental concepts of desalination: thermodynamics, heat transfer and mass transfer.
2. Identify the thermal and membrane desalination processes.
3. Identify and make a choice among the different desalination technologies for a certain application and water throughput.
4. Understand how the proper choice of a desalination technology can influence the environment and affect the economics of water.
5. Analyze and solve problems encountered in desalination processes.
6. Recognize important variables affecting water production and energy consumption.

Course Resources

Course Website(s)

Required Course Texts and Materials

Grades are divided on the following evaluation tools:

Project and Oral presentation	20
Midterm Exam	30
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time.Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion. According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses.

Course Schedule

Week	**Date**	**Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)**
1-2		Course Overview. Introduction, Desalination terminology

3-4		Sea water and Brackish water properties. Water Alkalinity. Scales Formation and Corrosion
5-8		Thermal Desalination Processes: Multi Stage Flash (MSF), Multi Effect Distillation (MED), Vapor Compression (VC)
9-12		Membrane Desalination Processes: Reverse Osmosis (RO), Nano filtration and Ultrafiltration (NF & UF), Electro Dialysis Membrane Fouling, pretreatment and post treatment in water desalination plants.
13-14		Novel Desalination Technologies: Membrane Distillation (MD) and Foreword Osmosis (FO)
15-16		Utilizing renewable energy resources and economics of Desalination processes. Sustainability.

Mapping Courses from Science & Technology Group

University of Jordan

Course Classification:

1. Core Courses (*for All Euro Pass Candidates*)
2. Elective Courses (*from Student Major or Group*)
3. Capstone Course
4. Additional Elective Courses

Core Courses:

Three courses (9 Credit Hours), one from each group as in the following Table:

Group	Course Code	Course Title	Prerequisite	Department	Faculty (College)	Course Category

Environment and Society	2305100	Introduction to Sociology	---	Sociology	Arts	University Elective
Economics and Public Policy	1607100	International Political Economy	---	Business Economy	Business	University Elective
Science and Technology	0305100	Environment	---	Geology	Science	University Elective

Elective Courses:

Three programs from the Science and Technology group are involved, namely, Geology, Chemical Engineering and Mechanical Engineering. Six courses (18 Credit Hours) may be taken by student from his major or other majors within the group.

Course Code	**Course Title**	**Prerequisite**	**Department**	**Faculty (College)**	**Course Category**
0345102	Principles of Environmental Geology	0305101	Geology	Science	Dept. Core
0335361	Fundamentals of Hydrology	0335231	Geology	Science	Dept. Core
0345381	Earth Resources and Environment	0335231	Geology	Science	Dept. Core
0345481	Environmental Geochemistry	0345351	Geology	Science	Dept. Core.
0305402	Teaching Earth Science and Environment	0345392	Geology	Science	Dept. Core
0335461	Water Resources Management	0335361	Geology	Science	Dept. Elective
0345483	Environmental Impact Assessment	0365481	Geology	Science	Dept. Elective
0905371	Fuel and Energy	0905343	Chemical Engineering	Engineering & Technology	Dept. Elective
0905471	Energy Conservation and Management	0905371	Chemical Engineering	Engineering & Technology	Dept. Elective

0905473	Environmental Engineering	0905342	Chemical Engineering	Engineering & Technology	Dept. Core
0905474	Waste Water Treatment	0905473	Chemical Engineering	Engineering & Technology	Dept. Elective
0905474	Air Pollution	0905421	Chemical Engineering	Engineering & Technology	Dept. Elective
0905573	Solid Waste Management	0905473	Chemical Engineering	Engineering & Technology	Dept. Elective
0905542	Water Desalination	0905442	Chemical Engineering	Engineering & Technology	Dept. Elective
0904445	Air Conditioning (1)	0904441, 0904342	Mechanical Engineering	Engineering & Technology	Dept. Core
0904443	Thermal Power Plants	0904342	Mechanical Engineering	Engineering & Technology	Dept. Elective
0904554	Solar Energy	0905441	Mechanical Engineering	Engineering & Technology	Dept. Elective
0904453	Refrigeration Systems	0904342	Mechanical Engineering	Engineering & Technology	Dept. Elective
0904459	Energy Conversion	0904342	Mechanical Engineering	Engineering & Technology	Dept. Elective
0904545	Internal Combustion Engines	0904342	Mechanical Engineering	Engineering & Technology	Dept. Core

Capstone Course:

This course is based on design and/or practical training for senior students. Depending on the student major, the following courses fit as capstone course provided the training is conducted in the field of climate change and environmental sustainability. 6 Credit Hours.

Course Code	**Course Title**	**Prerequisite**	**Department**	**Faculty (College)**	**Course Category**
0300150	Community Service	---	Geology	Science	University Requirement

0905599	(Final Year) Project	Completing 124 Credit Hour	Chemical Engineering	Engineering & Technology	Department Core
0904599	(Final Year) Project	Completing 124 Credit Hour	Mechanical Engineering	Engineering & Technology	Department Core
0900500	Practical Training	Completing 120 Credit Hour	All Engineering	Engineering & Technology	College Requirement

Additional Elective Courses

The following list contains courses than can be taken by student in case he/she wishes to diversify knowledge or unable to register in elective courses offered by his/her Department.

Course Code	**Course Title**	**Prerequisite**	**Department**	**Faculty (College)**	**Course Category**
0352100	Energy Principles and Economics	---	Physics	Science	University Elective
0515100	Principles of Public Health	---	Family and Community Medicine	Medicine	University Elective
0601100	Home Plantation	---	Plant Production	Agriculture	University Elective
0802414	Environmental Education for Children	---	Curricula and Teaching	Educational Sciences	Dept. Elective
0905101	Jordanian Industries	---	Chemical Engineering	Engineering & Technology	University Elective
1601433	Business Ethics and Social Responsibility	---	Business Administration, Business Economy	Business	Department Elective
2633100	Archaeology of Jordan	---	Archaeology	Archaeology and Tourism	University Elective
2305100	Introduction to Sociology	---	Sociology	Arts	University Elective

2305421	Globalization Issues	---	Sociology	Arts	Dept. Elective
1132100	Sports and Health	---	Health and Recreation	Physical Education	University Elective

**A student cannot register in a university elective course offered by the Department of his/her major.

Course Description
Available; will be added after finalizing the selected courses list.

Course Syllabi
A unified template is desirable for all courses.

Course List and Course Syllabus Revision
The courses are selected from current Study Plans of related program at the University. The course list and course syllabi will be revised and updated immediately when Study Plans are modified or changed by academic programs.

Faculty Website: http://www2.ju.edu.jo/sites/Academic/abuyaghi/default.aspx

Course Identification

Course Number: **0935473**

Course Name: Environmental Engineering

Course Location: University Campus

Class Times: Mon Wed 11:00am- 12:30pm

Prerequisites: 0955342

Course Description/Overview

Environmental Engineering uses environmental science principles, along with engineering concepts and techniques (design, operation and maintenance of engineering units, structures or equipment) to assess the impacts of societal activities on the environment and the impact of environment on people as well as to protect both human and environmental health. Environmental Engineering is a multidisciplinary area that requires a sound background in various subjects of pure and applied sciences covering both technical and social aspects to deal with the quality and availability of environmental resources. The catalog description of the course is as follows:

Concepts and terminology. Sources and impacts of water pollutants. Conventional water and wastewater treatment processes: Sedimentation, flocculation, softening, filtration, disinfection and biological systems. Sources and impacts of air pollutants. Air pollution control through gas cleaning devices: cyclones and wet scrubbers. Solid waste classification, handling and ultimate disposal.

Course Objectives

The overarching goals of this course are providing students with exposure to the main topics in environmental engineering in a multidisciplinary learning approach that integrates air, water and soil pollution covering issues of from scientific, engineering and management perspectives.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

7. Be familiar with major environmental laws, regulations, standards and ethics.
8. Understand the environmental quality parameters and how to measure and communicate them.
9. Describe the major pollutants of environment as well as their sources, effects, measurement and expression.
10. Select and design basic processes and techniques for water treatment, waste management and pollution control.
11. Appreciate the role and responsibility of engineers in sustainable development .
12. Work in team.

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

Assignments	10
Group Project	10
Midterm Exam	30
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time. Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion. According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses. No makeup for classwork.

Course Schedule

Week	Date	Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)
1	15/9/2014	**Course Overview** Discussion of syllabus and evaluation tools, Course requirements and policy, Course Introduction: Concepts and terminology
2	22/9	Overview of ecological and environmental systems: Water, Air and solid waste management
3-4	29/9, 6/10	Environmental ethics, laws, regulations and standards. Environmental impact assessment and sustainability policy.
5-6	13/10, 20/10	Water treatment, water pollution and water quality management Classwork #1
7-9	27/10, 3/11, 10/11	Environmental Microbiology, selection, design and operation of municipal wastewater treatment systems: suspended and attached growth processes, nutrient removal Classwork #2, Midterm Exam
10-11	17/11, 24/11	Air pollution and meteorology, climate change, global, regional and local effects
12	1/12, 8/12	Gas and particulate pollutants sources, effects, dispersion and control. Classwork #3
13-14	8/12, 15/12	Solid waste management including waste minimization, processing, recycling, recovery and ultimate disposal Classwork #4
15	22/12	Introduction to hazardous waste Term Project Submission
16	29/12	Environmental management in Jordan: discussion of policy, practice and case studies in light of what have been learned from course

CLIMASP Course Modules for 0935473 Environmental Engineering

Course	**0935473**
Module 1	Introduction and overview of ecological and environmental systems
Key Concepts	Natural ecosystem, environment, pollution, water quality, water supply, air quality, waste management, role of engineer
Overview	
Aim	To instil an understanding by students of the multidisciplinary nature of Environmental Engine basic concepts from natural ecology and main areas of built environment.
Learning Outcomes	At the end of this module, students will be able to: • Understand the role of microbiology and chemistry in natural ecosystems • Identify the components and process steps of water treatment, wastewater

	Treatment/disposal, air quality management, solid waste processing/disposal
Units	Unit 1.1 What is Environmental Engineering Unit 1.2 Natural Ecological Systems Unit 1.3 Environmental Engineering Systems
Readings	
Activity	Reading and Class Discussion Read Chapter 1 of textbook (Davis & Cornwell)
Module 2	Environmental ethics, laws, regulations and standards; Environmental impact assessment and sustainability policy.
Key Concepts	Ethics, regulations, standards, sustainable development, EIA
Overview	
Aim	To familiarize students with common environmental values and national and international regu at different level to protect the environment
Learning Outcomes	At the end of this module, students will be able to: • Disclose environmental ethics for professionals • Understand the legal framework for environmental protection • Distinguish different types of legislation • Understand the relationship between environment and development • Appreciate EIA studies as a tool for sustainable development
Units	Unit 2.1 Ethics and Regulations Unit 2.2 Sustainable Development and EIA
Readings	Optional reading of the book: Introduction to Environmental Impact Assessment: A Guide to Principles and Practice by

	Bram F. Noble, Oxford, 2009.
Activity	Website visit, Reading, Class Discussion Visit the website of the Ministry of Environment in Jordan: www.moenv.gov.jo Read about the national environmental regulations including penalty for violations, administrative structure of Ministry, their projects for environmental preservation and enhancement A group Term Project is initiated. Term project is literature or field survey on a topic offered by instructor and chosen by students. A professional technical report is sought.
Module 3	Water treatment, water pollution and water quality management
Key Concepts	Coagulation, Chlorination, softening, BOD, TKN, eutrophication, dissolved oxygen sag
Overview	
Aim	To develop an understanding and knowledge on water pollution indicators, factors affecting them and the practical methods of water purification
Learning Outcomes	At the end of this module, students will be able to: • x •
Units	Unit 3.1 *Unit 3.2*
Readings	
Activity	Group classwork on problem solving of water chemistry and water pollution parameters, open book and notes
Module 4	Science & Engineering of Wastewater Treatment
Key Concepts	Microbiology, biomass growth, settling, biodegradation, aeration, nitrification / denitrification, phosphorus removal, design, operation
Overview	

Aim	
Learning Outcomes	
Units	Unit 4.1: Unit 4.2: Unit 4.3:
Readings	
Activity	Group classwork on problem solving and design Midterm Exam
Module 5	Air pollution and Control
Key Concepts	Stratification of atmosphere, climate change, carbon footprint, GHC, ozone depletion, acid rain, smog, health risk, primary and secondary pollutants, dispersion, renewable energy, collection efficiency
Overview	
Aim	
Learning Outcomes	
Units	Unit 5.1 Unit 5.2
Readings	
Activity	Group classwork on problem solving and design of air pollution dispersion as well as gas and particulate removal devices
Module 6	Solid Waste Management
Key Concepts	Waste classification, minimization, processing, recycling, recovery, landfill, incineration, Disposal, ground water contamination

Overview	
Aim	
Learning Outcomes	
Units	
Readings	
Activity	Group classwork Term project submission

Course Syllabus

0935473 Environmental Engineering

University of Jordan, Faculty of Engineering & Technology,

Chemical Engineering Department

Fall Semester, 2014-2015

Instructor Information

Instructor: Dr. Ahmad M. AbuYaghi
Office Location: University Campus, Engineering Building, 2nd Floor
Office Telephone: +962 6 535 5000 Ext. 22906
Office Hours: Mon Wed 9:30- 11:00am
E-mail: ahmad.ay55@gmail.com
Faculty Website: http://www2.ju.edu.jo/sites/Academic/abuyaghi/default.aspx

Course Identification

Course Number: **0935473**
Course Name: Environmental Engineering

Course Location: University Campus
Class Times: Mon Wed 11:00am- 12:30pm
Prerequisites: 0955342

Course Description/Overview

Environmental Engineering uses environmental science principles, along with engineering concepts and techniques (design, operation and maintenance of engineering units, structures or equipment) to assess the impacts of societal activities on the environment and the impact of environment on people as well as to protect both human and environmental health. Environmental Engineering is a multidisciplinary area that requires a sound background in various subjects of pure and applied sciences covering both technical and social aspects to deal with the quality and availability of environmental resources. The catalog description of the course is as follows:

Concepts and terminology. Sources and impacts of water pollutants. Conventional water and wastewater treatment processes: Sedimentation, flocculation, softening, filtration, disinfection and biological systems. Sources and impacts of air pollutants. Air pollution control through gas cleaning devices: cyclones and wet scrubbers. Solid waste classification, handling and ultimate disposal.

Course Objectives

The overarching goals of this course are providing students with exposure to the main topics in environmental engineering in a multidisciplinary learning approach that integrates air, water and soil pollution covering issues of from scientific, engineering and management perspectives.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

13. Be familiar with major environmental laws, regulations, standards and ethics.
14. Understand the environmental quality parameters and how to measure and communicate them.
15. Describe the major pollutants of environment as well as their sources, effects, measurement and expression.
16. Select and design basic processes and techniques for water treatment, waste management and pollution control.
17. Appreciate the role and responsibility of engineers in sustainable development .
18. Work in team.

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

Assignments	10
Group Project	10
Midterm Exam	30
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time. Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion. According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses. No makeup for classwork.

Course Schedule

Week	**Date**	**Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)**
1	15/9/2014	**Course Overview** Discussion of syllabus and evaluation tools, Course requirements and policy, Course Introduction: Concepts and terminology
2	22/9	Overview of ecological and environmental systems: Water, Air and solid waste management
3-4	29/9, 6/10	Environmental ethics, laws, regulations and standards. Environmental impact assessment and sustainability policy.

5-6	13/10, 20/10	Water treatment, water pollution and water quality management Classwork #1
7-9	27/10, 3/11, 10/11	Environmental Microbiology, selection, design and operation of municipal wastewater treatment systems: suspended and attached growth processes, nutrient removal Classwork #2, Midterm Exam
10-11	17/11, 24/11	Air pollution and meteorology, climate change, global, regional and local effects
12	1/12, 8/12	Gas and particulate pollutants sources, effects, dispersion and control. Classwork #3
13-14	8/12, 15/12	Solid waste management including waste minimization, processing, recycling, recovery and ultimate disposal Classwork #4
15	22/12	Introduction to hazardous waste Term Project Submission
16	29/12	Environmental management in Jordan: discussion of policy, practice and case studies in light of what have been learned from course

CLIMASP Course Modules for 0935473 Environmental Engineering

Course	**0935473**
Module 1	Introduction and overview of ecological and environmental systems
Key Concepts	Natural ecosystem, environment, pollution, water quality, water supply, air quality, waste management, role of engineer
Overview	
Aim	To instil an understanding by students of the multidisciplinary nature of Environmental Engine basic concepts from natural ecology and main areas of built environment.
Learning Outcomes	At the end of this module, students will be able to: • Understand the role of microbiology and chemistry in natural ecosystems • Identify the components and process steps of water treatment, wastewater Treatment/disposal, air quality management, solid waste processing/disposal
Units	Unit 1.1 What is Environmental Engineering Unit 1.2 Natural Ecological Systems Unit 1.3 Environmental Engineering Systems
Readings	
Activity	Reading and Class Discussion Read Chapter 1 of textbook (Davis & Cornwell)
Module 2	Environmental ethics, laws, regulations and standards; Environmental impact assessment and sustainability policy.

Key Concepts	Ethics, regulations, standards, sustainable development, EIA
Overview	
Aim	To familiarize students with common environmental values and national and international regu at different level to protect the environment
Learning Outcomes	At the end of this module, students will be able to: • Disclose environmental ethics for professionals • Understand the legal framework for environmental protection • Distinguish different types of legislation • Understand the relationship between environment and development • Appreciate EIA studies as a tool for sustainable development
Units	Unit 2.1 Ethics and Regulations Unit 2.2 Sustainable Development and EIA
Readings	Optional reading of the book: Introduction to Environmental Impact Assessment: A Guide to Principles and Practice by Bram F. Noble, Oxford, 2009.
Activity	Website visit, Reading, Class Discussion Visit the website of the Ministry of Environment in Jordan: www.moenv.gov.jo Read about the national environmental regulations including penalty for violations, administrative structure of Ministry, their projects for environmental preservation and enhancement A group Term Project is initiated. Term project is literature or field survey on a topic offered by instructor and chosen by students. A professional technical report is sought.
Module 3	Water treatment, water pollution and water quality management
Key Concepts	Coagulation, Chlorination, softening, BOD, TKN, eutrophication, dissolved oxygen sag
Overview	
Aim	To develop an understanding and knowledge on water pollution indicators, factors affecting

	them and the practical methods of water purification
Learning Outcomes	At the end of this module, students will be able to: • x •
Units	Unit 3.1 *Unit 3.2*
Readings	
Activity	Group classwork on problem solving of water chemistry and water pollution parameters, open book and notes
Module 4	Science & Engineering of Wastewater Treatment
Key Concepts	Microbiology, biomass growth, settling, biodegradation, aeration, nitrification / denitrification, phosphorus removal, design, operation
Overview	
Aim	
Learning Outcomes	
Units	Unit 4.1: Unit 4.2: Unit 4.3:
Readings	
Activity	Group classwork on problem solving and design Midterm Exam
Module 5	Air pollution and Control
Key Concepts	Stratification of atmosphere, climate change, carbon footprint, GHC, ozone depletion, acid rain, smog, health risk, primary and secondary pollutants, dispersion, renewable energy, collection efficiency

Overview	
Aim	
Learning Outcomes	
Units	Unit 5.1 Unit 5.2
Readings	
Activity	Group classwork on problem solving and design of air pollution dispersion as well as gas and particulate removal devices
Module 6	Solid Waste Management
Key Concepts	Waste classification, minimization, processing, recycling, recovery, landfill, incineration, Disposal, ground water contamination
Overview	
Aim	
Learning Outcomes	
Units	
Readings	
Activity	Group classwork Term project submission

Course Syllabus

0934545 Internal Combustion Engines

University of Jordan, Faculty of Engineering & Technology,

Mechanical Engineering Department

Fall Semester, 2014-2015

Instructor Information

Instructor:	Dr. Ahmad Sakhrieh
Office Location:	University Campus, Engineering Building, 3rd Floor
Office Telephone:	+962 6 535 5000 Ext. 22906
Office Hours:	Sun Tue Thu 9:00- 11:00 am
E-mail:	asakhrieh@ju.edu.jo
Faculty Website:	http://www2.ju.edu.jo/sites/Academic/abuyaghi/default.aspx

Course Identification

Course Number:	0934545
Course Name:	Internal Combustion Engines
Course Location:	University Campus
Class Times:	Sun Tue Thu 12:00am- 13:00pm
Prerequisites:	0904342

Course Description/Overview

The course starts with an introduction to engines, classifications and terminology which leads to the introduction and analysis of engine performance parameters and the main engine cycles including: Otto, Diesel, Dual and two-stroke cycles. Then the course moves to introduce the student to the common fuels used in IC engines, the reactions and the associated thermochemical calculations. This is followed by the introduction of engine emissions and their control technologies and strategies. After that, the student is made familiar with air and fuel induction methods and technologies, in addition to the physics of the combustion phenomena. Finally, the course ends with the evaluation of friction losses and the characterization of different engine lubricants.

Course Objectives

The course is intended to provide the student with the fundamental principles and operational characteristics of internal combustion engines. This will be achieved through covering a wide range of related topics with the support of lab-based experiments.

Course Learning Outcomes

Upon successful completion of this course, will be familiar with the following:

- Engine classifications and definitions
- Engine operating characteristics and performance evaluation
- Engine cycles
- Thermo-chemical calculations
- Properties of different fuels
- Air and fuel induction technologies
- The physics of the combustion phenomena
- Engine pollutants and emissions control strategies
- Friction losses and lubrication

Course Resources

They are expected to come prepared and participate actively in class discussion.According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses. No makeup for classwork.

Course Schedule

Week	Date	Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)
1	15/9/2014	**Course Overview** Engine Classification; Terminology; Engine Components; Basic Engine Cycles
2-4	22/9, 29/9,	**Operating Characteristics**; Engine Parameters; Work; Mean Effective Pressure;

	6,10	Torque and Power; Dynamometers; Air-Fuel Ratio; Specific Fuel Consumption; Engine Efficiencies; Volumetric Efficiency Classwork #1
5-7	13/10, 20/10 27/10	**Engine Cycles**; Air Standard Cycles; Otto Cycle; Diesel Cycle; Dual Cycle; Comparison of Cycles; Real Air-Fuel Cycles; Two Stroke Cycles
8-10	3/11,10/11, 17/11	**Thermochemistry and Fuels**; Thermochemistry; Hydrocarbon Fuels; Gasoline Fuel; Diesel Fuel; Alternative Fuels Classwork #2
11-12	24/11,1/12	**Air and Fuel Induction; Intake Manifold;** Intake Valves; Volumetric Efficiency; Fuel Injection; Carburetors; Supercharging and turbocharging; Midterm Exam
13	8/12	**Combustion;** Combustion in SI Engines; Homogeneous and Stratified mixtures; Fast Burn Chambers Classwork #3
14-15	15/12, 22/12	**Emissions and Air Pollution**; Carbon Monoxide; Hydrocarbons; Oxides of Nitrogen; Particulates; Other Emissions; Aftertreatment; Engine Modifications; Fuel Modifications
16	29/12	**Friction and Lubrication**; Engine Friction; Piston Forces; Engine Lubrication Systems; Lubricating Oils Classwork #4

Course Syllabus

0904554 Solar Energy

University of Jordan, Faculty of Engineering & Technology,

Mechanical Engineering Department

Fall Semester, 2014-2015

Instructor Information

Instructor:	Dr. Osama Ayadi
Office Location:	University Campus, Engineering Building, 2nd Floor
Office Telephone:	+962 6 535 5000 Ext. 22802
Office Hours:	Sun Tue Thu 9:00- 11:00 am
E-mail:	o.ayadi@ju.edu.jo
Faculty Website:	http://eacademic.ju.edu.jo/o.ayadi/default.aspx

Course Identification

Course Number:	0904554

Course Name: Solar Energy
Course Location: University Campus
Class Times: Mon Wen 9:30am- 11:00pm
Prerequisites: Heat Transfer (1) – 0904441

Course Description/Overview

Fundamentals of solar radiation; methods of solar radiation collection; thermal systems components and analysis; transfer of collected heat; storage of collected heat; domestic hot water system; introduction to solar energy applications.

Course Objectives

The course is intended to provide the student with the fundamental principles and operational characteristics of Solar energy and its applications. This will be achieved through covering a wide range of related topics with the support of lab-based experiments.

Course Learning Outcomes

Upon successful completion of this course, will be familiar with the following:

1. Understand the physics of solar radiation, solar times and angles.
2. Calculate the direction of solar radiation at any time and location.
3. Orient solar collection system at any time and location for maximum energy gain
4. Estimate and measure actual solar radiation at a surface of any orientation and position.
5. Select proper material for various components of solar energy collectors.
6. Select proper flat-plate solar collector for a desired job
7. Figure out the performance of various flat-plate solar collector combinations
8. Evaluate energy storage capabilities of a solar collection system
9. Model and predict thermal performance of a solar collection system
10. Evaluate the problems associated with local thermosyphonic solar collection systems.

Course Website(s)

http://oayadi.wix.com/course

Required Course Texts and Materials

23. J. A. Duffie, W. A. Beckman. Solar Engineering of Thermal Processes, Wiley. 3rd edition, 2006.
24. Hand-outs prepared by the instructor.

Optional Course Texts and Materials

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

Assignments	10
Group Project	10
Midterm Exam	30
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time.Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion.According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses. No makeup for classwork.

Course Schedule

Week	Date	Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)
1-2		Solar radiation
3		Available solar radiation
4		Selected topics in heat transfer (A quick review)
5		Radiation transmission through covers and absorption by collectors
6-7		Theory of flat-plate collectors
7-8		Energy storage
8-11		System thermal calculations
12-15		Solar water heating

Course Syllabus

0904453 Refrigeration systems

University of Jordan, Faculty of Engineering & Technology,

Mechanical Engineering Department

Fall Semester, 2014-2015

Instructor Information

Instructor: Dr. Osama Ayadi

Office Location: University Campus, Engineering Building, 2nd Floor

Office Telephone: +962 6 535 5000 Ext. 22802

Course Identification

Course Number: 0904453

Course Name: Refrigeration systems

Course Location: University Campus

Class Times: Sun Tue Thu 12:00am- 13:00pm

Prerequisites: Thermodynamics (2) - 0904342

Course Description/Overview

Basic definitions and concepts; review of vapor compression and absorption cycles; compressors, condensers, evaporators, expansion devices; refrigerants; cooling towers; components of an absorption cycles, controls..

Course Objectives

The course is intended to provide the student with the fundamental principles and operational characteristics of Refrigeration systems. This will be achieved through covering a wide range of related topics with the support of lab-based experiments.

Course Learning Outcomes

Upon successful completion of this course, will be familiar with the following:

11. Apply the first law of thermodynamics on the various psychrometric processes.
12. Apply the basic concepts of heat transfer, fluid mechanics and thermodynamics in the design of refrigeration systems.
13. Evaluate the refrigeration loads of cold stores, and design a suitable refrigeration system that satisfies the loads.
14. Understand the end user requirement for a refrigeration plant and design an appropriate refrigeration system.
15. Analyse the performance of the vapor compression and absorption cycles.
16. Understand the effect of the selection of Referigeration systems components materials on their performance.
17. Study the basic principles of the operation of compresssors and their types
18. Size and select the proper compressors and refrigeration plant components.
19. Apply the ASHRAE codes in the procedure of selecting design parameters.
20. Explain the vital rule of air conditioning systems on the life quality of humankind in residential and commercial buildings.

Course Resources

Course Website(s)

Course Identification

Course Number:	0934445
Course Name:	Air Conditioning (1)
Course Location:	University Campus
Class Times:	Mon Wen 9:30am- 11:00pm
Prerequisites:	Heat Transfer (1) – 0904441 & Thermodynamics (2) - 0904342

Course Description/Overview

Review of psychrometry. Air conditioning processes. Thermal comfort, Inside and outside design conditions. Ventilation and infiltration. Heating load calculations. Solar radiation, cooling load calculations. Water heating systems layout and design. Air systems design. Underfloor heating.

Course Objectives

The course is intended to provide the student with the fundamental principles and operational characteristics of Refrigeration systems. This will be achieved through covering a wide range of related topics with the support of lab-based experiments.

Course Learning Outcomes

Upon successful completion of this course, will be familiar with the following:

21. Apply the first law of thermodynamics on the various psychrometric processes.
22. Apply the basic concepts of heat transfer, fluid mechanics and thermodynamics in the design of air conditioning systems.
23. Evaluate the heating loads of a building, and design a suitable air conditioning system that satisfies these loads.
24. Understand the architectial plans of a building and desing the optimal air conditioning system for it.
25. Analyse the performance of the vapor compression cycle used for air conditioning systems.
26. Understand the effect of the selection of building materials on the building behavior.
27. Size the air ducts for war air heating and calculate the pressure drop in the system.
28. Size and select the proper fan and other air conditioning plant components.
29. Apply the Jordanian local codes and the ASHRAE codes in the procedure of selecting design parameters.
30. Explain the vital rule of air conditioning systems on the life quality of humankind in residential and commercial buildings.

Course Website(s)

Required Course Texts and Materials

Course Syllabus

0904589 Energy Conversion

University of Jordan, Faculty of Engineering & Technology,

Mechanical Engineering Department

Fall Semester, 2014-2015

Instructor Information

Instructor:	Dr. Osama Ayadi
Office Location:	University Campus, Engineering Building, 2nd Floor
Office Telephone:	+962 6 535 5000 Ext. 22802
Office Hours:	Sun Tue Thu 9:00- 11:00 am
E-mail:	o.ayadi@ju.edu.jo
Faculty Website:	http://eacademic.ju.edu.jo/o.ayadi/default.aspx

Course Identification

Course Number:	0904589
Course Name:	Energy Conversion
Course Location:	University Campus
Class Times:	Mon Wen 9:30am- 11:00pm
Prerequisites:	0904342: Thermodynamics-2

Course Description/Overview

Energy classification, resources and utilization; Principal fuels for energy conversion; Production of thermal energy; Fossil fuel systems; Environmental impact of power plant operation; Production of electrical energy(by direct energy conversion); Wind energy; Solar energy; geothermal energy; Energy storage and conservation.

Course Objectives

The course is intended to provide the student with the fundamental principles of energy and its conversion. This will be achieved through covering a wide range of related topics with the support of lab-based experiments.

Course Learning Outcomes

Upon successful completion of this course, will be familiar with the following:

1. Identify energy consumption and utilization features on the global, regional and local levels.
2. Predict energy consumption in a certain country given the growth rate is known.
3. Figure out various properties, including the heating values for a mixture of gaseous, liquid and solid fuels.
4. Calculate theoretical and actual air/fuel ratios for the combustion of various kinds of fuels, especially coals, given their analysis are known.
5. Select basic draft systems for a power plant.
6. Estimate solar radiation on any surface.
7. Select a solar collector for a given job.
8. Size and select a windmill for a given job.
9. Assess environmental impact of power plant operation.
10. Analyze and calculate energy costs for a certain power plant and find the breakeven point for that plant.
11. Estimate boiler efficiency.

Problems, Quizes and Exams may include various units from English and SI systems.
Report is required about a certain aspect of energy utilization
All exams and quizzes are open book.
Ability to solve problems, quizes and exams in English and SI systems.

Course Website(s)

All students are expected to attend all classes and should arrive on time.Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion.According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses. No makeup for classwork.

Course Schedule

Week	**Date**	**Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)**
1, 2		1-Energy classification, resources and utilization.
3, 4		2- Principal fuels for energy conversion.
5,6,7		3- Production of thermal energy.
8,9,10		4- Fossil fuel systems.

11,12		5- Environmental impact of power plant operation.
13		6- Production of electrical energy(by direct energy conversion).
14		7- Wind energy.
15		8- Solar energy.

CLIMASP Project

Mapping Courses from Economics & Public Policy Group
University of Jordan

Course Classification:

5. Core Courses (*for All Euro Pass Candidates*)
6. Elective Courses (*from Student Major or Group*)
7. Capstone Course
8. Additional Elective Courses

Core Courses:

*Two courses (6 Credit Hours), one from each other groups as in the following Table:

Group	Course Code	Course Title	Prerequisite	Department	Faculty (College)	Course Category
Environment and Society	2305100	Introduction to Sociology	---	Sociology	Arts	University Elective
Economics and Public Policy	1607100	**International political economy	---	Business Economic	Business	University Elective
Science and Technology	0305100	Environment	---	Geology	Science	University Elective

Elective Courses:

Two programs from the Economics and Public Policy are involved, namely, Business Economics and Finance. Six courses (18 Credit Hours) may be taken by student from his major or other majors within the group.

Course Code	Course Title	Prerequisite	Department	Faculty (College)	Course Category

Course Number: 1607100
Course Name: International Political Economy
Course Location:
Class Times:
Prerequisites: None
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course seeks to explore the interaction of economics and politics in global affairs- the struggle for power and wealth within the international system. The course begins by identification of the economic science and economic problem, the development of economic thought across different economic schools, concentrating on their different standpoints regarding the role of the government in the economic activity. The course aims also to study and analyze different economic systems and their characteristics.

Special emphasis will be placed on the international dimension of political economy, focusing on the interconnected political and economic structures of the world and considering the undergoing enormous change, in order to understand the key elements of this change and see which paths lead to the most promising future. While the questions of international monetary, financial and trading systems are of particular importance, other topics of interest include: the flow across borders of goods, capital, foreign investment and migration ;role of multinational corporations, regional economic organizations and their role in economic integration, environmentally sustainable development, climate change, and prospects for welfare as an economic, political, technological and socio-cultural ongoing process.

Course Learning Objectives

The main goals of this course are to:

- Raise awareness that neither international politics nor international economics can be understood in isolation.
- Focus attention on the four types of cross-border flows (goods, capital, .investment and migration),and the polices- set forth by domestic and international institutions and arrangements- that regulate these flows.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

A1) Understand the major theoretical perspectives on international political economy, the assumptions concerning appropriate unit analysis and nature of interactions between units on which they are based, and their implications for policy.
A2)) Learn how economic organizations on the national and international levels compete and integrate with each other.
A3) Understand the importance of the ecological constraints on economic growth and development.
A4) Try to investigate the extent of the Jordanian economy to influence and be affected by the world economy.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

B1) Indentify and evaluate institutional, political, cultural and economic constraints on the speed and effectiveness of political and/or economic positive change in developing countries.

B2) Collect and analyze relevant data associated with international political economy.

LO **3- Teaching and Learning Methods**:

- Lectures, dialogue and discussion.
- Research.
- Cooperative learning.
- Brain – storming.

Instructor Information

Instructor: Buthaina M.A.Muhtaseb, Associate Professor
Office Location: The School of Business / Business Economics Department -Building #1 first floor.
Telephone: 5355000 ext. 24839
Office Hours:
E-mail: b.muhtaseb@ju.edu.jo, b.muhtaseb@yahoo.com

Course Identification

Course Number: 1607330
Course Name: International Trade Theory
Course Location:
Class Times:
Prerequisites: Principles of Microeconomics (1607110)
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This courses analyzes the causes and consequences of international trade. Various theories of international trade and its extensions will be explained and evaluated in both perfect and imperfect competition, with some reference to the empirical evidence. Some of the essential questions that will be addressed: Why do countries trade? Are countries better off because they trade? Are both trading partners better off? Who gains and who loses within a country? What is the relation between trade and growth? What if markets don't work perfectly? How does that affect our assessments?

Course Learning Objectives

1-To introduce students to international economic concepts and ideas.
2- To develop the ability to reason accurately and objectively about international economic issues.
3- To aid students in judging what kinds of decisions, policies, and behavior are sensible from an international perspective.
4- Enable students to understand international trade flows incentives, directions, and effects.
5- To highlight the relation between international trade and economic growth and welfare. (Welfare should not be measured by the rise in consumption only. Other aspects as good social relations, and clean nature should be considered).

Course Content Learning Outcomes (ILOS)

Successful completion of this course should lead to the following learning outcomes:
LO1- Knowledge and Understanding:
A1) Understand basic concepts of foreign trade.
A2) Demonstrate knowledge and understanding of different international trade theories
A3) Understand foreign trade structure of Jordan
A4) Describe and understand the links between foreign trade and growth
A5) understand international trade under different market structures (competitive versus noncompetitive markets)

LO2- Intellectual Skills:

B1) Prepare and present reports using critical thinking, trade data, and international trade theories
B2) Explain the mechanisms of international flows of commodities and factors
B3) Relate local economic developments to international economic developments
B4) Use computers and internet to access trade flows data and sources.

LO3- Subject Specific Skills:
C1) Apply international trade theories to relate domestic equilibrium prices to foreign prices
C2) Employ trade models to analyze the effects of trade on production, prices and terms of trade, and economic growth
C3) Use micro and macro-economic tools to assess net gains from international trade
C4) Develop the skills required to relate domestic economy equilibrium/disequilibrium to domestic and foreign influences
C5) Analyze international commodities flows directions and causes, and explain migration incentives and disincentives.

LO4- Transferable Skills:
D1) Gather data for basic economic research from various sources, including the computer and other forms of electronic media, such as the Internet.
D2) Acquire English language command of international trade concepts and definitions.
D3) Demonstrate knowledge and skills necessary for integrating information technology into global trade**.**

Course Policies

Academic Honesty

All the assignments and work submitted by the student should be his or her own. All actions of academic dishonesty including cheating, plagiarism or helping other students in such actions will be dealt with strictly according to the university regulations.

Course Schedule

Week	Materials
1	Unit 1: Introduction to International Economics -Causes of trade. -Patterns of trade. -Gains from trade. * Fair Trade. * Drawbacks of Free Trade
2+3+4	Unit 2: Labor Productivity and Comparative Advantage - Dynamic comparative advantage and ethics. **+** **Exam 1**
5+6+7	Unit 3: Resources and Trade: The Heckscher-Ohlin

	Model - The role of resources in explaining foreign trade. - The concept of sustainability and its relation to natural resources. - Each generation should leave the environment not worse off, and not damaged by depletion of resources or pollution of land, water and atmosphere.
8+9	Unit 4: The Standard Trade Model - Income Distribution (Who gain and who loses from free trade within a country? - Trade Development and Growth * Interaction between the three dimensions of development : economic, social and environmental. * Growth and sustainability (Is the traditional macroeconomic goal of economic growth compatible with the long term goal of sustainability?) - Trade and the environment * Analysis combining trade theory with the theory of externalities to show how the basic principle of gains from trade must be modified in a real world with many environmental complications. * The issues of sustainable trade and "greening" global environment institutions encourage the student to place the theoretical issues in the context of real – world policy.

10+11	Unit 5: Modern Theories of International Trade: Economies of Scale, Imperfect Competition, and International Trade. - The Gravity Modal (The role of language, history and culture in addition to other factors in enhancing exports and imports. **+** **Exam 2**
12	Unit 6: International Factor Movements -Immigration -Multinational Enterprise - Linkages between international Labor and capital mobility (Investor rights, Labor standards).
13+14	Unit 7 : Trade Polices and Trade Agreements - Tariffs and Quotas. - Some nontariff barriers are unfair(Indirect way of developed countries to reduce imports from

	developing countries) - Trade liberalization and the WTO, IMF, WB (suspicious roles?)
15	Unit 8 : Application on Foreign Trade to Jordan - Real cases (trade and the environment in Jordan). - Computation of "terms of trade" of Jordan, their change over time and the impact of this change on welfare" **+** **Exam 3 (Final): Cover all units with higher weights given to units not covered in the previous exams.**

Class Times: Mon, Wed 12:30-2:00
Prerequisites: 1607111 Principle of Macroeconomics
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course introduces the theory of growth and economic development, providing a qualitative and analytical perspective of economic transformation of developing countries for undergraduate students. It tries to provide an explanation for the exceptional progress that has been made in many parts of the developing world, but fully deals with the massive problems and challenges that remain to be addressed in the years ahead. It explains measurements of and obstacles to growth and development and tries to explore the difficulties that confront the sustainable development policies. The module focuses on the theory of growth and development and its interaction with trade, population, poverty, and income distribution. The pace and extent of economic development continues its prompt, imbalanced, and sometimes unexpected evolution. The course has been divided into two parts, the first part is about concepts and principles and includes three sections; an introduction of economic development from global perspective, comparative economic development and analysis of convergence, and Classic theories of economic growth and development. The second part is about problems and polices that faces the development in less developing countries; poverty inequality and development, Population Growth and Economic Development and finally the environment and development, basic issues in Global warming and climate change and its fallout on economic development.

Course Learning Objectives

- The main objectives of this course are: 1) to offer an analytical approach to the concepts related to growth and economic development in the context of sustainable development. 2) to equip students with appropriate tools and techniques that help them to analyze situations related to growth and development such as poverty and inequalities .... 3) draw the attention to some issues in environmental pollution and global economic and its relation with economic development. 4) realize the climate change consequences on sustainable economic development. 5) to provide students with the resources to draw independent conclusions as they confront development problems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- knowledge and understanding:**

- Understanding different theories related to economic development
- Comparing developing and developed countries experiences.

- Understanding the aims of development and how to reach them through the different sectors of the economy.
- Classifying the stages of economic development.
- Identifying the problems related to sustainability and the impact of climate change in economic development over time.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Comparing theories and finding the best suitable one which can be applied in Jordan economy.
- Developing some of the core models in poverty and inequality measurement and analysis.
- Highlighting and developing some of the core models in microeconomics of fertility and relationships between population growth and economic growth.
- Discuss the relationship between the environmental economics models and the sustainable economic development.

LO **3- Teaching and learning methods**:

- There will be 2 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical and the qualitative cases presented in the book.

- A number of problems (end-of-chapter problems) will be indicated in class, to be submitted by students. Students should do the homework and should come to class prepared to discuss the assigned problems.

Course Identification

Course Number: 1607421
Course Name: International Finance
Course Location:
Class Times: Monday & Wednesday 11:00 – 12:15
Prerequisites: 1607111, Macroeconomics principles
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This is a course in international monetary economics, which includes the connection between the exchange rates and international macroeconomic policies. The subject of international finance draws its importance from the consequences of worldwide economic policies on a country economy's main outcomes (Employment, National Saving, Trade Balance and Price levels and Money). The course divided into three parts: The first part of the course will present several theories of exchange rate, and the second part will help you gather these theories into an overall analytical framework. The third part will challenge you to employ this analytical framework to real-world applications, and try to link the global financial crisis and the climate change issue. Provide students an up-to-date and understandable analytical framework for revealing current events. Help them grasp and retain the underlying logic of international finance through six to seven sections; first section we will talk about the national income accounts an d balance of payments, second section will be about the asset approach of exchange market and foreign exchange market, third section is about money market and inflation and exchange rate dynamics. In the fourth section the student will try to explore the causes of the fluctuations in exchange rate in long and short runs periods. The fixed exchange rates system will be introduced in section five. And finally in sixth section we will discuss the international macroeconomic policy and try to connect the causes of financial crisis with the most contemporary issue the climate change and their interaction.

Course Learning Objectives

The objectives of this course are: 1) introduce the main exchange rates theories and its determinants and understand the role of exchange rates in international trade . 2) students will understand the movements in macroeconomic variables such as the trade balance, the exchange rate, money, interest rate, national output, and inflation, in short and long runs. 3) Understanding how the interactions of national economies influence the worldwide pattern of macroeconomic activity.4) explore the various international currency arrangements and how did countries try to attain internal and external balance. 5) explain the linkages between the financial crisis and the environmental economics specifically the climate change issue.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- knowledge and understanding:**

- Understand the basic theory of international macroeconomics and finance.
- Understand the determination of the exchange rates in foreign exchange markets.
- Understand why exchange rates can change dramatically over periods of several years.
- Understand the complicated factors that cause output, exchange rates, and inflation to change in the short-run.
- Understand the role of the central bank foreign exchange intervention in the determination of the exchange rates under fixed and managed floating system.
- Understand how the international monetary system influenced the macroeconomic policy making during certain periods.
- Understand the performance and policy problems of the global capital market.
- Understand the international finance of climate change from different perspectives.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Analyze, in an unbiased way, a wide array of important international policy issues.
- Analyze the exchange rates movements in the modern theory of floating exchange rates.
- Relate mathematical and identification models to their assumptions and to the real world.
- Predict in somehow financial crises.

- Link the financial crisis with global warming proplem (climate change issue)

LO **3- Teaching and learning methods**:

- There will be 2 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

- A number of problems (end-of-chapter problems) will be indicated in class, to be submitted by students. Students should attempt the homework and should come to class prepared to discuss the assigned problems.
- Case studies reinforcing material covered, illustrating its applicability in the real world.

Class Times:
Prerequisites: 1607210 and 1607211
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course is primarily concerned with contemporary economic issues at the domestic, regional and international levels. Specific topics are chosen from current and recent policy debates.

Course Learning Objectives

The main objective of this course is to augment the students' comprehension of the various contemporary economic issues which arise in the world, and analyze their negative and positive effects on the Jordanian community.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

A1) understand the new and important contemporary economic issues.
A2) understand the problems and reasons that are associated with economic issues.
A3) realize the importance of the issues of environmental economics and climate change.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

B1) collect and analyze relevant data associated with contemporary economic issues.
B2) perform basic analytical techniques and operations in the context of economic issues.
B3) comprehend and communicate positively and effectively data presented in dialogue forums.
B4) develop analytical skills through class presentations, discussions and writing research papers.
B5) apply microeconomic and macroeconomic analysis to evaluate a current public policy.

LO **3- Teaching and Learning Methods**:

Lectures, case studies, problem solving and tutorials.

- Lectures: 7 weeks, 21 hours
- Discussion forums: 7 weeks, 21 hours
- Tutorials: 2 weeks, 6 hours
- Applications (office hours): as requested

Course Resources

Students should use course description as general guidelines. Book lists and syllabi are subject to change.

Because the course focuses on current economic issues, students will be asked to supplement the chosen textbooks with readings from newspapers, magazines, and the internet

Course Website(s)

- http://blackboard.ju.edu.jo

Required Course Texts and Materials

Although the complete list of references and textbooks materials will be assigned during the course, these books are required:

- **Bonello, Frank J. And Isobel Lobo, *Taking Sides : Clashing Views on Economic Issues*. 15th Edition. McGraw Hill, 2012.**
- **Robart, C.Guell, *Economics Today*, sixth edition, McGraw Hill, 2010.**
- **Anothony D. Owen, Nick Hanley, *The Economics of Climate Change*,2004.**

Optional Course Texts and Materials

- **Nick Hanley, Jason Shogren, and Ben White, *Introduction to Environmental Economics***

Assignments and Grading Scheme

Grading System

A , A- **Excellent**
B+ , B, B- **Very good**
C+, C, C- **Good**
D+ , D, D- **pass**
D-, F = **Fail**

Grading Policy

Students will be assessed based on the following:

Mid-term Exam	30%
Second exam	7%
Participation	5%
Short Paper	8%
Final Exam	50%

Assignments are individual assignments. Details of these assignments and the submission deadlines will be announced in class.

Course Policies

University Policies regarding class attendance, course pre-requisites, and academic honesty, grading, incompletes, and final exams will be observed as stated in the University of Jordan. You are responsible for all material discussed in class and assigned in the textbook.

Missing class is strongly discouraged. Your professor is far less sympathetic to those who miss class regularly. If you miss class, you are responsible to get the notes from a classmate.

Any type of academic misconduct will result in (F). By Enrolling in this course, you agree with the University of Jordan Policy on Academic Misconduct.

Course Schedule

The contents of this course will be determined according to the economic issues that arise during a particular time period.

Below is a proposed list of some topics. We do not want to make this a formal Schedule because we want to be able to introduce topics as they arise. This may mean introducing new topics or shifting the order of the topics we have already chosen.

Detailed lecture schedule			
Homework and Assignments	**Material:**	**Week:**	
TBA	-Introduction World recession / recovery	Week 1+2	
TBA	Globalization.	Week 3+4	
TBA	Poverty and sustainable development First Exam	Week 5	
TBA	Assessment of the Greater Arab Free Trade Area.	Week 6	
TBA	Environmental justice: income, race	Week 7	

	and health		
TBA	The transition to renewable energy. +second exam	Week 8+9	
TBA	The economics of climate change	Week 10	
TBA	Developing countries and climate change.	Week 11+12	
TBA	Climate change Cost –benefit analysis	Week 13+14	
TBA	Final exam	Week 15

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Industrial Economics

University of Jordan, Faculty of Business, Department of Business Economics

Instructor Information

Instructor: Nahil I. Saqfalhait, Associate Professor
Office Location: Faculty of Business / Business Economics Department -Building #2, second floor.
Telephone: 5355000 ext. 24172
Office Hours: TBD
E-mail: nahil.saqfalhait@ju.edu.jo

Course Identification

Course Number: 1607225
Course Name: Industrial Economics
Course Location: TBD
Class Times: TBD
Prerequisites: Principles of Microeconomics (1607110)
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

Industrial organization is essentially a branch of applied microeconomics which seeks to understand the causes and effects of various market structures on pricing and product choices. The course focuses on the theory of the firm and the industry in imperfectly competitive markets with an emphasis upon oligopoly theory, but it also addresses empirical applications of the theory. The course explains how firms compete with each other; it models firms' strategies on imperfect markets and derives the impact of firms' behavior on welfare and market structures.

We will analyze market structure, firm conduct, and economic performance of industries. Of special interest is firms' strategic behavior in price and non-price competition. The types of behavior, or conduct, include oligopoly pricing and production, strategic entry deterrence, location strategies, product differentiation, advertising, vertical and horizontal integration, and research and development. The effects of firms' conduct upon economic welfare and feedback effects upon market structure are examined. Moreover, we will analyze the acquisition and use of market power by firms, antitrust law or/and the role of government competition policy.

We will also look at how institutions and industry can shape improvements in environmental quality and support efficient allocations of resources.

Course Learning Objectives

This module aims at providing students with major topics in the field of Industrial Organization. The knowledge that the student will derive from the course is useful for further study of firms and markets as well as the study of effects of regulatory and legal systems (such as antitrust law or competitive policies) upon firms. The knowledge is also useful in further study of the internal operation of firms. Topics covered in this course are useful not only for academic consideration, but also in private enterprises, including financial and legal institutions; in government regulatory agencies; and in international trade.

Course Content Learning Outcomes

Upon the completion of this module, students should be able to achieve the following:

LO **1- knowledge and understanding:**

Students should have knowledge of:

- The definition, measurement and analysis of various key elements of industrial organization.
- Why markets are organized as they are and behave in the way they do.

- Models of competitive, oligopolistic, and monopoly markets.
- The basic dimensions of industries structure, conduct, and performance.
- Price and non-price competition among firms.
- The acquisition and use of market power by firms.
- Role of government competition policy and regulation.
- Industrial environmental economics issues.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Analyze and evaluate models of competitive, oligopolistic, and monopoly markets.
- Analyze and evaluate how firms' structure and conduct affect economic welfare and how these results feed back to effect structure and conduct.
- Explain the various types of industry structures, conduct, and performance; business strategies; and policy alternatives.
- Understand how firms make their decisions based on strategic thinking.
- Discuss theoretical and empirical issues relating to the interactions among firms in a market economy.
- Apply basic concepts of economic analysis of market structures and understand current debates concerning plausible reform of competition policy.
- Evaluate antitrust policies and other government regulations of industry.
- *Analyze environmental issues through a deeper understanding of firms' economic behavior and incentives.*

LO **3- Teaching and learning methods**:

- There will be 3 hours per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.
- A number of problems will be indicated in class, to be submitted by students. Students should attempt the homework and should come to class prepared to discuss the assigned problems.

Course Resources

Course Website

- http://blackboard.ju.edu.jo

Main textbook(s) and additional readings

- *Industrial Organization: Contemporary Theory and Empirical Applications,* 4th edition, Lynne Pepall, Dan Richards, and George Norman, Blackwell Publishing, 2008.
- *Modern Industrial Organization*, 4th Edition, Dennis Carlton and Jeffrey Perloff, Adison-Wesley, 2004.
- Hanley, N., H. Folmer (1998) *Game Theory and the Environment*. Edward Elgar Publishing.
- Dutta, P. and R.K. Sundaram (1993) "*The Tragedy of the Commons?*" Economic Theory, 3, pp. 413-426.

Assignments and Grading Scheme

Grading System

A , A- **Excellent**
B+ , B, B- **Very good**
C+, C, C- **Good**
D+ , D, D- **pass**
D-, F = **Failure**

Grading Policy

Students will be assessed based on the following:

Mid-term Exam	30%
Second exam	15%
Short Paper	5%
Final Exam	50%

The objective of the paper is to provide students with an opportunity to apply concepts from this course to a "real" market. Each student's presentation is expected to include the following three parts:
1. Clear description of the market to be discussed.
2. Complete analysis of recent strategic behavior within this market, across all relevant dimensions of firm behavior, including the choice of prices, capacity, products, advertising, R&D, entry, exit, etc.
3. Detailed analysis of one firm in this market (main focus of the presentation).

Details of the assignment and the submission deadline will be announced in class. Dates of exams will be announced in the class.

Course Policies

Classroom Protocol

We oblige ourselves to a high standard of professional behavior. Accordingly, lateness, holding private conversations and indeed any behavior that interrupts me or your colleagues will be considered improper. Using cell phones is forbidden in the class. Repeated violations of this standard may affect your participation grade or may cause withdrawal from course.

Academic Honesty

All the assignments and work submitted by the student should be his or her own. All actions of academic dishonesty including cheating, lifting or helping other students in such actions will be dealt with strictly according to the university regulations.

Course Schedule

Detailed lecture schedule			
Homework and Assignments	**Material:**	**Week:**	
TBA	Introduction • The field of industrial organization • Review of Firm, Market, production & cost concepts • Perfect competition compared to monopoly, the concept of economic efficiency	Week 1	
TBA	The industrial organization framework • Basic conditions • Structure • Conduct • Performance	Week 2	
TBA	Market Structure • Economies of Scale • Barriers to Entry and Exit and Contestability • Market Concentration • Product Differentiation	Week 3+4	
TBA	Market Performance • Definition of market performance • Dimensions of market performance	Week 5	

	• Measuring market performance		
TBA	Market Strategy in Oligopoly Market • The Cournot Oligopoly Model • The Bertrand Oligopoly Model • Edgworth Oligopoly Model • Stackelberg Oligopoly Model • Game Theory and Oligopoly • Cartels and Collusion • Kinked Demand Curve	Week 6+7+8	
TBA	Price Discrimination • Incentive and conditions for price discrimination • First-degree (perfect) price discrimination • Second degree price discrimination • Third degree price discrimination • Welfare effects of price discrimination	Week 9	
TBA	Mergers and Acquisitions • Reasons for mergers and acquisitions • Vertical mergers • Horizontal mergers • welfare effects of mergers • Nonprice Competition • Advertising and Information	Week 10	

	• Brandnames R&D, Patents, and Innovation Antitrust and regulation • Antitrust laws and their purposes • The objectives of regulation • Deregulation		
TBA	Industrial Environmental Economics issues Selected topics from: • The impacts of environmental regulations on industrial activity • Issues in industrial proliferation and environmental preservation, pollution control policies • Game Theory and the Environment ➢ Free-riding and Cooperation in Environmental games ➢ Incentives to participate in an international environmental agreements ➢ The Economics of Exhaustible Resources ➢ The Tragedy of the Commons ➢ The Problem of Externalities	Week 11+ 12	

TBA	Presentations	Week 13+14	
TBA	Final exam	Week 15

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus
Managerial Economics
The University of Jordan, the School of Business, Department of Business Economics

Instructor Information

Instructor: Dr. Mohammed Alawen.
Office Location: The School of Business / Business Economics Department -Building #1 First Floor.
Telephone: 5355000 ext.
Office Hours:
E-mail:

Course Identification

Course Number:
Course Name: Managerial Economics
Course Location:
Class Times:
Prerequisites: 1607210 and 1607211
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

Economic theory is the fundamental determinant of firms' profitability and growth, and economic thinking should be an essential element in nearly every managerial decision. In this course, we will examine the principles of microeconomics, and show how they apply

to managerial decision-making. It explains how and why economic theory is used to analyze business problem. In this course we will start with part one; preliminaries (market equilibrium, optimal decisions and Basic estimation techniques), then explore part two demand analysis and its applications (elasticity and demand estimation and forecasting). In part three the production and cost analysis will be or main topic. In part four the student will learn hoe the firms maximize their profits in various market structures. In this particular part we will introduce a very important topic that can be related to take optimal decisions under risk and uncertainty with present of externalities. The climate change will be introduce as a hot topic from utilitarian perspective, the environment is taken into consideration only to the extent that it is useful to humans and then to the policy makers that may affect the standing of firms and global business. Economists are concerned with the environment in so far as it affects the wellbeing of human societies. Whereas environmentalists are concerned about natural systems, economists are primarily interested in natural resources. The economic model focuses on the efficiency of the use of natural resources in the production process. The ecological model places value on the long-term sustainability of natural systems. These dissimilar standards imply different goals for economic activity. We will try to explore these different situations and decision making within climate and einvernoment changes.

Course Learning Objectives

1. To equip the student with the principles he or she needs to make sense out of the conflicting and contradictory discussions of economic conditions and policies in newspapers and news magazines.
2. Enable the student to evaluate the performance of decision makers, and to predict the impact of their policy actions on families and business.
3. Understand and predict the economic forces shaping real-world business decisions.
4. Develop and strengthen overall analytical skills.
5. Develop critical thinking skills about markets and business decisions.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

- Understand managerial behavior regarding maximizing the profit of the firm under different market structure.
- Understand managerial reaction concerning government policy and activities.
- Understand mathematical methods (Derivative, linear programming), and statistical techniques (regression – model) to help managers taking optimal decisions under risk and uncertinity.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

- Present written and/or oral reports using critical thinking, economic data, and economic theory.
- Perform mathematics, and statistical knowledge and its application on economic- decision of the firms.
- Comprehend and communicate data presented graphically and/or mathematically.
- relate mathematical and statistical models to their assumptions and to the real world.

LO **3- Teaching and Learning Methods**:

Lectures, case studies, problem solving and tutorials.

- Lectures: 7 weeks, 21 hours
- Discussion forums: 7 weeks, 21 hours
- Tutorials: 2 weeks, 6 hours
- Applications (office hours): as requested

Course Resources

There will be 3 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Environmental Economics

University of Jordan, Faculty of Business, Department of Business Economics

Instructor Information

Instructor: Khawlah A. Abdalla Spetan, Assistant Professor
Office Location: Faculty of Business / Business Economic Department -Building #1 first floor.
Telephone: 5355000 ext. 24163
Office Hours: TBD
E-mail: khawlah.spetan@ju.edu.jo, khawlahs2000@yahoo.com

Course Identification

Course Number:

Course Name: Environmental Economics
Course Location: TBD
Class Times: TBD
Prerequisites:
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course tries to shed the light on a very important issue that started to affect all aspects of our life. Students will be introduced to the environmental issues from economics point of view. It offers an integrated understanding of environmental and natural resource economics. Important principles and concepts will be presented to provide students with clear understanding for contemporary environmental and natural resource issues and policy considerations. The course includes real world case studies to demonstrate the policy relevance and implications of key notions. Many areas of economics and impact of environmental policies will be covered. Basic concepts of environmental economics will be explored and examined, such as the economics of natural resource scarcity, climate change, environmental pollution, natural disasters, the economics of pollution, and the economics of sustainable development. The course provides an introduction to the subject of environmental economics without assuming any in-depth prior knowledge of economics. Part one explains the fundamental economic concepts. Part two uses these concepts in understanding and developing policy responses to some of the major environmental issues of our time. Examples will be drawn from all over the world and include such fundamental issues as climate change, water pollution, and loss of biodiversity.

Course Learning Objectives

The main objectives of this course are:1) increasing awareness towards the contemporary environmental issues caused by various human activities. 2) Identifying the issues of environmental pollution and global economic and development effects. 3) Cost Benefit Analysis of the various economic activities to determine their environmental impacts. 4) Understanding the economics of climate change and its impact on economic development issues.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- knowledge and understanding:**

- Understanding the linkages between economics and environmental issues.
- Understanding economic concepts in the context of environmental problems.
- Understanding the problems of climate change, water pollution, and loss of biodiversity within global overview of environmental issues.
- Understanding the various possible policy responses to major environmental issues.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Apply microeconomic theory to the study of environmental issues.
- Identify and critically evaluate alternative environmental policy instruments.
- Develop written and verbal skills in communicating an environmental economic perspective.

LO **3- Teaching and learning methods**:

- There will be 2 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

- A number of problems (end-of-chapter problems) will be indicated in class, to be submitted by students. Students should attempt the homework and should prepare to discuss the assigned problems in the class.

Course Resources

Course Website(s)

- http://blackboard.ju.edu.jo

Required Course Texts and Materials

- **Handouts prepared by the instructor for the class.**
- Field, Barry C. and Martha K. Field, Environmental Economics, 5th Edition (San Francisco, CA: McGraw-Hill, 2009).

Optional Course Texts and Materials

• Keohane and Olmstead, *Markets and the Environment* (Island Press, 2007)
• Matthew Kahn, *Fundamentals of Environmental Economics: Solving Urban Pollution Problems.*

• Charles Kolstad, *Environmental Economics* (Oxford University Press, 1st edition 2000, or 2nd edition 2010)

• *The RFF Reader in Environmental and Resource Policy* (Wallace Oates Editor, 2nd edition 2006, RFF Press)

Assignments and Grading Scheme

Grading System

A , A- Excellent
B+ , B, B- Very good
C+, C, C- Good
D+ , D, D- pass
D-, F = Failure

Grading Policy

Students will be assessed based on the following:
Mid-term Exam 30%
Second exam 7%

Participation 5%
Short Paper 8%
Final Exam 50%
Details of assignments and the submission deadlines will be announced in class.

Course Policies

Late Assignments policy

All assignments are due at the beginning of class. Anything turned in after that will be considered late. Assignments will be accepted up to four days after the due date for half credit. Assignments will not be accepted at all after the four-day extension. Excessive absenteeism and late or missing work will result in lower grades. Contact with your teacher is strongly encouraged especially in the case of being absent. Additionally, please read the college's policy regarding absence and make-up work.

Classroom Protocol

We oblige ourselves to a high standard of professional behavior. Accordingly, lateness, holding private conversations and indeed any behavior that interrupts me or your colleagues will be considered improper. Using cell phones is forbidden in the class. Repeated violations of this standard may affect your participation grade or may cause withdrawal from course.

Scientific Research in Economics

University of Jordan, Faculty of Business, Department of Business Economics

…… Semester, ……

Instructor Information

Instructor: Dr.Dalal Alkadi

Office Location: Faculty of Business / Business Economics Department – Building #2, 2edfloor

Telephone: 5355000 ext. 24160
Office Hours:
E-mail: d.alkadi@ju.edu.jo
Website: www.ju.edu.jo

Course Identification

Course Number: **1607311**
Course Name: **Scientific Research in Economics**
Course Location:
Class Times:
Prerequisites: Principles of Statistics 1607150
Faculty Web Page: www.ju.edu.jo

Course Description/Overview

Covers these topics: the concept of scientific research and its definition, and kinds of scientific research, stages and objectives of scientific research, kinds and sources of data and data collection: Questionnaire, population and sample: kinds of sampling, the relation between statistics and scientific research, implementation and analyzing data using statistical methods with SPSS, finally writing reports.

Course Learning Objectives

Providing students with concepts and definition and the importance of scientific research, also providing students with skills in choosing the appropriate way of writing the Questionnaire, the statistical analysis and writing the final report.

Note: Students who are involved in CLIMASP sertificate can apply their research work on environmental issues.

Course Content Learning Outcomes

A. Knowledge and Understanding:

Students should have knowledge of:

- The main concepts of scientific research, and its importance.
- How to think wisely and scientifically.
- How to write questions in the Questionnaire.
- How to deal with the data.

B. Intellectual Analytical and Cognitive Skills:

Student is expected to:

- Write the questions in the Questionnaire correctly.
- Choosing and applying the appropriate statistical analysis.
- Writing the reports.

Course Resources

Hands-out prepared by the instructor for the class

Alkadi, D. (2008), "Methodology and techniques of Scientific Research and Data Analysis using SPSS".

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following:

Evaluation	Point %	Date
Midterm Exam	30	TBA
Second Exam & assignments	20	TBA
Final Exam	50	TBA
Total Points	**100**	

Course Policies

Learning Methodology

Duration: 16 weeks, 48 hours in total
Lectures: 42 hours, 3 per week (including two 1-hour term exams)
Although the lectures cover the vast majority of the course material, students must use the text book.
A number of problems (some could be chosen from the end of chapter problems) will be indicated in class, specifying their due time. A discussion of the assigned problems can be done through the preceding lectures. Also, applying all steps for different statistical methods using SPSS by students.

Classroom Protocol

Details of the assignments and the submission deadlines will be announced in class and/or posted on the course website. Students are advised to keep track of what is announced in class, it is their responsibility to do so, BEING ABSENT IS NOT AN EXCUSE FOR NOT KNOWING WHAT IS GOING ON.

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations.Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Name: International Political Economy

Course Location:

Class Times:

Prerequisites: None

Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course seeks to explore the interaction of economics and politics in global affairs- the struggle for power and wealth within the international system. The course begins by identification of the economic science and economic problem, the development of economic thought across different economic schools, concentrating on their different standpoints regarding the role of the government in the economic activity. The course aims also to study and analyze different economic systems and their characteristics.

Special emphasis will be placed on the international dimension of political economy, focusing on the interconnected political and economic structures of the world and considering the undergoing enormous change, in order to understand the key elements of this change and see which paths lead to the most promising future. While the questions of international monetary, financial and trading systems are of particular importance, other topics of interest include: the flow across borders of goods, capital, foreign investment and migration ;role of multinational corporations, regional economic organizations and their role in economic integration, environmentally sustainable development, climate change, and prospects for welfare as an economic, political, technological and socio-cultural ongoing process.

Course Learning Objectives

The main goals of this course are to:

- Raise awareness that neither international politics nor international economics can be understood in isolation.
- Focus attention on the four types of cross-border flows (goods, capital, .investment and migration),and the polices- set forth by domestic and international institutions and arrangements- that regulate these flows.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

A1) Understand the major theoretical perspectives on international political economy, the assumptions concerning appropriate unit analysis and nature of interactions between units on which they are based, and their implications for policy.
A2)) Learn how economic organizations on the national and international levels compete and integrate with each other.
A3) Understand the importance of the ecological constraints on economic growth and development.
A4) Try to investigate the extent of the Jordanian economy to influence and be affected by the world economy.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

B1) Indentify and evaluate institutional, political, cultural and economic constraints on the speed and effectiveness of political and/or economic positive change in developing countries.
B2) Collect and analyze relevant data associated with international political economy.

LO **3- Teaching and Learning Methods**:

- Lectures, dialogue and discussion.
- Research.
- Cooperative learning.
- Brain – storming.

Course Syllabus

International Trade Theory

The University of Jordan, The School of Business, Department of Business Economics

Instructor Information

Instructor: Buthaina M.A.Muhtaseb, Associate Professor

Office Location: The School of Business / Business Economics Department -Building #1 first floor.

Telephone: 5355000 ext. 24839

Office Hours:

E-mail: b.muhtaseb@ju.edu.jo, b.muhtaseb@yahoo.com

Course Identification

Course Number: 1607330

Course Name: International Trade Theory

Course Location:

Class Times:

Prerequisites: Principles of Microeconomics (1607110)

Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This courses analyzes the causes and consequences of international trade. Various theories of international trade and its extensions will be explained and evaluated in both perfect and imperfect competition, with some reference to the empirical evidence. Some of the essential questions that will be addressed: Why do countries trade? Are countries better off because they trade? Are both trading partners better off? Who gains and who loses within a country? What is the relation between trade and growth? What if markets don't work perfectly? How does that affect our assessments?

Course Learning Objectives

1-To introduce students to international economic concepts and ideas.
2- To develop the ability to reason accurately and objectively about international economic issues.
3- To aid students in judging what kinds of decisions, policies, and behavior are sensible from an international perspective.
4- Enable students to understand international trade flows incentives, directions, and effects.
5- To highlight the relation between international trade and economic growth and welfare. (Welfare should not be measured by the rise in consumption only. Other aspects as good social relations, and clean nature should be considered).

Course Content Learning Outcomes (ILOS)

Successful completion of this course should lead to the following learning outcomes:

LO1- Knowledge and Understanding:

A1) Understand basic concepts of foreign trade.
A2) Demonstrate knowledge and understanding of different international trade theories
A3) Understand foreign trade structure of Jordan
A4) Describe and understand the links between foreign trade and growth
A5) understand international trade under different market structures (competitive versus noncompetitive markets)

LO2- Intellectual Skills:

B1) Prepare and present reports using critical thinking, trade data, and international trade theories
B2) Explain the mechanisms of international flows of commodities and factors
B3) Relate local economic developments to international economic developments
B4) Use computers and internet to access trade flows data and sources.

LO3- Subject Specific Skills:

C1) Apply international trade theories to relate domestic equilibrium prices to foreign prices

C2) Employ trade models to analyze the effects of trade on production, prices and terms of trade, and economic growth
C3) Use micro and macro-economic tools to assess net gains from international trade
C4) Develop the skills required to relate domestic economy equilibrium/disequilibrium to domestic and foreign influences
C5) Analyze international commodities flows directions and causes, and explain migration incentives and disincentives.

LO4- Transferable Skills:

D1) Gather data for basic economic research from various sources, including the computer and other forms of electronic media, such as the Internet.
D2) Acquire English language command of international trade concepts and definitions.
D3) Demonstrate knowledge and skills necessary for integrating information technology into global trade**.**

Teaching and Learning Methods

Duration: 16 weeks, 48 hours in total

Required Course Texts and Materials

- Awad Talib***, "International Trade: Theory and Policy" ,*** The University of Jordan, Amman, 1995.
- Krugman R. Paul and Obstfeld Maurice, "***International Economics: Theory and Policy***", seventh Edition. Boston: Addison-Wesley, 2008

Optional Course Texts and Materials

All the assignments and work submitted by the student should be his or her own. All actions of academic dishonesty including cheating, plagiarism or helping other students in such actions will be dealt with strictly according to the university regulations.

Course Schedule

Week	Materials
1	Unit 1: Introduction to International Economics -Causes of trade. -Patterns of trade. -Gains from trade. * Fair Trade. * Drawbacks of Free Trade
2+3+4	Unit 2: Labor Productivity and Comparative Advantage - Dynamic comparative advantage and ethics. + **Exam 1**
5+6+7	Unit 3: Resources and Trade: The Heckscher-Ohlin Model - The role of resources in explaining foreign trade. - The concept of sustainability and its relation to natural resources. - Each generation should leave the environment not worse off, and not damaged by depletion of resources

	or pollution of land, water and atmosphere.
8+9	Unit 4: The Standard Trade Model - Income Distribution (Who gain and who loses from free trade within a country? - Trade Development and Growth * Interaction between the three dimensions of development : economic, social and environmental. * Growth and sustainability (Is the traditional macroeconomic goal of economic growth compatible with the long term goal of sustainability?) - Trade and the environment * Analysis combining trade theory with the theory of externalities to show how the basic principle of gains from trade must be modified in a real world with many environmental complications. * The issues of sustainable trade and "greening" global environment institutions encourage the student to place the theoretical issues in the context of real – world policy.
10+11	Unit 5: Modern Theories of International Trade: Economies of Scale, Imperfect Competition, and International Trade. - The Gravity Modal (The role of language, history and culture in addition to other factors in enhancing exports and imports.

	+ **Exam 2**
12	Unit 6: International Factor Movements -Immigration -Multinational Enterprise - Linkages between international Labor and capital mobility (Investor rights, Labor standards).
13+14	Unit 7 : Trade Polices and Trade Agreements - Tariffs and Quotas. - Some nontariff barriers are unfair(Indirect way of developed countries to reduce imports from developing countries) - Trade liberalization and the WTO, IMF, WB (suspicious roles?)
15	Unit 8 : Application on Foreign Trade to Jordan - Real cases (trade and the environment in Jordan). - Computation of "terms of trade" of Jordan, their change over time and the impact of this change on welfare" + **Exam 3 (Final): Cover all units with higher weights given to units not covered in the previous exams.**

Course Location: University Campus
Class Times: Mon, Wed 12:30-2:00
Prerequisites: 1607111 Principle of Macroeconomics
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course introduces the theory of growth and economic development, providing a qualitative and analytical perspective of economic transformation of developing countries for undergraduate students. It tries to provide an explanation for the exceptional progress that has been made in many parts of the developing world, but fully deals with the massive problems and challenges that remain to be addressed in the years ahead. It explains measurements of and obstacles to growth and development and tries to explore the difficulties that confront the sustainable development policies. The module focuses on the theory of growth and development and its interaction with trade, population, poverty, and income distribution. The pace and extent of economic development continues its prompt, imbalanced, and sometimes unexpected evolution. The course has been divided into two parts, the first part is about concepts and principles and includes three sections; an introduction of economic development from global perspective, comparative economic development and analysis of convergence, and Classic theories of economic growth and development. The second part is about problems and polices that faces the development in less developing countries; poverty inequality and development, Population Growth and Economic Development and finally the environment and development, basic issues in Global warming and climate change and its fallout on economic development.

Course Learning Objectives

- The main objectives of this course are: 1) to offer an analytical approach to the concepts related to growth and economic development in the context of sustainable development. 2) to equip students with appropriate tools and techniques that help them to analyze situations related to growth and development such as poverty and inequalities …. 3) draw the attention to some issues in environmental pollution and global economic and its relation with economic development. 4) realize the climate change consequences on sustainable economic development. 5) to provide students with the resources to draw independent conclusions as they confront development problems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- knowledge and understanding:**

- Understanding different theories related to economic development
- Comparing developing and developed countries experiences.
- Understanding the aims of development and how to reach them through the different sectors of the economy.
- Classifying the stages of economic development.
- Identifying the problems related to sustainability and the impact of climate change in economic development over time.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Comparing theories and finding the best suitable one which can be applied in Jordan economy.
- Developing some of the core models in poverty and inequality measurement and analysis.
- Highlighting and developing some of the core models in microeconomics of fertility and relationships between population growth and economic growth.
- Discuss the relationship between the environmental economics models and the sustainable economic development.

LO **3- Teaching and learning methods**:

- There will be 2 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical and the qualitative cases presented in the book.

- A number of problems (end-of-chapter problems) will be indicated in class, to be submitted by students. Students should do the homework and should come to class prepared to discuss the assigned problems.

Course Syllabus

1607421: International Finance

University of Jordan, Faculty of Business, Department of Business Economics

Spring, 2014

Instructor Information

Instructor: Khawlah A. Abdalla Spetan, Assistant Professor

Office Location: Faculty of Business / Business Economic Department -Building # first floor

Telephone: 5355000 ext. 24163

Office Hours: Day(s) time: Sun., Tues. & Thur. 10:00-11:00
Mon. & Wed. 1:45 -2:15

E-mail: khawlah.spetan@ju.edu.jo, khawlahs2000@yahoo.com

Course Identification

Course Number: 1607421

Course Name: International Finance

Course Location:

Class Times: Monday & Wednesday 11:00 – 12:15

Prerequisites: 1607111, Macroeconomics principles

Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This is a course in international monetary economics, which includes the connection between the exchange rates and international macroeconomic policies. The subject of international finance draws its importance from the consequences of worldwide economic policies on a country economy's main outcomes (Employment, National Saving, Trade Balance and Price levels and Money). The course divided into three parts: The first part of the course will present several theories of exchange rate, and the second part will help you gather these theories into an overall analytical framework. The third part will challenge you to employ this analytical framework to real-world applications, and try to link the global financial crisis and the climate change issue. Provide students an up-to-date and understandable analytical framework for revealing current events. Help them grasp and retain the underlying logic of international finance through six to seven sections; first section we will talk about the national income accounts an d balance of payments, second section will be about the asset approach of exchange market and foreign exchange market, third section is about money market and inflation and exchange rate dynamics. In the fourth section the student will try to explore the causes of the fluctuations in exchange rate in long and short runs periods. The fixed exchange rates system will be introduced in section five. And finally in sixth section we will discuss the international macroeconomic policy and try to connect the causes of financial crisis with the most contemporary issue the climate change and their interaction.

Course Learning Objectives

The objectives of this course are: 1) introduce the main exchange rates theories and its determinants and understand the role of exchange rates in international trade . 2) students will understand the movements in macroeconomic variables such as the trade balance, the exchange rate, money, interest rate, national output, and inflation, in short and long runs. 3) Understanding how the interactions of national economies influence the worldwide pattern of macroeconomic activity.4) explore the various international currency arrangements and how did countries try to attain internal and external balance. 5) explain the linkages between the financial crisis and the environmental economics specifically the climate change issue.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- knowledge and understanding:**

- Understand the basic theory of international macroeconomics and finance.
- Understand the determination of the exchange rates in foreign exchange markets.
- Understand why exchange rates can change dramatically over periods of several years.
- Understand the complicated factors that cause output, exchange rates, and inflation to change in the short-run.
- Understand the role of the central bank foreign exchange intervention in the determination of the exchange rates under fixed and managed floating system.
- Understand how the international monetary system influenced the macroeconomic policy making during certain periods.
- Understand the performance and policy problems of the global capital market.
- Understand the international finance of climate change from different perspectives.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Analyze, in an unbiased way, a wide array of important international policy issues.
- Analyze the exchange rates movements in the modern theory of floating exchange rates.
- Relate mathematical and identification models to their assumptions and to the real world.
- Predict in somehow financial crises.
- Link the financial crisis with global warming proplem (climate change issue)

LO **3- Teaching and learning methods**:

- There will be 2 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

- A number of problems (end-of-chapter problems) will be indicated in class, to be submitted by students. Students should attempt the homework and should come to class prepared to discuss the assigned problems.

- Case studies reinforcing material covered, illustrating its applicability in the real world.

Course Name: Contemporary Economic Issues
Course Location:
Class Times:
Prerequisites: 1607210 and 1607211
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course is primarily concerned with contemporary economic issues at the domestic, regional and international levels. Specific topics are chosen from current and recent policy debates.

Course Learning Objectives

The main objective of this course is to augment the students' comprehension of the various contemporary economic issues which arise in the world, and analyze their negative and positive effects on the Jordanian community.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

A1) understand the new and important contemporary economic issues.
A2) understand the problems and reasons that are associated with economic issues.
A3) realize the importance of the issues of environmental economics and climate change.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

B1) collect and analyze relevant data associated with contemporary economic issues.
B2) perform basic analytical techniques and operations in the context of economic issues.
B3) comprehend and communicate positively and effectively data presented in dialogue forums.
B4) develop analytical skills through class presentations, discussions and writing research papers.
B5) apply microeconomic and macroeconomic analysis to evaluate a current public policy.

LO **3- Teaching and Learning Methods**:

Lectures, case studies, problem solving and tutorials.

- Lectures: 7 weeks, 21 hours
- Discussion forums: 7 weeks, 21 hours
- Tutorials: 2 weeks, 6 hours
- Applications (office hours): as requested

Course Resources

Students should use course description as general guidelines. Book lists and syllabi are subject to change.

Because the course focuses on current economic issues, students will be asked to supplement the chosen textbooks with readings from newspapers, magazines, and the internet

Course Website(s)

- http://blackboard.ju.edu.jo

Required Course Texts and Materials

Although the complete list of references and textbooks materials will be assigned during the course, these books are required:

- **Bonello, Frank J. And Isobel Lobo, *Taking Sides : Clashing Views on Economic Issues.* 15th Edition. McGraw Hill, 2012.**
- **Robart, C.Guell, *Economics Today*, sixth edition, McGraw Hill, 2010.**
- **Anothony D. Owen, Nick Hanley, *The Economics of Climate Change*,2004.**

Optional Course Texts and Materials

- **Nick Hanley, Jason Shogren, and Ben White, *Introduction to Environmental Economics***

Final Exam	50%

Assignments are individual assignments. Details of these assignments and the submission deadlines will be announced in class.

Course Policies

University Policies regarding class attendance, course pre-requisites, and academic honesty, grading, incompletes, and final exams will be observed as stated in the University of Jordan. You are responsible for all material discussed in class and assigned in the textbook. Missing class is strongly discouraged. Your professor is far less sympathetic to those who miss class regularly. If you miss class, you are responsible to get the notes from a classmate.

Any type of academic misconduct will result in (F). By Enrolling in this course, you agree with the University of Jordan Policy on Academic Misconduct.

Course Schedule

The contents of this course will be determined according to the economic issues that arise during a particular time period.

Below is a proposed list of some topics. We do not want to make this a formal Schedule because we want to be able to introduce topics as they arise. This may mean introducing new topics or shifting the order of the topics we have already chosen.

Detailed lecture schedule			
	Week:	**Material:**	**Homework and Assignments**
	Week 1+2	-Introduction World recession / recovery	TBA
	Week 3+4	Globalization.	TBA
	Week 5	Poverty and sustainable development First Exam	TBA
	Week 6	Assessment of the Greater Arab Free Trade Area.	TBA

	Week 7	Environmental justice: income, race and health	TBA
	Week 8+9	The transition to renewable energy. +second exam	TBA
	Week 10	The economics of climate change	TBA
	Week 11+12	Developing countries and climate change.	TBA
	Week 13+14	Climate change Cost –benefit analysis	TBA
	Week 15	Final exam	TBA

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Industrial Economics

University of Jordan, Faculty of Business, Department of Business Economics

Instructor Information

Instructor:	Nahil I. Saqfalhait, Associate Professor
Office Location:	Faculty of Business / Business Economics Department -Building #2, second floor.
Telephone:	5355000 ext. 24172
Office Hours:	TBD
E-mail:	nahil.saqfalhait@ju.edu.jo

Course Identification

Course Number:	1607225
Course Name:	Industrial Economics
Course Location:	TBD
Class Times:	TBD
Prerequisites:	Principles of Microeconomics (1607110)

Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

Industrial organization is essentially a branch of applied microeconomics which seeks to understand the causes and effects of various market structures on pricing and product choices. The course focuses on the theory of the firm and the industry in imperfectly competitive markets with an emphasis upon oligopoly theory, but it also addresses empirical applications of the theory. The course explains how firms compete with each other; it models firms' strategies on imperfect markets and derives the impact of firms' behavior on welfare and market structures.
We will analyze market structure, firm conduct, and economic performance of industries. Of special interest is firms' strategic behavior in price and non-price competition. The types of behavior, or conduct, include oligopoly pricing and production, strategic entry deterrence, location strategies, product differentiation, advertising, vertical and horizontal integration, and research and development. The effects of firms' conduct upon economic welfare and feedback effects upon market structure are examined. Moreover, we will analyze the acquisition and use of market power by firms, antitrust law or/and the role of government competition policy.
We will also look at how institutions and industry can shape improvements in environmental quality and support efficient allocations of resources.

Course Learning Objectives

This module aims at providing students with major topics in the field of Industrial Organization. The knowledge that the student will derive from the course is useful for further study of firms and markets as well as the study of effects of regulatory and legal systems (such as antitrust law or competitive policies) upon firms. The knowledge is also useful in further study of the internal operation of firms. Topics covered in this course are useful not only for academic consideration, but also in private enterprises, including financial and legal institutions; in government regulatory agencies; and in international trade.

Course Content Learning Outcomes

Upon the completion of this module, students should be able to achieve the following:

LO **1- knowledge and understanding:**

Students should have knowledge of:

- The definition, measurement and analysis of various key elements of industrial organization.
- Why markets are organized as they are and behave in the way they do.
- Models of competitive, oligopolistic, and monopoly markets.
- The basic dimensions of industries structure, conduct, and performance.
- Price and non-price competition among firms.
- The acquisition and use of market power by firms.
- Role of government competition policy and regulation.
- Industrial environmental economics issues.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Analyze and evaluate models of competitive, oligopolistic, and monopoly markets.
- Analyze and evaluate how firms' structure and conduct affect economic welfare and how these results feed back to effect structure and conduct.
- Explain the various types of industry structures, conduct, and performance; business strategies; and policy alternatives.
- Understand how firms make their decisions based on strategic thinking.
- Discuss theoretical and empirical issues relating to the interactions among firms in a market economy.
- Apply basic concepts of economic analysis of market structures and understand current debates concerning plausible reform of competition policy.
- Evaluate antitrust policies and other government regulations of industry.
- *Analyze environmental issues through a deeper understanding of firms' economic behavior and incentives.*

LO **3- Teaching and learning methods**:

- There will be 3 hours per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

- A number of problems will be indicated in class, to be submitted by students. Students should attempt the homework and should come to class prepared to discuss the assigned problems.

Course Resources

Course Website

- http://blackboard.ju.edu.jo

Main textbook(s) and additional readings

- *Industrial Organization: Contemporary Theory and Empirical Applications,* 4th edition, Lynne Pepall, Dan Richards, and George Norman, Blackwell Publishing, 2008.

- *Modern Industrial Organization*, 4th Edition, Dennis Carlton and Jeffrey Perloff, Adison-Wesley, 2004.

- Hanley, N., H. Folmer (1998) *Game Theory and the Environment*. Edward Elgar Publishing.

- Dutta, P. and R.K. Sundaram (1993) "*The Tragedy of the Commons?*" Economic Theory, 3, pp. 413-426.

Assignments and Grading Scheme

Grading System

A , A- **Excellent**
B+ , B, B- **Very good**
C+, C, C- **Good**
D+ , D, D- **pass**
D-, F = **Failure**

Grading Policy

Students will be assessed based on the following:

Mid-term Exam	30%
Second exam	15%
Short Paper	5%
Final Exam	50%

The objective of the paper is to provide students with an opportunity to apply concepts from this course to a "real" market. Each student's presentation is expected to include the following three parts:
1. Clear description of the market to be discussed.
2. Complete analysis of recent strategic behavior within this market, across all relevant dimensions of firm behavior, including the choice of prices, capacity, products, advertising, R&D, entry, exit, etc.
3. Detailed analysis of one firm in this market (main focus of the presentation).

Details of the assignment and the submission deadline will be announced in class. Dates of exams will be announced in the class.

Course Policies

Classroom Protocol

We oblige ourselves to a high standard of professional behavior. Accordingly, lateness, holding private conversations and indeed any behavior that interrupts me or your colleagues will be considered improper. Using cell phones is forbidden in the class. Repeated violations of this standard may affect your participation grade or may cause withdrawal from course.

Academic Honesty

All the assignments and work submitted by the student should be his or her own. All actions of academic dishonesty including cheating, lifting or helping other students in such actions will be dealt with strictly according to the university regulations.

Course Schedule

Detailed lecture schedule			
	Week:	**Material:**	**Homework and Assignments**
	Week 1	Introduction • The field of industrial organization • Review of Firm, Market, production & cost concepts • Perfect competition compared to monopoly, the concept of economic	TBA

		efficiency	
	Week 2	The industrial organization framework • Basic conditions • Structure • Conduct • Performance	TBA
	Week 3+4	Market Structure • Economies of Scale • Barriers to Entry and Exit and Contestability • Market Concentration • Product Differentiation	TBA
	Week 5	Market Performance • Definition of market performance • Dimensions of market performance • Measuring market performance	TBA
	Week 6+7+8	Market Strategy in Oligopoly Market • The Cournot Oligopoly Model • The Bertrand Oligopoly Model • Edgworth Oligopoly Model • Stackelberg Oligopoly Model • Game Theory and Oligopoly • Cartels and Collusion • Kinked Demand Curve	TBA

	Week 9	Price Discrimination • Incentive and conditions for price discrimination • First-degree (perfect) price discrimination • Second degree price discrimination • Third degree price discrimination • Welfare effects of price discrimination	TBA
	Week 10	Mergers and Acquisitions • Reasons for mergers and acquisitions • Vertical mergers • Horizontal mergers • welfare effects of mergers • Nonprice Competition • Advertising and Information • Brandnames R&D, Patents, and Innovation Antitrust and regulation • Antitrust laws and their purposes • The objectives of regulation • Deregulation	TBA
	Week 11+ 12	Industrial Environmental Economics issues Selected topics from:	TBA

		• The impacts of environmental regulations on industrial activity • Issues in industrial proliferation and environmental preservation, pollution control policies • Game Theory and the Environment ➢ Free-riding and Cooperation in Environmental games ➢ Incentives to participate in an international environmental agreements ➢ The Economics of Exhaustible Resources ➢ The Tragedy of the Commons ➢ The Problem of Externalities

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Managerial Economics

The University of Jordan, the School of Business, Department of Business Economics

Instructor Information

Instructor: Dr. Mohammed Alawen.

Office Location: The School of Business / Business Economics Department -Building #1 First Floor.
Telephone: 5355000 ext.
Office Hours:
E-mail:

Course Identification

Course Number:
Course Name: Managerial Economics
Course Location:
Class Times:
Prerequisites: 1607210 and 1607211
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

Economic theory is the fundamental determinant of firms' profitability and growth, and economic thinking should be an essential element in nearly every managerial decision. In this course, we will examine the principles of microeconomics, and show how they apply to managerial decision-making. It explains how and why economic theory is used to analyze business problem. In this course we will start with part one; preliminaries (market equilibrium, optimal decisions and Basic estimation techniques), then explore part two demand analysis and its applications (elasticity and demand estimation and forecasting). In part three the production and cost analysis will be or main topic. In part four the student will learn hoe the firms maximize their profits in various market structures. In this particular part we will introduce a very important topic that can be related to take optimal decisions under risk and uncertainty with present of externalities. The climate change will be introduce as a hot topic from utilitarian perspective, the environment is taken into consideration only to the extent that it is useful to humans and then to the policy makers that may affect the standing of firms and global business. Economists are concerned with the environment in so far as it affects the wellbeing of human societies. Whereas environmentalists are concerned about natural systems, economists are primarily interested in natural resources. The economic model focuses on the efficiency of the use of natural

resources in the production process. The ecological model places value on the long-term sustainability of natural systems. These dissimilar standards imply different goals for economic activity. We will try to explore these different situations and decision making within climate and einvernoment changes.

Course Learning Objectives

6. To equip the student with the principles he or she needs to make sense out of the conflicting and contradictory discussions of economic conditions and policies in newspapers and news magazines.
7. Enable the student to evaluate the performance of decision makers, and to predict the impact of their policy actions on families and business.
8. Understand and predict the economic forces shaping real-world business decisions.
9. Develop and strengthen overall analytical skills.
10. Develop critical thinking skills about markets and business decisions.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

- Understand managerial behavior regarding maximizing the profit of the firm under different market structure.
- Understand managerial reaction concerning government policy and activities.
- Understand mathematical methods (Derivative, linear programming), and statistical techniques (regression – model) to help managers taking optimal decisions under risk and uncertinity.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

- Present written and/or oral reports using critical thinking, economic data, and economic theory.

- Perform mathematics, and statistical knowledge and its application on economic- decision of the firms.
- Comprehend and communicate data presented graphically and/or mathematically.
- relate mathematical and statistical models to their assumptions and to the real world.

LO **3- Teaching and Learning Methods**:

Lectures, case studies, problem solving and tutorials.

- Lectures: 7 weeks, 21 hours
- Discussion forums: 7 weeks, 21 hours
- Tutorials: 2 weeks, 6 hours
- Applications (office hours): as requested

Course Resources

There will be 3 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

Course Identification

Course Number:
Course Name: Environmental Economics
Course Location: TBD
Class Times: TBD
Prerequisites:
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course tries to shed the light on a very important issue that started to affect all aspects of our life. Students will be introduced to the environmental issues from economics point of view. It offers an integrated understanding of environmental and natural resource economics. Important principles and concepts will be presented to provide students with clear understanding for contemporary environmental and natural resource issues and policy considerations. The course includes real world case studies to demonstrate the policy relevance and implications of key notions. Many areas of economics and impact of environmental policies will be covered. Basic concepts of environmental economics will be explored and examined, such as the economics of natural resource scarcity, climate change, environmental pollution, natural disasters, the economics of pollution, and the economics of sustainable development. The course provides an introduction to the subject of environmental economics without assuming any in-depth prior knowledge of economics. Part one explains the fundamental

economic concepts. Part two uses these concepts in understanding and developing policy responses to some of the major environmental issues of our time. Examples will be drawn from all over the world and include such fundamental issues as climate change, water pollution, and loss of biodiversity.

Course Learning Objectives

The main objectives of this course are:1) increasing awareness towards the contemporary environmental issues caused by various human activities. 2) Identifying the issues of environmental pollution and global economic and development effects. 3) Cost Benefit Analysis of the various economic activities to determine their environmental impacts. 4) Understanding the economics of climate change and its impact on economic development issues.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- knowledge and understanding:**

- Understanding the linkages between economics and environmental issues.
- Understanding economic concepts in the context of environmental problems.
- Understanding the problems of climate change, water pollution, and loss of biodiversity within global overview of environmental issues.
- Understanding the various possible policy responses to major environmental issues.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Apply microeconomic theory to the study of environmental issues.
- Identify and critically evaluate alternative environmental policy instruments.
- Develop written and verbal skills in communicating an environmental economic perspective.

LO **3- Teaching and learning methods**:

- There will be 2 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

- A number of problems (end-of-chapter problems) will be indicated in class, to be submitted by students. Students should attempt the homework and should prepare to discuss the assigned problems in the class.

Course Resources

Course Website(s)

- http://blackboard.ju.edu.jo

Required Course Texts and Materials

- **Handouts prepared by the instructor for the class.**
- Field, Barry C. and Martha K. Field, Environmental Economics, 5th Edition (San Francisco, CA: McGraw-Hill, 2009).

Optional Course Texts and Materials

• Keohane and Olmstead, *Markets and the Environment* (Island Press, 2007)
• Matthew Kahn, *Fundamentals of Environmental Economics: Solving Urban Pollution Problems.*

• Charles Kolstad, *Environmental Economics* (Oxford University Press, 1st edition 2000, or 2nd edition 2010)

• *The RFF Reader in Environmental and Resource Policy* (Wallace Oates Editor, 2nd edition 2006, RFF Press)

Assignments and Grading Scheme

Grading System

A , A- **Excellent**
B+ , B, B- **Very good**
C+, C, C- **Good**
D+ , D, D- **pass**
D-, F = **Failure**

Grading Policy

Students will be assessed based on the following:

Mid-term Exam	30%
Second exam	7%
Participation	5%
Short Paper	8%
Final Exam	50%

Details of assignments and the submission deadlines will be announced in class.

Course Policies

Late Assignments policy

All assignments are due at the beginning of class. Anything turned in after that will be considered late. Assignments will be accepted up to four days after the due date for half credit. Assignments will not be accepted at all after the four-day extension. Excessive absenteeism and late or missing work will result in lower grades. Contact with your teacher is strongly encouraged especially in the case of being absent. Additionally, please read the college's policy regarding absence and make-up work.

Classroom Protocol

We oblige ourselves to a high standard of professional behavior. Accordingly, lateness, holding private conversations and indeed any behavior that interrupts me or your colleagues will be considered improper. Using cell phones is forbidden in the class. Repeated violations of this standard may affect your participation grade or may cause withdrawal from course.

Course Schedule

Detailed lecture schedule		
Week:	**Material:**	**Homework and Assignments**

Course Identification

Course Number: **1607311**
Course Name: **Scientific Research in Economics**
Course Location:
Class Times:
Prerequisites: Principles of Statistics 1607150
Faculty Web Page: www.ju.edu.jo

Course Description/Overview

Covers these topics: the concept of scientific research and its definition, and kinds of scientific research, stages and objectives of scientific research, kinds and sources of data and data collection: Questionnaire, population and sample: kinds of sampling, the relation between statistics and scientific research, implementation and analyzing data using statistical methods with SPSS, finally writing reports.

Course Learning Objectives

Providing students with concepts and definition and the importance of scientific research, also providing students with skills in choosing the appropriate way of writing the Questionnaire, the statistical analysis and writing the final report.

Note: Students who are involved in CLIMASP sertificate can apply their research work on environmental issues.

Course Content Learning Outcomes

A. Knowledge and Understanding:

Students should have knowledge of:

- The main concepts of scientific research, and its importance.
- How to think wisely and scientifically.
- How to write questions in the Questionnaire.
- How to deal with the data.

B. Intellectual Analytical and Cognitive Skills:

Student is expected to:

- Write the questions in the Questionnaire correctly.
- Choosing and applying the appropriate statistical analysis.
- Writing the reports.

Course Resources

Hands-out prepared by the instructor for the class

Alkadi, D. (2008), "Methodology and techniques of Scientific Research and Data Analysis using SPSS".

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following:

Evaluation	Point %	Date
Midterm Exam	30	TBA
Second Exam & assignments	20	TBA
Final Exam	50	TBA
Total Points	**100**	

Course Policies

Learning Methodology

Duration: 16 weeks, 48 hours in total
Lectures: 42 hours, 3 per week (including two 1-hour term exams)
Although the lectures cover the vast majority of the course material, students must use the text book.
A number of problems (some could be chosen from the end of chapter problems) will be indicated in class, specifying their due time. A discussion of the assigned problems can be done through the preceding lectures. Also, applying all steps for different statistical methods using SPSS by students.

Classroom Protocol

Details of the assignments and the submission deadlines will be announced in class and/or posted on the course website. Students are advised to keep track of what is announced in class, it is their responsibility to do so, BEING ABSENT IS NOT AN EXCUSE FOR NOT KNOWING WHAT IS GOING ON.

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations.Establishing reasonable accommodations should be considered on a case-by-case basis.

Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course seeks to explore the interaction of economics and politics in global affairs- the struggle for power and wealth within the international system. The course begins by identification of the economic science and economic problem, the development of economic thought across different economic schools, concentrating on their different standpoints regarding the role of the government in the economic activity. The course aims also to study and analyze different economic systems and their characteristics.

Special emphasis will be placed on the international dimension of political economy, focusing on the interconnected political and economic structures of the world and considering the undergoing enormous change, in order to understand the key elements of this change and see which paths lead to the most promising future. While the questions of international monetary, financial and trading systems are of particular importance, other topics of interest include: the flow across borders of goods, capital, foreign investment and migration ;role of multinational corporations, regional economic organizations and their role in economic integration, environmentally sustainable development, climate change, and prospects for welfare as an economic, political, technological and socio-cultural ongoing process.

Course Learning Objectives

The main goals of this course are to:

- Raise awareness that neither international politics nor international economics can be understood in isolation.
- Focus attention on the four types of cross-border flows (goods, capital, .investment and migration),and the polices- set forth by domestic and international institutions and arrangements- that regulate these flows.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

A1) Understand the major theoretical perspectives on international political economy, the assumptions concerning appropriate unit analysis and nature of interactions between units on which they are based, and their implications for policy.
A2)) Learn how economic organizations on the national and international levels compete and integrate with each other.
A3) Understand the importance of the ecological constraints on economic growth and development.
A4) Try to investigate the extent of the Jordanian economy to influence and be affected by the world economy.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

B1) Indentify and evaluate institutional, political, cultural and economic constraints on the speed and effectiveness of political and/or economic positive change in developing countries.
B2) Collect and analyze relevant data associated with international political economy.

LO **3- Teaching and Learning Methods**:

- Lectures, dialogue and discussion.
- Research.
- Cooperative learning.
- Brain – storming.

Course Syllabus

International Trade Theory

The University of Jordan, The School of Business, Department of Business Economics

Instructor Information

Instructor: Buthaina M.A.Muhtaseb, Associate Professor

Office Location: The School of Business / Business Economics Department -Building #1 first floor.

Telephone: 5355000 ext. 24839

Office Hours:

E-mail: b.muhtaseb@ju.edu.jo, b.muhtaseb@yahoo.com

Course Identification

Course Number: 1607330

Course Name: International Trade Theory

Course Location:

Class Times:

Prerequisites: Principles of Microeconomics (1607110)

Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This courses analyzes the causes and consequences of international trade. Various theories of international trade and its extensions will be explained and evaluated in both perfect and imperfect competition, with some reference to the empirical evidence. Some of the essential questions that will be addressed: Why do countries trade? Are countries better off because they trade? Are both trading partners better off? Who gains and who loses within a country? What is the relation between trade and growth? What if markets don't work perfectly? How does that affect our assessments?

Course Learning Objectives

1-To introduce students to international economic concepts and ideas.
2- To develop the ability to reason accurately and objectively about international economic issues.
3- To aid students in judging what kinds of decisions, policies, and behavior are sensible from an international perspective.
4- Enable students to understand international trade flows incentives, directions, and effects.
5- To highlight the relation between international trade and economic growth and welfare. (Welfare should not be measured by the rise in consumption only. Other aspects as good social relations, and clean nature should be considered).

Course Content Learning Outcomes (ILOS)

Successful completion of this course should lead to the following learning outcomes:

LO1- Knowledge and Understanding:

A1) Understand basic concepts of foreign trade.
A2) Demonstrate knowledge and understanding of different international trade theories
A3) Understand foreign trade structure of Jordan
A4) Describe and understand the links between foreign trade and growth
A5) understand international trade under different market structures (competitive versus noncompetitive markets)

LO2- Intellectual Skills:

B1) Prepare and present reports using critical thinking, trade data, and international trade theories
B2) Explain the mechanisms of international flows of commodities and factors
B3) Relate local economic developments to international economic developments
B4) Use computers and internet to access trade flows data and sources.

LO3- Subject Specific Skills:

C1) Apply international trade theories to relate domestic equilibrium prices to foreign prices

C2) Employ trade models to analyze the effects of trade on production, prices and terms of trade, and economic growth
C3) Use micro and macro-economic tools to assess net gains from international trade
C4) Develop the skills required to relate domestic economy equilibrium/disequilibrium to domestic and foreign influences
C5) Analyze international commodities flows directions and causes, and explain migration incentives and disincentives.

LO4- Transferable Skills:
D1) Gather data for basic economic research from various sources, including the computer and other forms of electronic media, such as the Internet.
D2) Acquire English language command of international trade concepts and definitions.
D3) Demonstrate knowledge and skills necessary for integrating information technology into global trade**.**

Teaching and Learning Methods

Duration: 16 weeks, 48 hours in total
Lectures: 28 hours, 3 per week (including two 1-hour midterm exams)

Required Course Texts and Materials

- Awad Talib***, "International Trade: Theory and Policy" ,*** The University of Jordan, Amman, 1995.
- Krugman R. Paul and Obstfeld Maurice, "***International Economics: Theory and Policy***", seventh Edition. Boston: Addison-Wesley, 2008

Optional Course Texts and Materials

All the assignments and work submitted by the student should be his or her own. All actions of academic dishonesty including cheating, plagiarism or helping other students in such actions will be dealt with strictly according to the university regulations.

Course Schedule

Week	Materials
1	Unit 1: Introduction to International Economics -Causes of trade. -Patterns of trade. -Gains from trade. * Fair Trade. * Drawbacks of Free Trade
2+3+4	Unit 2: Labor Productivity and Comparative Advantage - Dynamic comparative advantage and ethics. + **Exam 1**
5+6+7	Unit 3: Resources and Trade: The Heckscher-Ohlin Model - The role of resources in explaining foreign trade. - The concept of sustainability and its relation to natural resources. - Each generation should leave the environment not worse off, and not damaged by depletion of resources

	or pollution of land, water and atmosphere.
8+9	Unit 4: The Standard Trade Model - Income Distribution (Who gain and who loses from free trade within a country? - Trade Development and Growth * Interaction between the three dimensions of development : economic, social and environmental. * Growth and sustainability (Is the traditional macroeconomic goal of economic growth compatible with the long term goal of sustainability?) - Trade and the environment * Analysis combining trade theory with the theory of externalities to show how the basic principle of gains from trade must be modified in a real world with many environmental complications. * The issues of sustainable trade and "greening" global environment institutions encourage the student to place the theoretical issues in the context of real – world policy.
10+11	Unit 5: Modern Theories of International Trade: Economies of Scale, Imperfect Competition, and International Trade. - The Gravity Modal (The role of language, history and culture in addition to other factors in enhancing exports and imports.

	+ **Exam 2**
12	Unit 6: International Factor Movements -Immigration -Multinational Enterprise - Linkages between international Labor and capital mobility (Investor rights, Labor standards).
13+14	Unit 7 : Trade Polices and Trade Agreements - Tariffs and Quotas. - Some nontariff barriers are unfair(Indirect way of developed countries to reduce imports from developing countries) - Trade liberalization and the WTO, IMF, WB (suspicious roles?)
15	Unit 8 : Application on Foreign Trade to Jordan - Real cases (trade and the environment in Jordan). - Computation of "terms of trade" of Jordan, their change over time and the impact of this change on welfare" + **Exam 3 (Final): Cover all units with higher weights given to units not covered in the previous exams.**

Course Location: University Campus
Class Times: Mon, Wed 12:30-2:00
Prerequisites: 1607111 Principle of Macroeconomics
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course introduces the theory of growth and economic development, providing a qualitative and analytical perspective of economic transformation of developing countries for undergraduate students. It tries to provide an explanation for the exceptional progress that has been made in many parts of the developing world, but fully deals with the massive problems and challenges that remain to be addressed in the years ahead. It explains measurements of and obstacles to growth and development and tries to explore the difficulties that confront the sustainable development policies. The module focuses on the theory of growth and development and its interaction with trade, population, poverty, and income distribution. The pace and extent of economic development continues its prompt, imbalanced, and sometimes unexpected evolution. The course has been divided into two parts, the first part is about concepts and principles and includes three sections; an introduction of economic development from global perspective, comparative economic development and analysis of convergence, and Classic theories of economic growth and development. The second part is about problems and polices that faces the development in less developing countries; poverty inequality and development, Population Growth and Economic Development and finally the environment and development, basic issues in Global warming and climate change and its fallout on economic development.

Course Learning Objectives

- The main objectives of this course are: 1) to offer an analytical approach to the concepts related to growth and economic development in the context of sustainable development. 2) to equip students with appropriate tools and techniques that help them to analyze situations related to growth and development such as poverty and inequalities …. 3) draw the attention to some issues in environmental pollution and global economic and its relation with economic development. 4) realize the climate change consequences on sustainable economic development. 5) to provide students with the resources to draw independent conclusions as they confront development problems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- knowledge and understanding:**

- Understanding different theories related to economic development
- Comparing developing and developed countries experiences.
- Understanding the aims of development and how to reach them through the different sectors of the economy.
- Classifying the stages of economic development.
- Identifying the problems related to sustainability and the impact of climate change in economic development over time.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Comparing theories and finding the best suitable one which can be applied in Jordan economy.
- Developing some of the core models in poverty and inequality measurement and analysis.
- Highlighting and developing some of the core models in microeconomics of fertility and relationships between population growth and economic growth.
- Discuss the relationship between the environmental economics models and the sustainable economic development.

LO **3- Teaching and learning methods**:

- There will be 2 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical and the qualitative cases presented in the book.

- A number of problems (end-of-chapter problems) will be indicated in class, to be submitted by students. Students should do the homework and should come to class prepared to discuss the assigned problems.

Course Syllabus

1607421: International Finance

University of Jordan, Faculty of Business, Department of Business Economics

Spring, 2014

Instructor Information

Instructor: Khawlah A. Abdalla Spetan, Assistant Professor

Office Location: Faculty of Business / Business Economic Department -Building # first floor

Telephone: 5355000 ext. 24163

Office Hours: Day(s) time: Sun., Tues. & Thur. 10:00-11:00
Mon. & Wed. 1:45 -2:15

E-mail: khawlah.spetan@ju.edu.jo, khawlahs2000@yahoo.com

Course Identification

Course Number: 1607421

Course Name: International Finance

Course Location:

Class Times: Monday & Wednesday 11:00 – 12:15

Prerequisites: 1607111, Macroeconomics principles

Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This is a course in international monetary economics, which includes the connection between the exchange rates and international macroeconomic policies. The subject of international finance draws its importance from the consequences of worldwide economic policies on a country economy's main outcomes (Employment, National Saving, Trade Balance and Price levels and Money). The course divided into three parts: The first part of the course will present several theories of exchange rate, and the second part will help you gather these theories into an overall analytical framework. The third part will challenge you to employ this analytical framework to real-world applications, and try to link the global financial crisis and the climate change issue. Provide students an up-to-date and understandable analytical framework for revealing current events. Help them grasp and retain the underlying logic of international finance through six to seven sections; first section we will talk about the national income accounts an d balance of payments, second section will be about the asset approach of exchange market and foreign exchange market, third section is about money market and inflation and exchange rate dynamics. In the fourth section the student will try to explore the causes of the fluctuations in exchange rate in long and short runs periods. The fixed exchange rates system will be introduced in section five. And finally in sixth section we will discuss the international macroeconomic policy and try to connect the causes of financial crisis with the most contemporary issue the climate change and their interaction.

Course Learning Objectives

The objectives of this course are: 1) introduce the main exchange rates theories and its determinants and understand the role of exchange rates in international trade . 2) students will understand the movements in macroeconomic variables such as the trade balance, the exchange rate, money, interest rate, national output, and inflation, in short and long runs. 3) Understanding how the interactions of national economies influence the worldwide pattern of macroeconomic activity.4) explore the various international currency arrangements and how did countries try to attain internal and external balance. 5) explain the linkages between the financial crisis and the environmental economics specifically the climate change issue.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- knowledge and understanding:**

- Understand the basic theory of international macroeconomics and finance.
- Understand the determination of the exchange rates in foreign exchange markets.
- Understand why exchange rates can change dramatically over periods of several years.
- Understand the complicated factors that cause output, exchange rates, and inflation to change in the short-run.
- Understand the role of the central bank foreign exchange intervention in the determination of the exchange rates under fixed and managed floating system.
- Understand how the international monetary system influenced the macroeconomic policy making during certain periods.
- Understand the performance and policy problems of the global capital market.
- Understand the international finance of climate change from different perspectives.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Analyze, in an unbiased way, a wide array of important international policy issues.
- Analyze the exchange rates movements in the modern theory of floating exchange rates.
- Relate mathematical and identification models to their assumptions and to the real world.
- Predict in somehow financial crises.
- Link the financial crisis with global warming proplem (climate change issue)

LO **3- Teaching and learning methods**:

- There will be 2 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

- A number of problems (end-of-chapter problems) will be indicated in class, to be submitted by students. Students should attempt the homework and should come to class prepared to discuss the assigned problems.

- Case studies reinforcing material covered, illustrating its applicability in the real world.

Course Name: Contemporary Economic Issues
Course Location:
Class Times:
Prerequisites: 1607210 and 1607211
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course is primarily concerned with contemporary economic issues at the domestic, regional and international levels. Specific topics are chosen from current and recent policy debates.

Course Learning Objectives

The main objective of this course is to augment the students' comprehension of the various contemporary economic issues which arise in the world, and analyze their negative and positive effects on the Jordanian community.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

A1) understand the new and important contemporary economic issues.
A2) understand the problems and reasons that are associated with economic issues.
A3) realize the importance of the issues of environmental economics and climate change.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

B1) collect and analyze relevant data associated with contemporary economic issues.
B2) perform basic analytical techniques and operations in the context of economic issues.
B3) comprehend and communicate positively and effectively data presented in dialogue forums.
B4) develop analytical skills through class presentations, discussions and writing research papers.
B5) apply microeconomic and macroeconomic analysis to evaluate a current public policy.

LO **3- Teaching and Learning Methods**:

Lectures, case studies, problem solving and tutorials.

- Lectures: 7 weeks, 21 hours
- Discussion forums: 7 weeks, 21 hours
- Tutorials: 2 weeks, 6 hours
- Applications (office hours): as requested

Course Resources

Students should use course description as general guidelines. Book lists and syllabi are subject to change.

Because the course focuses on current economic issues, students will be asked to supplement the chosen textbooks with readings from newspapers, magazines, and the internet

Course Website(s)

- http://blackboard.ju.edu.jo

Required Course Texts and Materials

Although the complete list of references and textbooks materials will be assigned during the course, these books are required:

- **Bonello, Frank J. And Isobel Lobo, *Taking Sides : Clashing Views on Economic Issues.* 15th Edition. McGraw Hill, 2012.**
- **Robart, C.Guell, *Economics Today*, sixth edition, McGraw Hill, 2010.**
- **Anothony D. Owen, Nick Hanley, *The Economics of Climate Change*,2004.**

Optional Course Texts and Materials

- **Nick Hanley, Jason Shogren, and Ben White, *Introduction to Environmental Economics***

Assignments and Grading Scheme

Grading Policy

Students will be assessed based on the following:

Mid-term Exam	30%
Second exam	7%
Participation	5%
Short Paper	8%
Final Exam	50%

Assignments are individual assignments. Details of these assignments and the submission deadlines will be announced in class.

Course Policies

University Policies regarding class attendance, course pre-requisites, and academic honesty, grading, incompletes, and final exams will be observed as stated in the University of Jordan. You are responsible for all material discussed in class and assigned in the textbook. Missing class is strongly discouraged. Your professor is far less sympathetic to those who miss class regularly. If you miss class, you are responsible to get the notes from a classmate.

Any type of academic misconduct will result in (F). By Enrolling in this course, you agree with the University of Jordan Policy on Academic Misconduct.

Course Schedule

The contents of this course will be determined according to the economic issues that arise during a particular time period.

Below is a proposed list of some topics. We do not want to make this a formal Schedule because we want to be able to introduce topics as they arise. This may mean introducing new topics or shifting the order of the topics we have already chosen.

Detailed lecture schedule

Prerequisites: Principles of Microeconomics (1607110)

Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

Industrial organization is essentially a branch of applied microeconomics which seeks to understand the causes and effects of various market structures on pricing and product choices. The course focuses on the theory of the firm and the industry in imperfectly competitive markets with an emphasis upon oligopoly theory, but it also addresses empirical applications of the theory. The course explains how firms compete with each other; it models firms' strategies on imperfect markets and derives the impact of firms' behavior on welfare and market structures.
We will analyze market structure, firm conduct, and economic performance of industries. Of special interest is firms' strategic behavior in price and non-price competition. The types of behavior, or conduct, include oligopoly pricing and production, strategic entry deterrence, location strategies, product differentiation, advertising, vertical and horizontal integration, and research and development. The effects of firms' conduct upon economic welfare and feedback effects upon market structure are examined. Moreover, we will analyze the acquisition and use of market power by firms, antitrust law or/and the role of government competition policy.
We will also look at how institutions and industry can shape improvements in environmental quality and support efficient allocations of resources.

Course Learning Objectives

This module aims at providing students with major topics in the field of Industrial Organization. The knowledge that the student will derive from the course is useful for further study of firms and markets as well as the study of effects of regulatory and legal systems (such as antitrust law or competitive policies) upon firms. The knowledge is also useful in further study of the internal operation of firms. Topics covered in this course are useful not only for academic consideration, but also in private enterprises, including financial and legal institutions; in government regulatory agencies; and in international trade.

Course Content Learning Outcomes

Upon the completion of this module, students should be able to achieve the following:

LO **1- knowledge and understanding:**

Students should have knowledge of:

- The definition, measurement and analysis of various key elements of industrial organization.
- Why markets are organized as they are and behave in the way they do.
- Models of competitive, oligopolistic, and monopoly markets.
- The basic dimensions of industries structure, conduct, and performance.
- Price and non-price competition among firms.
- The acquisition and use of market power by firms.
- Role of government competition policy and regulation.
- Industrial environmental economics issues.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Analyze and evaluate models of competitive, oligopolistic, and monopoly markets.
- Analyze and evaluate how firms' structure and conduct affect economic welfare and how these results feed back to effect structure and conduct.
- Explain the various types of industry structures, conduct, and performance; business strategies; and policy alternatives.
- Understand how firms make their decisions based on strategic thinking.
- Discuss theoretical and empirical issues relating to the interactions among firms in a market economy.
- Apply basic concepts of economic analysis of market structures and understand current debates concerning plausible reform of competition policy.
- Evaluate antitrust policies and other government regulations of industry.
- *Analyze environmental issues through a deeper understanding of firms' economic behavior and incentives.*

LO **3- Teaching and learning methods**:

- There will be 3 hours per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

- A number of problems will be indicated in class, to be submitted by students. Students should attempt the homework and should come to class prepared to discuss the assigned problems.

Course Resources

Course Website

- http://blackboard.ju.edu.jo

Main textbook(s) and additional readings

- *Industrial Organization: Contemporary Theory and Empirical Applications,* 4th edition, Lynne Pepall, Dan Richards, and George Norman, Blackwell Publishing, 2008.

- *Modern Industrial Organization*, 4th Edition, Dennis Carlton and Jeffrey Perloff, Adison-Wesley, 2004.

- Hanley, N., H. Folmer (1998) *Game Theory and the Environment*. Edward Elgar Publishing.

- Dutta, P. and R.K. Sundaram (1993) "*The Tragedy of the Commons?*" Economic Theory, 3, pp. 413-426.

Assignments and Grading Scheme

Grading System

A , A- **Excellent**
B+ , B, B- **Very good**
C+, C, C- **Good**
D+ , D, D- **pass**
D-, F = **Failure**

Grading Policy

Students will be assessed based on the following:

Mid-term Exam	30%
Second exam	15%
Short Paper	5%
Final Exam	50%

The objective of the paper is to provide students with an opportunity to apply concepts from this course to a "real" market. Each student's presentation is expected to include the following three parts:
1. Clear description of the market to be discussed.
2. Complete analysis of recent strategic behavior within this market, across all relevant dimensions of firm behavior, including the choice of prices, capacity, products, advertising, R&D, entry, exit, etc.
3. Detailed analysis of one firm in this market (main focus of the presentation).

Details of the assignment and the submission deadline will be announced in class. Dates of exams will be announced in the class.

Course Policies

Classroom Protocol

We oblige ourselves to a high standard of professional behavior. Accordingly, lateness, holding private conversations and indeed any behavior that interrupts me or your colleagues will be considered improper. Using cell phones is forbidden in the class. Repeated violations of this standard may affect your participation grade or may cause withdrawal from course.

Academic Honesty

All the assignments and work submitted by the student should be his or her own. All actions of academic dishonesty including cheating, lifting or helping other students in such actions will be dealt with strictly according to the university regulations.

Course Schedule

Detailed lecture schedule			
	Week:	**Material:**	**Homework and Assignments**
	Week 1	Introduction • The field of industrial organization • Review of Firm, Market, production & cost concepts • Perfect competition compared to monopoly, the concept of economic	TBA

		efficiency	
	Week 2	The industrial organization framework • Basic conditions • Structure • Conduct • Performance	TBA
	Week 3+4	Market Structure • Economies of Scale • Barriers to Entry and Exit and Contestability • Market Concentration • Product Differentiation	TBA
	Week 5	Market Performance • Definition of market performance • Dimensions of market performance • Measuring market performance	TBA
	Week 6+7+8	Market Strategy in Oligopoly Market • The Cournot Oligopoly Model • The Bertrand Oligopoly Model • Edgworth Oligopoly Model • Stackelberg Oligopoly Model • Game Theory and Oligopoly • Cartels and Collusion • Kinked Demand Curve	TBA

	Week 9	Price Discrimination • Incentive and conditions for price discrimination • First-degree (perfect) price discrimination • Second degree price discrimination • Third degree price discrimination • Welfare effects of price discrimination	TBA
	Week 10	Mergers and Acquisitions • Reasons for mergers and acquisitions • Vertical mergers • Horizontal mergers • welfare effects of mergers • Nonprice Competition • Advertising and Information • Brandnames R&D, Patents, and Innovation Antitrust and regulation • Antitrust laws and their purposes • The objectives of regulation • Deregulation	TBA
	Week 11+ 12	Industrial Environmental Economics issues Selected topics from:	TBA

		• The impacts of environmental regulations on industrial activity • Issues in industrial proliferation and environmental preservation, pollution control policies • Game Theory and the Environment ➢ Free-riding and Cooperation in Environmental games ➢ Incentives to participate in an international environmental agreements ➢ The Economics of Exhaustible Resources ➢ The Tragedy of the Commons ➢ The Problem of Externalities	
	Week 13+14	Presentations	TBA
	Week 15	Final exam	TBA

Course Identification

Course Number:
Course Name: Managerial Economics
Course Location:
Class Times:
Prerequisites: 1607210 and 1607211
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

Economic theory is the fundamental determinant of firms' profitability and growth, and economic thinking should be an essential element in nearly every managerial decision. In this course, we will examine the principles of microeconomics, and show how they apply to managerial decision-making. It explains how and why economic theory is used to analyze business problem. In this course we will start with part one; preliminaries (market equilibrium, optimal decisions and Basic estimation techniques), then explore part two demand analysis and its applications (elasticity and demand estimation and forecasting). In part three the production and cost analysis will be or main topic. In part four the student will learn hoe the firms maximize their profits in various market structures. In this particular part we will introduce a very important topic that can be related to take optimal decisions under risk and uncertainty with present of externalities. The climate change will be introduce as a hot topic from utilitarian perspective, the environment is taken into consideration only to the extent that it is useful to humans and then to the policy makers that may affect the standing of firms and global business. Economists are concerned with the environment in so far as it affects the wellbeing of human societies. Whereas environmentalists are concerned about natural systems, economists are primarily interested in natural resources. The economic model focuses on the efficiency of the use of natural

resources in the production process. The ecological model places value on the long-term sustainability of natural systems. These dissimilar standards imply different goals for economic activity. We will try to explore these different situations and decision making within climate and einvernoment changes.

Course Learning Objectives

11. To equip the student with the principles he or she needs to make sense out of the conflicting and contradictory discussions of economic conditions and policies in newspapers and news magazines.
12. Enable the student to evaluate the performance of decision makers, and to predict the impact of their policy actions on families and business.
13. Understand and predict the economic forces shaping real-world business decisions.
14. Develop and strengthen overall analytical skills.
15. Develop critical thinking skills about markets and business decisions.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

- Understand managerial behavior regarding maximizing the profit of the firm under different market structure.
- Understand managerial reaction concerning government policy and activities.
- Understand mathematical methods (Derivative, linear programming), and statistical techniques (regression – model) to help managers taking optimal decisions under risk and uncertinity.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

- Present written and/or oral reports using critical thinking, economic data, and economic theory.

- Perform mathematics, and statistical knowledge and its application on economic- decision of the firms.
- Comprehend and communicate data presented graphically and/or mathematically.
- relate mathematical and statistical models to their assumptions and to the real world.

LO **3- Teaching and Learning Methods**:

Lectures, case studies, problem solving and tutorials.

- Lectures: 7 weeks, 21 hours
- Discussion forums: 7 weeks, 21 hours
- Tutorials: 2 weeks, 6 hours
- Applications (office hours): as requested

Course Resources

There will be 3 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

Course Identification

Course Number:
Course Name: Environmental Economics
Course Location: TBD
Class Times: TBD
Prerequisites:
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

This course tries to shed the light on a very important issue that started to affect all aspects of our life. Students will be introduced to the environmental issues from economics point of view. It offers an integrated understanding of environmental and natural resource economics. Important principles and concepts will be presented to provide students with clear understanding for contemporary environmental and natural resource issues and policy considerations. The course includes real world case studies to demonstrate the policy relevance and implications of key notions. Many areas of economics and impact of environmental policies will be covered. Basic concepts of environmental economics will be explored and examined, such as the economics of natural resource scarcity, climate change, environmental pollution, natural disasters, the economics of pollution, and the economics of sustainable development. The course provides an introduction to the subject of environmental economics without assuming any in-depth prior knowledge of economics. Part one explains the fundamental

economic concepts. Part two uses these concepts in understanding and developing policy responses to some of the major environmental issues of our time. Examples will be drawn from all over the world and include such fundamental issues as climate change, water pollution, and loss of biodiversity.

Course Learning Objectives

The main objectives of this course are:1) increasing awareness towards the contemporary environmental issues caused by various human activities. 2) Identifying the issues of environmental pollution and global economic and development effects. 3) Cost Benefit Analysis of the various economic activities to determine their environmental impacts. 4) Understanding the economics of climate change and its impact on economic development issues.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- knowledge and understanding:**

- Understanding the linkages between economics and environmental issues.
- Understanding economic concepts in the context of environmental problems.
- Understanding the problems of climate change, water pollution, and loss of biodiversity within global overview of environmental issues.
- Understanding the various possible policy responses to major environmental issues.

LO **2- analytical and thinking skills**:

Students should have the ability to:

- Apply microeconomic theory to the study of environmental issues.
- Identify and critically evaluate alternative environmental policy instruments.
- Develop written and verbal skills in communicating an environmental economic perspective.

LO **3- Teaching and learning methods**:

- There will be 2 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

- A number of problems (end-of-chapter problems) will be indicated in class, to be submitted by students. Students should attempt the homework and should prepare to discuss the assigned problems in the class.

Course Resources

Course Website(s)

- http://blackboard.ju.edu.jo

Required Course Texts and Materials

- **Handouts prepared by the instructor for the class.**
- Field, Barry C. and Martha K. Field, Environmental Economics, 5th Edition (San Francisco, CA: McGraw-Hill, 2009).

Optional Course Texts and Materials

• Keohane and Olmstead, *Markets and the Environment* (Island Press, 2007)
• Matthew Kahn, *Fundamentals of Environmental Economics: Solving Urban Pollution Problems.*

• Charles Kolstad, *Environmental Economics* (Oxford University Press, 1st edition 2000, or 2nd edition 2010)

• *The RFF Reader in Environmental and Resource Policy* (Wallace Oates Editor, 2nd edition 2006, RFF Press)

Assignments and Grading Scheme

Grading System

A , A- **Excellent**
B+ , B, B- **Very good**
C+, C, C- **Good**
D+ , D, D- **pass**
D-, F = **Failure**

Grading Policy

Students will be assessed based on the following:

Mid-term Exam	30%
Second exam	7%
Participation	5%
Short Paper	8%
Final Exam	50%

Details of assignments and the submission deadlines will be announced in class.

Course Policies

Late Assignments policy

All assignments are due at the beginning of class. Anything turned in after that will be considered late. Assignments will be accepted up to four days after the due date for half credit. Assignments will not be accepted at all after the four-day extension. Excessive absenteeism and late or missing work will result in lower grades. Contact with your teacher is strongly encouraged especially in the case of being absent. Additionally, please read the college's policy regarding absence and make-up work.

Classroom Protocol

We oblige ourselves to a high standard of professional behavior. Accordingly, lateness, holding private conversations and indeed any behavior that interrupts me or your colleagues will be considered improper. Using cell phones is forbidden in the class. Repeated violations of this standard may affect your participation grade or may cause withdrawal from course.

Course Schedule

Detailed lecture schedule		
Week:	**Material:**	**Homework and Assignments**
Week 1+2	**I. INTRODUCTION** **Economics and the Environment: Introduction** What is Environmental Economics? Ch. 1 and Ch. 2.	TBA

	Week 3+4	**ENVIRONMENTAL ECONOMIC ANALYSIS** **C. Environmental Analysis** Benefits and Costs, Supply and Demand, Ch. 3 Economic Efficiency: Markets, Ch. 4. Economics of Environmental Quality, Ch. 5	TBA
	Week 5 + 6	***B. Analytical Methods*** Framework of Analysis Ch. 6 Benefit-Cost Analysis: Benefits Ch. 7 Benefit-Cost Analysis: Costs Ch. 8 **MIDTERM EXAMINATION** Chapters (1 – 8)	TBA
	Week 7	ENVIRONMENTAL POLICY ANALYSIS **A. Criteria and Strategies** Criteria for Evaluating Environmental Policies, Ch. 9 Decentralized Policies: Liability Laws, Property Rights, Moral Suasion", Ch. 10	TBA
	Week 8 + 9	Command-and-Control Strategies: The Case of Standards, Ch. 11 Incentive-Based Strategies: Emission Charges and Subsidies, Ch. 12	TBA
	Week 10	Incentive-Based Strategies: Transferable Discharge Permits, Ch. 13	TBA
	Week 11	**B. Water Pollution** Water Pollution-Control Policy, Ch. 14	TBA

	Week 12	**C. Air Pollution** Air Pollution-Control Policy, Ch. 15	TBA
	Week 13+14	***D. Waste Pollution*** Government Policy on Toxics and Hazardous Substances, Ch. 16 State and Local Environmental Issues, Ch. 17	TBA
	Week 15	Final exam	TBA

Course Identification

Course Number: **1607311**
Course Name: **Scientific Research in Economics**
Course Location:
Class Times:
Prerequisites: Principles of Statistics 1607150
Faculty Web Page: www.ju.edu.jo

Course Description/Overview

Covers these topics: the concept of scientific research and its definition, and kinds of scientific research, stages and objectives of scientific research, kinds and sources of data and data collection: Questionnaire, population and sample: kinds of sampling, the relation between statistics and scientific research, implementation and analyzing data using statistical methods with SPSS, finally writing reports.

Course Learning Objectives

Providing students with concepts and definition and the importance of scientific research, also providing students with skills in choosing the appropriate way of writing the Questionnaire, the statistical analysis and writing the final report.

Note: Students who are involved in CLIMASP sertificate can apply their research work on environmental issues.

Course Content Learning Outcomes

A. Knowledge and Understanding:

Students should have knowledge of:

- The main concepts of scientific research, and its importance.
- How to think wisely and scientifically.
- How to write questions in the Questionnaire.
- How to deal with the data.

B. Intellectual Analytical and Cognitive Skills:

Student is expected to:

- Write the questions in the Questionnaire correctly.
- Choosing and applying the appropriate statistical analysis.
- Writing the reports.

Course Resources

Hands-out prepared by the instructor for the class

Alkadi, D. (2008), "Methodology and techniques of Scientific Research and Data Analysis using SPSS".

Grading System

0 to 10 (where 5 is the least pass mark)

Grading Policy

Grades can be based on the following:

Evaluation	Point %	Date
Midterm Exam	30	TBA
Second Exam & assignments	20	TBA
Final Exam	50	TBA
Total Points	**100**	

Course Policies

Learning Methodology

Duration: 16 weeks, 48 hours in total
Lectures: 42 hours, 3 per week (including two 1-hour term exams)
Although the lectures cover the vast majority of the course material, students must use the text book.
A number of problems (some could be chosen from the end of chapter problems) will be indicated in class, specifying their due time. A discussion of the assigned problems can be done through the preceding lectures. Also, applying all steps for different statistical methods using SPSS by students.

Classroom Protocol

Details of the assignments and the submission deadlines will be announced in class and/or posted on the course website. Students are advised to keep track of what is announced in class, it is their responsibility to do so, BEING ABSENT IS NOT AN EXCUSE FOR NOT KNOWING WHAT IS GOING ON.

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations.Establishing reasonable accommodations should be considered on a case-by-case basis.

0802313	Basic Mathematical concepts and their teaching methods (2)	------	Curriculum & Instruction	Educational Sciences	Dept. Core.

Capstone Course:

This course is based on design and/or practical training for students. Depending on the student major, the following course fits as a capstone course provided the training is conducted in the field of climate change and environmental sustainability. 6 Credit Hours.

Course Code	Course Title	Prerequisite	Department	Faculty (College)	Course Category
0300150	Community Service	---	Curriculum &Instruction	Educational Sciences	University Requirement

Additional Elective Courses

The following list contains courses than can be taken by student in case he/she wishes to diversify knowledge or unable to register in elective courses offered by his/her Department.

Course Code	Course Title	Prerequisite	Department	Faculty (College)	Course Category
1032464	Law of Environment	---	Public Law	Law	Dept. Elective
0515100	Principles of Public Health	---	Family and Community Medicine	Medicine	University Elective

0601100	Home Plantation	---	Plant Production	Agriculture	University Elective
0802414	Environmental Education for Children	---	Curriculum &Instruction	Educational Sciences	Dept. Elective *
1601433	Business Ethics and Social Responsibility	---	Business Administration, Business Economy	Business	Department Elective
2633100	Archaeology of Jordan	---	Archaeology	Archaeology and Tourism	University Elective
2305100	Introduction to Sociology	---	Sociology	Arts	University Elective
2305421	Globalization Issues	---	Sociology	Arts	Dept. Elective
1132100	Sports and Health	---	Health and Recreation	Physical Education	University Elective

*Not to be taken by the Educational Sciences faculty's students
**A student cannot register in a university elective course offered by the Department of his/her major.
***The student will take 8 Courses (24 hrs). Student will take 6 courses from her/his field and the other 2 courses will be the core courses. With the 6 hrs capstone course the total credit hours are 30 hrs.

Course Description

0802317 Child Computerized program (3 Cr. Hrs)

Prerequisite: (None)
This course discuss some child computerized programs (software) for the purposes of instruction, fun, and literacy. The importance of the computerized programs assisted child creative thinking and develop different skills. In addition to that children will learn some basic skills in design, production analyzing and evaluating some computerized programs and some applications on it.

0802391 Instructional Materials for Children (3 Cr. Hrs)

Prerequisite: (None)

Identifies educational materials for children their importance, sources and types, Choosing ready – made materials according to appropriate criteria and identifying their uses in the classroom. Students will learn to design needed materials which promote

children's thinking abilities such as classification, sorting, numbers, special relations, measurement, time, causality… etc. Emphasis is also placed on designing materials in ways that enhance children's total development and also to judge the efficiency of the produced learning materials.

0802414 Environmental Education child (3 Cr. Hrs)

Prerequisite: (None)

This course will include: Environmental education concept, the importance of integrating it with other subjects, ecosystems, sustaining, natural resources, environmental problem, desertification, distinction, green house effect, environmental pollution, effects of natural phenomena and environment, protecting and managing environment, and national and international safety, science, technology, society and human. Also integrated approach in designing and implementation environmental curriculum will be included.

0802303 Designing and producing Instructional Materials (3 Cr. Hrs)

Prerequisite: (None)

Introduces the concept of instructional materials; definition; relationship to instructional technology; classification; sources; role of such materials in the instructional process; the impact of perception and communication on designing different kinds of instructional materials such as transparencies, slides, audio cassettes, video tapes, and computer disks; principles of designing, producing and using instructional materials according to the system approach; practical application in designing, producing and using instructional materials in different subject matters.

0802213 Basic Mathematical concepts and their teaching methods (1)

Prerequisite: (None) (3 Cr. Hrs)

This course discusses some mathematical concepts and their methods of teaching, such as: numbers, metric system, nation and proportion, prime and composite numbers, and other geometrical concepts such as area and volume, Also this course discusses mathematical goals and objectives

0802313 Basic Mathematical concepts and their teaching methods (2)

Prerequisite: (None) (3 Cr. Hrs)

This course discusses current trends of teaching elementary mathematics with the concentrating on constructivism. Also, this course focuses in different strategies of teaching mathematical concepts, generalization, skills and problem solving. Finally, this course focuses on teaching of some geometrical concepts such as points, lines, and congruence and similarity.

Fall Semester, 2014/2015

Instructor Information

Instructor:	Dr. Diala Hamaidi, Assistant Professor
Office Location:	Department of Curriculum and Instruction
Telephone:	Office – :(962)-6-5355000 ext. 24591
Office Hours:	S,T,Th (10:00am-11:00am)
E-mail:	dhamaidi@nmsu.edu
Website:	http://www.ju.edu.jo/sites/academic/dHamaidi/default.aspx

Course Identification

Course Number:	0802391
Course Name:	Instructional Materials for Children
Course Location:	Department of Curriculum and Instruction
Class Times:	S,T, Th 1:00pm – 2:00pm
Prerequisites:	_
Faculty Web Page:	http://educational.ju.edu.jo/ar/arabic/Home.aspx

Course Description/Overview

Identifies educational materials for children, their importance, sources and types, Choosing ready – made materials according to appropriate criteria and identifying their uses in the classroom. Students will learn to design needed materials which promote children's thinking abilities such as classification, sorting, numbers, special relations, measurement, time, causality… etc. Emphasis is also placed on designing materials in ways that enhance children's total development and also to judge the efficiency of the produced learning materials.

Course Learning Objectives

The students will be able to:

- Identify the meaning of instructional materials for young children (Specifically, kindergarteners)
- Describe the wide variety of instructional materials that can be used in teaching young children
- Reflect on a field visit of Jordanian kindergartens' instructional materials
- Discuss the link between educational theories (Behavioral theory, Constructive theory) and choosing specific instructional materials.
- Design a thematic unit and its related instructional materials (2 sections: theoretical part and practical part)

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO1 & LO2: express their own understanding of instructional materials and search different web sites to provide examples of different instructional materials that they can use in their future teaching)

LO3: Make a presentation in front of his or her classmates in which they will respond to a guideline that was distributed to the whole class regarding a field visit for one of the Jordanian kindergartens (could be private or public). In this presentation the student will describe the physical and emotional environment with a focus on describing the existed instructional materials there. Every student will provide evidence of that visit (could be pictures, drawing, crafts, …)

LO4: Role play and present their understanding of theorists who reflect the constructive theory such as Piaget and Vygotsky, Behavioral theory (such as: Skinner). They will focus on their understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.

LO5: Choose a specific theme based on the children developmental characteristics (the discussion in the class and the references will help them choose their favorite theme). After choosing the theme the students design a complete unit that includes a theoretical part (the idea behind choosing the theme, the long-term objectives of the unit, the short-term objectives, the activities, instructional materials that will help to achieve these objectives, and the assessment of those objectives) and a practical part (designing a variety of instructional materials that

reflect the objectives and show an evidence that their work is designed by themselves. They will provide crafts, real materials, hands-on activities,…)

Required Course Texts and Materials

- **Instructional materials for young children (2007).**

Optional Course Texts and Materials

1. Kritchevsky, S & Prescott. E. (1990) Planning Environment for young children NAEYC. Washington D.C.
2. Lasky, L. & Mukerji, R. (1990) Art Basic for young children. NAEYC. Washington D.C.
3. Allen, R. & Hart, B. The Early ears, Arrangements for learning prentic Hall 1989.
4. Schickedan & Forsyth. Toward understanding children. Little Brown comp. 1990.
5. Day, B. Early childhood Ed. Creative Learning Activities Macmillan Pub. Com. 1988.
6. Good, R. How children learn science. MacMillan Pub. Com. 1997.

Assignments and Grading Scheme

Grading System

LO1 &LO2: Search different web sites to provide examples of different instructional materials.

LO3: Make a presentation (Rubric is attached)

LO4: Role play presentation (Rubric is attached)

LO5: Designing thematic unit with related instructional materials (Rubric is attached)

Grading System

Historical Role Play : Educational Theories (LO4)

Teacher Name: **Dr. Hamaidi**

Student Name: _____

CATEGORY	5	4	3	2
Historical Accuracy	All historical information appeared to be accurate and in chronological order.	Almost all historical information appeared to be accurate and in chronological order.	Most of the historical information was accurate and in chronological order.	Very little of the historical information was accurate and/or in chronological order.
Role	Point-of-view, arguments, and solutions proposed were consistently in character.	Point-of-view, arguments, and solutions proposed were often in character.	Point-of-view, arguments, and solutions proposed were sometimes in character.	Point-of-view, arguments, and solutions proposed were rarely in character.
Knowledge Gained	Can clearly explain several ways in which his character \"saw\" things differently than other characters and can clearly explain why.	Can clearly explain several ways in which his character \"saw\" things differently than other characters.	Can clearly explain one way in which his character \"saw\" things differently than other characters.	Cannot explain one way in which his character \"saw\" things differently than other characters.

Oral Presentation Rubric : Field Visit: Kindergarten Instructional Materials (LO3)

Teacher Name: **Diala Hamaidi**

Student Name: _____

CATEGORY	5	4	2	1

Enthusiasm	Facial expressions and body language generate a strong interest and enthusiasm about the topic in others.	Facial expressions and body language sometimes generate a strong interest and enthusiasm about the topic in others.	Facial expressions and body language are used to try to generate enthusiasm, but seem somewhat faked.	Very little use of facial expressions or body language. Did not generate much interest in topic being presented.
Stays on Topic	Stays on topic all (100%) of the time.	Stays on topic most (99-90%) of the time.	Stays on topic some (89%-75%) of the time.	It was hard to tell what the topic was.
Content	Shows a full understanding of the topic.	Shows a good understanding of the topic.	Shows a good understanding of parts of the topic.	Does not seem to understand the topic very well.
Time-Limit	Presentation is 5-6 minutes long.	Presentation is 4 minutes long.	Presentation is 3 minutes long.	Presentation is less than 3 minutes OR more than 6 minutes.

LO1 &LO2 Class discussion of students' search.

Final Project Presentation: LO5

CATEGORY	**25-21**	**20-16**	**15-11**	**10-0**

Resources / Assessment - 30%	Theme is clear and appropriate to the grade level. Goes along with the Mass. Curriculum Framework.	Theme is clear but not quite appropriate to the grade level. Goes along with the Mass. Curriculum Framework.	Theme is clear but not appropriate to the grade level. Does not go along with the Mass. Curriculum Framework.	Theme is not clear and not appropriate to the grade level. Does not go along with the Mass. Curriculum Framework.
Integrated Study - 20%	The unit includes other disciplines integrated into the lessons with a focus on science and math.	The unit only shows some integration but focuses mostly on math and science.	The unit includes very little materials and resources.	The unit does not contain any materials used or maybe only a short list of them.
Resources / Assessment - 20%	Covers topic in-depth with details and examples. Subject knowledge is excellent.	Includes essential knowledge about the topic. Subject knowledge appears to be good.	Includes essential information about the topic but there are 1-2 factual errors.	Content is minimal OR there are several factual errors.
Mechanics / Organization - 10%	Project is submitted in a plastic file box which includes a binder of lessons as well as materials to support lesson. It will	Project submitted in file box and is mostly well organized. It includes lessons and supporting material. It is computer generated.	Project lacks organization and is missing materials. May not be submitted in correct format. Some things may not be typed.	Project has no organization and is not submitted in the correct format. The project may be missing materials / excessive errors.
Oral Presentation - 20%	Interesting, well-rehearsed with smooth delivery that holds audience attention.	Relatively interesting, rehearsed with a fairly smooth delivery that usually holds audience attention.	Delivery not smooth, but able to hold audience attention most of the time.	Delivery not smooth and audience attention lost.

Grading Policy

Grades can be based on the following: (Example)

Assignments	20%
Exams (1 midterm +1 Final)	70%
Class attendance/Activity participation	10%
Total Points	100

Course Policies

Late Assignments

If you pass the due date your final grade of the assignment will be affected. 5% will be deducted from the late assignment.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class.

Dissability

Appropriate accommodations will be provided for students who have self-identified in the office of Services for Students with Disabilities. If you have, or believe you have a disability, you may wish to self-identify.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	14/9/2014	• Instructor and Students [Presentation: Know each other] • Schedule & Syllabus Review [Lecture] ▪ Next Class [Announcements] 21/9 ▪ Search online websites: meaning of instructional materials for young children
2	21/9	Instructional materials resourses
3	28/9	Designing instructional materials, Ways and methods of utilizing instructional materials: aproaches to ESD
4	12/10	Class discussion of students' search Chapter1: Textbook (Examples of Instructional Materials) Group discussion – Whole class discussion Ch.2: Textbooks: Criteria of choosing Instructional materials
5	19/10	Benefits of Instructional materials: Discussion of the following article from: Cone of Experience / Edgar Dale http://www.khayma.com/education-technology/w5.htm http://www.bhteachersbh.com/forum/new.php?print=1&id=2791 Kritchevsky, S & Prescott. E. (1990) Planning Environment for young children NAEYC. Washington D.C. Presentations of Field Visit Assignment Presentation continue …

6	26/10	presentation continue to build a solid foundation of what is existed in the Jordanian kindergartens
7	2/11	Ch.4: Educational Theories: PowerPoint Presentation: Whole Class discussion regarding each theory and its implementations on choosing instructional materials Skinner, Piaget, Vygotsky, Pruner, Ausubel, Bloom Taxonomy http://www.4uarab.com/vb/showthread.php?t=55885 *faculty.ksu.edu.sa/74637/441/نظريات%20التعلم.doc* http://educationaden.50webs.com/Ausubel.pdf *faculty.ksu.edu.sa/ualturki/Documents/نظريات%20التعلم1.ppt* *Other related links*
8	9/11	Educational Theories: Role Play Presentations Group Presentation *Historical Role Play : Educational Theories (LO4)*
9	16/11	Implementations of Educational Theories in classrooms Introduction: Designing Thematic Unit (Instructor presentation of previous examples)
10	23/11	Midterm Exam: 25/03/2012 Search: Kindergarteners' Developmental Characteristics Students' Search
11	30/11	Designing Thematic Unit (Instructor presentation of previous examples)
12	7/12	How to design the theoretical part of the thematic units

		Review Jordanian Kindergarten curriculum Interactive Kindergarten Curriculum
13	14/12	Designing the practical part of the thematic units How to design hands-on activities and experiences that cover the following domains: Knowledgeable aspect (cover all content areas that are introduced in KG Curriculum and match the developmental aspects of kindergarteners) Social and emotional aspect Physical aspect
14-16	21-28/12	Final Project presentations

Course Syllabus

0802303 Designing and Producing Instructional Materials

The University of Jordan

Faculty of Educational Sciences

Department of Curriculum & Instruction

Instructor Information

Instructor: Dr. Suhair Jaradat
Office Location: 2nd floor, Faculty of Educational Sciences Building
Telephone: 5355000 – 24590
Office Hours: Sun, Tues, Thurs 10-11
E-mail: s.jaradat@ju.edu.jo

Course Identification

Course Number: 0802303
Course Name: Designing and Producing Instructional Materials
Course Location: room 102, Faculty of Educational Sciences Building
Class Times: Sun, Tues, Thurs 11-12
Prerequisites: NA
Faculty Web Page: http://educational.ju.edu.jo/Home.aspx

Course Description/Overview

Designing and Producing Instructional Materials (3 Cr. Hrs)

Introduces the concept of instructional materials; definition; relationship to instructional technology; classification; sources; role of such materials in the instructional process; the impact of perception and communication on designing different kinds of instructional materials such as transparencies, slides, audio cassettes, video tapes, and computer disks; principles of designing, producing and using instructional materials according to the system approach; practical application in designing, producing and using instructional materials in different subject matters.

Course Learning Objectives

Students will be taught the following:

1. Identify instructional materials and their role in the teaching learning process.
2. Understand the relationship between instructional materials and instructional technology.
3. Introduced to the available instructional materials and equipments.
4. How to use the available instructional equipments.
5. Identify the basics of designing and producing instructional materials.
6. Learn the criteria used to evaluate the instructional materials.
7. Learn how to design and produce instructional materials.
8. Learn how to use instructional materials
9. Gain positive attitudes towards using instructional materials in the classroom.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Identify the concepts related to instructional materials.

2. Recognize the relationship between instructional materials and other concepts such as instructional technology, educational technology, perception, and communication.
3. Evaluate instructional materials.
4. Select the appropriate instructional materials for different subjects.
5. Use the available educational equipment.
6. Design and produce instructional materials for different subjects.
7. Design and produce involving the learners' senses.
8. Choose computerized instructional software as ready instructional material.
9. Apply the criteria of evaluating instructional materials during the design and production process.
10. Demonstrate their ability to use instructional materials in real teaching learning situation.

10. Beginning Radio and TV Newswriting: A Self-Instructional Learning Experience by K. Tim Wulfemeyer (May 26, 2009)
11. Enhancing Teaching and Learning: A Leadership Guide for School Library Media Specialists, Second Edition Revised by Jean Donham (July 18, 2008)

Assignments and Grading Scheme

(Insert the course assignments here, and indicate how each assignment is aligning with the learning outcomes).

1. In this course you are required to visit any elementary school you choose around campus or in your neighborhood and observe one of the classes in which the teacher is using instructional materials (grades 1-3), so you can get an idea on using instructional materials in a real situation. You need to write a short report 1-2 pages, you will be provided with questions to answer through

your observation or to ask the teacher after class, one week before the time of the visit. You will be given an official letter from the college of education asking the school administration to allow you in the class.

2. For the final project you will be asked to design and produce instructional materials for any subject you choose for grades 1-3. Through this project you need to apply all what you have learned in the class, and to demonstrate your ability to use the materials you have produced in a real teaching-learning situation.

Grading Policy

Grades will be based on the following:

Mid Term Exam	20%
Field observation	5%
Class attendance/participation	5%
Project (design & Produce instructional materials in class)	20%
Final Exam	50%
Total Points	**100**

Course Policies

Late Assignments

Late assignments will be loosing 2 points for the 1st day after the deadline, and will no be considered after that.

Classroom Protocol

All students in this class are expected to:

1. Participate in class discussions.
2. Attend classes regularly, if you miss more than 7 classes you will not be allowed to attend the final exam.

3. Arrive to the class on time.
4. Turn off cell phones in the class.

Dissability

If you are a student with special needs, please talk to the instructor at the beginning of the semester.

Important Dates to Remember

Mid-term exam Nov 5, 2014
Final exam is based on official announcement by the university.

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines
1	14/9/2014	Introduction to the course, Syllabus
2	21/9	The concept of instructional materials, instructional technology, teaching &learning. Instructional materials and the systemic approach. Scientific approach. Historical overview
3	28/9	The role of instructional materials in facilitating the teaching-learning process Criteria for a good instructional material

		Rules to be followed when using instructional materials
	5/10	Holidays
4	12/10	Philosophical perspectives Classifications of instructional materials
5	19/10	Evaluating instructional materials Perception and instructional materials, principles, factors
6	26/10	Educational communication Historical overview, goals, models
7	2/11	Communication: criteria, barriers General features in designing and producing instructional materials For whom, how, when, why, where
8	9/11	Learning principles and psychological perspective Instructional design : concepts, steps(different models) Planning for producing instructional materials Steps to follow
9	16/11	Instructional equipments available: demonstrations Midterm exam
10	23/11	Computerized instructional materials
11	30/11	Exploring, evaluating samples of instructional materials in the lab Classroom observation
12	7/12	Divide in groups Planning for designing and producing instructional materials: goals, target group, materials to be used, description, how to be used
13	14/12	Start production

14	21/12	Continue production
15	28/12	Class presentations
16	4/1	Final exam

Course Identification

Course Number: 0832213

Course Name: *Basic Mathematical concepts and their teaching methods (1)*

Course Location: Room 102, Faculty of Educational Sciences Building
Class Times: Sunday, Tuesday, Thursday 9-10
Prerequisites: -
Faculty Web Page: http://Educationalsciences.ju.edu.jo

Course Description

This course displays basic mathematical concepts and its teaching methods and strategies such as: numbers and its computational operations, base ten system, place values, fractions, decimals and its computational operations, rounding with respect to place value, percentage, powers and operations, prime factorization, proportion and ratio, integers, metric measure, linear measure, and time. Furthermore, this course addresses the objectives and the teaching methods and strategies for the first three grades.

Course Learning Objectives

1. Identify the nature of mathematics.
2. Identify the learning objectives of teaching mathematics for the first three grades.
3. Identify the effective /modern strategy for teaching mathematical concepts/generalization\skills\and problem solving for the first thee grades.
4. Understand geometric concepts \theories related to the first thee grades.
5. Learn how to analyze, connect, develop, mathematical concepts.
6. Learn about NCTM

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Implement different effective /modern strategy for teaching mathematical concepts/generalization\skills\and problem solving for the first thee grades.
2. Solve mathematical problems using concepts /theories in more than one method.

3. Explain mathematical concepts using different teaching strategies
4. Use high level skills such as analysis, prediction, connection, representation,… in teaching mathematics for the first thee grades.
5. Analyze a unit from math textbook (1st three grades) with respect to concepts/generalization/skills/problem solving.
6. Analyze a unit from math textbook (1st three grades) with respect to the NCTM content and operation standards.

Grading Policy

Grades can be based on the following:

Assignments(projects, practicum, presentation, field visits)	25%
Participation	5%
Mid-term Exam	20%
Final Exam	50%
Total Points	**100**

Course Policies

Late Assignments

Any late assignment without an official permission will not be considered.

Classroom Protocol

Students are expected to attend every class at the beginning of the session, unless you have an excused absence due to illness or an emergency. According to the university regulations, if you miss more than 15% of 48 hours during the term, you will fail the course.

Dissability

Any student with special needs should contact me and provide official documents at the beginning of the semester.

Important Dates to Remember

Mid-term exam April 2, 2015

Final Exam is based on the official announcement by the university

Course Schedule

Week	Topics
1,2	Introduction to the course Math curriculum for the 1st three grades
3,4	Analyzing the Jordanian math curriculum for the 1st three grades Comparing Jordanian Math textbooks with other Arab Math textbooks
5,6	Set theory
7	Counting models
8	Whole number basic mathematical operations, and its properties
9	Students' presentations Mid-term test
10	Integers , basic mathematical operations, and its properties
11	Fractions, basic mathematical operations, and its properties
12	Real numbers, , basic mathematical operations, and its properties
13	Prime factorization

14	Percentage and ratio
15	Problem solving
16	Review and the Final Exam

Course Description

This course discusses current trends of teaching elementary mathematics with the concentrating on constructivism. Also, this course focuses in different strategies of teaching geometric concepts, generalization, skills and problem solving. Finally, this course focuses on teaching of some geometrical concepts such as points, lines, congruence and similarity, perimeter, area, volume.

Course Learning Objectives

7. Identify the nature of mathematics.
8. Identify the learning objectives of teaching geometric for the first three grades.
9. Identify the effective /modern strategy for teaching geometric concepts/generalization\skills\and problem solving for the first thee grades.
10. Understand geometric concepts \theories related to the first thee grades.
11. Learn how to analyze, connect, develop, geometric concepts.
12. Learn about NCTM

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

7. Implement different effective /modern strategy for teaching geometric concepts/generalization\skills\and problem solving for the first thee grades.
8. Solve geometric problems using concepts /theories in more than one method.
9. Explain geometric concepts using different teaching strategies
10. Use high level skills such as analysis, prediction, connection, representation,… in teaching geometric for the first thee grades.

8. Moore, K. (2010). Classroom teaching skills. Mc Grow-Hill, Inc: London.

Grading Policy

Grades can be based on the following:

Assignments(projects, practicum, presentation, field visits)	25%
Participation	5%
Mid-term Exam	20%
Final Exam	50%
Total Points	**100**

Course Policies

Late Assignments

Any late assignment without an official permission will not be considered.

Classroom Protocol

Students are expected to attend every class at the beginning of the session, unless you have an excused absence due to illness or an emergency. According to the university regulations, if you miss more than 15% of 48 hours during the term, you will fail the course.

Dissability

Any student with special needs should contact me and provide official documents at the beginning of the semester.

Important Dates to Remember

Mid-term exam April 2, 2015

Final Exam is based on the official announcement by the university

Course Schedule

Week	Topics
1,2	Introduction to the course Lines and angels
3,4	Measurements
5	Time
6	2D shapes and its properties
7	3D shapes and its properties
8	Perimeter
9 &10	Students' presentations Mid-term test
11	Area
12	Volume
13	Cartesian Representation
14	NCTM Standards and Principles
15	Problem Solving
16	Review and the Final Exam

نموذج وصف مادة

اسم المادة ورقمها **برامج الأطفال المحوسبة** **(0802317)**	اسم المحاضر: د. سهير جرادات E-mail: s.jaradat@ju.edu.jo Tel: 5355000 Ext. 24590
عدد الساعات المعتمدة: 3	
عدد الأسابيع: 16	

وصف المادة:

تتناول هذه المادة البرامج التعليمية والترفيهية والتثقيفية وأهميتها للأطفال وأثرها في نمو مهاراتهم المختلفة والاستراتيجيات المختلفة لتوظيف هذه البرامج لأغراض تعليمية ومعايير تقويمها ، وأسس تصميم وإنتاج وتحليل البرامج التعليمية وتطبيقات عملية.

الأهداف:

تهدف هذه المادة إلى:

1. تعريف الطالب بدور الحاسوب وأهميته كوسيلة تعليمية وترفيهية وتثقيفية للأطفال.
2. إكساب الطالب بعض الكفايات التكنولوجية المتعلقة بموضوع المادة.
3. التعرف على بعض المعايير التي يمكن إتباعها في اختيار وتقويم برمجيات حاسوبية جاهزة مناسبة للأطفال.
4. إكساب الطالب مهارات تطبيقية لبرمجيات حاسوبية جاهزة تناسب الأطفال في أعمار مختلفة وكيفية استخدامها في تعليمهم.
5. إكساب الطالب مهارة تصميم أنشطة والعاب تعليمية محوسبة للأطفال.

مخرجات التعلم:

1. يدرك الطالب المفاهيم المتعلقة بالثقافة الحاسوبية.
2. يميز الطالب دورا لحاسوب وأهميته كوسيلة تعليمية وترفيهية وتثقيفية للأطفال.
3. يقدر الطالب المخاطر الصحية والنفسية والاجتماعية والعقلية للحاسوب.
4. يدرك الطالب مفاهيم متعلقة بكيفية استخدام الحاسوب كوسيلة تعليمية وترفيهية مساعدة للأطفال.
5. استخدام الانترنت كمصدر وأداة بحث عن مواقع وبرمجيات جاهزة ومجانية مناسبة للأطفال.
6. استخدام برمجيات مختلفة ولأغراض مختلفة للأطفال.
7. يستخدم الطالب الحاسوب في تطبيق العاب تعليمية وترفيهية وتثقيفية.
8. يختار البرمجية التعليمية الجاهزة والمناسبة للمرحلة العمرية والاحتياجات المختلفة للأطفال.

9. يصمم أنشطة و العاب تعليمية في موضوعات مختلفة للأطفال.
10. يقيم البرامج والألعاب والمواقع التعليمية المختلفة للأطفال.
11. يوظف الطالب ما تعلمه وصممه من أنشطة وألعاب تعليمية محوسبة في غرفة الصف.

التقويم:

1. امتحان منتصف الفصل 20%
2. أعمال الفصل 30%
3. الامتحان النهائي (نظري + عملي) 50%

يتوقع من الطالب الالتزام بمواعيد تسليم الواجبات التي يحددها المدرس. كما ويتوقع من الطالب الالتزام بحضور المحاضرات ووقتها و مواعيد الامتحانات، والتقيد بمضمون أنظمة وتعليمات الجامعة.

طرائق التدريس:

1. المحاضرة
2. المناقشة والحوار.
3. تطبيقات عملية في مواضيع مختلفة باستخدام الحاسوب.
4. البحث والاستقصاء
5. تعلم تعاوني
6. التعلم من خلال المشروع والمهام العملية

الخطــة:

الأسبوع	الموضوع	ملاحظات
	الفصل الأول: أهمية استخدام الحاسوب لطفل الروضة	

2+1	1. مبادئ تقديم الخبرات المحوسبة للأطفال 2. مبادئ تصميم عناصر عملية التعليم باستخدام البرامج التعليمية المحوسبة للأطفال 3. مخاطر استخدام الحاسوب وإرشادات وقائية 4. كفايات مهنية و تكنولوجية لدى المعلم	
3	**الفصل الثاني: المرحلة العمرية للطفل(خصائصها وحاجاتها للبرامج المحوسبة** 1. النمو الجسمي والحركي للطفل 2. النمو الانفعالي للطفل 3. النمو الاجتماعي للطفل 4. النمو اللغوي للطفل 5. النمو العقلي للطفل	
4	**الفصل الثالث: استعدادات الأطفال وتقويمها** 1. استعدادات(قدرات) حسية: سمعية – بصرية... 2. استعدادات(استجابات) حركية: دقة التحكم- زمن الرجع- مهارة الإصبع 3. استعدادات اجتماعية: ذكاء اجتماعي- مهارات اجتماعية 4. استعدادات أكاديمية: علمي-لغوي- رياضياتي 5. استعدادات مهنية: موسيقية- فنية – تكنولوجية	
5	**الفصل الرابع: تصنيفات برامج الأطفال المحوسبة** 1. ترفيهية: رياضية- خيالية- عنف واقعي- عنف خيالي- معمارية بنائية- إستراتيجية 2.تثقيفية: اثرائية- موجهة بيئيا- رسم وتلوين- قصص وكتب الكترونية- العاب	

	تفكير 3. تعليمية: تدريب وممارسة- تدريس خصوصي- حوار وتخاطب- حل المشكلات- محاكاة- العاب تعليمية 4. تصنيف البرامج وفق نظريات التعلم : السلوكية- البنائية	
6	**الفصل الخامس: معايير لتقويم لبرامج الأطفال المحوسبة** 1. معايير تربوية < الأسس النفسية والفلسفية- أهداف البرنامج- محتوى البرنامج> 2. معايير فنية < تشغيل البرنامج- المساعد- واجهة الاستخدام- التصميم العام – تقويم البرنامج> 3. إرشادات توظيف البرنامج < مبادئ تقديم الخبرات المحوسبة- أسس تصميم وإنتاج البرامج المحوسبة> 4. خطوات بناء البرامج المحوسبة للأطفال <مرحلة الدراسة والتحليل- مرحلة تصميم السيناريو-مرحلة الإنتاج>	
7+8+9	**تطبيقات عملية باستخدام البرمجيات التعليمية الجاهزة الآتية:** برمجية تعلم الحروف العربية مع النطق برمجية صور تعليمية للأطفال برمجية لغة انجليزية للمرحلة الأساسية برمجية تعليم الرياضيات برمجية تعلم بعض العبادات للأطفال	يتضمن استخدام و تقييم وتوظيف للمواقع والبرمجيات المذكورة
10	برمجية MS-Logo	يتضمن عرض ومناقشة أعمال الطلبة للواجب

11+12	برمجية Classtools	المطلوب (تصميم أنشطة وألعاب تعليمية) لكل من البرمجيات المذكورة
13+14	برمجية kidspiration	
15+16	برمجية Windows Movie Maker

وصف المساق

يتناول هذا المساق مفهوم التربية البيئية وأهمية التكامل في عرضها ضمن الموضوعات الممكنة، النظام البيئي، المصادر الطبيعية والمحافظة عليها، المشكلات البيئية والتصحر، والانقراض، ظاهرة البيت الزجاجي، تلوث البيئة، الظواهر الطبيعية وأثرها في البيئة، إدارة البيئة وحمايتها، صحة البيئة، البيئة والأمن الوطني والقومي، وقضايا العلم والتكنولوجيا والبيئة والإنسان. وتعرف المنحى التكاملي في تصميم منهاج التربية البيئية وتنفيذه.

محتويات المساق

الوحدة	المحتويات

الوحدة	المحتويات
الوحدة الأولى : التربية البيئية: المفهوم– الأهداف – المعوقات– الضوابط	– تعريف البيئة – التربية البيئية و أهدافها – النظام البيئي الطبيعي والحضاري – النظام البيئي ومكوناته – دورات المواد وأنواعه – اختلال التوازن البيئي ومسبباته – الإنسان وتغيير النظم البيئي – الضوابط اللازمة لتحقيق أهداف التربية البيئية – أنشطة تثقيفية و إثرائية –
الوحدة الثانية : أهم التحديات الأساسية التي تؤثر في العمل البيئي في الوطن العربي	– السكان – محدودية بعض الموارد البيئية وإهدار الكثير منها – آثار التغيرات العالمية على البيئة العربية - أنشطة تثقيفية
الوحدة الثالثة :	– النزاعات والحروب وتأثيرها على البيئة والتنمية المستدامة في الوطن

الوحدة	المحتويات
أهم المشكلات البيئية على المستوى العالمي والعربي	العربي – العولمة والحكم الرشيد، وتأثيرهما على البيئة في الوطن العربي – إدارة البيئة وحمايتها – تلوث الهواء وتغير المناخ وأثرهما على المستوى العالمي والعربي – البيئة الساحلية في الوطن العربي – نقص التنوع الحيوي في الوطن العربي – الزحف الصحراوي في الوطن العربي – أنماط الإنتاج والاستهلاك غير المستدام – المخلفات الصلبة والنفايات الخطرة والملوثات العضوية الثابتة – الطاقة واستخداماتها في الوطن العربي – الكوارث البيئية - البيت الزجاجي – صحة البيئة – **المشكلات البيئية في الأردن ودور التربية البيئية في مواجهتها**
الوحدة الرابعة : وسائل التغلب والتخفيف من حدة المشكلات البيئية	– المؤتمرات الدولية والإقليمية ودعوتها إلى التنمية المستدامة – التشريعات والقوانين البيئية – الإعلام البيئي

الوحدة	المحتويات
	- أنشطة تثقيفية
الوحدة الخامسة ممارسات بيئية إيجابية وعملية	– بعض الممارسات العملية للحفاظ على البيئة – الحقوق والواجبات البيئية - صحة البيئة
الوحدة السادسة : قضايا العلم والتكنولوجيا والبيئة والإنسان **تعليم التربية البيئية**	- قضايا العلم والتكنولوجيا والبيئة والإنسان. - أهم أساليب تربية طفل ما قبل المدرسة بيئيا - تقويم التربية البيئية

متطلبات المساق :

- **حضور جميع المحاضرات والمساهمة الفاعلة فيها .**
- **امتحان أول 20 %**
- **المشاركة والأنشطة العملية في الميدان 30%**
- **امتحان نهائي 50 %**

المجموع 100 %

Course	**International Trade Theory**
Module 1	**Introduction to International Economics and Overview of World Trade.**
Key Concepts	International trade, international money, acceleration of the size of world trade.
Overview	The study of international economics has become very important in recent decades, and the international economics relations have b crucial to every country. Significant themes are considered in this subject including the gains from trade, the patterns of protectionism and international capital markets. The size of trade flows of goods and services and capital has accelerated during t few decades, as appears in the rise in the ratio of this trade to GDP. This aspect has been driven by several factors such as the coop

	on international trade policies.
Aim	To create the awareness of the importance of international trade itself, and the importance of studying it. Also, to introduce stud international economic concepts and issues.
Learning Outcomes	At the end of this module learner will be able to : • Distinguish between international and domestic issues. • Distinguish between the trade and monetary aspects of international economics. • Understand the causes of trade, patterns of trade and terms of trade. • Acquire data on the development of exports trade and imports at the global level, as well as domestic one.
Units	Chapter 1: Introduction Chapter 2: World Trade : An overview.
Readings	• Paul Bairoch. Economics and World History, London : Harvester, 1993 A grand survey of the world economy over time. • World Bank. World Development Report of 1995.
Activity	1- Calculate the ratio of (exports of goods and services) to GDP for each of the Arab Asian countries for years 2000 and 2013. Compare results and provide your comments. 2- Compare the export rankings of the top ten leading exports of 1994 to the rankings top ten leading exports in 2013. Discuss some of t reasons why rankings have changed. 3- A century ago, most British imports came from relatively distant locations: North America, Latin America, and Asia. Today, most Br imports come from other European countries. How does this fit in with the changing types ofgoods that make up world trade?
Module 2	Labor Productivity and Comparative Advantage: The Ricardian Model.
Key Concepts	Absolute advantage, comparative advantage, opportunity cost, partial equilibrium analysis, unit labor requirement, production possi frontier, dynamic comparative advantage and ethics.
Overview	The Ricardian model is the simplest model that shows how differences between countries in labor productivity give rise to trade and from trade. In this model, countries will export goods that their labor produces relatively efficiently and import goods that their labo produces relatively inefficiently. A country's production pattern is determined by comparative advantage. The proposition that trade beneficial is unqualified. That is, there is no requirement that a country be "competitive" or that the trade be fair.
Aim	Introducing students to the concept of comparative advantage and develop a specific model of how comparative advantage determi pattern of international trade.

<table>
<tr><td>Learning Outcomes</td><td>After reading this module, the student will be able to:
Explain how the Ricardian model works and how it illustrates the principle of comparative advantage.
Demonstrate gains from trade and refute common fallacies about international trade.
Describe the empirical evidence that wages reflect productivity and that trade patterns reflect relative productivity.</td></tr>
<tr><td>Units</td><td>Chapter 3</td></tr>
<tr><td>Readings</td><td>- Rudiger Dornbusch, Stanley Fischer and Paul Samuelson. "Comparative Advantage, Trade and Payments in Ricardian Model with a Continuum of Goals." American Economic Review 67 (December 1977),pp. 823-83.
- David Ricardo. The Principles of Political Economy and Taxation. Homewood; IL. : Irwin, 1963.</td></tr>
<tr><td>Activity</td><td>1. Given the input-output relationships in the table below:
<table>
<tr><td rowspan="2">goods</td><td colspan="2">countries</td></tr>
<tr><td>Jordan</td><td>Lebanon</td></tr>
<tr><td>grapes</td><td>8</td><td>4</td></tr>
<tr><td>olives</td><td>4</td><td>1</td></tr>
</table>
a) Which country has absolute advantage in which good and why?
b) Which country has comparative advantage in which good and why?
c) If Jordan is endowed with 8000 hours of labor, how much X will it produce after trade begins? How much Y? Explain.
d) What is the allowable range on Jordan's wages relative to Lebanon's if trade is flowing between these two countries according to comparative advantage?
2. Home has 1200 units of labor available. It can produce two goods, apples and bananas. The unit labor requirement in apple productio while in banana production it is 2.
a) Graph home's production possibility curve.
b) What is the opportunity cost of apples in terms of bananas?
c) In the absence of trade, what would the price of apples in terms of bananas be? Why?
3. Explain how trade will tend to emerge along lines of comparative advantage if markets are allowed to work freely.
4. What is meant by " Fair Trade " ? Are there organizations, or affiliations for world organizations in Jordan, that are engaged actively supporting producers to export?</td></tr>
</table>

Module 3	Resources and Trade: **The Heckscher-Ohlin (HO) Model.**
Key Concepts	Factor abundance, factor intensity, biased expansion of production possibilities, factor proportion theory.
Overview	The Heckscher- Ohlin model is based on two goods that are produced using two factors of production. The two goods differ in their intensity. A country that has a large supply of one resource relative to its supply of other resources is abundant in that resource. A c will tend to produce relatively more of goods that use its abundant resources intensively. The result is the basic H-O theory of Countries tend to export goods that are intensive in the factors with which they are a abundantly supplied.
Aim	The HO model is considered a primary tool of general equilibriums analysis for open economies. As such, this chapter seeks to p students with a clear but relatively analytical introduction to the model.
Learning Outcomes	At the end of this module learners will be able to: • Explain how differences in resources can cause international trade. • Discuss why trade often creates losers as well as winners. • Understand the meaning of gains from trade when there are losers. • Discuss the reasons why trade is a politically contentious issue and the arguments for free trade despite the existence o losers. • Understand the concept of sustainability and its relation to natural resources. • Discuss why each generation should leave the environment not worse off, and not damaged by depletion of resources o pollution of land, water and atmosphere.
Units	Chapter 4
Readings	- Donald Davis and David Weinstein. "An Account of Global Factor Trade." National Bureau of Economic Research working Paper No. 1998. - Paul Samuelson, "International Trade and the Equalization of Factor Prices." Economic Journal 58(1948), PP. 163-184.
Activity	1. Explain carefully why the assumption of identical technology worldwide eliminates the classical basis for international trade. 2. Explain how free international trade tends to lead to factor price equalization under the assumption of the HO model? What does this predict about which groups should be in favor of or opposed to free international trade? 3. The world's poorest countries cannot find anything to export. There is neither resource that is abundant- certainly not capital nor land

	small poor nations not even labor is abundant. Discuss
Module 4	**The Standard Trade Model.**
Key Concepts	Export biased growth, import biased growth, immiserizing growth.
Overview	This model has been developed, as a mixture of the Ricardian model and Heckscher-Ohlin model, in order to be more capable to a real problems. The two mentioned models may be viewed as special cases of a more general model of a trading world economy. A many important issues in international economies can be conducted in terms of this general model, with only the details depend which special model we choose. These issues include effects of shifts in world demand resulting from foreign aid; and simulation s supply and demand resulting from tariffs and export subsidies.
Aim	The aim of this module is to develop the ability of students to reason accurately and analyse real problems and issues of world trade.
Learning Outcomes	After reading this module, students will be able to: • Understand how the components of the standard trade model production possibilities curve, isovalue lines and indiff curves fit together to illustrate how trade patterns are established by a combination of supply – side and demand factors. • Recognize how changes in the terms of trade, economic growth and transfers between nations affect the welfare of n engaged in international – trade, and recognize the relation between trade, development and growth . • Understand the impact of trade between trading nations on the distribution of income and welfare within these countr • Understand the interaction between the three dimensions of development: economic, social and environmental throug combining trade theory with the theory of externalities to show how the basic principle of gains from trade must be mo in a real world with many environmental complications. • Discuss how the issues related to sustainable trade and "greening" global environment institutions can be placed in th context of real – world policy.
Units	Chapter 5
Readings	- Paul krugman. " Does Third World Growth Hurt First World Prosperity? " Harvard Business Review 72 (July – August 1994), PP. 11 121. - John Whalley. Trade Liberalization Among Major World Trading Areas. Cambridge: MIT Press, 1985.

Activity	1. Countries A and B have two factors of production, capital and labor, with which they produce two goods, X and Y. Technology is the in the two countries. X is capital – intensive; A is capital abundant. Analyze the effects on the terms of trade and the welfare of the two countries of the following: a) An increase in A's capital stock. b) An increase in A's labor supply. c) An increase in B's capital stock. d) An increase in B's labor supply. 2. Assume that Norway and Sweden trade with each other, with Norway exporting fish to Sweden and Sweden exporting volvos (autom to Norway. Illustrate the gains from trade between the two countries using the standard trade model, assuming first that tastes for the are the same in both countries, but the production possibilities curves differ: Norway has a long coast that borders on the north Atlant making it relatively more productive in fishing. Sweden has a greater endowment of capital making it relatively more productive in automobiles. 3. In practice much foreign aid is "tied"; that is, it comes with restrictions that require the recipient spend the aid on goods from the donc country. For example, Germany might provide money for an irrigation project in Africa, on the condition that the pumps, pipeline, an construction equipment be purchased from Germany. How does such tying of aid affect the transfer problem analysis? Does tying of a make sense from the donor's point of view? Can you think of a scenario in which tied aid usually makes the recipient worse off? 4. Do you think that Saudi Arabia has experienced immiserizing growth at the end of the seventies and beginning of the eighties of the l century? (The price of oil has increased substantially in this period).
Module 5	Economies of Scale, Imperfect Competition and International Trade.
Key Concepts	Monopolistic competition, internal and external economics of scale, interindustry and intraindustry trade, dumping.
Overview	Economies of scale give countries an incentive to specialize and trade even in the absence of differences between countries i resources or technology. Economies of scale can be internal (depending on the size of the firm) or external (depending on the size industry).
Aim	The aim of this module is to focus on another cause of international trade, other than differences in comparative advantage. Trad arise between countries to achieve economies of scale in production. And we want to also to show how in the real world patt

	international trade reflect the interaction of both these motives.
Learning Outcomes	After reading this module students will be able to: • Recognize why international trade often occurs from increasing returns to scale and imperfect competition. • Understand the source of intraindustry trade and how it differs from interindustry trade. • Detail the "dumping" arguments used by domestic industries as a basis for protectionism.
Units	Chapter 6
Readings	- Henryk Kierzkowski, ed. Monopolistic Competition in International trade, Oxford: Clarendon Press. 1984. - Micheal Porter. The competitive Advantage of Nations. New York, Free Press, 1990.
Activity	• Give two examples of products that are traded on international markets for which there are increasing returns. • Evaluate the relative importance of economies of scale and comparative advantage in causing the following: a) Most of the world's aluminum is smelted in Norway or Canada. b) Much of the world's best olive oil comes from the Mediterranean countries, including Jordan. c) Half of the world's large jet aircraft are assembled in Seattle in the United States. d) Most of the semiconductors are manufactured in either the United States or Japan. e) Investigate the situation of Jordan with respect to dumping. Discuss one of the cases (if any) of dumping in Jordan.
Module 6	**International Factor Movements**
Key Concepts	International labor mobility, direct foreign investment and multinational firms, international borrowing and lending.
Overview	International factor movements can sometimes substitute for trade, so international migration of labor is similar in its causes and ef international trade based on differences in resources. International borrowing and lending can be viewed as a kind of internationa but one that involves trade of present consumption for future consumption. Multinational firms primarily exist as ways of ext control over activities taking places in two or more different countries.
Aim	The main aim here is to enhance understanding that the essentials underlying international trade in goods can – in principle – be app on factors movements. Also, the effects of their movements will be analysed .
Learning Outcomes	After reading this module, students will be able to: • Discuss the causes as well as the winners and losers from migration and labor mobility between nations.

	• Understand theories that explain international capital flows, as well as the existence of multinational firms and the motivation for foreign direct investment across economies. • Discuss some aspects related to migration and capital flows, such as: investor rights and labor standards.
Units	Chapter 7
Readings	- Charles P. Kindleberger. Europe's Postwar Growth: The Role of Labor Supply. Cambridge : Harvard University Press, 1967. - Richard A. Breeher and Robert C. Feenstra. " International Trade and capital Mobility Between Diversified Economics" Journal of International Economics 14 (May 1983). - Richard E. Caves. Multinational Enterprises and Economic Analysis. Cambridge: Harvard University Press, 1982.
Activity	1. Explain the analogy between international borrowing and lending and ordinary international trade. 2. Which of the following are direct foreign investment, and which are not? a) A Saudi businessman buys $10 million of IBM stock? b) The same businessman buys a Jordan apartment building. c) A French company merges with an American company; stockholding in the U.S. company exchange their stock for shares in t French firms.
Module 7	**Trade Policies and Trade Agreements**
Key Concepts	Tariffs, import quota, nontariff barriers, protectionism, strategic trade policy, free trade area, and custom union, WTO.
Overview	This module examines some of the reasons governments do not base their policy on economists' cost – benefit calculations. Sophis arguments for government intervention in trade emerged in advanced countries (strategic – trade policy) and in developing co (effects of trade on workers).
Aim	To introduce students to the reasons behind restricting trade flows and with what instruments.
Learning Outcomes	After reading this module, students will be able to: • Evaluate the costs and benefits of tariffs, their welfare effects, and winners and losers from tariff policies. • Discuss other important instruments of trade policy. • Evaluate national welfare arguments against free trade. • Relate the theory and evidence behind "political economy" views of trade policy. • Explain how international negotiations and agreements have promoted world trade.

	• Discuss the "infant industry argument" • Evaluate the claims of the anti – globalization movement related to trade effects on workers, labor standards, and the environment in l the counter arguments.
Units	Chapter 8 (The instruments of trade policy) ; 9 (the political economy of trade policy); 10 (trade policy in developing countries and controversies in trade policy).
Readings	- W.M Corden. The Theory of Protection. Oxford : Clarendon Press, 1971. - Robert E. Baldwin. " Trade Policies in Developing Countries," in Roland W. Jones and Peter B. Kenen, eds. Handbook of Internationa Economics, vol. 1. Amesterdam. North – Holand 1984. - World Bank. World Development Report 2005. Equity and Development. - Kimberly Ann Elliot. Can Labor standards Improve Under Globalization? Washington, D.C. : Institute for International Economics. 2 - European Parliament, Directorate – General for External Policy – Policy Department. International Trade Policy in the Context of Cli Change Imperative, 2010.
Activity	1. What are advantages and disadvantages of instituting higher labor standards in developing countries? 2. What is the main critique against the WTO with respect to environmental protection? How does the WTO justify its position on trade disputes that involve environmental issues? 3. What were some of the reasons for the decline in import – substituting industrialization strategy in favor of a strategy that promotes o trade? Which strategy is more successful in the case of Jordan, as a small economy? Why? 4. Suppose that Jordan (the small country case) can import a, good at a world price of 10 per unit. The domestic supply curve of the goo 50+5p, the demand curve is D= 400 – 10p. In addition, each unit of production yields a marginal social benefit of 10. a) Evaluate the total effect on welfare of a tariff of 5 units levied on imports. b) Calculate the total effect of a production subsidy of 5 units. c) Why does the production subsidy produce a greater gain in welfare than tariff?

Course	International Political Economy
Module 1	**Introduction and Basic Concepts.**
Key Concepts	Interaction of economics and politics.
Overview	This module is a general introduction on the international political economy. It emphasizes the interconnectedness between economics and politics at the international level. Major concepts and topics at the international level are explored in a general manner.
Aim	To give a general idea about the concepts and issues of international political economy.
Learning Outcomes	After taking this module, students should be able to : • Realize the interaction nature of economics and politics. • Understand the general meaning of the main concepts of this subject.
Units	1: Introduction and basic concepts
Readings	
Activity	• Explain why both economy and politics are interconnected.
Module 2	Definition of economic scince and economic problem
Key Concepts	Scarcity and efficiency, normative vs. positive economics, Laissez-faire, mixed economies, production-possipilities curve, opportunity cost.
Overview	As the "International Political Economy" trys to explore the interaction of economics and politics in global affairs, it is convenient to introduce at first the definition of " Economics ", and to explain how societies solve the three problems of economic organization, (what, How and for whom). Also this module through constructing the " production possibilities curve ", can illustrate many basic economic processes and issues. .

Aim	To introduce students to basic concepts of economics and the economic problem.
Learning Outcomes	At the end of this module, students will be able to: • Understand what is economics about. • Analyse key idea in economics such as: unlimited wants, scarce resources and that society must use them efficiently.
Units	2. Definition of economic science and economic problem
Readings	- Samuelson – Nordhous. Economics. MASS INSITTUTE of TECH, 19 th Edition 2010. - Robert Heilbronet, the world philosophers, seventh Edition, 1999.
Activity	* Define each of the following terms carefully and give examples: PPC, scarcity, production efficiency, inputs, outputs. * Many scientists believe that we are rapidly depleting our natural resources. Assume that there are only two inputs (labor and natural resources) produce two goods (concerts and gasoline) with no improvement in society's technology over time. Show what would happen to PPC over time as natural resources are exhausted. How would invention and technological improvement modify your answer on the basis of this example, explain why it is said that " economic growth is a race between depletion and invention "
Module 3	Development and analysis of different schools of economic thought **.**
Key Concepts	Classical school, new classical economic thought, Chicago school of economics.
Overview	This module deals with different thinkers and theories in the political economy and economics. These schools of economic thought include : Islamic economics (Ibn Khaldun), Mercantilism (nationalism and international trade) the physiocrats (and the circular flow), classical economics, capitalism, communism and Karl Marx, Neoclassical economic thought. John Mynard Keynes and Keynesianism, the globalization era, the Chicago school of economics, Milton Freedman (capitalism and freedom). This module includes also main arguments made by these schools and their impacts on the economy.
Aim	The aim of this modules is to provide students with a base to understand the development of ideas and

	points of view toward economic issues and the impacts of these thoughts on policymakers.
Learning Outcomes	• Identify and discuss the different schools of economic thought. • Discuss how thoughts can have an impact on the economy, and how can they change it.
Units	
Readings	
Activity	* What is the main differences between the classical school and keynesian school? How did each of them affect economic policy?
Module 4	**Economic Systems.**
Key Concepts	Economic system of Islam, capitalism, socialism and communism, mixed economy.
Overview	Main criteria to distinguish between the different economic system are: ownership of means of production, the role of the government in the economy, the role of the profit motive in directing business, and the distribution of wealth and income among the people. The major economic systems are: Islamic economic system, capitalism and socialism.
Aim	To provide students with the characteristics of each of the major economic systems and to show them how these systems are different in political, economic and social aspects.
Learning Outcomes	At the end of this module learners will be able to: • Discuss the characteristics of each of the Islamic economic system, capitalism and socialism. • Differentiate among the main economic systems
Units	
Readings	
Activity	• Discuss the (pros) and (cons) of the major economic systems.
Module 5	Sustainable Global Development.
Key Concepts	Economic, social and environmental dimensions or " ecology, economy and equity ".

Overview	A widely accepted definition of sustainable development is the general definition of Bruntland (1987). It is understood that this concept encompasses a number of areas and highlights sustainability as the idea of international global issues of environmental, economic and social progress and equaty, all within is based on the limits of natural resources. This concept is based on elements of nature, life support, community (peace and culture), people and economy. Although in theory, development that is sustainable and not damaging to the planet is very possible, inreality there are a lot of politics and challenges involved.
Aim	To introduce the concept of global sustainable development in terms of issues, impacts, institutions and technology.
Learning Outcomes	After reading this module students will be able to: • Understand the meaning of global sustained development and its different elements . • Know how much progress has been attained in sustainable development since the 1992 Rio Earth summit. • Discuss the political challenges in facing this issue.
Units	
Readings	الأمن و الإقتصاد, د.أحمد العوران
Activity	Discuss the climate-land-energy-water-development nexus in the case of Jordan.
Module 6	**Financial and monetary systems, international finance third world debt and the macroeconomic controversy.**
Key Concepts	Bretton Woods System, IMF, Developing-country borrowing and debt.
Overview	This module covers several issues related to international finance, global capital flows and the global distribution of income, focusing on the impacts of the global institution on developing counties.
Aim	To explain international and monetary systems, as well as the third world debt and the debate on the IMF-WB structural adjustment programs

Learning Outcomes	After reading this module, students will be able to: • Understand the Bretton Woods System. • Discuss the need for reforming the world's finanicial " architecture "
Units	Unit 8 : Financial system and fiscal policy. Unit 9 : International Finance. Unit 10 : Third world debt and the macroeconomic stabilization controversy.
Readings	
Activity	Discuss the relation between politics and the international monetary – financial instutions.
Module 7	**Trade policy, FDI and foreign aid.**
Key Concepts	Trade policy, WTO, regional trade agreements, FDI.
Overview	This module emphasizes the importance of the issues related to trade policy and how this is dominated by political considerations. Also the flow of foreign direct investment and foreign aid will be discussed.
Aim	To provide students with major concepts on the international flow of capital, aid and trade, as well as discussing this with respect of developing countries.
Learning Outcomes	After completion of this module students will be able to : • Understand how some restrictions on the flow of international trade, foreign direct investment are desirable, particularly for developing countries.
Units	Unit 11 : Trade policy, regional and world trade organizations. Unit 12 : Direct foreign investment and foreign aid.
Readings	
Activity	Discuss the impact of the trade agreement among Arab countries (GAFTA) on Arab's trade and welfare.
Module 8	**The global environmental threat and climate protection.**
Key Concepts	Externalities, air / water pollution, ozone depletion, global warming, solid waste management .

Overview	This module is a general introduction to the environmental threat and climate change. The emphasis is an identification sources of environmental problems, valuing environmental resources and designing environmental policy within the global framework. Climate change elements are also considered. These include: global warming, Kyoto protocol, the role of economic instruments, the role of energy prices, developing countries and climate change, and the transition to renewable energy.
Aim	To give an overall idea about the environmental threat pacing the globa, and how to deal with climate change, emphasizing that these two topics are fully global (and ethical) phenomenon.
Learning Outcomes	After taking this module, students will be able to : • Explain the foundations of environmental problems, conflicts and policy. • Understand that there is a need for globally coordinated action.
Units	Unit 13 : The global environmental threat. Unit 14 : Climate protection.
Readings	* Ahmad M. Hussen. Principles of Environmental Economics and sustainability An Integrated Economic and Ecological Approach, 3rd Edition. Routledge – 2012. * Nick Hanley and Anthonoy Owen. The Economics of Climate Change, Routledge, 2004.
Activity	• Carry out economic analysis of a real-world environmental issue facing Jordan. What solutions do you propose? • Discuss the extent of cooperation among developing and developed countries with respect to facing the global environmental threat and climate protection.

Course	**International Finance**
Module 1	

Key Concepts	Introduction National Income Accounting and the Balance of Payments.
Overview	We try to explain the accounting concepts economists use to describe a country's level of production and its international transactions. We use two related and essential tools for macroeconomic linkages. The first tool is the national income accounting, records all the expenditures that contribute to a country's income and output. The second tool, balance of payments accounting. Student should know how can economic policy ensure that factors of production are fully employed? And what determines how an economy's capacity to produce goods and services changes over time? To answer these questions, we must understand macroeconomics, the branch of economics that studies how economies' overall levels of employment, production, and growth are determined.
Aim	The aim of this module is to make students able to discuss how the interactions of national economies influence the worldwide pattern of macroeconomic activities.
Learning Outcomes	At the end of this module learners will be able to: - Discuss the concept of the current account balance. - Use the current account balance to extend national income accounting to open economies. - Relate the current account to changes in a country's net foreign wealth.
Units	Unit 13 National Income Accounting and Balance of Payments.
Readings	Monthly Bulletin, Central Bank of Jordan, 2014. التجارة الدولية نظريات و سياسات، الدكتور طالب عوض، 1995
Activity	**Overview**
	- Student draw the relationship between the national income identities in open economy: Y=C+I+G+CA(EX-IM)

	- The balance of payment keeps track of country's payments to and receipts from foreigners. The students should get the POB of Jordan and from the CBJ from the website and analyze the figures in each term. - Understanding the statistical concepts from monthly statistical bulletin. - Write examples of paired transactions: **Credit** **Debit** Fax machine purchase (Current account, U.S. good import) $1,000 Sale of bank deposit by Citibank (Financial account, U.S. asset sale) $1,000 - The officials reserves of Jordan in the BOP will be observed by students during the semester and analyzing its position and the economic stand. - Jordan's Balance of Payments, 2013.
Module 2	The exchange Rates Market and the Determinants
Key Concepts	
Overview	Introduce how the exchange rates is determined using the asset approach. In this approach student will recognize how the exchange rates market work. Describing all the variables and situations that affect the exchange rates. The student must know how the changes in interest rate expectations and the spot rates affect the expected returns on foreign deposit. How does money market influence the foreign exchange market?
Aim	The main goal is to understand the role of exchange rates in international trade activity and to understand how exchange rates are determined.
Learning Outcomes	At the end of this module learners will be able to: - Relate exchange rate changes to changes in the relative prices of countries' exports. - Describe the structure and functions of the foreign exchange market. - Apply the interest parity condition to find equilibrium exchange rates. - Find the effects of interest rates and expectation shifts on exchange rates.

	- Show how monetary policy and interest rates feed into the foreign exchange market. - Draw the relationship between the short-run and the long-run effects of monetary policy.
Units	Unit 14: Exchange rates and foreign exchange market Unit 15: Money, interest rates, and exchange rates.
Readings	Paul R. Krugman. "The International Role of the Dollar: Theory and Prospect," in John F. O. Bilson and Richard C. Marston, eds. *Exchange Rate Theory and Practice*. Chicago: University of Chicago Press, 1984, pp. 261–278. Theoretical and empirical analysis of the dollar's position as an "international money." Ben S. Bernanke, Thomas Laubach, Frederic S. Mishkin, and Adam S. Posen. Inflation Targeting: Lessons from the International Experience. Princeton, NJ: Princeton University Press, 1999. Discusses recent monetary policy experience and the consequences for inflation and other macroeconomic Rudiger Dornbusch. "Expectations and Exchange Rate Dynamics." *Journal of Political Economy* 84(December 1976), pp. 1161–1176. A theoretical analysis of exchange rate overshooting. Events in international finance issues will be followed and discussed. The Jordan times, The Economists, The Financial Times, are Journals that student may find useful as a source of information. Global Finance, https://www.gfmag.com/.
Activity	**Overview**
	Construct a model of foreign exchange rates market. Visit the Central bank of Jordan, the main financial institution in Jordan.

Module 3	Relative Prices and the Exchange Rates in the Long Run
Overview	Many investors found price changes difficult to foresee, and as a consequence wealth were lost—and made—in the foreign exchange market. In this module student should acknowledge the question of What economic forces lie behind such dramatic long-term movements in exchange rates? National price levels play a crucial role in determining both interest rates and the relative prices at which countries' products are traded from long run perspective. A theory of how national price levels interact with exchange rates is thus central to understanding why exchange rates can change dramatically over periods of several years. Theory of purchasing power parity (PPP) explains movements in the exchange rate between two countries' currencies by changes in the countries' price levels. Next, the students will determine the reasons why PPP may fail to give accurate long-run predictions and show how the theory must sometimes be modified to account for supply or demand shifts in countries' output markets.
Aim	This module aims to understand factors other than money supplies and demands that also can have sustained effects on exchange rates.
Learning Outcomes	At the end of this module learners will be able to: - Explain the purchasing power parity theory of exchange rates and its relationship to international goods-market integration. - Express how monetary factors such as ongoing price level inflation affect exchange rates in the long run. - Understand factors that affect real exchange rates and relative currency prices in the long run.
Units	Ch. 16 Relative Prices and the Exchange Rates
Readings	Taylor, A. and M. Taylor (2004), "The Purchasing Power Parity Debate", Journal of Economic Perspectives, Vol. 18, NO. 4, pp. 135-58

	Purchasing Power Parity: Weights Matter Finance & Development ,*Tim Callen*,2012 http://www.imf.org/external/pubs/ft/fandd/basics/ppp.htm
Activity	**Overview** *Assignment 1:* student should answer the following questions: 1) Explain the nature of the relationship between the increasing rate in the money supply and the increasing rate in prices (inflation), using a time series represents the variables available for Jordan. (You can use the electronic pages of central bank of Jordan to get the material required). 2) Assume that there is a decrease in the overall real demand for money. What are the short and long runs effects on exchange rates, interest rate and the general level of prices? 3) What is the name of the currency of each of the following countries: Brazil, Mexico, Malaysia, India, Morocco, Egypt, Mauritania, Belgium, Sweden, Australia, Libya, Kuwait, South Africa, China? 4) Suppose that the inflation rate in Russia was 50% within one year, and the rate of inflation in Britain only 10% in the same year. According to the relative purchasing power parity(Relative PPP) What will happen during the year to the exchange rate of the pound sterling against the Russian ruble?
Module 4	Current Account Determination

Overview	We now combine what we have learned about asset markets and the long-run behavior of exchange rates with a new element, a theory of how the real sector "output market" adjusts to demand changes when product prices in the economy are themselves slow to adjust.
Aim	The aim of this module is to restructure the complicated factors that cause output, exchange rates, and inflation to change, and examining how output and the exchange rate are determined in the short run.
Learning Outcomes	At the end of this module learners will be able to: - Clarify the role of the real exchange rate in determining the aggregate demand for a country's output. - Explain how monetary and fiscal policies affect the exchange rate and national output in the short run. - Describe and interpret the long-run effects of permanent macroeconomic changes. - Analyze the relationship among macroeconomic policies, the current account balance, and the exchange rate.
Units	Ch.17 Output and the Exchange Rate in the Short Run
Readings	Mann, C (2002), "Perspectives on the U.S. Current Account Deficit and Sustainability", Journal of Economic Perspectives, Vol. 16, No.3, pp. 131-52. Robert A. Mundell. *International Economics*, chapter 17. New York: Macmillan, 1968. A classic account of macroeconomic policy effects under floating exchange rates. Dominick Salvatore, international economics, ch.19;Wiley,"Prices and Output in an Open Economy: Aggregate Demand and Aggregate Supply.2005.
Activity	**Overview**

	The student will do a research about Financial Crisis the causes , effects and solutions. Students work in groups of 5. Each group chose a country to study its economic and social characteristics and explore any economic or financial crisis and how each country solve its economic problems through applying the policy instruments they took during the semester. they suppose to be a future analyst in economic field. Students used all the tools and theories -they took in this semester and others - to understand and predict the economic crises and the way each country solve its finance problems. The Key objectives for this practice are: 1- Practice, analysing and predict the different types of economic crises and its causes. 2- Implement the monetary and fiscal policy and other macroeconomic variables in the open economy. Each group choose a country and then try to collect the data they need for their country and study its own characteristics. They use graphs and tables, to explain their ideas. Meet some decision makers to see how and why policy is been talking this way or another. Then they submit the final draft of their projects and each group present their result and discuss it with the class.
Module 5	**International Macroeconomic Policy**
Key Concepts	Fixed Exchange Rates, The International Monetary System
Overview	In this module the students will explore the issue of how central banks intervene in the foreign exchange market to fix exchange rates and how macroeconomic policies work when exchange rates are fixed. This will help us understand the role of central bank

	foreign exchange intervention in the determination of exchange rates under a system of managed floating. Also it will examine how the international monetary system influenced macroeconomic policy making and performance during four periods: the gold standard era (1870–1914), the interwar period (1918–1939), the post–World War II years during which exchange rates were fixed under the Bretton Woods agreement (1946–1973), and the recent period of widespread reliance on floating exchange rates (1973–present). In an open economy, macroeconomic policy has two essential goals, internal balance and external balance in this context we will try to relate both targets with sustainability matter. The goal of external balance presents a clear picture of how policy actions taken abroad may change an economy's position relative to the position its government prefers.
Aim	The aim of this module is to provide students with the a number of international currency arrangements since 1870, and explain how did countries try to attain internal and external balance, and how successful were they.
Learning Outcomes	At the end of this module learners will be able to: - Discuss causes and effects of balance of payments crises. - Describe how alternative multilateral systems for pegging exchange rates work. - Explain how the goals of internal and external balance motivate economic policy makers in open economies. - Describe the structure of the international gold standard that linked countries' exchange rates and policies prior to World War I, and the role of the Great Depression of the 1930s in ending efforts to restore the pre-1914 world monetary order and related to some cultural effects. - Discuss how the post–World War II Bretton Woods system of globally fixed

	exchange rates was designed to combine exchange rate stability with limited autonomy of national macroeconomic policies.
Units	Ch. 18: Fixed Exchange Rates and Foreign Exchange Intervention. Ch.19: The International Monetary System, 1870-1973.
Readings	Michael Mussa. *The Role of Official Intervention*. Occasional Paper 6. New York: Group of Thirty, 1981. Discusses the theory and practice of central bank foreign exchange intervention under a dirty float. Olivier Jeanne. *Currency Crises: A Perspective on Recent Theoretical Developments*. Princeton Special Papers in International Economics 20. International Finance Section, Department of Economics, Princeton University, March 2000. Recent thinking on speculative crises and attacks. Harold James. *The End of Globalization: Lessons from the Great Depression.* Cambridge, MA: Harvard University Press, 2001. Political and economic analysis of international economic disintegration between 1914 and 1939. Maurice Obstfeld and Alan M. Taylor. *Global Capital Markets: Integration, Crisis, and Growth.* Cambridge, U.K.: Cambridge University Press, 2004. Overview of the linkages between international financial integration and exchange rate regimes. John Williamson. *The Exchange Rate System*, 2nd edition. Policy Analyses in International Economics 5. Washington, D.C.: Institute for International Economics, 1985. An indictment of floating exchange rates and a case for target zones.
Activity	**Overview**
	Watching a documentary film in title: "End of the Road; How Money Became Worthless"

	The students discuss the financial crisis 2008 and try to analyze what documentary suggested and predicted.
Module 6	introduction of climate change problem
Key Concepts	
Overview	In this module we will try to explore the climate change as an environmental issue and relate it to the international finance subject from sustainability perspective.
Aim	The aim of this module is to learn how to link the environmental economic specifically climate change matter with global finance.
Learning Outcomes	At the end of this module learners will be able to: - Explain the climate change as an international issue and clarify it from economic prospect. - Link the climate change with international macroeconomic policy.
Units	- The economics of climate change.
Readings	A compilation of hands-out: • The economics of climate change, Anothony D. Owen, Nick Hanley,2004.
Activity	**Overview**
	Discuss the new issues regarding the climate change and international finance. Students start to represent their paper.
Module 7	Developing Countries: Growth, Crisis, global warming and climate change.
Key Concepts	Growth, sustainability, climate change
Overview	Student should explore these new issues ant try to find the link between

	them through searching new resources and contact environmental institution in Jordan and see the environmental policies that have been adopted by government of Jordan and the financial issues that may create some restrictions.
Aim	The aim of this module is to help students relate the financial crisis with sustainability policies.
Learning Outcomes	At the end of this module learners will be able to: - Understand the relationship between climate change and financial crisis. - Discuss this question: Is there any impact of global financial crisis on climate change?
Units	Climate change and the financial crisis
Readings	Climate Change and the Global Financial Crisis, Robin Leichenko, Karen O'Brien and William Solecki**.** Climate change and the financial crisis: A case of double Exposure**,** Robin M. Leichenko, Karen L. O'Brien, and William D. Solecki**,** *Annals of the Association of American Geographers*, 100(4) 2010, pp. 963–972 C, Published by Taylor & Francis, LLC. The economics of climate change, Anothony D. Owen, Nick Hanley**,** 2004. International Climate Change Financing: The Green Climate Fund (GCF). Richard K. Lattanzio Analyst in Environmental Policy, Congressional Research Service April 16, 2013. The Effect of the Global Financial Crisis on Climate Change, Imogen Reed. Posted on April 13, 2012 . Climate Change May Trigger the Next Financial Crisis. What is the impact of the economic crisis on the climate change debate? Question submitted by

	Soumaya Maghnouj, from Sciences-Po, March 22, 2013 Answered by: Daniel P. Ahn, Adjunct Fellow for Energy
Activity	**Overview**
	Explain and discuss the relationship between the financial crisis and climate change problem. Watching movies related these two issues. Continue presenting the papers done by students in the class.

Course Syllabus

0305100

University of Jordan, Faculty of Science,
Department of Applied Geology and Environment
First Semester, 2014-2015

Instructor Information

Instructor:	Fathi Shaqour
Office Location:	Geology Building, first floor
Office Telephone:	22281
Office Hours:	12:30 – 13:30 Sunday, Monday, Tuseday and Wednesday.
E-mail:	f.shaqour@ju.edu.jo
Faculty Website:	

Course Identification

Course Number:	0305100
Course Name:	Environmental Science
Course Location:	Geology
Class Times:	12-13 Sunday, Tuesday and Thursday
Prerequisites:	None

Course Description/Overview

Environment is a science discipline. Our understanding of environmental science is developed by adopting the scientific method whereby data is collected by investigation or observation and used to formulate and test hypotheses. It depends on scientists being objective and sharing all their data, methods and ideas with their peers, by publishing their findings. This allows other scientists to further analyse and build on this body of knowledge by which we learn about Engineering Geology. Professional scientists must always acknowledge their sources. **Plagiarism** is the presentation of thought or work of another person as though it is one's own without proper acknowledgment. The University's regulations make it clear that plagiarising is a breach of student discipline and may incur a range of penalties.

Course Objectives

Main objectives are the following:

1- To learn the basics of environment and its influencing factors,
2- To learn terms and concepts of the environment and natural resources and hazards (earthquakes, subsidence, coastal processes),
3- To gain appreciation to the interacting parameters those contribute to interchangeable influences between human and the surrounding environment.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

4. Demonstrate an understanding of the terms, concepts and principles of the environment,
5. Demonstrate an understanding of the Earth resources and hazards (earthquakes, volcanic activity, erosion and mass wasting),
6. Develop awareness of the role of human for better environmental management.

Course Resources

Text book, power point lectures, hand outs wherever needed

Course Website(s): www.ju.edu.jo

Required Course Texts and Materials

1. Environmental Science Earth as a living planet, D.BBotkin and E.A Keller, 2010, http://www.ucmp.berkeley.edu/glossary/gloss5/biome/

Optional Course Texts and Materials

1. CheckUJ library and Google books for other references. http://books.google.com.au/books……..

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

First test	20
Midterm Exam	30
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time.Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion. According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses only. No makeup for non-exam activities.

Course Schedule

Week	Ref.	Topic
1	Ch.1 Lecture	1- Introduction to environmental science: discuss the syllabus, why study the course, General information 2- Major themes, human population and famine, 3- Sustainability and carrying capacity.

2	Chs.2-4 Lecture slides	4- The scientific method and environmental sciences; what is science and scientific method, science and technology, 5- How to think about complex systems; systems stability, environmental unity, Earth as a living system and life, ecosystems. 6- Population dynamics and human population, population growth (past and present), population and technology, quality of life and limiting factors.
3	Chs5-7 Lecture slides	7- The chemistry of life; biogeochemical cycles, ecosystem cycles (metal and non-metal), 8- Ecosystems: The unit that sustains life, basic characteristics of ecosystems, ecological systems, food chains, community interactions, 9- Diversity of life; evolution, natural selection, evolution of life,
4	Chs8,11 & 12 Lecture	10-Biomes; Biotic provinces, geographical patterns of life, Earth biomes, forests, deserts, wetlands, fresh and sea water, 11-The ecology of food production; can we feed the world?, what we eat and grow, history and future of agriculture, 12-Farming and the environment; soil degradation, soil sustainability
5	Chs 13 & 15, Lecture	13-Forests and the environment; forestation and deforestation 14- **First Exam** 15-How the environment affects our health; disease, pollution,
6	Ch.16, &17 Lecture	16-Chance and catastrophes; hazards, disasters, 17-Chance and catastrophes; hazards, disasters, 18-Energy concepts;
7	Chs.18, 21, Lecture	19- Oil, natural gas and coal 20-How we obtain and use water, 21- How we obtain and use water,
8	Chs 22, & 23 Lect.	22-How we pollute and clean water, 23-How we pollute and clean water, 24-Global worming

9	Chs 23, 24, Lectures	25-Global worming 26-Air pollution; sources and effects, 27-Air pollution; sources and effects,
10	Chs 25, Lectures	28-**Second Exam** 29-The air we breathe indoors; sources, symptoms, 30-The air we breathe indoors; sources, symptoms,
11	Chs. 26, 27, Lecture	31-Mining and environment 32-Mining and environment 33-Environmental economics;
12	Chs. 27, 29, Lecture	34-Environmental economics; 35-Treating wastes 36-Treating wastes
13		Revision and applications

Course Syllabus

0935473 Environmental Engineering

University of Jordan, Faculty of Engineering & Technology,

Chemical Engineering Department

Fall Semester, 2014-2015

Instructor Information

Instructor: Dr. Ahmad M. AbuYaghi

Office Location: University Campus, Engineering Building, 2nd Floor

Office Telephone: +962 6 535 5000 Ext. 22906

Office Hours: Mon Wed 9:30- 11:00am

E-mail: ahmad.ay55@gmail.com
Faculty Website: http://www2.ju.edu.jo/sites/Academic/abuyaghi/default.aspx

Course Identification

Course Number: **0935473**
Course Name: Environmental Engineering
Course Location: University Campus
Class Times: Mon Wed 11:00am- 12:30pm
Prerequisites: 0955342

Course Description/Overview

Environmental Engineering uses environmental science principles, along with engineering concepts and techniques (design, operation and maintenance of engineering units, structures or equipment) to assess the impacts of societal activities on the environment and the impact of environment on people as well as to protect both human and environmental health. Environmental Engineering is a multidisciplinary area that requires a sound background in various subjects of pure and applied sciences covering both technical and social aspects to deal with the quality and availability of environmental resources. The catalog description of the course is as follows:

Concepts and terminology. Sources and impacts of water pollutants. Conventional water and wastewater treatment processes: Sedimentation, flocculation, softening, filtration, disinfection and biological systems. Sources and impacts of air pollutants. Air pollution control through gas cleaning devices: cyclones and wet scrubbers. Solid waste classification, handling and ultimate disposal.

Course Objectives

The overarching goals of this course are providing students with exposure to the main topics in environmental engineering in a multidisciplinary learning approach that integrates air, water and soil pollution covering issues of from scientific, engineering and management perspectives.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

19. Be familiar with major environmental laws, regulations, standards and ethics.
20. Understand the environmental quality parameters and how to measure and communicate them.
21. Describe the major pollutants of environment as well as their sources, effects, measurement and expression.

22. Select and design basic processes and techniques for water treatment, waste management and pollution control.
23. Appreciate the role and responsibility of engineers in sustainable development .
24. Work in team.

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

Assignments	10
Group Project	10
Midterm Exam	30
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time. Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion. According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses. No makeup for classwork.

Course Schedule

Week	**Date**	**Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)**
1	15/9/2014	**Course Overview** Discussion of syllabus and evaluation tools, Course requirements and policy, Course Introduction: Concepts and terminology
2	22/9	Overview of ecological and environmental systems: Water, Air and solid waste management
3-4	29/9, 6/10	Environmental ethics, laws, regulations and standards. Environmental impact assessment and sustainability policy.

5-6	13/10, 20/10	Water treatment, water pollution and water quality management Classwork #1
7-9	27/10, 3/11, 10/11	Environmental Microbiology, selection, design and operation of municipal wastewater treatment systems: suspended and attached growth processes, nutrient removal Classwork #2, Midterm Exam
10-11	17/11, 24/11	Air pollution and meteorology, climate change, global, regional and local effects
12	1/12, 8/12	Gas and particulate pollutants sources, effects, dispersion and control. Classwork #3
13-14	8/12, 15/12	Solid waste management including waste minimization, processing, recycling, recovery and ultimate disposal Classwork #4
15	22/12	Introduction to hazardous waste Term Project Submission
16	29/12	Environmental management in Jordan: discussion of policy, practice and case studies in light of what have been learned from course

CLIMASP Course Modules for 0935473 Environmental Engineering

Course	**0935473**
Module 1	Introduction and overview of ecological and environmental systems
Key Concepts	Natural ecosystem, environment, pollution, water quality, water supply, air quality, waste management, role of engineer
Overview	Using the principles of biology and chemistry, environmental engineers develop solutions to environmental problems. They are involved in water and air pollution control, waste recycling and disposal as well as public health issues. Environmental engineering is concerned with local and worldwide environmental issues and is involved in the protection of wildlife.

Aim	To instil an understanding by students of the multidisciplinary nature of Environmental Engineering, basic concepts from natural ecology and main areas of built environment.
Learning Outcomes	At the end of this module, students will be able to: 1. Understand the role of microbiology and chemistry in natural ecosystems 2. Identify the components and process steps of water treatment, wastewater 3. Treatment/disposal, air quality management, solid waste processing/disposal
Units	Unit 1.1 What is Environmental Engineering Unit 1.2 Natural Ecological Systems Unit 1.3 Environmental Engineering Systems
Readings	Search relevant websites, explore resources
Activity	Reading and Class Discussion Read Chapter 1 of textbook (Davis & Cornwell)
Module 2	Environmental ethics, laws, regulations and standards; Environmental impact assessment and sustainability policy.
Key Concepts	Ethics, regulations, standards, sustainable development, EIA
Overview	On key element of modern environmental science and engineering is that they are driven by government policy, which is increasingly set on the basis of risk. Therefore, knowledge of governmental policy and regulations is essential to environmental engineers in their profession
Aim	To familiarize students with common environmental values and national and international regulations at different level to protect the environment
Learning Outcomes	At the end of this module, students will be able to: 1. Disclose environmental ethics for professionals 2. Understand the legal framework for environmental protection 3. Distinguish different types of legislation 4. Understand the relationship between environment and development 5. Appreciate EIA studies as a tool for sustainable development
Units	Unit 2.1 Ethics and Regulations

	Unit 2.2 Sustainable Development and EIA
Readings	Optional reading of the book: Introduction to Environmental Impact Assessment: A Guide to Principles and Practice by Bram F. Noble, Oxford, 2009.
Activity	Website visit, Reading, Class Discussion Visit the website of the Ministry of Environment in Jordan: www.moenv.gov.jo Read about the national environmental regulations including penalty for violations, administrative structure of Ministry, their projects for environmental preservation and enhancement A group Term Project is initiated. Term project is literature or field survey on a topic offered by instructor and chosen by students. A professional technical report is sought.
Module 3	Water treatment, water pollution and water quality management
Key Concepts	Hardness, BOD, TKN, eutrophication, DO sag, coagulation, chlorination, softening
Overview	The responsibilities of the environmental engineer involves design and operation of water treatment processes as well as control of the quality of water supply resources in the open environment. Testing and characterizing pollution parameters are essential to subsequent treatment processes
Aim	To develop an understanding and knowledge on water pollution indicators, factors affecting them and the practical methods of water purification
Learning Outcomes	At the end of this module, students will be able to: 1. Define water quality parameters and describe how they are measured and reported. 2. Understand why and how water quality in streams is deteriorated and restored using Streeter-Phelps DO sag model 3. Draw a full block diagram of surface and ground water treatment processes 4. Understand the chemistry of coagulation, softening and chlorination
Units	Unit 3.1 Water pollution and water quality management

	Unit 3.2 Drinking water treatment processes
Readings	BOD kinetics and Softening chemistry
Activity	Group classwork on problem solving of water chemistry and water pollution parameters, open book and notes
Module 4	Science & Engineering of Wastewater Treatment
Key Concepts	Microbiology, biomass growth, settling, biodegradation, aeration, nitrification / denitrification, phosphorus removal, design, operation
Overview	Among the key elements of modern environmental engineering is that it is based on chemistry, environmental quality is described by chemical composition of the system. Also, knowledge of fundamentals of biology, particularly microbiology, is a pre-requisite to studying wastewater treatment plants
Aim	To enable students understand, select and design the basic units in common municipal wast treatment plants.
Learning Outcomes	At the end of this module, students will be able to: 1. Understand the role of microorganisms in wastewater treatment 2. Know how to design a bioreactor in a suspended growth biological system based on growth kinetics 3. Able to select proper treatment system/process based on wastewater characteristics and other considerations
Units	Unit 4.1: Suspended growth aerobic system (mainly activated sludge process) Unit 4.2: Fixed growth system (Trickling filters and RBC) Unit 4.3: Biological removal of nitrogen and phosphorus Unit 4.4 Sludge Treatment and disposal (including anaerobic digestion)
Readings	Anaerobic pathways and biogas production
Activity	Group classwork on problem solving and design Midterm Exam
Module 5	Air pollution and Control

Key Concepts	Stratification of atmosphere, climate change, carbon footprint, GHC, ozone depletion, acid rain, smog, health risk, primary and secondary pollutants, dispersion, renewable energy, collection efficiency
Overview	The atmosphere is a complex natural gaseous system that is essential to support life on planet E Air pollution due to both natural and anthropogenic sources is a major health and environmental hazard. The amounts and types of emissions change every year; caused by changes in economy, industrial activity, technology improvements, traffic and many other factors. Air pollution regulations and emission controls also have an effect.
Aim	Enable students to examine the various issues related to air pollution at the local, regional and g levels and how to manage and mitigate their consequences
Learning Outcomes	At the end of this module, students will be able to: 1. demonstrate knowledge and understanding of air pollutants, their sources, properties, dispersion and effects 2. demonstrate knowledge and understanding of modern techniques and devices of gas ar particulate removal
Units	Unit 5.1 Air Pollution Unit 5.2 Gas and particulate removal
Readings	Climates change and GHG control
Activity	Group classwork on problem solving and design of air pollution dispersion as well as gas and particulate removal devices
Module 6	Solid Waste Management (SWM)
Key Concepts	Waste classification, minimization, processing, recycling, recovery, landfill, incineration, Disposal, ground water contamination
Overview	Solid waste is not something that is taken to a 'dump' any more. SWM is a comprehensive syst including collection, storage, transportation, processing and ultimately disposal. Recycling is v important from sustainability point of view. Disposal techniques including landfilling, incinera

	and composting. Both the engineering and socio-political aspects will be of considered.
Aim	To enlighten students with basic components of solid waste management and enable them to ex various options of processing, recovery and disposal.
Learning Outcomes	At the end of this module, students will be able to: 1. Recognize different kinds of solid wastes and their general characteristics 2. Formulate a block diagram describing all major steps of SWM. 3. Differentiate between different options of solid waste processing, recycling and dispos 4. Understand the impact of landfills on groundwater pollution and mitigation options
Units	Unit 6.1 Types and characterization of solid waste Unit 6.2 Processing for resource and energy recovery Unit 6.3 Sanitary landfill design and operation
Readings	Ground water pollution due to uncontrolled waste dump
Activity	Group classwork Term project submission

Course Syllabus

0934545 Internal Combustion Engines

University of Jordan, Faculty of Engineering & Technology,

Mechanical Engineering Department

Fall Semester, 2014-2015

Instructor Information

Instructor: Dr. Ahmad Sakhrieh

Office Location: University Campus, Engineering Building, 3rd Floor

Office Telephone: +962 6 535 5000 Ext. 22906

Office Hours: Sun Tue Thu 9:00- 11:00 am

E-mail: asakhrieh@ju.edu.jo
Faculty Website: http://www2.ju.edu.jo/sites/Academic/abuyaghi/default.aspx

Course Identification

Course Number: 0934545
Course Name: Internal Combustion Engines
Course Location: University Campus
Class Times: Sun Tue Thu 12:00am- 13:00pm
Prerequisites: 0904342

Course Description/Overview

The course starts with an introduction to engines, classifications and terminology which leads to the introduction and analysis of engine performance parameters and the main engine cycles including: Otto, Diesel, Dual and two-stroke cycles. Then the course moves to introduce the student to the common fuels used in IC engines, the reactions and the associated thermochemical calculations. This is followed by the introduction of engine emissions and their control technologies and strategies. After that, the student is made familiar with air and fuel induction methods and technologies, in addition to the physics of the combustion phenomena. Finally, the course ends with the evaluation of friction losses and the characterization of different engine lubricants.

Course Objectives

The course is intended to provide the student with the fundamental principles and operational characteristics of internal combustion engines. This will be achieved through covering a wide range of related topics with the support of lab-based experiments.

Course Learning Outcomes

Upon successful completion of this course, will be familiar with the following:

- Engine classifications and definitions
- Engine operating characteristics and performance evaluation
- Engine cycles
- Thermo-chemical calculations
- Properties of different fuels
- Air and fuel induction technologies
- The physics of the combustion phenomena

- Engine pollutants and emissions control strategies
- Friction losses and lubrication

Course Schedule

Week	Date	Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)
1	15/9/2014	**Course Overview** Engine Classification; Terminology; Engine Components; Basic Engine Cycles
2-4	22/9, 29/9, 6,10	**Operating Characteristics**; Engine Parameters; Work; Mean Effective Pressure; Torque and Power; Dynamometers; Air-Fuel Ratio; Specific Fuel Consumption; Engine Efficiencies; Volumetric Efficiency

		Classwork #1
5-7	13/10, 20/10 27/10	**Engine Cycles**; Air Standard Cycles; Otto Cycle; Diesel Cycle; Dual Cycle; Comparison of Cycles; Real Air-Fuel Cycles; Two Stroke Cycles
8-10	3/11,10/11, 17/11	**Thermochemistry and Fuels**; Thermochemistry; Hydrocarbon Fuels; Gasoline Fuel; Diesel Fuel; Alternative Fuels Classwork #2
11-12	24/11,1/12	**Air and Fuel Induction; Intake Manifold;** Intake Valves; Volumetric Efficiency; Fuel Injection; Carburetors; Supercharging and turbocharging; Midterm Exam
13	8/12	**Combustion;** Combustion in SI Engines; Homogeneous and Stratified mixtures; Fast Burn Chambers Classwork #3
14-15	15/12, 22/12	**Emissions and Air Pollution**; Carbon Monoxide; Hydrocarbons; Oxides of Nitrogen; Particulates; Other Emissions; Aftertreatment; Engine Modifications; Fuel Modifications
16	29/12	**Friction and Lubrication**; Engine Friction; Piston Forces; Engine Lubrication Systems; Lubricating Oils Classwork #4

Course	0934545 **Internal Combustion Engine**
Module 1	Introduction and overview of internal combustion engines
Key Concepts	Introducing and defining the internal combustion engine. It lists ways of classifying engin terminology used in engine technology. Descriptions are given of many common engine comp and of basic four-stroke and two-stroke cycles for both spark ignition and compression i engines.
Overview	
Aim	To Understand Engine classifications and components.
Learning Outcomes	At the end of this module, students will be able to: • Identify engine components • Differentiate between 2-stroke and 4-stroke engines
Units	Unit 1.1 Engine Classification; Engine Components; Unit 1.2 Engine Terminology Unit 1.3 Engine Components Unit 1.4 Basic Engine Cycles

Readings	
Activity	Reading and Class Discussion Read Chapter 1 of textbook
Module 2	**Operating Characteristics**.
Key Concepts	Examines the operating characteristics of reciprocating internal combustion engines. These inc the mechanical output parameters of work, torque, and power; the input requirements of air, fu combustion; efficiencies; and emission measurements of engine exhaust
Overview	
Aim	To introduce the students to the main operating characteristics of the internal combustion engir
Learning Outcomes	At the end of this module, students will be able to: • Understand the operating characteristics of the internal combustion engines • Define the inputs and outputs of the combustion process in internal combustion • Identify the exhaust gases.
Units	Unit 2.1 Operating characteristics of reciprocating internal combustion engines Unit 2.2 Emission measurements of engine exhaust
Readings	Optional reading of the book: Introduction to Environmental Impact Assessment: A Guide to Principles and Practice by Bram F. Noble, Oxford, 2009.
Activity	Reading and Class Discussion Read Chapter 2 of textbook
Module 3	**Engine Cycles**
Key Concepts	The basic cycles used in reciprocating internal combustion engines, both four stroke and two st The most common four-stroke SI and CI cycles are analyzed in detail using air-standard analys
Overview	

Aim	To develop an understanding and knowledge on the cycles of reciprocating internal combustio engines
Learning Outcomes	At the end of this module, students will be able to: • Analyse the basic air standard cycle • Compare between different types of air cycles
Units	Unit 3.1 Basic air standard cycles. Unit 3.2 OTTO Cycle Unit 3.3 Diesel Cycle Unit 3.4 Dual Cycle
Readings	
Activity	Reading and Class Discussion Read Chapter 3 of textbook
Module 4	**Thermochemistry and Fuels**
Key Concepts	Review the basic thermochemistry principles as applied to IC engines. It studies i characteristics and combustion in engines, the octane number of SI fuels, and the cetane nun CI fuels. Gasoline and other possible alternate fuels are examined
Overview	
Aim	To learn the basic thermochemistry principles as applied to IC engines.
Learning Outcomes	At the end of this module, students will be able to: • Understand the octane number of SI fuels • Understand the cetane number of CI fuels
Units	Unit 4.1: Chemical reaction and equilibrium Unit 4.2: Hydrocarbon components Unit 4.3: Self ignition and octane number
Readings	

Activity	Reading and Class Discussion Read Chapter 4 of textbook Midterm Exam
Module 5	**Air and Fuel Induction**
Key Concepts	Intake systems of engines
Overview	
Aim	Learning how air and fuel are delivered into the cylinders.
Learning Outcomes	At the end of this module, students will be able to: • Identify different types of Fuel injectors • Differentiate between superchargers and turbo chargers • Realise the importance of fuel injection timing
Units	Unit 5.1 Fuel injectors Unit 5.2 Superchargers Unit 5.3 Turbochargers
Readings	
Activity	Reading and Class Discussion Read Chapter 5 of textbook
Module 6	**Combustion**
Key Concepts	Waste classification, minimization, processing, recycling, recovery, landfill, incineration, Disposal, ground water contamination
Overview	
Aim	Understand air, fuel, and exhaust gas motion that occurs within the cylinders during the comp stroke, combustion, and power stroke of the cycle.

Learning Outcomes	At the end of this module, students will be able to: • understand the normal desired turbulence for complete combustion • Examine the combustion process in IC engines • Differentiate between combustion in SI and CI engines
Units	Unit 6.1 Turbulence Unit 6.2 Swirl Unit 6.3 Combustion in SI engines Unit 6.4 Combustion in CI engine
Readings	
Activity	Reading and Class Discussion Read Chapter 7+8 of textbook Group classwork Term project submission
Module 7	**Emissions and Air Pollution**
Key Concepts	Explore the undesirable emissions generated in the combustion process of automobile and ot engines
Overview	
Aim	Recognize that emissions pollute the environment and contribute to global warming, acid rain, odors, and respiratory and other health problems.
Learning Outcomes	At the end of this module, students will be able to: • Explore the undesirable emissions generated in the combustion • Identify the major causes of emissions in IC engines

Units	Unit 7.1 Air Pollution Unit 7.2 Hydrocarbons Unit 6.3 Carbon Monoxide Unit 6.4 Nitrogen Oxides
Readings	
Activity	Reading and Class Discussion Read Chapter 9 of textbook
Module 8	**Friction and Lubrication**
Key Concepts	Friction refers to the forces acting between mechanical components due to their relative moti to the forces on and by fluids when they move· through the engine
Overview	
Aim	Examines the friction that occurs in an engine and the lubrication needed to minimize this fricti
Learning Outcomes	At the end of this module, students will be able to: • Understand Mechanical friction and lubrication • Analyze the engine lubrication system • Recognize lubricating oils
Units	Unit 8.1 Mechanical friction Unit 8.2 Forces on Piston Unit 8.3 Lubricating Oils Unit 8.4 Oil Filters
Readings	
Activity	Reading and Class Discussion Read Chapter 10 of textbook

	Final Exam

APENDIX I: The CLIMASP Course Syllabus Template Example

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Course Number: 0802391

Instructional Materials for Children
University of Jordan, Faculty of Educational Sciences, Department of Curriculum and Instruction
Fall Semester, 2014/2015

Instructor Information

Instructor: Dr. Diala Hamaidi, Assistant Professor
Office Location: Department of Curriculum and Instruction

Telephone: Office – :(962)-6-5355000 ext. 24591
Office Hours: S,T,Th (10:00am-11:00am)
E-mail: dhamaidi@nmsu.edu
Website: http://www.ju.edu.jo/sites/academic/dHamaidi/default.aspx

Course Identification

Course Number: 0802391
Course Name: Instructional Materials for Children
Course Location: Department of Curriculum and Instruction
Class Times: S,T, Th 1:00pm – 2:00pm
Prerequisites: _
Faculty Web Page: http://educational.ju.edu.jo/ar/arabic/Home.aspx

Course Description/Overview

Identifies educational materials for children, their importance, sources and types, Choosing ready – made materials according to appropriate criteria and identifying their uses in the classroom. Students will learn to design needed materials which promote children's thinking abilities such as classification, sorting, numbers, special relations, measurement, time, causality… etc. Emphasis is also placed on designing materials in ways that enhance children's total development and also to judge the efficiency of the produced learning materials.

Course Learning Objectives

The students will be able to:

- Identify the meaning of instructional materials for young children (Specifically, kindergarteners)
- Describe the wide variety of instructional materials that can be used in teaching young children

- Reflect on a field visit of Jordanian kindergartens' instructional materials
- Discuss the link between educational theories (Behavioral theory, Constructive theory) and choosing specific instructional materials.
- Design a thematic unit and its related instructional materials (2 sections: theoretical part and practical part)

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO1 & LO2: express their own understanding of instructional materials and search different web sites to provide examples of different instructional materials that they can use in their future teaching)

LO3: Make a presentation in front of his or her classmates in which they will respond to a guideline that was distributed to the whole class regarding a field visit for one of the Jordanian kindergartens (could be private or public). In this presentation the student will describe the physical and emotional environment with a focus on describing the existed instructional materials there. Every student will provide evidence of that visit (could be pictures, drawing, crafts, …)

LO4: Role play and present their understanding of theorists who reflect the constructive theory such as Piaget and Vygotsky, Behavioral theory (such as: Skinner). They will focus on their understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.

LO5: Choose a specific theme based on the children developmental characteristics (the discussion in the class and the references will help them choose their favorite theme). After choosing the theme the students design a complete unit that includes a theoretical part (the idea behind choosing the theme, the long-term objectives of the unit, the short-term objectives, the activities, instructional materials that will help to achieve these objectives, and the assessment of those objectives) and a practical part (designing a variety of instructional materials that reflect the objectives and show an evidence that their work is designed by themselves. They will provide crafts, real materials, hands-on activities,…)

Assignments and Grading Scheme

Grading System

LO1 &LO2: Search different web sites to provide examples of different instructional materials.

LO3: Make a presentation (Rubric is attached)

LO4: Role play presentation (Rubric is attached)

LO5: Designing thematic unit with related instructional materials (Rubric is attached)

Grading System

Historical Role Play : Educational Theories (LO4)

Teacher Name: **Dr. Hamaidi**

Student Name: _____

CATEGORY	5	4	3	2

Historical Accuracy	All historical information appeared to be accurate and in chronological order.	Almost all historical information appeared to be accurate and in chronological order.	Most of the historical information was accurate and in chronological order.	Very little of the historical information was accurate and/or in chronological order.
Role	Point-of-view, arguments, and solutions proposed were consistently in character.	Point-of-view, arguments, and solutions proposed were often in character.	Point-of-view, arguments, and solutions proposed were sometimes in character.	Point-of-view, arguments, and solutions proposed were rarely in character.
Knowledge Gained	Can clearly explain several ways in which his character \"saw\" things differently than other characters and can clearly explain why.	Can clearly explain several ways in which his character \"saw\" things differently than other characters.	Can clearly explain one way in which his character \"saw\" things differently than other characters.	Cannot explain one way in which his character \"saw\" things differently than other characters.

Oral Presentation Rubric : Field Visit: Kindergarten Instructional Materials (LO3)

Teacher Name: **Diala Hamaidi**

Student Name: _____

CATEGORY	**5**	**4**	**2**	**1**

Enthusiasm	Facial expressions and body language generate a strong interest and enthusiasm about the topic in others.	Facial expressions and body language sometimes generate a strong interest and enthusiasm about the topic in others.	Facial expressions and body language are used to try to generate enthusiasm, but seem somewhat faked.	Very little use of facial expressions or body language. Did not generate much interest in topic being presented.
Stays on Topic	Stays on topic all (100%) of the time.	Stays on topic most (99-90%) of the time.	Stays on topic some (89%-75%) of the time.	It was hard to tell what the topic was.
Content	Shows a full understanding of the topic.	Shows a good understanding of the topic.	Shows a good understanding of parts of the topic.	Does not seem to understand the topic very well.
Time-Limit	Presentation is 5-6 minutes long.	Presentation is 4 minutes long.	Presentation is 3 minutes long.	Presentation is less than 3 minutes OR more than 6 minutes.

LO1 &LO2 Class discussion of students' search.

Final Project Presentation: LO5

CATEGORY	**25-21**	**20-16**	**15-11**	**10-0**

Resources / Assessment - 30%	Theme is clear and appropriate to the grade level. Goes along with the Mass. Curriculum Framework.	Theme is clear but not quite appropriate to the grade level. Goes along with the Mass. Curriculum Framework.	Theme is clear but not appropriate to the grade level. Does not go along with the Mass. Curriculum Framework.	Theme is not clear and not appropriate to the grade level. Does not go along with the Mass. Curriculum Framework.
Integrated Study - 20%	The unit includes other disciplines integrated into the lessons with a focus on science and math.	The unit only shows some integration but focuses mostly on math and science.	The unit includes very little materials and resources.	The unit does not contain any materials used or maybe only a short list of them.
Resources / Assessment - 20%	Covers topic in-depth with details and examples. Subject knowledge is excellent.	Includes essential knowledge about the topic. Subject knowledge appears to be good.	Includes essential information about the topic but there are 1-2 factual errors.	Content is minimal OR there are several factual errors.
Mechanics / Organization - 10%	Project is submitted in a plastic file box which includes a binder of lessons as well as materials to support lesson. It will	Project submitted in file box and is mostly well organized. It includes lessons and supporting material. It is computer generated.	Project lacks organization and is missing materials. May not be submitted in correct format. Some things may not be typed.	Project has no organization and is not submitted in the correct format. The project may be missing materials / excessive errors.
Oral Presentation - 20%	Interesting, well-rehearsed with smooth delivery that holds audience attention.	Relatively interesting, rehearsed with a fairly smooth delivery that usually holds audience attention.	Delivery not smooth, but able to hold audience attention most of the time.	Delivery not smooth and audience attention lost.

Grading Policy

Grades can be based on the following: (Example)

Assignments	20%
Exams (1 midterm +1 Final)	70%
Class attendance/Activity participation	10%
Total Points	100

Course Policies

Late Assignments

If you pass the due date your final grade of the assignment will be affected. 5% will be deducted from the late assignment.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than three classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class.

Dissability

Appropriate accommodations will be provided for students who have self-identified in the office of Services for Students with Disabilities. If you have, or believe you have a disability, you may wish to self-identify.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1	14/9/2014	• Instructor and Students [Presentation: Know each other] • Schedule & Syllabus Review [Lecture] ▪ Next Class [Announcements] 21/9 ▪ Search online websites: meaning of instructional materials for young children
2	21/9	Instructional materials resourses
3	28/9	Designing instructional materials, Ways and methods of utili instructional materials: aproaches to ESD

Course	• Instructional Materials for the Young Child

Module 1	Overview of Instructional Materials in Early Childhood Education
Key Concepts	▪ meaning of instructional materials for young children ▪ Examples of Instructional Materials
Overview	This module introduces the students to the wide variety of instructional materials that can be used in teaching young children in early childhood settings. Designing instructional materials, Ways and methods of utilizing instructional materials: approaches to Education for Sustainable Development (ESD)
Aim	This module aimed at guiding students to express their own understanding of the variety of instructional materials: types and resources. During this model the students will search different web sites to provide examples of different instructional materials that they can use in their future teaching.
Learning Outcomes	At the end of this module learners will be able to: • Identify the meaning of instructional materials for young children (Specifically, kindergarteners) • Describe the wide variety of instructional materials that can be used in teaching young children • Reflect on a field visit of Jordanian kindergartens' instructional materials
Units	Chapter1: Textbook (Examples of Instructional Materials) Ch.2: Criteria of choosing Instructional materials
Readings	Benefits of Instructional materials: Discussion of the following article from: Cone of Experience / Edgar Dale http://www.khayma.com/education-technology/w5.htm http://www.bhteachersbh.com/forum/new.php?print=1&id=2791

	Kritchevsky, S & Prescott. E. (1990) Planning Environment for young children NAEYC. Washington D.C.
Activity	Overview ▪ *Assignment 1 :* Search online websites: meaning of instructional materials for young children 1- Activity (1) (Examples of Instructional Materials) can be facilitated by Class discussion & Group discussion 2- Activity (2) field visits to Jordanian kindergartens' Learning Centers *After visiting schools the students will make:* ****Presentations of Field Visit Assignment* *Make a presentation in front of the classmates in which they will respond to a guideline that was distributed to the whole class regarding a field visit for one of the Jordanian kindergartens (could be private or public). In this presentation the student will describe the physical and emotional environment with a focus on describing the existed instructional materials there. Every student will provide evidence of that visit (could be pictures, drawing, crafts, …)*
Module 2	Educational Theories and their Implication on Designing Learning Materials
Key Concepts	Constructive theory: Piaget and Vygotsky, Behavioral theory (such as: Skinner). They will focus on their understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.
Overview	The focus of this module will be on bridging the gap between theory and

	practice. The module will highlight the insights of theorists who reflect the constructive theory such as Piaget and Vygotsky, Behavioral theory (such as: Skinner). The module will focus on expanding the students' understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.
Aim	The aim of this module is to 1- understand the main tenets of each theory 2- understand the link between educational theories (Behavioral theory, Constructive theory) and choosing specific instructional materials.
Learning Outcomes	At the end of this module learners will be able to: • Explore the link between educational theories (Behavioral theory, Constructive theory) and choosing specific instructional materials.
Units	Ch.4: Educational Theories
Readings	• **Instructional materials for young children (2007).** • Skinner, Piaget, Vygotsky, Pruner, Ausubel, Bloom Taxonomy • http://www.4uarab.com/vb/showthread.php?t=55885 • *faculty.ksu.edu.sa/74637/441/التعلم20%نظريات.doc* • http://educationaden.50webs.com/Ausubel.pdf • *faculty.ksu.edu.sa/ualturki/Documents/التعلم20%نظريات1.ppt*
Activity	PowerPoint Presentation: Whole Class discussion regarding each theory and its implementations on choosing instructional materials

	Skinner, Piaget, Vygotsky, Pruner, Ausubel, Bloom Taxonomy http://www.4uarab.com/vb/showthread.php?t=55885 faculty.ksu.edu.sa/74637/441/نظريات%20التعلم.doc http://educationaden.50webs.com/Ausubel.pdf faculty.ksu.edu.sa/ualturki/Documents/نظريات%20التعلم1.ppt Role play and present their understanding of theorists who reflect the constructive theory such as Piaget and Vygotsky, Behavioral theory (such as: Skinner). They will focus on their understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.
Module 3	Designing Thematic Unit
Key Concepts	Implementations, Educational Theories in classrooms Introduction, Designing Thematic Unit
Overview	How to design the theoretical part of the thematic units Review Jordanian Kindergarten curriculum Interactive Kindergarten Curriculum. Designing the practical part of the thematic units. How to design hands-on activities and experiences that cover the following domains: Knowledgeable aspect (cover all content areas that are introduced in KG Curriculum and match the developmental aspects of kindergarteners). Social and emotional aspect. Physical aspect
Aim	Designing thematic unit with related instructional materials (Rubric is attached)
Learning Outcomes	At the end of this module learners will be able to: - Demonstrate an understanding designing thematic units related to ESD - Design a thematic unit and its related instructional materials (2 sections:

	theoretical part and practical part
Units	Ch. 5
Readings	• **Instructional materials for young children (2007).**
Activity	(Instructor will provide a presentation of previous examples) Choose a specific theme based on the children developmental characteristics (the discussion in the class and the references will help them choose their favorite theme). After choosing the theme the students design a complete unit that includes a theoretical part (the idea behind choosing the theme, the long-term objectives of the unit, the short-term objectives, the activities, instructional materials that will help to achieve these objectives, and the assessment of those objectives) and a practical part (designing a variety of instructional materials that reflect the objectives and show an evidence that their work is designed by themselves. They will provide crafts, real materials, hands-on activities,…)
	Assignment 1: Generating Themes 29. Consider one of the indicated themes of this module. 30. Next explain the modalities of its implementation 31. Explain which impact it has en SD? 32. Next consider whether this theme is important at the national and local level of your country

Course	• Instructional Materials for the Young Child
Module 1	Overview of Instructional Materials in Early Childhood Education
Key Concepts	▪ meaning of instructional materials for young children ▪ Examples of Instructional Materials
Overview	This module introduces the students to the wide variety of instructional materials that can be used in teaching young children in early childhood settings. Designing instructional materials, Ways and methods of utilizing instructional materials: approaches to Education for Sustainable Development (ESD)
Aim	This module aimed at guiding students to express their own understanding of the variety of instructional materials: types and resources. During this model the students will search different web sites to provide examples of different instructional materials that they can use in their future teaching.
Learning Outcomes	At the end of this module learners will be able to: • Identify the meaning of instructional materials for young children (Specifically, kindergarteners) • Describe the wide variety of instructional materials that can be used in

	teaching young children • Reflect on a field visit of Jordanian kindergartens' instructional materials
Units	Chapter1: Textbook (Examples of Instructional Materials) Ch.2: Criteria of choosing Instructional materials
Readings	Benefits of Instructional materials: Discussion of the following article from: Cone of Experience / Edgar Dale http://www.khayma.com/education-technology/w5.htm http://www.bhteachersbh.com/forum/new.php?print=1&id=2791 Kritchevsky, S & Prescott. E. (1990) Planning Environment for young children NAEYC. Washington D.C.
Activity	Overview ▪ *Assignment 1 :* Search online websites: meaning of instructional materials for young children 3- Activity (1) (Examples of Instructional Materials) can be facilitated by Class discussion & Group discussion 4- Activity (2) field visits to Jordanian kindergartens' Learning Centers *After visiting schools the students will make:* ****Presentations of Field Visit Assignment* *Make a presentation in front of the classmates in which they will respond to a guideline that was distributed to the whole class regarding a field visit for one of the Jordanian kindergartens (could be private or public). In this presentation the student will describe the physical and emotional environment with a focus on describing the existed instructional materials there. Every student will*

	provide evidence of that visit (could be pictures, drawing, crafts, …)
Module 2	Educational Theories and their Implication on Designing Learning Materials
Key Concepts	Constructive theory: Piaget and Vygotsky, Behavioral theory (such as: Skinner). They will focus on their understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.
Overview	The focus of this module will be on bridging the gap between theory and practice. The module will highlight the insights of theorists who reflect the constructive theory such as Piaget and Vygotsky, Behavioral theory (such as: Skinner). The module will focus on expanding the students' understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.
Aim	The aim of this module is to 3- understand the main tenets of each theory 4- understand the link between educational theories (Behavioral theory, Constructive theory) and choosing specific instructional materials.
Learning Outcomes	At the end of this module learners will be able to: • Explore the link between educational theories (Behavioral theory, Constructive theory) and choosing specific instructional materials.

Units	Ch.4: Educational Theories
Readings	• **Instructional materials for young children (2007).** • Skinner, Piaget, Vygotsky, Pruner, Ausubel, Bloom Taxonomy • http://www.4uarab.com/vb/showthread.php?t=55885 • *faculty.ksu.edu.sa/74637/441/نظريات%20التعلم.doc* • http://educationaden.50webs.com/Ausubel.pdf • *faculty.ksu.edu.sa/ualturki/Documents/نظريات%20التعلم1.ppt*
Activity	PowerPoint Presentation: Whole Class discussion regarding each theory and its implementations on choosing instructional materials Skinner, Piaget, Vygotsky, Pruner, Ausubel, Bloom Taxonomy http://www.4uarab.com/vb/showthread.php?t=55885 *faculty.ksu.edu.sa/74637/441/نظريات%20التعلم.doc* http://educationaden.50webs.com/Ausubel.pdf *faculty.ksu.edu.sa/ualturki/Documents/نظريات%20التعلم1.ppt* Role play and present their understanding of theorists who reflect the constructive theory such as Piaget and Vygotsky, Behavioral theory (such as: Skinner). They will focus on their understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.
Module 3	Designing Thematic Unit
Key Concepts	Implementations, Educational Theories in classrooms Introduction, Designing Thematic Unit
Overview	How to design the theoretical part of the thematic units

	Review Jordanian Kindergarten curriculum Interactive Kindergarten Curriculum. Designing the practical part of the thematic units. How to design hands-on activities and experiences that cover the following domains: Knowledgeable aspect (cover all content areas that are introduced in KG Curriculum and match the developmental aspects of kindergarteners). Social and emotional aspect. Physical aspect
Aim	Designing thematic unit with related instructional materials (Rubric is attached)
Learning Outcomes	At the end of this module learners will be able to: - Demonstrate an understanding designing thematic units related to ESD - Design a thematic unit and its related instructional materials (2 sections: theoretical part and practical part
Units	Ch. 5
Readings	• **Instructional materials for young children (2007).**
Activity	(Instructor will provide a presentation of previous examples) Choose a specific theme based on the children developmental characteristics (the discussion in the class and the references will help them choose their favorite theme). After choosing the theme the students design a complete unit that includes a theoretical part (the idea behind choosing the theme, the long-term objectives of the unit, the short-term objectives, the activities, instructional materials that will help to achieve these objectives, and the assessment of those objectives) and a practical part (designing a variety of instructional materials that reflect the objectives and show an evidence that their work is designed by themselves. They will provide crafts, real materials, hands-on activities,…)
	Assignment 1: Generating Themes

	33. Consider one of the indicated themes of this module. 34. Next explain the modalities of its implementation 35. Explain which impact it has en SD? 36. Next consider whether this theme is important at the national and local level of your country

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Managerial Economics

The University of Jordan, the School of Business, Department of Business Economics

Instructor Information

Instructor: Dr. Mohammad Alawin

Office Location: The School of Business / Business Economics Department -Building #1 First Floor.

Telephone: 5355000 ext.

Office Hours: 12-1 Sun, Tue, Thur.

E-mail: m.alawin@ju.edu.jo

Course Identification

Course Number: 1607421
Course Name: Managerial Economics
Course Location: Building #2/ Business School
Class Times: 9-10
Prerequisites: 1607210 and 1607211
Faculty Web Page: http://business.ju.edu.jo

Course Description/Overview

Economic theory is the fundamental determinant of firms' profitability and growth, and economic thinking should be an essential element in nearly every managerial decision. In this course, we will examine the principles of microeconomics, and show how they apply to managerial decision-making.

Course Learning Objectives

16. To equip the student with the principles he or she needs to make sense out of the conflicting and contradictory discussions of economic conditions and policies in newspapers and news magazines.
17. Enable the student to evaluate the performance of decision makers, and to predict the impact of their policy actions on families and business.
18. Understand and predict the economic forces shaping real-world business decisions.
19. Develop and strengthen overall analytical skills.

Develop critical thinking skills about markets and business decisions.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

LO **1- Knowledge and Understanding:**

- Understand managerial behavior regarding maximizing the profit of the firm under different market structure.
- Understand managerial reaction concerning government policy and activities.
- Understand mathematical methods (Derivative, linear programming), and statistical techniques (regression – model) to help managers taking optimal decisions.

LO **2- Analytical and Thinking Skills**:

Students should have the ability to:

- Present written and/or oral reports using critical thinking, economic data, and economic theory.
- Perform mathematics, and statistical knowledge and its application on economic- decision of the firms.
- Comprehend and communicate data presented graphically and/or mathematically.
- relate mathematical and statistical models to their assumptions and to the real world.

LO **3- Teaching and Learning Methods**:

Lectures, case studies, problem solving and tutorials.

- Lectures: 7 weeks, 21 hours
- Discussion forums: 7 weeks, 21 hours
- Tutorials: 2 weeks, 6 hours
- Applications (office hours): as requested

Course Resources

There will be 3 lectures per week. Although the lectures cover the vast majority of the module material, students must make use of the textbooks extensively especially the empirical cases presented in the book.

Course Website(s)

-

Required Course Texts and Materials

(Managerial Economics) 10th edition, 2011. *McGraw Hill* By: Thomas and Maurice.

.Optional Course Texts and Materials

- Nick Hanley, Jason Shogren, and Ben White, *Introduction to Environmental Economics*

Assignments and Grading Scheme

Grading System

A , A- Excellent
B+ , B, B- Very good
C+, C, C- Good

D+ , D, D- pass
D-, F = Fail

Grading Policy

Students will be assessed based on the following:

Mid-term Exam	30%
Second exam	15%
Participation	5%
Final Exam	50%

Assignments are individual assignments. Details of these assignments and the submission deadlines will be announced in class.

Course Policies

University Policies regarding class attendance, course pre-requisites, and academic honesty, grading, incompletes, and final exams will be observed as stated in the University of Jordan. You are responsible for all material discussed in class and assigned in the textbook. Missing class is strongly discouraged. Your professor is far less sympathetic to those who miss class regularly. If you miss class, you are responsible to get the notes from a classmate.

Any type of academic misconduct will result in (F). By Enrolling in this course, you agree with the University of Jordan Policy on Academic Misconduct.

Course Schedule

Detailed lecture schedule			
	Week:	Material:	Homework and Assignments
	Week 1	Ch (1): Managers, Profits and Markets(2-28)	TBA
	Week 2+3	Ch (2): Demand, Supply, & Market Equilibrium (36-64).	TBA
	Week 4	Ch (6): Elasticity and Demand (204-229)	TBA
	Week 5+6+7	Ch (3): Marginal Analysis for Optimal Decision Making(86-108) Ch (7): Demand Estimation & Forecasting(243-262)	TBA
	Week 8+9	Ch (8+9): Production and Cost in the Short (284-312),and long Runs (320-359),	TBA
	Week 10	Ch (10): Production and Cost Estimation (371-377)	
	Week 11+12	Ch (11): Managerial Decisions in Competitive Markets (398-441)	TBA

	Week 13+14	Ch (12): Managerial Decisions for Firms with Market Power. (453-478)	TBA
	Week 15	Linear programming	
	Week 16	Final exam	TBA

Course	• Instructional Materials for the Young Child
Module 1	Overview of Instructional Materials in Early Childhood Education
Key Concepts	▪ meaning of instructional materials for young children ▪ Examples of Instructional Materials
Overview	This module introduces the students to the wide variety of instructional materials that can be used in teaching young children in early childhood settings. Designing instructional materials, Ways and methods of utilizing instructional materials: approaches to Education for Sustainable Development (ESD)
Aim	This module aimed at guiding students to express their own understanding of the variety of instructional materials: types and resources. During this model the students will search different web sites to provide examples of different

	instructional materials that they can use in their future teaching.
Learning Outcomes	At the end of this module learners will be able to: • Identify the meaning of instructional materials for young children (Specifically, kindergarteners) • Describe the wide variety of instructional materials that can be used in teaching young children • Reflect on a field visit of Jordanian kindergartens' instructional materials
Units	Chapter1: Textbook (Examples of Instructional Materials) Ch.2: Criteria of choosing Instructional materials
Readings	Benefits of Instructional materials: Discussion of the following article from: Cone of Experience / Edgar Dale http://www.khayma.com/education-technology/w5.htm http://www.bhteachersbh.com/forum/new.php?print=1&id=2791 Kritchevsky, S & Prescott. E. (1990) Planning Environment for young children NAEYC. Washington D.C.
Activity	Overview ▪ *Assignment 1 :* Search online websites: meaning of instructional materials for young children 5- Activity (1) (Examples of Instructional Materials) can be facilitated by Class discussion & Group discussion 6- Activity (2) field visits to Jordanian kindergartens' Learning Centers *After visiting schools the students will make:*

	****Presentations of Field Visit Assignment* *Make a presentation in front of the classmates in which they will respond to a guideline that was distributed to the whole class regarding a field visit for one of the Jordanian kindergartens (could be private or public). In this presentation the student will describe the physical and emotional environment with a focus on describing the existed instructional materials there. Every student will provide evidence of that visit (could be pictures, drawing, crafts, …)*
Module 2	Educational Theories and their Implication on Designing Learning Materials
Key Concepts	Constructive theory: Piaget and Vygotsky, Behavioral theory (such as: Skinner). They will focus on their understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.
Overview	The focus of this module will be on bridging the gap between theory and practice. The module will highlight the insights of theorists who reflect the constructive theory such as Piaget and Vygotsky, Behavioral theory (such as: Skinner). The module will focus on expanding the students' understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.
Aim	The aim of this module is to 5- understand the main tenets of each theory 6- understand the link between educational theories (Behavioral theory, Constructive theory) and choosing specific instructional materials.

Learning Outcomes	At the end of this module learners will be able to: • Explore the link between educational theories (Behavioral theory, Constructive theory) and choosing specific instructional materials.
Units	Ch.4: Educational Theories
Readings	• **Instructional materials for young children (2007).** • Skinner, Piaget, Vygotsky, Pruner, Ausubel, Bloom Taxonomy • http://www.4uarab.com/vb/showthread.php?t=55885 • *faculty.ksu.edu.sa/74637/441/التعلم20%نظريات.doc* • http://educationaden.50webs.com/Ausubel.pdf • *faculty.ksu.edu.sa/ualturki/Documents/التعلم20%نظريات1.ppt*
Activity	PowerPoint Presentation: Whole Class discussion regarding each theory and its implementations on choosing instructional materials Skinner, Piaget, Vygotsky, Pruner, Ausubel, Bloom Taxonomy http://www.4uarab.com/vb/showthread.php?t=55885 *faculty.ksu.edu.sa/74637/441/التعلم20%نظريات.doc* http://educationaden.50webs.com/Ausubel.pdf *faculty.ksu.edu.sa/ualturki/Documents/التعلم20%نظريات1.ppt* Role play and present their understanding of theorists who reflect the constructive theory such as Piaget and Vygotsky, Behavioral theory (such as: Skinner). They will focus on their understanding of the implementation of each theory in the kindergarten and the relationship between the specific theorist and choosing the suitable instructional materials that reflect that theory.

Module 3	Designing Thematic Unit
Key Concepts	Implementations, Educational Theories in classrooms Introduction, Designing Thematic Unit
Overview	How to design the theoretical part of the thematic units Review Jordanian Kindergarten curriculum Interactive Kindergarten Curriculum. Designing the practical part of the thematic units. How to design hands-on activities and experiences that cover the following domains: Knowledgeable aspect (cover all content areas that are introduced in KG Curriculum and match the developmental aspects of kindergarteners). Social and emotional aspect. Physical aspect
Aim	Designing thematic unit with related instructional materials (Rubric is attached)
Learning Outcomes	At the end of this module learners will be able to: - Demonstrate an understanding designing thematic units related to ESD - Design a thematic unit and its related instructional materials (2 sections: theoretical part and practical part
Units	Ch. 5
Readings	• **Instructional materials for young children (2007).**
Activity	(Instructor will provide a presentation of previous examples) Choose a specific theme based on the children developmental characteristics (the discussion in the class and the references will help them choose their favorite theme). After choosing the theme the students design a complete unit that includes a theoretical part (the idea behind choosing the theme, the long-term objectives of the unit, the short-term objectives, the activities, instructional materials that will help to achieve these objectives, and the

	assessment of those objectives) and a practical part (designing a variety of instructional materials that reflect the objectives and show an evidence that their work is designed by themselves. They will provide crafts, real materials, hands-on activities,…)
	Assignment 1: Generating Themes 37. Consider one of the indicated themes of this module. 38. Next explain the modalities of its implementation 39. Explain which impact it has en SD? 40. Next consider whether this theme is important at the national and local level of your country

Course	**Managerial Economics**
Module 1	**Introduction to Managerial Economics**
Key Concepts	Introduction Managers, Profits and Markets
Overview	We try to explain the accounting concepts in the area of microeconomics and industrial organization such as: Business practices (or) tactics, Industrial organization, Strategic Decisions In addition, we will go over some concepts related to Economic Cost of Using Resources such as: Opportunity cost, market-supplied resources, owner-supplied resources, Total economic cost, explicit costs, implicit costs, economic profit, and accounting profit.
Aim	The aim of this module is to make students able to apply microeconomic theories to business problems
Learning	At the end of this module learners will be able to:

Outcomes	- Discuss the economic way of thinking about business. - Measuring and maximizing economic profit - Understand Separation of ownership and control.
Units	Unit 1: Managers, Profits and Markets.
Readings	(Managerial Economics) 11th edition, 2013. *McGraw Hill* By: Thomas and Maurice.
Activity	**Overview**
	Students should be able to answer the following questions: - Explain the role of economic theory in managerial economics? - Measure the explicit opportunity cost of using market-supplied resources to produce goods or services. - Over the next three years, a firm is expected to earn economic profit of $700,000 in the first year, $800,000 in the second year, and $500,000 in the third year. After the end of the third year, the firm goes out of business. a. If the risk-adjusted discount rate is 16 percent for each of the next three years, how much the value of the firm will be? b. If the risk-adjusted discount rate is 10 percent for each of the next three years, then, how much the value of the firm will be?

Module 2	(Demand, Supply, and Market Equilibrium) and (Elasticity of Demand)
Key Concepts	(Demand, Supply, and Market Equilibrium) and (Elasticity of Demand)
Overview	- In this part, students will work with three different types of demand relations: general, direct, and inverse demand functions. - We will List six principal variables that determine the quantity demanded of a good, and another six principal variables that determine the quantity supplied. - Distinguish between changes in "quantity demanded" (i.e., a movement along demand) and changes in "demand" (i.e., a shift in the demand curve) - Explain why market equilibrium occurs at the price for which quantity demanded equals quantity supplied (i.e., neither excess demand nor excess supply exist). - Employ the concepts of consumer surplus, producer surplus, and social surplus to measure the gains to society from market exchange between buyers and sellers. - Explain the role that price elasticity plays in determining how a change in the price of a commodity affects the total revenue (TR = P × Q) received. - List and explain several factors that affect the elasticity of demand. - Calculate the elasticity of demand (a) over an interval using the interval (or arc) formula, and (b) at a point on a demand curve. - Define and compute the income elasticity of demand (EM) and the cross-price elasticity of demand (EX Y). - Relate marginal revenue to total revenue and demand elasticity.
Aim	The main goal is to understand the role of demand and supply in affecting the equilibrium of the market. In addition, a one should know how he/she will response (presented by the quantity purchased of one good) to changes in price of that good, income, and the price of related goods.
Learning	At the end of this module learners will be able to:

Outcomes	- Explain the determinants of Supply and demand and understanding the meaning of equilibrium of the market. - Explain how price elasticity of demand (E) is used to measure the responsiveness or sensitivity of consumers to a change in the price of a good.
Units	Unit 2: Demand, Supply, and Market Equilibrium Unit 6: Elasticity of Demand
Readings	(Managerial Economics) 11th edition, 2013. *McGraw Hill* By: Thomas and Maurice.
Activity	**Overview**
	Construct two models: The first one is for the demand of one good (explaining the factors that determine the relationship with it). The second model shows the determinants of supply of that good (explaining the relationships of these determinants with that good).

Module 3	**(Demand Estimation and Forecasting)**
Key Concepts	Demand Estimation, Demand Forecasting, least-squares regression
Overview	- In this part, students will work on specifying an empirical demand function—both linear and nonlinear functional forms. - Forecast sales and prices using time-series regression analysis.

	- Employ dummy variables to account for cyclical or seasonal variation in sales.
Aim	- After reading and understanding this chapter, students should be able to: - For price-setting firms with market power, we will learn to how to use least-squares regression methodology to estimate a firm's demand function. - Discuss and explain several important problems that arise when using statistical methods to forecast demand. -
Learning Outcomes	At the end of this module learners will be able to: forecast the demand on one good.
Units	- Unit 7: Demand Estimation and Forecasting
Readings	(Managerial Economics) 11th edition, 2013. *McGraw Hill* By: Thomas and Maurice.
Activity	**Overview**
	Construct a model for the demand of one good (explaining the factors that determine the relationship with it). Then collecting data on these variables. Finally, performing how to forecast that model.

Module 4	**Production and Cost in the Short-Run and the Long-Run**
Key Concepts	production, cost, short run, long run
Overview	In this part, students should be able to: - Understand the information given by a production function. - Explain the difference between long-run and short-run production time periods. - Define and explain the law of diminishing marginal product. - Explain the difference between fixed costs and variable costs. - Define and draw graphs of total fixed cost (TFC), total variable cost (TVC), total cost (TC), and short-run marginal cost (SMC). - Define and draw graphs of average fixed cost (AFC), average variable cost

	(AVC), and average total cost (ATC). - Draw a graph of a typical production isoquant and use the definition of an isoquant to explain why isoquants must be downward sloping. - Construct isocost curves for a given level of expenditure on inputs. - Construct an expansion path. - Define and illustrate graphically the concept of returns to scale. - Construct a long-run total cost curve from an expansion path. - Define economies of scope and explain how to measure economies of scope. - Show the relation between long-run and short-run cost curves.
Aim	The main goal is to understand the role - Compute average product (AP) and marginal product (MP) and explain the relation among total, average, and marginal products. - Apply the theory of optimization to find the optimal input combination. - Show graphically that the conditions for minimizing the total cost of producing a given level of output are the same conditions for maximizing the level of output for a given level of total cost.
Learning Outcomes	At the end of this module learners will be able to: - Compare and contrast technical efficiency and economic efficiency. - Relate short-run costs to the production function using the relations between (i) average variable cost and average product, and (ii) short-run marginal cost and marginal product. - Discuss the properties of an isoquant. - Explain the concept of economies and diseconomies of scale.
Units	Unit 7: Production and Cost in the Short-Run Unit 8: Production and Cost in the Long-Run
Readings	(Managerial Economics) 11th edition, 2013. *McGraw Hill* By: Thomas and Maurice.
Activity	**Overview**

	Collecting data for a commercial company about its of production and cost levels. Try to isolate fixed and variable costs. Draw all data in useful figures.

Module 5	**(Marginal Analysis for Optimal Decisions)**
Key Concepts	
Overview	In this part, students will work with the following economic concepts: marginal analysis, net benefit, the choice variables (continuous or discrete), marginal benefit, and how to formulate an optimization problem
Aim	The main goal is to understand how to employ marginal analysis to find the optimal levels of activities in unconstrained maximization problems.
Learning Outcomes	At the end of this module learners will be able to: - Explain why sunk costs, fixed costs, and average costs are irrelevant for determining the optimal levels of activities. - Employ marginal analysis to find the optimal levels of two or more activities in constrained maximization and minimization problems.
Units	Unit 3: Marginal Analysis for Optimal Decisions
Readings	(Managerial Economics) 11th edition, 2013. *McGraw Hill* By: Thomas and Maurice.
Activity	**Overview**

Module 6	**(Economic Growth, Technology and Greenhouse Gas Emissions)**
Key Concepts	
Overview	- In this part, students will work with economic models that include climate change variables. In addition, we will go over the essential concepts about that subject.
Aim	The main goal is to understand the role - Understand the climate change problem
Learning Outcomes	At the end of this module learners will be able to: – Build a simple growth model that includes the climate change variable.
Units	Unit 4: Economic Growth, Technology
Readings	*The Economics of Climate Change: A Primer*. US Congressional Budget Office, 2003
Activity	**Overview**

Course Syllabus

0905371 Fuel and Energy

University of Jordan, Faculty of Engineering & Technology,
Chemical Engineering Department
First Semester, 2014-2015

Instructor Information

Instructor:	Prof.Yahia Al-Khraisha
Office Location:	University Campus, Engineering Building, 2nd Floor
Office Telephone:	+962 6 535 5000
Office Hours:	12:00-1:00 Sun Tue Thurs
E-mail:	khraisha@ju.edu.jo
Faculty Website:	http://www2.ju.edu.jo/sites/Academic/

Course Identification

Course Number:	0905371
Course Name:	Fuel and Energy
Course Location:	University Campus
Class Times:	11:00-12:00 Sun Tue Thurs
Prerequisites:	0905343 Process Heat Transfer

Course Description/Overview

Energy classification, sources and utilization. Non-renewable Energy: Fossilfuels, Nuclear energy, hydrogen fuel. Fossil-fuel systems and applications, wasteheat recovery systems. Renewable Energy: solar energy, wind power, tidal power,geothermal energy, and Biofuels. Energy storage: chemical storage, thermal storage and fuel cells. Energy and the Environment.

Course Objectives

The overarching goals of this course are providing students with knowledge and understanding of the fundamentals of fuel and energy science and engineering. These are important to chemical engineers since they need to deal with energy as a major utility in the chemical process industry. Moreover, many chemical engineers work in power plants or the energy conversion industry.

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

7. Classify and describe energy sources and specify their potentials.
8. Analyze existing and proposed renewable and non-renewable energy systems.
9. Classify and describe the concepts of different types of energy conversion systems.
10. Describe the various types of energy storage.
11. Realize the general impacts of fuel use and energy processing on the environment.

Course Resources

Course Website(s)

Required Course Texts and Materials

2. Culp, A. W., "Principle of Energy Conversion", second edition, McGraw-Hill, 1991.
3. Hodge, B.K., "Alternative Energy Systems and Applications", John Wiley,2010.
4. Weston, K. C., "Energy Conversion", electronic edition, 2000, revised from the 1992 edition, West Publishing.
5. Boyle, G. and Everett, B. and Ramage, J., "Energy Systems and Sustainability", Oxford University Press, UK, 2003.

Optional Course Texts and Materials

2. Boyle, G., "Renewable Energy", Oxford University Press, UK, 2004.
3. Probstein, R.F., Hicks, R. E., "Synthetic Fuels", 2nd edition, Dover publications, 2006.
4. *Speight, J.G. '*The Chemistry and Technology of Petroleu*m', 3rd edition, Pennwell, 1999.*

http\\:

Grading System

0 to 100 (where 50 is the least pass mark)

Grading Policy

Grades are divided on the following evaluation tools:

Quizzes	10
Project	10
Midterm Exam	30
Final Exam	50
Total Points	**100**

Course Policy

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

All students are expected to attend all classes and should arrive on time.Students should maintain discipline and respect for others. They are expected to come prepared and participate actively in class discussion. According to University regulations, the maximum absence allowed is 15% of classes. Makeup exams may be given for accepted excuses only. No makeup for non-exam activities.

Course Schedule

Week	Date	Topics, Assignments and Deadlines (Details on assignments and bibliography are available in the course modules)
1		**Course Overview**

		Syllabus, Evaluation tools, Policy, Overview and Introduction
2		Energy Classifications, Sources and Utilization
3-6		Fossil Fuels: Coal, Petroleum, Natural gas
7-8		Synthetic Fuels & Nuclear fuel
9-12		Renewable energy: Solar, Wind Power , Geothermal energy, etc.
13		Combustion Calculations
14-15		Fossil Fuel systems and applications
16		Energy Storages

LEBANON LAU

Course Syllabus

Course Number: ENV 211

Conserving Biodiversity in a Changing Climate

Lebanese American University

Department of Natural Sciences

Fall 2014 Semester

Instructor Information

Instructor:	Prof. Dr. Ahmad Houri
Office Location:	Beirut campus, Sage 202
Telephone:	Office 961-786456 x1253
Office Hours:	MTW 11:00 – 1:00.
E-mail:	ahouri@lau.edu.lb
Website:	http://ahmad.houri.lau.edu.lb/

Course Identification

Course Number:	ENV 211
Course Name:	Conserving Biodiversity in a Changing Climate

Course Location:	Sage G01, Beirut Campus
Class Times:	MWF 10:00 – 11:00
Prerequisites:	none
Faculty Web Page:	http://sas.lau.edu.lb/natural-sciences/people/ahouri.php

Course Description/Overview

Students of the course will examine current conservation strategies in terms of their effectiveness in addressing changing risks under a changing climate and will learn to develop new and/or modified strategies where necessary to address these risks. Students will also learn to use methods and tools that can assess ecosystem responses to climate variability and change and thus guide the development of new/modified conservation strategies. Course topics include: The role of ecosystems and biodiversity in sustaining the planet and major stresses; traditional approaches to biodiversity conservation including legal and policy aspects as well as community scale strategies; effectiveness of traditional approaches; approaches to designing landscapes for protecting ecosystems and biodiversity under climate change; use of spatial analysis tools to guide landscape design; management strategies; policies and tools for protecting matrix areas; community participation; planning for long term monitoring and evaluation; and case study approaches to designing climate sensitive conservation strategies. Students will design a conservation plan that is sensitive to changing risks in a changing climate for a selected region.

Course Objectives

The overall aim of this course is to generate strategies for adapting biodiversity conservation to changing risks under a changing climate by using existing/ new/modified conservation approaches, either singly or in any combination thereof. Applicable legal and policy instruments, and accounting for the role of local communities will be taken into account.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able:

89. To develop an understanding of traditional approaches to biodiversity conservation and legal and policy instruments, which govern conservation at the international or national/regional/local levels

90. To evaluate the effectiveness of traditional conservation approaches in terms of their benefits and shortcomings and in their ability to address changing risks due to climate change
91. To determine goals and priorities for conservation under a changing climate
92. To develop new and/or modified strategies for protecting areas of conservation importance under a changing climate
93. To develop tools and plans for the long term monitoring of protected areas to ensure the effectiveness of conservation strategies

Assignments and Grading Scheme

Grading System

0 to 100 (where 60 "D" is the passing grade)

Grading Policy

Grades are based on the following:

Debate/presentation	5%
3 exams	90%
Class attendance/participation	5%
Total Points	**100**

Course Policies

Classroom Protocol

POLICY ON CHEATING AND PLAGIARISM

Students caught cheating on an exam receive a grade of zero on the exam in their first cheating attempt and receive a warning. Students caught cheating for the second time will receive a grade of "F" in the course and another warning. Plagiarism on assignments and project work is a serious offense. If plagiarism is detected, a student will be subject to penalty, similar to the cheating case, which ranges from receiving a zero on the assignment concerned to an "F" in the course in addition to a warning.

ATTENDANCE POLICY

1. Students are held responsible for all the material presented in the classroom, even during their absence.
2. Students can miss no more than the equivalent of five weeks of instruction and still receive credit for that course.
3. Instructors have the right to impose specific attendance regulations in their courses, provided that the above-stated limit of absences is not exceeded, and the minimum number of absences allowed is no fewer than the equivalent of two weeks of classroom instruction, after the Drop and Add period.
4. Instructors will inform the Departments Chairperson and the Guidance Office, of any prolonged unexplained absence.
5. Students who exceed the allowed number of absences must withdraw from the course; otherwise, the course grade will be recorded as "F" (NP).

WITHDRAWAL POLICY

"Students wishing to withdraw from one or more courses must follow the withdrawal procedure provided by the Registrar's Office. Students withdrawing from courses after the late registration period and before the withdrawal deadline will receive Ws for all the courses in progress."
Deadline for withdrawal from courses (WI): Oct 22, 2014 (It is the student's responsibility to drop the course)

COURSE ONLINE EVALUATIONS

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

Course Schedule

Major Topics Covered in the Course and Tentative Schedule

1. Underlying need for protecting ecosystems and conserving biodiversity
2. Current biodiversity conservation strategies and their effectiveness
3. Protecting ecosystems and conserving biodiversity under a changing climate
4. Case Study: Designing conservation strategies for addressing climate impacts in a selected region

Detailed topics:

Week 1&2- Need for protecting ecosystems and conserving biodiversity

Week 3&4- Traditional approaches to biodiversity conservation

Week 6- Effectiveness of traditional approaches against various stressors

Week 6&7- Approaches to designing conservation responses that address climate change risks

Week 8- Designing landscapes

Week 9- Management of protected areas

Week 10- Protecting the matrix areas

Week 11- Community inclusive approaches

Week 12- Monitoring the effectiveness of adaptive strategies

Week 13 & 14- Case Study: Designing conservation strategies for addressing climate impacts in a selected region

Course Module

Course	Conserving Biodiversity in a Changing Climate
Module 1	**Underlying Need for Protecting Ecosystems and Conserving Biodiversity**
Key Concepts	Ecosystems, sustainability, endemism, endangered species, climatic and non-climatic stresses.
Overview	This module will briefly review the material covered in ENV210 on the role of ecosystems in the provision of goods and services and thus in sustaining the planet and supporting human development. An understanding of areas of high species endemism including endangered species and landscapes will be developed. Major stresses on ecosystems and biodiversity and their observed impacts over the past 50 years and potential impacts in the future will be discussed.
Aim	Understand the importance of Ecosystems and Biodiversity and learn the stresses that affect them.
Learning Outcomes	• Understand the concept of ecosystems goods and services and the role of ecosystems in supporting human development • Learn about the importance of areas of high endemic biodiversity • Learn about major climatic and non-climatic stresses, including those with anthropogenic origins, that affect ecosystem functioning and threaten biodiversity • Become familiar with major stresses that affect ecosystems and biodiversity
Units	1.1 Need for protecting ecosystems and conserving biodiversity
Readings	• Millennium Ecosystem Assessment (2005). Summary for decision-makers. In Ecosystems and Human Well-being: Synthesis. Island Press, Washington, DC, pp. 1-24. • Millennium Ecosystem Assessment (2005). Summary for decision-

	makers. In Ecosystems and Human Well-being: Biodiversity Synthesis. Island Press, Washington, DC, pp. 1-16. • Battarbee, R., P. Cox, C. Freeman, J. Lawton, G. Mace, A, Mackay, D. Read and J. Shepherd (2007). Biodiversity-Climate interactions: adaptation, mitigation and human livelihoods, Report of an international meeting held at the Royal Society 12-13 June 2007, Royal Society, UK Available: http://royalsociety.org/document.asp?tip=0&id=6830 • Mainka, S. A., McNeely, J. A. and Lackson, W. J. (Posted March 11, 2008) Depending on nature: ecosystem services for human livelihoods, Heldref Publications, March/April 2008. Available: http://www.redorbit.com/news/science/1290207/depending_on_nature_ecosystem_services_for_human_livelihoods/
Activity	**Video**
	Watch a documentary about one ecosystem with endemic and endangered species, showing its goods and services, the stresses affecting it and the need to conserve it.
Module 2	**Current Biodiversity Conservation Strategies and their Effectiveness**
Key Concepts	CBD, protected areas, IUCN, CBNRM, sustaining livelihoods
Overview	Students will learn about strategies and methods that are commonly employed for the conservation of biodiversity. International treaties, agreements and laws applicable to the protection of ecosystems and biodiversity will also be discussed. The extent of success of currently utilized strategies in meeting their objectives will be examined.
Aim	Learn the strategies and methods used for the conservation of biodiversity
Learning Outcomes	• Learn about international treaties and agreements, most importantly the convention on biological diversity (CBD), and will

	develop an idea of actions taken at regional/national/local scales. • Understand the concepts of in-situ and ex-situ conservation • Develop an understanding of place based conservation methods i.e. protected areas and learn about protected area categories based the World Conservation Union (IUCN) classification • Learn about the global distribution of protected areas • Learn about the traditional role of communities in protected area management, the diverse kinds of community efforts as well as popular approaches to community engagement such as the Community Based Natural Resource Management (CBNRM) strategies • Learn about the effectiveness of current protected area systems in protecting ecosystems and biodiversity against various stressors and therefore in supporting human development • Become aware of some of the key challenges in maintaining protected areas • Understand the strengths and weaknesses of traditional approaches to conservation, including in the context of climate change impacts
Units	2.1 Traditional approaches to biodiversity conservation 2.2 Effectiveness of traditional approaches against various stressors
Readings	• Lockwood, M (2006) Global protected area framework. In, M. Lockwood, G. L. Worboys and A. Kothari (Eds.), *Managing Protected Areas: A Global Guide,* Earthscan, London, UK and Sterling, USA, pp. 73-100 • Lockwood, M (2006) Social Context. In, M. Lockwood, G. L. Worboys and A. Ecological and Socio-economic benefits of protected areas in dealing with climate change. In L. Hansen, J. Biringer and J. Hoffman, (Eds.), Buying Time: A User's Manual for Building Resistance and Resilience to Climate Change in Natural Systems, WWF, Washington. Pp. 215-231. • Worboys, G., Winkler, C. and Lockwood, M. (2006) Threats to protected areas. In, M. Lockwood, G. L. Worboys and A. Kothari (Eds.), Managing Protected Areas: A Global Guide, Earthscan, London, UK and Sterling, USA, pp. 223-261 • Lockwood, M., Worboys, G. L. and Kothari, A. (2006) Challenges and opportunities. In, M. Lockwood, G. L. Worboys and A. Kothari (Eds.), Managing Protected Areas: A Global Guide, Earthscan, London, UK and Sterling, USA, pp. 677-681
Activity	**Short presentations by students**
	The students will research and give a short presentation on several treaties, conventions and unions such as CBD, IUCN and CBNRM explaining their missions, methods and actions taken.
Module 3	**Protecting Ecosystems and Conserving Biodiversity under a Changing**

	Climate
Key Concepts	Conservation strategies, changing climate, local versus regional context, protected area management, cost effective strategies, key stakeholders, monitoring.
Overview	This module will be devoted to understanding the manner in which response strategies can be designed to address the impacts of climate change on ecosystems and biodiversity in addition to the impacts of other pre-existing stressors as well as any synergistic outcomes. Each sub-module will address a key step in the process of designing conservation strategies suited to a more dynamic environment and students will be given the opportunity to participate in case study exercises aimed at conservation planning for selected regions.
Aim	Design conservation strategies under a changing climate using key guiding principles and various analytical tools. Learn the importance of monitoring the effectiveness of adapted strategies and develop a system to monitor the designed strategies.
Learning Outcomes	• Learn about key guiding principles to designing climate change responsive conservation strategies e.g. conserving existing biodiversity; reducing the impacts of non-climatic stressors; protecting and restoring habitats and maintaining habitat 29 • connectivity; relying on analytical evidence to guide decision-making; and integrating adaptation and mitigation efforts (from Hopkins et al, 2007) • Learn to use these guidelines to set broad conservation goals and priorities for their local/regional areas, keeping in mind institutional, legal and governance aspects. • Learn about various modeling methods for determining climate change impacts on ecosystems and species and therefore on conservation targets (e.g. regional climate projections, modeling

	changes in species distribution, species range shift models, etc.) • Based on these methods learn to determine future changes in conservation targets, keeping in mind the synergistic interactions of climate change impacts with non-climatic stressors • Learn to determine the future distribution and boundaries of protected areas, including the importance of maintaining landscape connectivity • Understand the need for a dynamic conservation plan in response to current and projected future distribution of species under a changing climate and informed by reserve planning tools (e.g. reserve selection algorithms) • Understand the role of planning and management in protected area design and conservation • Learn to evaluate current management tools in terms of their long-term applicability under a changing climate • Understand the importance of spatial coordination • Identify key stakeholders and their roles • Understand the need for planning and regulatory tools that can address climatic and non-climatic stressors and can maintain flexibility and reversibility as risks change with a changing climate • Identify additional costs in terms of staff, resources, training, and equipment needs. • Learn about the key role of the matrix as a source of biodiversity, as a source of resources for species, as a connective landscape, and as a potential suitable habitat for species under a changing climate. • Learn to apply analytical methods and tools to determine the current and future functions of matrix areas in biodiversity conservation

	• Understand the importance of periodic monitoring of climate induced changes as well as changes in other stressors in matrix areas, which are often under various land uses • Learn about the various options for protecting matrix areas to preserve their structure and function • Be informed about policy and regulatory approaches to protecting matrix areas • Evaluate traditional and current community conservation strategies in terms of their applicability for conservation under a changing climate • Identify other community stakeholders that could potentially play a role in biodiversity conservation under climate change • Identify current land-uses by local communities in areas that might need protection for biodiversity conservation under climate change and the ways in which these land uses can be made compatible with conservation objectives (are social appraisal tools like participatory rural appraisal useful here?) • Evaluate the usefulness of popular approaches such as the CBNRM in aiding community participation for biodiversity conservation under climate change • Identify policy and regulatory measures as well as incentives that could be used to elicit community cooperation and participation • Understand the importance of monitoring for effective conservation planning to address a changing climate • Understand the basics of designing a monitoring system that produces the desired results and is cost-effective • Learn to determine what must be monitored i.e. focus on key target species, processes and resources • Learn to select eco-regions or landscapes that must be monitored

	• Learn to determine the frequency of monitoring required • Learn to use various methods and tools for this purpose e.g. spatial analysis, survey methods, etc.
Units	3.1 Approaches to designing conservation responses that address climate change risks 3.2 Designing landscapes 3.3 Management of protected areas 3.4 Protecting the matrix areas 3.5 Community inclusive approaches 3.6 Monitoring the effectiveness of adaptive strategies

Activity	**Case study exercises (Unit 3.1), Visit to Shouf Cedar Reserve (Unit 3.3)**
	1- Design conservation strategies suited to a more dynamic environment in selected regions using principles and techniques learned in this module 2- Visit the Shouf Cedar Reserve and its headquarters to learn from their experience in managing protected areas.
Module 4	**Case Study: Designing Conservation Strategies for Addressing Climate Impacts in Selected Regions**
Key Concepts	Conservation plan, climate risks, integrated management plan, community participation strategies, periodic monitoring plan, cost effectiveness.
Overview	This module is designed as a hands-on activity where students will use the knowledge acquired from this course to design a conservation plan that is sensitive to changing risks under climate change for an area of their choice. Students will be expected to use the tools and resources provided in this course to develop their designs and must include all the key considerations, including the need for periodic monitoring. This exercise includes presentation of the conservation plans developed during this activity.
Aim	Hands on experience to design a conserving plan in a changing climate.
Learning Outcomes	• Identify broad goals and priorities • Identify climatic and non-climatic stressors, both current and

	future, and be able to determine potential future impacts in terms of changing species distribution and ranges • Identify matrix areas that important for future conservation needs • Assess the applicability of current conservation strategies in that region to address climate risks in future • Include a climate risk integrated management plan that considers future conservation landscapes, including matrix areas. • Identify key stakeholder roles, including community participation strategies • Identify policy/regulatory approaches • Include a periodic monitoring plan identifying key targets and landscapes to be monitored, monitoring frequency and methodology • Include an analysis of cost effectiveness
Units	Case Study: Designing Conservation Strategies for Addressing Climate Impacts in Selected Regions
Readings	All the readings from earlier modules are to be used as references
Activity	The module is an activity in itself.

Website:

Course Identification

Course Number: ENV 200

Course Name: Introduction to environmental Science

Course Location: Eng 506 Byblos Campus

Class Times: MWF 3-4

Prerequisites: none

Faculty Web Page: http://sas.lau.edu.lb/natural-sciences/people/roy-khalaf.php

Course Description/Overview

An introduction to the environmental problems and challenges facing mankind. Global problems will be directly related to issues facing the regional and local environment. The course covers environmental problems and their causes, ecosystems and how they work, deforestation, loss of biodiversity, species extinction, air pollution, global warming, ozone depletion, solid waste disposal, renewable

energy technologies and applications to alleviate environmental problems. Case studies will be presented and potential solutions will be attempted. The course also includes field trips.

Course Objectives

The objective of this course is to introduce the environment we live in to the students. The course will treat environmental science as an interdisciplinary study, combining ideas and information from natural sciences, such as biology and chemistry and social sciences such as economics, politics and ethics to present a general idea of how nature works and how things are interconnected. It will discuss problems affecting the environment and tries to offer solutions. The course stresses the important, but unfortunately sometimes harmful, role that man plays in shaping the environment and will attempt to install a sense of responsibility in each individual to live in harmony with- and not at the expense of- nature. The course aims at providing a better appreciation of the value of environmental conservation especially in Lebanon. This course should also motivate students to become active participants in presenting and evaluating environmental solutions to the problems we have created. This heightened sense of awareness will be achieved through lectures, hosting of keynote speakers, field trips and possible class debates.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

94. Understand the notion of food webs, food chains and energy cycles.
95. Understand the harmful role man plays in shaping the environment.
96. Identify the major environmental concerns of our world today and come up with potential solutions within financial and technological constraints.
97. Acquire practical experience by becoming familiar with places of special environmental interest in Lebanon.
98. Possess a heightened sense of ethics and morality in dealing with nature, or with people of other cultures and religions

Course Resources

Required Course Texts and Materials

Living in the Environment, G. Tyler Miller JR , Brooks/Cole, thirteenth edition

Optional Course Texts and Materials

- UN's Tunza Magazine
- Photographic Guide to Wild Flowers of Lebanon
- Ministry of Environment Web page**: www.moe.gov.lb**
- SELDAS book.
- Excerpts from newspapers, magazines, internet websites etc..
- Website for the book: www.brookscole.com/product/0534376975s

Assignments and Grading Scheme

Grading System

0 to 100 (where 60 "D" is the passing grade)

Grading Policy

Grades can be based on the following: (Example)

Debate/presentation	5%
3 exams	90%
Class attendance/participation	5%
Total Points	**100**

Course Policies

Classroom Protocol

POLICY ON CHEATING AND PLAGIARISM

Students caught cheating on an exam receive a grade of zero on the exam in their first cheating attempt and receive a warning. Students caught cheating for the second time will receive a grade of "F" in the course and another warning. Plagiarism on assignments and project work is a serious offense. If plagiarism is detected, a student will be subject to penalty, similar to the cheating case, which ranges from receiving a zero on the assignment concerned to an "F" in the course in addition to a warning.

ATTENDANCE POLICY

6. Students are held responsible for all the material presented in the classroom, even during their absence.
7. Students can miss no more than the equivalent of five weeks of instruction and still receive credit for that course.
8. Instructors have the right to impose specific attendance regulations in their courses, provided that the above-stated limit of absences is not exceeded, and the minimum number of absences allowed is no fewer than the equivalent of two weeks of classroom instruction, after the Drop and Add period.
9. Instructors will inform the Departments Chairperson and the Guidance Office, of any prolonged unexplained absence.
10. Students who exceed the allowed number of absences must withdraw from the course; otherwise, the course grade will be recorded as "F" (NP).

WITHDRAWAL POLICY

"Students wishing to withdraw from one or more courses must follow the withdrawal procedure provided by the Registrar's Office. Students withdrawing from courses after the late registration period and before the withdrawal deadline will receive Ws for all the courses in progress."
Deadline for withdrawal from courses (WI): Oct 22, 2014 (It is the student's responsibility to drop the course)

COURSE ONLINE EVALUATIONS

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

Important Dates to Remember

Course Schedule

Major Topics Covered in the Course and Tentative Schedule

1. Introduction to Environmental systems
2. Ecology and sustainability
3. Sustaining Biodiversity
4. Sustaining Key resources
5. Sustaining Environmental Quality
6. Sustaining Human Societies

Detailed topics:

Week 1-Ecology and Ecosystems

Week 2-Evolution and Biodiversity

Week 3-Human Population

Week 4-Food Resources

Week 5-Water Resources

Week6-Nonrenewable and Renewable Energy Sources

Week 7-Air and Air Pollution

Week 8-Water Pollution

Week 9-Climate Change and Ozone Loss

Week 10-Biodiversity Loss: Example of Amphibian decline in Canada

Week 11-Ecotourism: Example from the Al-Jord project in Lebanon.

Week 12- Industrial Ecology

Week 13- Sustainable Development, Ecocities

Week 14- Societal, Political, and Ethical Solutions (an essay by the world renowned environmentalist, David Suzuki)

Course Module

Course	Introduction to Environmental Science
Module 1	Introduction to environmental systems, biodiversity and sustainability
Key Concepts	Ecology, evolution, biodiversity, sustainability
Overview	Instil in students key concepts in ecology, environmental science, biodiversity and evolution. An overview of energy cycles, trophic levels, food chains, food webs and ranges of tolerance will be discussed. Characteristics of different biomes and ecosystems and the type of biodiversity found will also be discussed. Concepts in Darwinism and Lamarckism, mutations, natural and artificial selection will be introduced. This module will also explain the concept of self-sustainability, stressing the adverse role man is playing.
Aim	Lay the background needed to better understand environmental issues
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss different ecosystems • Understand key concepts in evolution leading to biodiversity • Understand the concept of self-sustainability of nature
Units	Unit 1.1 Ecology and Ecosystems Unit 1.2: Evolution and Biodiversity
Readings	Living in the Environment, pages 64-109, 560-630 plus extra hand-outs
Activity	**None**

Module 2	Human population and Sustaining key resources
Key Concepts	Population, food resources, pollution,
Overview	This broad module will discuss human population growth and its effect on the environment. Human population growth has been said to be the single most devastating factor leading to biodiversity decline But is it? Is the problem just a numbers issue? Maybe it an issue of population distribution between the developing and the developed nations? Or maybe an issue that relates to our ever changing non sustainable lifestyle and ever increasing energy needs? This module will challenge students by asking existential questions about human population, civilization, and lifestyle. It will also discuss key environmental resources such as food, water, energy and subsequent pollution in light of the ever increasing demand and consumption by one overwhelming species-the human race .
Aim	The aim of this module is to understand the collective impact mankind is having on key environmental resources
Learning Outcomes	• At the end of this module students should be able to: • Understand the impact of human population growth on key environmental resources
Units	Unit 2.1: population growth Unit 2.2: food resources Unit 2.3: sustainable and non-sustainable energy resources Unit 2.4: air and air pollution

	Unit 2.3: water and water pollution
Readings	Living in the Environment pages 250-520 plus extra readings
Activity	**Overview** 1) A debate on genetically modified food will take place. Class will be divided into two sections, one arguing for and one against genetically modified foods. The debate will cover all aspects from the ethical to the effect on the economy, to human health, to biodiversity. 2) A trip to the water treatment plant in Dbayeh and then to Chabrouh Dam will be attempted.
Module 3	Climate change and ozone loss
Key Concepts	Global warming, CO_2, ozone, UV light, Antarctica
Overview	This module discusses the concept of global warming from an anthropogenic perspective. It stresses the effect that greenhouse gases-especially carbon dioxide from our ever increasing demand on non-renewable energy-are having on the planet. This module reminds students that the greenhouse effect-within a certain range-is actually a good thing and necessary for life. Ozone depletion resulting in increased UV radiation due to man-made CFC chemicals and their effect on human disease and health will also be discussed. This module also attempts to link both concepts, as an increase in global warming in the troposphere results in a colder stratosphere resulting in ozone loss

Aim	The aim here is to understand the role man is playing in both global warming and ozone depletion.
Learning Outcomes	At the end of this module learners will be able to: • Understand how human civilization is contributing to global warming • Understand that ozone loss and global warming are linked events
Units	Unit 3.1: Climate change and ozone loss
Readings	Living in the Environment pages 446-482 and extra readings
Activity	**Overview** Movie: An inconvenient truth, by Al Gore
Module 4	Sustaining human societies, ecocities, industrial ecology
Key Concepts	Ecotourism, sustainable development, eco-cities
Overview	The world population is expected to plateau at around 11 billion people. As such how can a limited number of resources sustain so many people? The answer is through a change in lifestyle, through sustainable development. Use as much resources as can be regenerated in a lifetime. This implies a combination of principles from ethical and moral issues to concepts of renewable energy. It entails preserving diversity, not only at the biological level, but at the level of cultures, races, and languages by empowering locals. This module discusses concepts in eco-cities / self-sustainable cities-such as Curitiba in Brazil, and examples of eco village projects, such as the Al Jord project in Lebanon. Sustainability not only applies to development, it can apply to tourism the world's largest industry where ecotourism can be an alternative to rampant mass tourism. Sustainability can also be part of industry; creating industrial ecology that aims to recycle industrial by-products in the same manner nature recycles resources and

	energy. The last part of this module discusses an essay by the world renowned Canadian environmentalist, David Suzuki which highlights the main reasons behind most of our environmental problems.
Aim	The aim here is to instil a holistic approach in students. To have them understand that everything in life is linked, that in the end the issue at hand is a moral issue. That in order for life as we know it to continue to exist, we need to change our way of thinking, our habits and our lifestyle, and in the end we will be the ones benefiting from such a change.
Learning Outcomes	At the end of this module learners will be able to: • Differentiate between eco-cities as smart growth versus urban sprawl , between mass tourism and ecotourism • understand the concept of industrial ecology
Units	Unit 3.1: Ecotourism and industrial ecology Unit 3.2: Sustainable development and eco-cities
Readings	Living in the Environment Pages 660-716 plus extra readings
Activity	**Overview**
	1) Movie: State of the Planet by David Attenborough 2) Presentations: 5' student presentation about sustainability and biodiversity.

RENEWABLE ENERGY FOR SUSTAINABLE DEVELOPMENT

Course Syllabus

Course Number: ENV 220

Lebanese American University

Department of Natural Sciences

Fall 2014 Semester

Instructor Information

Instructor:	Prof. Dr. Ahmad Houri
Office Location:	Beirut campus, Sage 202
Telephone:	Office 961-786456 x1253
Office Hours:	MTW 11:00 – 1:00.
E-mail:	ahouri@lau.edu.lb
Website:	http://ahmad.houri.lau.edu.lb/

Course Identification

Course Number:	ENV 220
Course Name:	Renewable Energy for Sustainable Development
Course Location:	Sage G01, Beirut Campus
Class Times:	MWF 10:00 – 11:00

Prerequisites: none
Faculty Web Page: http://sas.lau.edu.lb/natural-sciences/people/ahouri.php

Course Description/Overview

We live in an era of ever-rising oil prices, where economic development is strongly correlated with increasing energy use and levels of electrification rates. Economies are restricted by fluctuating energy supplies and put under pressure due to the burdens energy security puts on their national policies and strategic planning.

The importance of utilziation of smart renewable energy solutions helps economies and nations in achieving reliable energy supply at affordable costs and reduced negative environmental impact. The use of clean energy sources is on essential ingridient of sustainable economic development, enhancing the strength of the economy through providing green jobs, imrpocing energy supply, and protecting eco-tourism.

This course looks at renewable energy solutions as key component to developing economies and strenthening the capabilities of developing nations. It is designed to intriduce students to the issues of energy in the 21st century and their effects on the economy covering energy production and use from different perspectives including biology. Engineering, economics, climate science, and socio-economic science.

Course Learning Objectives

The overarching goals of this course are to:

a) provide a clear understanding of the critical role that energy plays in reshaping nation's economy;
b) present the different renewable energy technologies and their applicability for development;
c) establish a link between the development of nations and the utilization of renewable energy for electricity production; and
d) evaluate the environmental impact of energy produced through renewable and non-renewable sources.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

99. Understand the role of energy in the economy
100. Analyse the effect of fluctuating oil prices on the national economy
101. Understand the different renewable energy technologies and their applicability in different situation
102. Perform preliminary environmental impact assessment of energy sources
103. Perform a techno-economic analysis of renewable energy sources

Course Outline

- *Module 1: Introduction to Energy*
  - *Intro to energy*
  - *Conventional sources of energy*
  - *Energy and the environment*
  - *Future energy needs and consequences*
- *Module 2: Solar Energy*
  - *Basics of solar power*
  - *Solar thermal applications*
  - *Solar PV*
  - *Current trends and uses of solar energy*
  - *Solar energy environmental impact*
- *Module 3: Wind Energy*

    - *Intro to wind energy*
    - *Wind resources*
    - *Wind turbines*
    - *Wind turbines environmental impact*
- *Module 4: Ocean & Hydro Energy*
    - *Intro to ocean power*
    - *Wave energy technologies*
    - *Tidal energy applications*
    - *Osmotic power*
    - *Hydro power*
    - *Ocean & hydro environmental impact*
- *Module 5: Geothermal Energy*
    - *Geothermal resources*
    - *Shallow geothermal applications*
    - *Deep geothermal applications*
    - *Geothermal energy environmental impact*
- *Module 6: Biofuels*
    - *Intro to biofuels*
    - *First generation biofuels*
    - *Second generation biofuels*
    - *Biofuels environmental impact*
- *Module 7: Socio-economic Issues*
    - *Socio-economic impact of energy production and use*

- *Economics of energy*
- *Renewable energy in rural regions*
- *Lifecycle assessment of fossil and renewable fuels*

Course Resources

Course Website

Through the BlackBoard Learn platform

Required Course Texts and Materials

- Hands-out prepared by the instructor for the class
- Fanchi, John R. "Energy in the 21st century" Hackensach, N.J." World Scientific, 2005
- Godfrey Boyle, " Renewable Energy, Power for a sustainable future", 2004, Oxford University Press
- REN 21, "Energy for Development", The Worldwatch Institute, 2005
  http://www.worldwatch.org/system/files/ren21-1.pdf
- DVD: Saved by the sun, produced by Steve Latham, Larry Klein, Evan I. Schwartz ; written by Larry Klein and Evan I. Schwartz ; directed by Steven Latham ; a Steven Latham production for WGBH/Nova ; WGBH Educational Foundation. WGBH Video, 2007
- The power of wind, produced by the American Wind Energy Association with the support of the U.S. Department of Energy. American Wind Energy Association (AWEA), 2005.

Optional Course Texts and Materials

- Bent Sorensen, "Renewable energy :its physics, engineering, use, environmental impacts, economy, and planning aspects" Elsevier Academic Press, 2004
- John Twidell, Tony Weir, Anthon D. Weir, "Renewable energy resources", Taylor & Francis, 2005

- Chiras, Daniel D. “The homeowner’s guide to renewable energy: achieving energy independence through solar, wind, biomass, and hydropower”

Assignments and Grading Scheme

Grading System

0 to 100 (where 60 is the least pass mark)

Grading Policy

Grades can be based on the following:

Quizzes/Assignments	30%	The best 6 out of 7 quizzes and assignments account for 30%
Exam	35%	Final exam covering all the material of the course accounting for 35%
Project	25%	Group project accounting for 25% of the final grade
Attendance/Discussion Forum	10%	Activeness in class discussions and discussion forums account for 10%
Total Points	100%	Final grade (60% minimum passing grade)

Course Policies

Classroom Protocol

POLICY ON CHEATING AND PLAGIARISM

Students caught cheating on an exam receive a grade of zero on the exam in their first cheating attempt and receive a warning. Students caught cheating for the second time will receive a grade of "F" in the course and another warning. Plagiarism on assignments and project work is a serious offense. If plagiarism is detected, a student will be subject to penalty, similar to the cheating case, which ranges from receiving a zero on the assignment concerned to an "F" in the course in addition to a warning.

ATTENDANCE POLICY

11. Students are held responsible for all the material presented in the classroom, even during their absence.
12. Students can miss no more than the equivalent of five weeks of instruction and still receive credit for that course.
13. Instructors have the right to impose specific attendance regulations in their courses, provided that the above-stated limit of absences is not exceeded, and the minimum number of absences allowed is no fewer than the equivalent of two weeks of classroom instruction, after the Drop and Add period.
14. Instructors will inform the Departments Chairperson and the Guidance Office, of any prolonged unexplained absence.
15. Students who exceed the allowed number of absences must withdraw from the course; otherwise, the course grade will be recorded as "F" (NP).

WITHDRAWAL POLICY

"Students wishing to withdraw from one or more courses must follow the withdrawal procedure provided by the Registrar's Office. Students withdrawing from courses after the late registration period and before the withdrawal deadline will receive Ws for all the courses in progress."
Deadline for withdrawal from courses (WI): Oct 22, 2014 (It is the student's responsibility to drop the course)

COURSE ONLINE EVALUATIONS

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

COURSE GENERAL NOTES

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

This class requires students to attend classes, participate in webinars, contribute to the discussion forum, submit periodic assignments and projects, and sit for prescheduled exams. Students are expected to attend all classes and participate in the different activities of the course.

At the end of each module there is a quiz/assignment that tests student's understanding of the course objectives and their ability to demonstrate the knowledge acquired throughout the module. At the middle of the course students will be assigned a project (in groups), to be submitted during the last month of the courses. The final exam tests student's understanding of the course as a whole and includes concepts from the classes, discussion forums, assigned videos, and projects.

Course Schedule

Week	Module	Topics, Reading, Assignments and Deadlines
1	1	***Course Overview*** - Introduction to energy - Conventional sources of energy
2		- Energy and the environment - Future energy needs and consequences ***Quiz 1***
3	2	- Basics of solar power - Solar thermal applications - Solar PV
4		- Current trends and uses of solar energy - Solar energy environmental impact ***Assignment 1 (DVD)***
5	3	- Intro to wind energy - Wind resources
6		- Wind turbines - Wind turbines environmental impact ***Assignment 2 (DVD)***
7	4	- Intro to ocean power - Wave energy technologies
8		- Tidal energy applications - Osmotic power
9		- Hydro power - Ocean energy environmental impact ***Project Overview***

		Quiz 2
10	5	- Geothermal resources - Shallow geothermal applications
11		- Deep geothermal applications - Geothermal energy environmental impact ***Quiz 3***
12	6	- Intro to biofuels - First generation biofuels
13		- Second generation biofuels - Biofuels environmental impact ***Assignment 3 (Webinar)***
14	7	- Socio-economic impact of energy production and use - Economics of energy
15		- Renewable energy in rural regions - Lifecycle assessment of fossil and renewable fuels ***Quiz 4***
16		***Presentation of Project*** ***Final Exam***

Course	Renewable Energy for Development
Module 1	**Introduction to Energy**
Key Concepts	Energy, renewable vs nonrenewable energy, energy and climate change
Overview	This module provides students with basic background about energy and its correlation with economic development. It presents the conventional sources of energy and their impact on the environment and the economic standing of nations. Questions answered in this module: • How is energy produced globally? • What effect does this have on the environment? • What are the current trends in energy production? • How does the future look?
Aim	This introductory module aims at providing students with essential background on energy systems and provide a good introduction to renewable energy
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different sources of energy • Understand the impact of energy consumption on the environment • Have a good idea about current and future global energy trends
Units	Unit 1.1 Intro to energy Unit 1.2 Conventional sources of energy Unit 1.3 Energy and the environment Unit 1.4 Future energy needs and consequences
Readings	Fanchi, John R. "Energy in the 21st century" Hackensach, N.J." World Scientific, 2005 (Chapters 1-4)

Activity	**Quiz** *A 20-minute quiz to test students understanding of energy systems and their ability to analyse energy-related graphs and figures.*
Module 2	**Solar Energy**
Key Concepts	Solar energy, solar EIA, solar PV, solar heating
Overview	This module presents the first and most common renewable energy technology, solar energy. It presents the different electrical and thermal applications of solar power and their role in clean energy generation to reduce large amounts of carbon emissions as compared to conventional technologies. Questions answered in this module: • How is solar energy used to generate electricity? • What makes solar energy a feasible solution? • How solar electricity achieves economic development? • How does solar really sustain the environment?
Aim	This module aims at giving the student the required information about solar thermal and electric applications.
Learning Outcomes	At the end of this module learners will be able to: • Understand the different solar energy applications • Compare different applications and understand their applicability • See the environmental impact of utilizing solar energy
Units	Unit 2.1 Basics of solar power Unit 2.2 Solar thermal applications Unit 2.3 Solar PV Unit 2.4 Current trends and uses of solar energy Unit 2.5 Solar energy environmental impact
Readings	Godfrey Boyle, " Renewable Energy, Power for a sustainable future", 2004, Oxford

	University Press (Chapters 1 & 2)
Activity	**Assignment** *Watch the DVD "Saved by the sun" produced by Steve Latham, and submit an essay with personal perception and analysis.*
Module 3	**Wind Energy**
Key Concepts	Wind Energy, wind EIA, wind resource assessment, wind turbines
Overview	The module discusses wind energy applications covering small scale as well as large wind farm scale. Studding the practicality and impact of wind turbines on the environment and surrounding community. Questions answered in this module: • How can wind be used to produce electricity? • What are the different applications of wind energy? • How is wind resource assessment performed? • What positive and negative impacts do wind turbines have on the environment?
Aim	This module aims at giving the student the required information about wind energy and how it can contribute to economic development.
Learning Outcomes	At the end of this module learners will be able to: • Understand the different wind energy applications • Compare different applications and understand their applicability • See the environmental impact of utilizing wind energy
Units	Unit 3.1 Intro to wind energy Unit 3.2 Wind resources Unit 3.3 Wind turbines Unit 3.4 Wind turbines environmental impact

Readings	Godfrey Boyle, " Renewable Energy, Power for a sustainable future", 2004, Oxford University Press (Chapter 7)
Activity	**Assignment** *Watch the DVD "The power of wind produced by the American Wind Energy Association and submit an essay with personal perception and analysis.*
Module 4	**Ocean & Hydro Energy**
Key Concepts	Hydro power, wave energy, tidal energy, osmotic power
Overview	This module gets into water, presenting the renewable sources of electricity including hydro power and ocean power including wave, tidal, and osmotic. Ocean biomass is not discussed in this module as it is covered under the biofuels module. Questions answered in this module: • How is water used to generate electricity? • What are the main applicable technologies in harnessing ocean power? • How do these technologies affect the environment?
Aim	This module aims at giving the student the required information about ocean power and hydroelectric applications. Allowing students to differentiate between different technologies and assess the pros and cons of each application.
Learning Outcomes	At the end of this module learners will be able to: • Understand the different water related energy applications • Compare different applications and understand their applicability • See the environmental impact of utilizing ocean and hydro power
Units	Unit 4.1 Intro to ocean power Unit 4.2 Wave energy technologies Unit 4.3 Tidal energy applications

	Unit 4.4 Osmotic power Unit 4.5 Hydro power Unit 4.6 Ocean & hydro environmental impact
Readings	Godfrey Boyle, " Renewable Energy, Power for a sustainable future", 2004, Oxford University Press (Chapters 5, 6, 8)
Activity	**Quiz** *A 20-minute quiz to test students understanding of ocean and hydro power systems. It includes basic technological issues but more economic and environmental related questions.*
Module 5	**Geothermal Energy**
Key Concepts	Geothermal, shallow geothermal, deep geothermal, geothermal assessment
Overview	This module introduces geothermal applications for electricity and thermal power generation. Deep as well as shallow geothermal applications are discussed including resource assessment, applicability, roles in developing communities, and environmental impact. Questions answered in this module: • How are geothermal resources assessed? • What are main geothermal applications? • How do these technologies affect the environment?
Aim	This module aims at giving the student the required information about geothermal applications for water heating and electricity generations. Allowing students to differentiate between different technologies and assess the pros and cons of each application.
Learning Outcomes	At the end of this module learners will be able to: • Understand the different geothermal energy applications • Compare different applications and understand their applicability

	• See the environmental impact of geothermal projects
Units	Unit 5.1 Geothermal resources Unit 5.2 Shallow geothermal applications Unit 5.3 Deep geothermal applications Unit 5.4 Geothermal energy environmental impact
Readings	Godfrey Boyle, " Renewable Energy, Power for a sustainable future", 2004, Oxford University Press (Chapter 9)
Activity	**Quiz** *A 20-minute quiz to test students understanding of geothermal applications. It includes a case study that requires students to propose the most practical geothermal solution and perform basic economic and environmental feasibility.*
Module 6	**Biofuels**
Key Concepts	Biofuels, bioenergy, biogas
Overview	This module presents different biofuels classified into first generation biofuels such as ethanol, biogas, syngas, green diesel, biodiesel, and many others, and second generation biofuels made from lignocellulosic biomass or woody crops. Questions answered in this module: • How can energy be produced from living organisms? • What are first generation biofuels? • What are second generation biofuels? • How sustainable are biofuels?
Aim	This module goes deep into different biofuels produced from living organisms and biomass products. Students will learn about various sources of energy that can be harnessed in sustainable manners
Learning Outcomes	At the end of this module learners will be able to: • Understand the different biofuels

	• Understand the difference between first and second generation biofuels • Perform environmental analysis of biofuel technologies
Units	Unit 6.1 Intro to biofuels Unit 6.2 First generation biofuels Unit 6.3 Second generation biofuels Unit 6.4 Biofuels environmental impact
Readings	Godfrey Boyle, " Renewable Energy, Power for a sustainable future", 2004, Oxford University Press (Chapter 4)
Activity	**Webinar** *Students are required to attend a webinar on energy production from Algae. Following the webinar, they will be assessed for their understanding of ocean biomass technologies.*
Module 6	**Socio-economic Issues**
Key Concepts	Renewable energy socio-economics
Overview	This module allows students to perform social, economic, and environmental analysis of renewable energy technologies, allowing them to assess the impact on community development. Questions answered in this module: • What are the impacts of energy production based on the source? • How are energy and the economy related? • How does renewable energy affect the lives of rural inhabitants? • How sustainable are renewables?
Aim	Student will develop the skills to perform socio-economic as well as environmental impact of different energy sources
Learning Outcomes	At the end of this module learners will be able to:

	• Perform socioeconomic analysis • Understand lifecycle assessment • Compare different technologies based on the three core categories
Units	Unit 7.1 Socio-economic impact of energy production and use Unit 7.2 Economics of energy Unit 7.3 Renewable energy in rural regions Unit 7.4 Lifecycle assessment of fossil and renewable fuels
Readings	REN 21, "Energy for Development", The Worldwatch Institute, 2005 http://www.worldwatch.org/system/files/ren21-1.pdf Fanchi, John R. "Energy in the 21st century" Hackensach, N.J." World Scientific, 2005 (Chapters 12)
Activity	**Quiz** *A 20-minute quiz to test students understanding of socio-economic issues related to the integration of renewable energy applications.*

SOCIAL ASPECTS OF RENEWABLE ENERGY FOR RURAL DEVELOPMENT

Course Number: ENV 222

Lebanese American University

Department of Natural Sciences

Fall 2014 Semester

Instructor Information

Instructor:	Prof. Dr. Ahmad Houri
Office Location:	Beirut campus, Sage 202
Telephone:	Office 961-786456 x1253
Office Hours:	MTW 11:00 – 1:00.
E-mail:	ahouri@lau.edu.lb
Website:	http://ahmad.houri.lau.edu.lb/

Course Identification

Course Number:	ENV 222
Course Name:	Social Aspects of Renewable Energy for Rural Development
Course Location:	Sage G01, Beirut Campus
Class Times:	MWF 10:00 – 11:00
Prerequisites:	none
Faculty Web Page:	http://sas.lau.edu.lb/natural-sciences/people/ahouri.php

Course Description/Overview

“Rich are getting richer while the poor are getting poorer”. This can be described as the most commonly used phrase in the 21st century. This situation gets worse with the increasing prices of basic human needs such as food, clothing, and energy supply.

Energy has become a critical issue in both urban and rural areas. While the first appears to have enough resources to cover up their demand and avoid economic drops, rural regions remain poor at resources and potential, and mainly suffer from shortage in energy supply leading to a deterioration in their social and economic standing.

The course offers students a deep understanding of the role renewable energy plays in sustainable rural development. It allows students to study the various renewable energy applications that can be utilized in rural regions at low cost for improved social standing. During the course, students will examine the energy demand and requirements in rural regions and how renewable energy can be utilized to cover this demand, reducing low productivity in sectors such as agriculture and industry due to insufficient and interpretable supply of power, water, and other main resources.

Course Learning Objectives

The overarching goals of this course are:

e) To understand the importance of renewable energy in supporting rural communities and increasing the yield of productive sectors;

f) learn about the major rural applications of renewable energy and how they affect the lives of rural inhabitants;

g) examine real life applications of renewable energy in rural communities; and

h) assess the social impact of renewable energy in rural regions.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

104. Understand the importance of energy in rural regions
105. Understand the different renewable energy applications and their impact on rural communities
106. Set up sustainable rural development strategies

Course Outline

- *Module 1: Energy and Rural Areas*
    - *The impact of energy supply on rural regions*
    - *Rural demand for energy*
    - *Environmental cost of energy stress in rural regions*
    - *The role or renewable energy sources in rural regions*
- *Module 2: Solar Applications in Rural Regions*
    - *Solar cooking*
    - *Off-grid solar PV for electricity*
    - *Solar food drying*
    - *Solar water treatment*
    - *Solar pumping*
- *Module 3: Wind & Hydro Applications in Rural Regions*
    - *Wind water pumping*
    - *Small-scale water wheels*
    - *Water storage for electricity generation*
    - *Hydro for electricity generation*
- *Module 4: Biogas Applications in Rural Regions*
    - *Biogas for decentralized cooking*
    - *Biodiesel for agriculture transportation*
    - *Solid biomass*
    - *Liquid biofuels*

- *Module 5: Community-developed Renewable Applications*
    - *Building wind turbines*
    - *Building hydro turbines*
    - *Building solar collectors*
    - *Building biogas digesters*
- *Module 6: Micro-grids in Rural Communities*
    - *Micro grids for electricity*
    - *Independent power supply*
- *Module 7: Social Impact of Renewable Energy Supply in Rural Regions*
    - *Reduction of energy stress*
    - *Green jobs*
    - *Improved sector productivity*

Assignments and Grading Scheme

Grading System

0 to 100 (where 60 is the least pass mark)

Grading Policy

Grades can be based on the following:

Quizzes/Assignments	25%	The best 5 out of 6 quizzes and assignments account for 25%
Exam	35%	Final exam covering all the material of the course accounting for 35%
Field Project	30%	Group project accounting for 30% of the final grade
Attendance/Discussion Forum	10%	Activeness in class discussions and discussion forums account for 10%
Total Points	100%	Final grade (60% minimum passing grade)

Course Policies

POLICY ON CHEATING AND PLAGIARISM

Students caught cheating on an exam receive a grade of zero on the exam in their first cheating attempt and receive a warning. Students caught cheating for the second time will receive a grade of "F" in the course and another warning. Plagiarism on assignments and project work is a serious offense. If plagiarism is detected, a student will be subject to penalty, similar to the cheating case, which ranges from receiving a zero on the assignment concerned to an "F" in the course in addition to a warning.

ATTENDANCE POLICY

16. Students are held responsible for all the material presented in the classroom, even during their absence.
17. Students can miss no more than the equivalent of five weeks of instruction and still receive credit for that course.
18. Instructors have the right to impose specific attendance regulations in their courses, provided that the above-stated limit of absences is not exceeded, and the minimum number of absences allowed is no fewer than the equivalent of two weeks of classroom instruction, after the Drop and Add period.
19. Instructors will inform the Departments Chairperson and the Guidance Office, of any prolonged unexplained absence.
20. Students who exceed the allowed number of absences must withdraw from the course; otherwise, the course grade will be recorded as "F" (NP).

WITHDRAWAL POLICY

"Students wishing to withdraw from one or more courses must follow the withdrawal procedure provided by the Registrar's Office. Students withdrawing from courses after the late registration period and before the withdrawal deadline will receive Ws for all the courses in progress."
Deadline for withdrawal from courses (WI): Oct 22, 2014 (It is the student's responsibility to drop the course)

COURSE ONLINE EVALUATIONS

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

COURSE GENERAL NOTES

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

This class requires students to attend classes, participate in webinars, contribute to the discussion forum, submit periodic assignments and projects, and sit for prescheduled exams. Students are expected to attend all classes and participate in the different activities of the course.

At the end of each module there is a quiz/assignment that tests student's understanding of the course objectives and their ability to demonstrate the knowledge acquired throughout the module. At the middle of the course students will be assigned a project (in groups), to be submitted

during the last month of the courses. The final exam tests student's understanding of the course as a whole and includes concepts from the classes, discussion forums, assigned videos, and projects.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Schedule

Week	Module	Topics, Reading, Assignments and Deadlines
1	1	***Course Overview*** - The impact of energy supply on rural regions - Rural demand for energy
2		- Environmental cost of energy stress in rural regions - The role or renewable energy sources in rural regions ***Quiz 1***
3	2	- Off-grid solar PV for electricity
4		- Solar cooking - Solar food drying
5		- Solar water treatment - Solar pumping ***Assignment 1 (Case Study)***
6	3	- Wind water pumping - Small-scale water wheels
7		- Water storage for electricity generation - Hydro for electricity generation ***Assignment 2 (Case Study)***
8	4	- Biogas for decentralized cooking - Biodiesel for agriculture transportation
9		- Solid biomass - Liquid biofuels ***Assignment 3 (Case Study)***
10	5	- Building wind turbines - Building hydro turbines

11		- Building solar collectors - Building biogas digesters ***Project Overview***
12		- Field Assignment
13	6	- Micro grids for electricity - Independent power supply ***Quiz 2***
14	7	- Reduction of energy stress - Green jobs
15		- Improved sector productivity ***Quiz 3***
16		***Presentation of Project*** ***Final Exam***

Course	**Social Aspects of Renewables for Rural Development**
Module 1	**Energy and Rural Areas**
Key Concepts	Energy in rural regions, energy stress,
Overview	This module introduces the importance of energy in rural regions and studies the fundamental demand on electricity supply for economic and social development in remote areas. It allows students to assess the impact of insufficient supply of electricity at both social and environmental levels. Questions answered in this module: • What is the energy demand in rural regions? • What effects does energy stress on rural communities?

	• What is the environmental impact of energy stress? • How can renewable energy contribute to rural development?
Aim	This module puts things into perspective, giving students the background about energy demand in rural areas and the role renewable energy can play.
Learning Outcomes	At the end of this module learners will be able to: • Understand the energy demand in rural regions • Assess the impact of insufficient supply on the enrolment • Learn the role of renewable energy in sustainable rural development
Units	Unit 1.5 The impact of energy supply on rural regions Unit 1.6 Rural demand for energy Intro to energy Unit 1.7 Environmental cost of energy stress in rural regions Unit 1.8 The role or renewable energy sources in rural regions
Readings	El Bassam, N, Maegaard P. "Integrated Renewable Energy for Rural Communities: Planning Guidelines, Technologies and Applications", 2004 (Chapter 2)
Activity	**Quiz** *A 30-minute quiz to test students understanding of rural energy demand and renewable energy contribution*
Module 2	**Solar Applications in Rural Regions**
Key Concepts	Solar PV, solar pumping, solar food, solar water treatment
Overview	This module discusses solar applications in rural regions covering food drying, water pumping, electricity supply, water treatment, and cooking solutions. Questions answered in this module: • What are the possible low cost solar applications in rural regions? • How does solar contribute to social development? • How can solar energy reduce the carbon footprint in rural regions?

Aim	Students will learn about the most common solar technologies and should be able to identify the pros and cons of each application.
Learning Outcomes	At the end of this module learners will be able to: • Apply solar energy in rural regions • Identify what works and what doesn't based on the rural needs
Units	Unit 2.1 Off-grid solar PV for electricity Unit 2.2 Solar cooking Unit 2.3 Solar food drying Unit 2.4 Solar water treatment Unit 2.5 Solar pumping
Readings	El Bassam, N, Maegaard P. "Integrated Renewable Energy for Rural Communities: Planning Guidelines, Technologies and Applications", 2004 (Chapter 5 – Solar)
Activity	**Case Study: The Solar Home Systems in Indonesia** *Students to read the case study and submit a short essay with their analysis and feedback on the case.* *"Energy Access, Poverty, and Development: The Governance of Small-Scale Renewable Energy in Developing Asia" (Chapter 10)*
Module 3	**Wind & Hydro Applications in Rural Regions**
Key Concepts	Wind pumping, micro hydro applications
Overview	This module introduces micro-hydro and wind applications in rural regions. These applications are mainly used for electricity generation and water pumping. Questions answered in this module: • How to use wind power in rural regions? • How to harness hydro power through micro applications? • What impact do wind and hydro applications have on the environment?

Aim	Students will learn about the applicable wind and hydro applications mainly for the residential and industrial sectors
Learning Outcomes	At the end of this module learners will be able to: • Identify potential wind and hydro applications • Assess the applicability of hydro and wind technologies in rural regions
Units	Unit 3.1 Wind water pumping Unit 3.2 Small-scale water wheels Unit 3.3 Water storage for electricity generation Unit 3.4 Hydro for electricity generation
Readings	El Bassam, N, Maegaard P. "Integrated Renewable Energy for Rural Communities: Planning Guidelines, Technologies and Applications", 2004 (Chapter 5 – Wind)
Activity	**Case Study: China: solar PV and wind for off-grid electrification** *Students to read the case study and submit a short essay with their analysis and feedback on the case.* *"Renewable Energy Technologies for Rural Development", 2010 (4.3.2)*
Module 4	**Biogas Applications in Rural Regions**
Key Concepts	Biogas, woodstoves. biomass
Overview	The module tackles one of the most commonly utilized technologies in rural regions, Biomass/Biogas. With applications in water heating, cooking, agricultural use, and others. Questions answered in this module: • How is biomass used as a source of energy in rural regions? • How sustainable are biofuels in rural development? • What impact do they have on the environment?
Aim	Students will learn about the different uses of biomass and biogas in rural

	regions. They will be able to identify sustainable practices and efficient use of resources.
Learning Outcomes	At the end of this module learners will be able to: • Identify potential biomass and biogas applications • Identify applicable technologies based on available resources
Units	Unit 4.1 Biogas for decentralized cooking Unit 4.2 Biodiesel for agriculture transportation Unit 4.3 Solid biomass Unit 4.4 Liquid biofuels
Readings	El Bassam, N, Maegaard P. "Integrated Renewable Energy for Rural Communities: Planning Guidelines, Technologies and Applications", 2004 (Chapter 5 – Biogas)
Activity	**Case Study: China: Nepal Biogas Plant** *Students to read the case study and submit a short essay with their analysis and feedback on the case.* *"Renewable Energy Technologies for Rural Development", 2010 (4.2.2)*
Module 5	**Community Developed Renewable Applications**
Key Concepts	Locally made renewable technologies
Overview	This module discusses the potential for building and manufacturing technologies and components or renewable energy systems by local communities. Students will learn how to build a wind turbine, a biogas digester, a micro-hydro turbine, and solar thermal panels. Questions answered in this module: • How to produce renewable energy components? • What technologies can be integrated within the community? • What impact does capacity building have on the community?

Aim	Students will learn how to build renewable energy components and will be introduced to different lessons learn from previous experiences.
Learning Outcomes	At the end of this module learners will be able to: • Have basic knowledge on how to build renewable energy components • Assess the required resources to locally build components
Units	Unit 5.1 Building wind turbines Unit 5.2 Building hydro turbines Unit 5.3 Building solar collectors Unit 5.4 Building biogas digesters
Readings	N/A
Activity	**Project Preparation**
Module 6	**Micro-grids in Rural Communities**
Key Concepts	Micro-grids
Overview	The module focuses on electricity generation in rural areas through the use of renewable energy and with the development of dedicated micro-grids. Questions answered in this module: • How are micro-grids designed in rural areas? • What benefit do micro-grids bring into rural communities?
Aim	Students will be introduced to micro-grid applications and how such grids are developed in remote areas
Learning Outcomes	At the end of this module learners will be able to: • Know what benefits micro-grids bring to communities • Be aware of different micro-grid designs and requirements • Assess the environmental impact of micro-grids
Units	Unit 6.1 Micro-grids for electricity

	Unit 6.2 Independent power supply
Readings	C. Kirubi et al., "Community-Based Electric Micro-Grids Can Contribute to Rural Development: Evidence from Kenya," World Development 37, no. 7 (2009)
Activity	**Quiz** *A 30-minute quiz to test students understanding of micro-grids and their applicability*
Module 7	**Social Impact of Renewable Energy Supply in Rural Regions**
Key Concepts	Social impact of renewables
Overview	The final module presents the impact of renewable energy on rural communities. Impact including economic growth through green jobs, improved sectors productivity, and increased comfort. Questions answered in this module: • How does renewable energy improve the social and economic conditions in rural regions? • What are the benefits behind massive utilization of renewable energy in rural areas?
Aim	Students will learn how to perform socio-economic impact assessment and learn about the importance of renewable energy in rural regions
Learning Outcomes	At the end of this module learners will be able to: • Assess the socio-economic impact of renewables • Identify the added value of utilizing renewable energy
Units	Unit 7.1 Reduction of energy stress Unit 7.2 Green jobs Unit 7.3 Improved sector productivity
Readings	UNCTAD. "Renewable Energy Technologies for Rural Development", 2010

	(Chapter 2)
Activity	**Quiz***A 30-minute quiz to test students ability to perform socio-economic impact assessment*

FINANCING RENEWABLE ENERGY

Course Syllabus

Course Number: ENV 223

Lebanese American University

Department of Natural Sciences

Fall 2014 Semester

Instructor Information

Instructor:	Prof. Dr. Ahmad Houri
Office Location:	Beirut campus, Sage 202
Telephone:	Office 961-786456 x1253
Office Hours:	MTW 11:00 – 1:00.
E-mail:	ahouri@lau.edu.lb
Website:	http://ahmad.houri.lau.edu.lb/

Course Identification

Course Number:	ENV 223
Course Name:	Financing Renewable Energy
Course Location:	Sage G01, Beirut Campus
Class Times:	MWF 10:00 – 11:00
Prerequisites:	none
Faculty Web Page:	http://sas.lau.edu.lb/natural-sciences/people/ahouri.php

Course Description/Overview

With frequent increasing fluctuation of oil prices, the shift towards renewable energy is becoming more and more realistic. Nations are adopting renewable energy strategies to avoid remaining hand-tied and improve energy security, always with environmental concerns in mind.

With the remarkable technical advancements and the growing target market, renewable energy has become an option that every community and every family discuss going for it and reducing fossil fuel consumption. But the major barrier remains, which is the financing requirements of renewable energy projects.

There is no doubt that renewables do have less operating expenses compared to conventional energy, and less maintenance as well in so many conditions, but the capital investment is still too high to compare to a fuel oil or natural gas power plants. This requires a well-structured financing mechanism, a sustainable mechanism that would promote the use of clean energy and reduce the human impact on the environment.

This course presents the different financing methods being applied and discussed a couple of case studies from the developing world.

Course Learning Objectives

The overarching goals of this course are:

i) To provide a general overview of different financing schemes applicable for renewable energy;

j) show from previous experiences what works and what doesn't;

k) identify policy requirements for each method; and

l) establish a comprehensive guide on technology-specific financing methods.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

107. Understand the different financing schemes applicable to renewable energy
108. Know what mechanisms works in certain conditions
109. Understand the requirements and needs to secure sufficient and reliable financing

Course Outline

- *Module 1: Introduction to Renewables Energy Finance*
  - *Renewable energy technologies*
  - *Financing requirements*
  - *Project bankability*
  - *Internationally followed financed mechanisms*
- *Module 2: Debt finance*
  - *Non-recourse financing*
  - *Development banks and multilateral institutions*
  - *Micro-credit*
  - *Leasing*
  - *Revolving funds*
  - *Rural credit cooperatives*
- *Module 3: Grants and Guarantees*
  - *Loan guarantees*
  - *Partial loan guarantees*

    - *Political risk insurance*
- *Module 4: Equity Financing*
    - *Joint ventures*
    - *Equity investment funds and individual investors*
    - *Venture capital*
- *Module 5: Types of Financing Models*
    - *Government-led*
    - *Market-based*
- *Module 6: Types of Financing Regulations*
    - *Fiscal Measures*
    - *Subsidies*
    - *Market based*
    - *Institutional finance*

Course	Financing Renewable Energy
Module 1	**Introduction to Renewable Energy Finance**
Key Concepts	Renewable energy finance requirements, project bankability
Overview	This module gives a brief introduction about renewable energy technologies and financing requirements. It presents major renewable energy applications and the bankability analysis process along with main financing schemes being currently followed Questions answered in this module: • What renewable energy technologies require financing? • What are the requirements to apply for financing? • What makes a proposal bankable?
Aim	This module aims at giving students basic understanding of renewable energy and major financing mechanisms.
Learning Outcomes	At the end of this module learners will be able to: • Identify bankable projects • Know what is needed to apply for financing
Units	Unit 1.1 Renewable energy technologies Unit 1.2 Financing requirements Unit 1.3 Project bankability Unit 1.4 Internationally followed financed mechanisms
Readings	
Activity	**Quiz** *A 20-minute quiz to test students understanding of basic renewable energy financing requirements*

Module 2	**Debt Finance**
Key Concepts	Micro credit, debt financing , leasing, revolving funds
Overview	This module presents the various debt financing options applicable to renewable energy projects and ventures. This involves non-resource financing, multinational institutions, micro-credit, leasing, revolving funds, and rural credit cooperatives. Questions answered in this module: • What are the applicable debt financing options? • How does debt financing work?
Aim	This module aims at giving students a comprehensive understanding of different debt financing options
Learning Outcomes	At the end of this module learners will be able to: • Understand the different debt financing mechanisms • Know the pros and cons of each mechanism • Identify the proper mechanism for each type of project
Units	Unit 2.1 Non-recourse financing Unit 2.2 Development banks and multilateral institutions Unit 2.3 Micro-credit Unit 2.4 Leasing Unit 2.5 Revolving funds Unit 2.6 Rural credit cooperatives
Readings	Financing options for renewable energy and energy efficiency (4.1)
Activity	**Quiz** *A 20-minute quiz to test students understanding of debt financing for renewable energy*
Module 3	**Grants and Guarantees**

Key Concepts	Loan financing, risk insurance, partial loan guarantees
Overview	This module presents the various grants and guarantees financing options applicable to renewable energy projects and ventures. This involves loans and partial loans as well as political risk insurance. Questions answered in this module: • What are the applicable grants and guarantees financing options? • How does grant financing work?
Aim	This module aims at giving students a comprehensive understanding of different grants and guarantees financing options available
Learning Outcomes	At the end of this module learners will be able to: • Understand the different grants and guarantees options • Know the pros and cons of each option • Identify the proper mechanism for each type of project
Units	Unit 3.1 Loan guarantees Unit 3.2 Partial loan guarantees Unit 3.3 Political risk insurance
Readings	Financing options for renewable energy and energy efficiency (4.3)
Activity	**Quiz** *A 20-minute quiz to test students understanding of grants and guarantees financing options for renewable energy*
Module 4	**Equity Financing**
Key Concepts	Joint venture financing, equity investment, venture capital
Overview	This module presents the various equity financing options applicable to renewable energy projects and ventures. This involves joint ventures, equity investment funds, individual investors, and venture capital. Questions answered in this module:

	• What are the applicable equity financing options? • How does equity financing work?
Aim	This module aims at giving students a comprehensive understanding of different equity financing options
Learning Outcomes	At the end of this module learners will be able to: • Understand the different equity financing mechanisms • Know the pros and cons of each mechanism • Identify the proper mechanism for each type of project
Units	Unit 4.1 Joint ventures Unit 4.2 Equity investment funds and individual investors Unit 4.3 Venture capital
Readings	Financing options for renewable energy and energy efficiency (4.2)
Activity	**Quiz** *A 20-minute quiz to test students understanding of equity financing for renewable energy*
Module 5	**Types of Financing Models**
Key Concepts	Market based financing models, government led financing models
Overview	This module presents the various financing models based on two categories. The first being government-led, and the second market-based Questions answered in this module: • What is the difference between government-led and market-based financing models? • What are some practical government-led financing models? • What are some practical market-based financing models?
Aim	This module aims at giving students a comprehensive understanding of different

	government-led and market-based financing models
Learning Outcomes	At the end of this module learners will be able to: • Understand the difference between government-led and market-based financing models • Understand the different financing models and how they apply to renewable energy projects
Units	Unit 5.1 Government-led Unit 5.2 Market-based
Readings	Financing options for renewable energy and energy efficiency (Chapter 5)
Activity	**Quiz** *A 20-minute quiz to test students understanding of government-led and market-based financing models for renewable energy*
Module 6	**Types of Financing Regulations**
Key Concepts	Fiscal measures, subsidies, market-based financing regulations
Overview	This module presents the various financing regulations and policies being currently applied including fiscal measures, subsidy programs, market based regulations, and institutional financing. Questions answered in this module: • What are the major fiscal measures applied? • What are the major subsidy programs applied? • What are the major market-based regulations applied? • How does each of these regulations work?
Aim	This module aims at giving students a comprehensive understanding of different financing instruments and regulations being applied
Learning	At the end of this module learners will be able to:

Outcomes	• Understand the different financing policies and regulations applied internationally • Identify the practical measures for specific situations
Units	Unit 6.1 Fiscal Measures Unit 6.2 Subsidies Unit 6.3 Market based Unit 6.4 Institutional finance
Readings	Financing options for renewable energy and energy efficiency (Chapter 6)
Activity	**Quiz** *A 20-minute quiz to test students understanding of existing financing regulations for renewable energy*

WORLD OCEAN SOLUTIONS

Course Syllabus

Course Number: ENV 224

Course Description/Overview

More than 70% of earth surface is water, leaving less than 30% for human utilization for various activities. Around 361,130,976 square kilometres is the total surface area of water on earth that has proven to be rich in resources and potential. Human have started benefiting from these resources mainly focusing on fishing and oil extraction, but there is more potential than just this.

The terrifyingly growing population that is expected to exceed 9 billion in2050, and the depletion of resources, together put a lot of pressure on food, water, and energy supplies, thus threaten biodiversity and contribute to climate deterioration.

This course explores untapped potential within the world ocean (oceans and seas) and studies its capacity in providing human basic needs to reduce food, water, and energy supply stress.

Course Learning Objectives

The overarching goals of this course are:

m) to understand the critical global challenges facing humanity;

n) to study the hidden potential within the ocean; and

o) to investigate the possibility of using oceans to secure more water, food and energy;

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

110. Have clear understanding of the major global challenges facing humanity

111. Understand the potential within the world ocean

112. Learn how solutions from the ocean can reduce the effect of global challenges

113. Learn how solutions from the ocean can mitigate climate change

Course Outline

- *Module 1: The World Ocean*
    - *The five oceans*
    - *Physical and biological properties of oceans and seas*
- *Module 2: Global Human Challenges*
    - *Global challenges facing humanity*
    - *Climate change*
    - *Clean water*
    - *Sufficient food*
    - *Energy supply*
- *Module 3: Energy from the Ocean*
    - *Thermal energy*
    - *Mechanical energy*
- *Module 4: Water from the Ocean*
    - *Conventional desalination*
    - *Solar desalination*
- *Module 5: Food from the Ocean*
    - *Food chain in the ocean*
    - *Ocean plants*
    - *Seafood of the ocean*
    - *Sustainable fishing*

- *Module 6: Climate Change Mitigation*
    - *Effect of climate change on the ecosystem*
    - *Carbon skins*
    - *Carbon capture and storage*

Course Website

Course webpage will be available through BlackBoard Learn platform.

Required Course Texts and Materials

- Hands-out prepared by the instructor for the class
- Charlier, R. H., Finkl, C. W., "Ocean Energy: Tide and Tidal Power". Springer (2009)
- Micale, M., Rizzuti, M., Cipollina, A. "Seawater Desalination: Conventional and Renewable Energy Processes", Springer (2009)
- Pauly, D. and Watson, R. 2003. Counting the last fish. Scientific American, July: 42-47.

Optional Course Texts and Materials

- UN Global Issues: http://www.un.org/en/globalissues/
- "Human Development Report 2014", UNDP

Assignments and Grading Scheme

Grading System

0 to 100 (where 60 is the least pass mark)

Grading Policy

Grades are based on the following:

Quizzes/Assignments	25%	The best 5 out of 6 quizzes and assignments account for 25%
Exam	40%	Final exam covering all the material of the course accounting for 40%
Project	25%	Group project accounting for 25% of the final grade
Attendance/Discussion Forum	10%	Activeness in class discussions and discussion forums account for 10%
Total Points	100%	Final grade (60% minimum passing grade)

Course Policies

Classroom Protocol

POLICY ON CHEATING AND PLAGIARISM

Students caught cheating on an exam receive a grade of zero on the exam in their first cheating attempt and receive a warning. Students caught cheating for the second time will receive a grade of "F" in the course and another warning. Plagiarism on assignments and project work is a

serious offense. If plagiarism is detected, a student will be subject to penalty, similar to the cheating case, which ranges from receiving a zero on the assignment concerned to an "F" in the course in addition to a warning.

ATTENDANCE POLICY

1. Students are held responsible for all the material presented in the classroom, even during their absence.
2. Students can miss no more than the equivalent of five weeks of instruction and still receive credit for that course.
3. Instructors have the right to impose specific attendance regulations in their courses, provided that the above-stated limit of absences is not exceeded, and the minimum number of absences allowed is no fewer than the equivalent of two weeks of classroom instruction, after the Drop and Add period.
4. Instructors will inform the Departments Chairperson and the Guidance Office, of any prolonged unexplained absence.
5. Students who exceed the allowed number of absences must withdraw from the course; otherwise, the course grade will be recorded as "F" (NP).

WITHDRAWAL POLICY

"Students wishing to withdraw from one or more courses must follow the withdrawal procedure provided by the Registrar's Office. Students withdrawing from courses after the late registration period and before the withdrawal deadline will receive Ws for all the courses in progress."
Deadline for withdrawal from courses (WI): Oct 22, 2014 (It is the student's responsibility to drop the course)

COURSE ONLINE EVALUATIONS

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

COURSE GENERAL NOTES

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

This class requires students to attend classes, participate in webinars, contribute to the discussion forum, submit periodic assignments and projects, and sit for prescheduled exams. Students are expected to attend all classes and participate in the different activities of the course.

At the end of each module there is a quiz/assignment that tests student's understanding of the course objectives and their ability to demonstrate the knowledge acquired throughout the module. At the middle of the course students will be assigned a project (in groups), to be submitted during the last month of the courses. The final exam tests student's understanding of the course as a whole and includes concepts from the classes, discussion forums, assigned videos, and projects.

Disability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Schedule

Week	Module	Topics, Reading, Assignments and Deadlines
1	1	***Course Overview*** - The five oceans
2		- Physical and biological properties of oceans and seas ***Quiz 1***
3	2	- Global challenges facing humanity - Climate change
4		- Clean water - Sufficient food
5		- Energy supply ***Assignment 1***
6	3	- Thermal energy
7		- Mechanical energy ***Quiz 2***
8	4	- Conventional desalination
9		- Solar desalination ***Assignment 2***
10	5	- Food chain in the ocean - Ocean plants
11		- Seafood of the ocean - Sustainable fishing ***Quiz 3***
12	6	- Effect of climate change on the ecosystem
13		- Carbon skins

14		- Carbon capture and storage
15		- International experiences ***Quiz 4***
16		***Presentation of Project*** ***Final Exam***

-

Course	Renewable Energy for Development
Module 1	**The World Ocean**
Key Concepts	Ocean characteristics
Overview	The introductory module will define oceans and seas and present the different characteristics of these water areas. It will help students have a general understanding of these systems. Questions answered in this module: • What makes an ocean and what makes a sea? • What is the difference between an ocean and a sea? • What characteristics does each system has?
Aim	The aim is to familiarize students with the definition and characteristics of the world oceans
Learning Outcomes	At the end of this module learners will be able to: • Know the differences between oceans and sea • Know what to expect in an ocean and what to expect in a sea
Units	Unit 1.9 The five oceans Unit 1.10 Physical and biological properties of oceans and seas
Readings	N/A
Activity	**Quiz** *A 20-minute quiz to test students understanding of oceans properties and characteristics*
Module 2	**Global Human Challenges**
Key Concepts	Global challenges, climate change, water stress, energy stress, food stress
Overview	The module will discuss the global challenges facing humanity and will focus on

	four major challenges namely food scarcity, energy supply, clean water availability, and climate change. Questions answered in this module: • What are the major challenges facing humanity? • How is climate change threatening human lives? • What are the major water-related issues facing humanity? • What are the major food-related issues facing humanity? • What are the major energy-related issues facing humanity?
Aim	Students should learn about the difference challenges threatening lives and the critical levels we have reached when it comes to water, food, and energy.
Learning Outcomes	At the end of this module learners will be able to: • Understand different global challenges • Relate global issues to human life • Understand the critical situation the world is currently facing
Units	Unit 2.1 Global challenges facing humanity Unit 2.2 Climate change Unit 2.3 Clean water Unit 2.4 Sufficient food Unit 2.5 Energy supply
Readings	UN Global Issues: http://www.un.org/en/globalissues/
Activity	**Assignment** *Students will be asked to choose a global challenge and perform links and relations analysis.*
Module 3	**Energy from the Ocean**
Key Concepts	Renewable energy from the ocean, tidal power, wave power, osmotic power

Overview	This module introduces students to the possible methods for generating power from the ocean, covering both renewable and non-renewable resources. Students will learn about techniques to produce electricity through both thermal and mechanical conversion including tidal power, wave power, heat pumps, natural gas, and many others. Questions answered in this module: • How can energy be harnessed from the ocean? • How sustainable it is to use wave and tidal power? • Is it possible to generate electricity from algae and other plants? • How much energy can be produced?
Aim	Give a comprehensive understanding of energy generation from the ocean, covering conventional and new technologies.
Learning Outcomes	At the end of this module learners will be able to: • Know about the different possible technologies • Understand the practicality and limitations of ocean energy solutions • Quantify the potential energy generation
Units	Unit 3.1 Thermal energy Unit 3.2 Mechanical energy
Readings	Ocean Energy: Tide and Tidal Power (Chapter 1)
Activity	**Quiz** *A 20-minute quiz to test students understanding of oceans power solutions*
Module 4	**Water from the Ocean**
Key Concepts	Ocean characteristics
Overview	This module presents possible solutions to generate clean water from the ocean, examining conventional and nonconventional desalination methods.

	Questions answered in this module: • How can clean water be produced from the ocean? • How has desalination technology improved? • How can renewable energy be used in desalination?
Aim	Introduce students to desalination techniques and possibilities to produce clean water from oceans and seas.
Learning Outcomes	At the end of this module learners will be able to: • Understand how desalination works • Understand the pros and cons of seawater desalination • Understand the impact of renewable energy on water desalination
Units	Unit 4.1 Conventional desalination Unit 4.2 Solar desalination
Readings	Seawater Desalination: Conventional and Renewable Energy Processes
Activity	**Assignment** *Prepare a brief report on a desalination technologies utilizing renewable energy*
Module 5	**Food from the Ocean**
Key Concepts	Ocean food chain, fishing, seafood, ocean bioresources
Overview	This module looks at oceans as a source of food. This includes different types such as flat fish and bioresources, Questions answered in this module: • What food sources are available in the ocean? • How is ocean food harnessed? • What makes sustainable harnessing?
Aim	Understand the food chain in the ocean and the sustainable methods in harnessing food from the ocean.

Learning Outcomes	At the end of this module learners will be able to: • Learn about food sources in the ocean • Identify sustainable fishing methods • Understand the food chain in the ocean
Units	Unit 5.1 Food chain in the ocean Unit 5.2 Ocean plants Unit 5.3 Seafood of the ocean Unit 5.4 Sustainable fishing
Readings	Counting the last fish
Activity	**Quiz** *A 20-minute quiz to test students understanding of Marine Fisheries Food Webs*
Module 6	**Climate Change Mitigation**
Key Concepts	Climate change, carbon capture and storage, carbon sink
Overview	This module looks at climate change and mitigation options. First it studies the effect of climate change on the ocean, and then looks at the ocean as a climate change mitigation option. Questions answered in this module: • What effect does climate change have on the ocean? • How does the ocean contribute to climate change mitigation? • How can carbon capture and storage be performed in the ocean?
Aim	Understand the link between climate change and oceans and learn about the potential mitigation options available.
Learning Outcomes	At the end of this module learners will be able to: • Link climate change with oceans • Know what can be done at oceans to mitigate climate change

	• Understand the potential applications of carbon capture and carbon sinks
Units	Unit 6.1 Effect of climate change on the ecosystem Unit 6.2 Carbon skins Unit 6.3 Carbon capture and storage
Readings	N/A
Activity	**Quiz** *A 20-minute quiz to test students understanding of oceans and climate change mitigation*

ENERGY IN BUILDINGS

Course Syllabus

Course Number: ENV 225

Lebanese American University

Department of Natural Sciences

Fall 2014 Semester

Instructor Information

Instructor: Prof. Dr. Ahmad Houri

Office Location: Beirut campus, Sage 202

Telephone: Office 961-786456 x1253

Office Hours:	MTW 11:00 – 1:00.
E-mail:	ahouri@lau.edu.lb
Website:	http://ahmad.houri.lau.edu.lb/

Course Identification

Course Number:	ENV 225
Course Name:	Energy in Buildings
Course Location:	Sage G01, Beirut Campus
Class Times:	MWF 10:00 – 11:00
Prerequisites:	none
Faculty Web Page:	http://sas.lau.edu.lb/natural-sciences/people/ahouri.php

Course Description/Overview

Buildings are reported to share more than 40% of the global energy consumption, and emitting large amounts of greenhouse gases that are contributing to climate change and global warming. Buildings are the highest electricity consuming sector, especially residential buildings that are occupied 24/7, consuming electricity mainly for lighting, air conditioning, and water heating purposes.

The course presents the concept of energy conservation in buildings and the role it plays in reducing greenhouse gas emissions. It illustrates the different green building design systems and shows the economic and environmental benefits behind efficient building design and operation.

Course Learning Objectives

The overarching goals of this course are to:

p) explain the role buildings play in increasing GHG emissions;

q) present the different methods that can be followed to reduce energy consumption in the building sector;

r) explain the different accreditation and certification systems followed in green building design; and

s) demonstrate the added value of energy efficiency in buildings at different levels including human comfort, environment, and money saving.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

114. Link greenhouse gas emissions to the building sector

115. Understand energy efficiency measures and their rile in reducing consumption

116. Perform energy audit to buildings

117. Understand the different green building certification systems

Course Outline

- *Module 1: The Energy Context*
  - *Introduction to energy*
  - *Energy conversion*
  - *Electrical and thermal energy systems*
- *Module 2: Energy Consumption in Buildings*
  - *Energy systems in buildings*
  - *Building envelope*
  - *Energy consumption measurements*
- *Module 3: Energy Conservation in Buildings*
  - *Electrical energy conservation measures*
  - *Thermal energy conservation measures*
  - *Good housekeeping measures*
- *Module 4: Energy Audits*
  - *Introduction to energy audits*
  - *Types of energy audits*
  - *Energy audit analysis*
- *Module 5: Green Building Design*
  - *The concept of green buildings*
  - *Green building impact assessment*

    - *Green building showcases*
- *Module 6: Green Building Certification*
    - *LEED*
    - *BREEAM*
    - *Other rating systems*

Course Resources

Course Website

Available through the BlackBoard Learn platform.

Required Course Texts and Materials

- Hands-out prepared by the instructor for the class
- Harris, D., A "Guide to Energy Management in Buildings", Spon Press (2011)

Optional Course Texts and Materials

- Harvey, D. "A Handbook on Low-Energy Buildings and District-Energy Systems: Fundamentals, Techniques, and Examples" (2006)
- Krigger, J., "Residential Energy: Cost Savings and Comfort for Existing Buildings" 5th, Starun (2009)
- Kibert, C. J., "Sustainable Construction: Green Building Design and Delivery" 3rd Edition, Wiley (2012)
- Reed, L., "Guide to Green Building Rating Systems", Wiley (2010)

Assignments and Grading Scheme

Grading System

0 to 100 (where 60 is the least pass mark)

Grading Policy

Grades will be based on the following:

Quizzes/Assignments	20%	The best 6 out of 7 quizzes and assignments account for 20%
Exam	30%	Final exam covering all the material of the course accounting for 30%
Project	40%	Group project accounting for 40% of the final grade
Attendance/Discussion Forum	10%	Activeness in class discussions and discussion forums account for 10%
Total Points	100%	Final grade (60% minimum passing grade)

Course Policies

Classroom Protocol

POLICY ON CHEATING AND PLAGIARISM

Students caught cheating on an exam receive a grade of zero on the exam in their first cheating attempt and receive a warning. Students caught cheating for the second time will receive a grade of "F" in the course and another warning. Plagiarism on assignments and project work is a serious offense. If plagiarism is detected, a student will be subject to penalty, similar to the cheating case, which ranges from receiving a zero on the assignment concerned to an "F" in the course in addition to a warning.

ATTENDANCE POLICY

6. Students are held responsible for all the material presented in the classroom, even during their absence.
7. Students can miss no more than the equivalent of five weeks of instruction and still receive credit for that course.
8. Instructors have the right to impose specific attendance regulations in their courses, provided that the above-stated limit of absences is not exceeded, and the minimum number of absences allowed is no fewer than the equivalent of two weeks of classroom instruction, after the Drop and Add period.
9. Instructors will inform the Departments Chairperson and the Guidance Office, of any prolonged unexplained absence.
10. Students who exceed the allowed number of absences must withdraw from the course; otherwise, the course grade will be recorded as "F" (NP).

WITHDRAWAL POLICY

"Students wishing to withdraw from one or more courses must follow the withdrawal procedure provided by the Registrar's Office. Students withdrawing from courses after the late registration period and before the withdrawal deadline will receive Ws for all the courses in progress."
Deadline for withdrawal from courses (WI): Oct 22, 2014 (It is the student's responsibility to drop the course)

COURSE ONLINE EVALUATIONS

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

COURSE GENERAL NOTES

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

This class requires students to attend classes, participate in webinars, contribute to the discussion forum, submit periodic assignments and projects, and sit for prescheduled exams. Students are expected to attend all classes and participate in the different activities of the course.

At the end of each module there is a quiz/assignment that tests student's understanding of the course objectives and their ability to demonstrate the knowledge acquired throughout the module. At the middle of the course students will be assigned a project (in groups), to be submitted

during the last month of the courses. The final exam tests student's understanding of the course as a whole and includes concepts from the classes, discussion forums, assigned videos, and projects.

Disability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Course Schedule

Week	Module	Topics, Reading, Assignments and Deadlines
1	1	***Course Overview*** - Introduction to energy - Energy conversion
2		- Electrical and thermal energy systems ***Quiz 1***

16		***Presentation of Project*** ***Final Exam***

Course	Renewable Energy for Development
Module 1	**The Energy Context**
Key Concepts	Energy conversion, energy systems
Overview	The introductory module introduces the concept of energy and energy conversion. It goes through the process of generating and consuming energy in its different methods, tackling different electrical and thermal energy systems. Questions answered in this module: • How is energy quantified? • How is energy transferred? • What are the characteristics of electrical and thermal energy systems?
Aim	Introduce the concept of energy and familiarize students with the process of producing electricity starting with primary energy to energy consumption
Learning Outcomes	At the end of this module learners will be able to: • Understand energy conversion methods • Understand thermal energy systems • Understand electrical energy systems
Units	Unit 1.1 Introduction to energy Unit 1.2 Energy conversion Unit 1.3 Electrical and thermal energy systems
Readings	Residential Energy: Cost Savings and Comfort for Existing Buildings (Chapter 1)
Activity	**Quiz** *A 20-minute quiz to test students understanding of energy.*
Module 2	**Energy Consumption in Buildings**
Key Concepts	Energy in buildings, building envelope, electricity consumption

Overview	This module gets into buildings and studies energy consumption in both commercial and residential buildings. It presents the major energy systems inside buildings including lighting, HVAC and others, as well as the effect of building envelope on energy consumption inside buildings. Questions answered in this module: • What are the major energy consuming energy systems in buildings? • What is the effect of building envelope on energy demand? • How is electrical energy measured?
Aim	Familiarize students with energy systems in buildings and their effect on electricity consumptions
Learning Outcomes	At the end of this module learners will be able to: • Understand different energy systems in buildings • Understand the significant role of building envelope • Perform basic measurements and analysis of electricity consumption in buildings
Units	Unit 2.1 Energy systems in buildings Unit 2.2 Building envelope Unit 2.3 Energy consumption measurements
Readings	Guide to Energy Management in Buildings (Chapter 2)
Activity	**Assignment** *Students will be asked to perform basic electricity consumption measurement and analysis at their own residence and submit a 2-page analysis report*
Module 3	**Energy Conservation in Buildings**
Key Concepts	Electricity saving, energy conservation measures
Overview	After introducing the different energy systems in buildings, this module presents energy saving potential and measures that can be taken to reduce electricity

	consumption in buildings. Measures in both electrical and thermal systems as well as basic good housekeeping measures. Questions answered in this module: • How to reduce energy consumption in electrical systems? • How to reduce energy consumption in thermal systems? • What are the basic good housekeeping measures that can be followed to reduce energy consumption? • How to perform feasibility analysis of energy conservation measures?
Aim	Provide students with solid knowledge of electrical and thermal energy systems and potential saving measures in buildings.
Learning Outcomes	At the end of this module learners will be able to: • Propose energy saving measures in buildings • Perform feasibility analysis of energy saving measures
Units	Unit 3.1 Electrical energy conservation measures Unit 3.2 Thermal energy conservation measures Unit 3.3 Good housekeeping measures
Readings	Guide to Energy Management in Buildings (Chapter 4) A Handbook on Low-Energy Buildings and District-Energy Systems (Chapters 13 & 14)
Activity	**Quiz** *A 20-minute quiz to test students understanding of feasibility analysis of energy conservation measures in buildings.*
Module4	**Energy Audits**
Key Concepts	Energy auditing
Overview	This module introduces energy audits to students presenting to them the different types of energy audits and how each is performed based on special

	cases. Questions answered in this module: • What is an energy audit? • What are the different types of energy audits? • What does and energy audit report include? • How to perform a comprehensive energy audit?
Aim	Provide students with the tools and knowledge to conduct energy audit studies and perform financial and environmental analysis
Learning Outcomes	At the end of this module learners will be able to: • Perform a comprehensive energy audit
Units	Unit 4.1 Introduction to energy audits Unit 4.2 Types of energy audits Unit 4.3 Energy audit analysis
Readings	Guide to Energy Management in Buildings (Chapters 3 & 5)
Activity	**Project** *Students will be asked to perform a complete energy audit to a selected facilities. This project will be performed in groups.*
Module 5	**Green Building Design**
Key Concepts	Green building design, green building impact assessment
Overview	This module introduces the concept of green building and the impact of green design on the energy consumption and environmental performance e of buildings. Questions answered in this module: • What is green building design? • What impact does a green building have? • What additional costs does a green building require?

Aim	Introduce students to the concept of green building and present to them calculation methods to quantify the pros and cons of green building design.
Learning Outcomes	At the end of this module learners will be able to: • Identify the design principles of green building • Quantify the added value of green building design • Link green building design to climate change mitigation
Units	Unit 5.1 The concept of green buildings Unit 5.2 Green building impact assessment Unit 5.3 Green building showcases
Readings	Sustainable Construction: Green Building Design and Delivery (Chapters 2 & 3)
Activity	**Quiz** *A 20-minute quiz to test students understanding of feasibility analysis of green buildings.*
Module6	**Green Building Certification**
Key Concepts	Green building certification, LEED, BREEAM
Overview	This module elaborates on green buildings and presents the different rating systems available with focus on LEED and BREEAM systems. Questions answered in this module: • What are applicable green building rating systems • What is LEED? • What is BREAM?
Aim	Students will have comprehensive information about green building rating systems and their applicability.
Learning Outcomes	At the end of this module learners will be able to: • Know what rating systems apply in specific cases

	• Perform basic LEED and BREEAM assessment • Know what makes a building green
Units	Unit 6.1 LEED Unit 6.2 BREEAM Unit 6.3 Other rating systems
Readings	Guide to Green Building Rating Systems
Activity	**Assignment** *Students will be asked to submit a comparative report about different green building rating systems*

SUSTAINABILITY IN PRACTICE

Course Syllabus

Course Number: ENV230

Lebanese American University

Department of Natural Sciences

Fall 2014 Semester

Instructor Information

Instructor: Prof. Dr. Ahmad Houri

Office Location: Beirut campus, Sage 202
Telephone: Office 961-786456 x1253
Office Hours: MTW 11:00 – 1:00.
E-mail: ahouri@lau.edu.lb
Website: http://ahmad.houri.lau.edu.lb/

Course Identification

Course Number: ENV 230
Course Name: Sustainability in Practice
Course Location: Sage G01, Beirut Campus
Class Times: MWF 10:00 – 11:00
Prerequisites: none
Faculty Web Page: http://sas.lau.edu.lb/natural-sciences/people/ahouri.php

Course Description/Overview

Defined as "meeting the needs of the present without compromising the ability of future generations to meet their own needs", sustainability has become one of the hottest topics in the 21st century. International agencies and organizations have clearly declared their commitment to establish more sustainable processes and operations in which a future for our kids and grandkids is guaranteed.

This course tackles sustainability from its practical perspective, and studies human actions and capabilities to handle global change, climatic deterioration, ecosystem degradation, and resource depletion. It covers the millennium development goals and the factors directly linked to achieving them. Factors such as growing population, energy demand, water scarcity, climate change, and environmental economics will be discussed.

Course Learning Objectives

The overarching goals of this course are:

t) To provide a clear understanding of sustainability and its importance;

u) offer an understanding of the major factors influencing sustainability;

v) understand the energy water nexus; and

w) measure sustainability and environmental footprint.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

118. Define sustainability in practice

119. Learn about the UN Millennium Development Goals

120. Understand the factors influencing sustainability

Course Outline

- *Module 1: Introduction to Sustainability*
  - *What is sustainability?*
  - *Sustainable development*
  - *UN Millennium Development Goals*
- *Module 2: Population Evolution*
  - *Demographic transition*

    - *Population pyramids*
    - *Birth/death rates*
- *Module 3: Climatic Deterioration*
    - *Climate change*
    - *Greenhouse gases*
    - *Tragedy of the commons*
    - *Ecosystem extinction*
- *Module 4: Energy & Sustainability*
    - *Peak oil*
    - *Energy forecast*
    - *Renewable energy*
    - *Energy efficiency*
- *Module 5: Water & Agriculture*
    - *Assessment of water resources*
    - *The water cycle*
    - *Agricultural yield*
    - *Green revolution*
- *Module 6: Measuring Sustainability*
    - *Sustainability metric*
    - *Carbon footprint*
    - *Biodiversity*
    - *Food mile*

- *Module 7: Seminar on Sustainable Development*

Course	Sustainability in Practice
Module 1	**Introduction to Sustainability**
Key Concepts	Sustainability, sustainable development, MDG
Overview	This introductory module introduces sustainability and sustainable development and presents the UN Millennium Development Goals (MDG), studying each of the eight goals and providing real life examples Questions answered in this module: • What is sustainability? • What is sustainable development? • What are the MDGs?
Aim	Achieve a common understanding of sustainability and learn about the worlds initiative for sustainable development
Learning Outcomes	At the end of this module learners will be able to: • Clearly define sustainability • Know how sustainable development is performed • Understand the MDGs
Units	Unit 1.11 What is sustainability? Unit 1.12 Sustainable development Unit 1.13 UN Millennium Development Goals
Activity	**Quiz** *A 20-minute quiz to test students understanding of sustainability and the MDGs*
Module 2	**Population Evolution**
Key Concepts	Population change, demographic transition, population pyramid
Overview	This module discusses the evolution of population and the transitions happening

	to the demographics of the earth. How population affects the sustainability and how this growth requires additional efforts to ensure continuation and avoid of resource depletion. Questions answered in this module: • How did the population grow? • What effect did this change have on sustainability?
Aim	Understand the demographic factor and its effect on sustainability
Learning Outcomes	At the end of this module learners will be able to: • Learn about the changes affecting world population • Understand the effect of population on sustainable living
Units	Unit 2.1 Demographic transition Unit 2.2 Population pyramids Unit 2.3 Birth/death rates
Activity	**Assignment (DVD)** *Watch the video "An Inconvenient Truth" by Al Gore and submit a short essay with reflections.*
Module 3	**Climatic Deterioration**
Key Concepts	Climate change, greenhouse gases emissions, tragedy of commons, ecosystem
Overview	The module focuses on climatic issues and the environmental conditions that are against sustainable development. It links human population and increase consumption to climate change and resource depletion. Questions answered in this module: • How is sustainability affected by climate change? • How are greenhouse emissions affecting climate change? • What does tragedy of commons mean?

Aim	Understand the reality behind climate change and link it to sustainability
Learning Outcomes	At the end of this module learners will be able to: • Understand the effect of humans on climate change and thus on sustainability • Quantify greenhouse gas emissions and propose mitigation methods
Units	Unit 3.1 Climate change Unit 3.2 Greenhouse gases Unit 3.3 Tragedy of the commons Unit 3.4 Ecosystem extinction
Activity	**Assignment** *Perform carbon inventory for yourself*
Module 4	**Energy & Sustainability**
Key Concepts	Renewable energy, energy forecast, energy efficiency
Overview	This module tackles the major factor behind climate change, which is increasing rapidly with the increase in population. Energy consumption and methods to reduce the negative impact of energy demand are discussed, including renewable energy technologies and energy efficiency methods. Questions answered in this module: • How does energy lead to environmental deterioration? • What renewable energy technologies help in reducing GHG emissions? • How can energy efficiency enhance sustainability?
Aim	Understand the effect of energy on the environment and learn about possible solutions to reduce carbon footprint while meeting energy demands.
Learning Outcomes	At the end of this module learners will be able to: • Understand the link between energy and sustainability

	• Know about the possible solutions to reduce energy impact
Units	Unit 4.1 Peak oil Unit 4.2 Energy forecast Unit 4.3 Renewable energy Unit 4.4 Energy efficiency
Activity	**Assignment** *Choose an unconventional energy source and perform environmental impact assessment.*
Module 5	**Water & Agriculture**
Key Concepts	Water resources, water conservation, agricultural yield
Overview	This module targets another major sustainability issue, which is water and its scarcity. The module discusses water resources and presents solution on water conservation. Questions answered in this module: • How serious is water scarcity? • What are possible solution to reduce water waste? • How to perform water assessment? • How is agriculture affected by water availability?
Aim	Understand the importance of water and learn about actions to save on water resources
Learning Outcomes	At the end of this module learners will be able to: • Know the importance of water for sustainability • Reduce water consumption and increase water use efficiency • Understand green agriculture and water conservation methods
Units	Unit 5.1 Assessment of water resources

	Unit 5.2 Water conservation Unit 5.3 Agricultural yield Unit 5.4 Green revolution
Activity	**Quiz** *A 20-minute quiz to test students understanding of sustainability in the agricultural sector*
Module 6	**Measuring Sustainability**
Key Concepts	Sustainability measurement, carbon footprint
Overview	This module gives the students a deep understanding of sustainability measurements and evaluation techniques including footprint, biodiversity protection, food mile and others. Questions answered in this module: • How is sustainability assessed? • How to measure carbon footprint? • What does carbon neutral really mean?
Aim	Be able to perform sustainability evaluation and propose active measures to enhance the sustainability level
Learning Outcomes	At the end of this module learners will be able to: • Perform sustainability evaluation • Perform carbon footprint calculation
Units	Unit 6.1 Sustainability metric Unit 6.2 Carbon footprint Unit 6.3 Biodiversity Unit 6.4 Food mile
Activity	**Assignment** *Perform sustainability measurement of yourself. This time with a roadmap to*

	improve sustainability level.

Course Name: Energy Systems & Sustainable Environments
Location: University Campus
Class Times:
Prerequisites: None

Faculty Web Page: WWW.LAU.EDU.LB

Course Description/Overview

This course introduces students to the concept of sustainability in the context of energy use. It stresses on the different aspects involved in our daily-life use of energy: environmental, societal, political, financial, etc. It covers technologies and means used in improving the sustainability of current fossil-fuel (coal, oil and gas) based energy systems, electric and nuclear systems by reducing their environmental and societal impacts. Finally, it introduces different renewable ('clean') energy technologies that can be used as alternatives to traditional ('dirty') energy systems.

Course Learning Objectives

The general objective of this course is to familiarize students with the problems associated with our daily-life use of energy (environmental, societal, economic, political …) and to introduce solutions to these problems. The course does not go deep in the technological aspects of the solutions as these will be covered individually in other courses of the PROGREEN curriculum, but rather focuses on putting them in the context of achieving a sustainable energy future.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- Identify different forms and sources of energy and their availability
2- Identify the environmental and health impacts of energy systems
3- Assess the environmental and health impacts of energy systems
4- Identify the implications of energy use on a political, societal, economic and environmental level
5- Estimate the cost of energy in domestic, industrial and transportation applications
6- Identify means of reducing the environmental impact of fossil-fuel-based energy systems
7- Assess the importance of renewable energy and green technologies as alternatives to fossil-fuelled energy

Course Website(s)

Required Course Texts and Materials

- "Godfrey Boyle, Bob Everett and Janet Ramage, Energy Systems and Sustainability: Power for a Sustainable Future, Oxford, 2003

Technical Requirements

- Intermediate computer skills

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 4 (where 2 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)
The course grade is calculated according to the following:

Quiz 1	12
Quiz 2	8
Quiz 3	8
Quiz 4	16
Quiz 5	24
Quiz 6	12
Quiz 7	20
Total Points	100

Course Policies.

Classroom Protocol

General Rules

1. Make your messages easier to read by making your paragraphs short and to the point.
2. TYPING IN ALL CAPS IS CONSIDERED SHOUTING ON THE INTERNET.
3. Messages in all lowercase letters can be difficult to read, instead, use normal capitalization.
4. *Asterisks* surrounding a word can be used to make a stronger point.
5. Be careful when using sarcasm and humor. Without face-to-face communications your joke may be viewed as criticism. When being humorous, use emoticons to express humor. (tilt your head to the left to see the emoticon smile) :-) = happy face for humor
6. Never give your user ID or password to another person. System administrators that need to access your account for maintenance or to correct problems will have full privileges to your account.

Make-up Policy

Failure to take a quiz during the assigned period will result in a grade of zero for that quiz unless the student has personally contacted the instructor and received permission to miss the quiz. A quiz missed due to a valid excuse must be made up within one week of the original assigned date. The student is responsible for arranging the make-up session with the course instructor.

Important Dates to Remember

Topics covered and course schedule

Week	**Topic**
Week 1	Module 1: Watch video, Take assigned quiz
Week 2	Module 2: Watch video, Take assigned quiz
Week 3-4	Module 3: Watch video, Take assigned quiz
Week 5-7	Module 4: Watch video, Take assigned quiz
Week 8-10	Module 5: Watch video, Take assigned quiz
Week 11-13	Module 6: Watch video, Take assigned quiz
Week 14-15	Module 7: Watch video, Take assigned quiz

APENDIX II: The CLIMASP Course Modules Template Example

Course	**Energy Systems**
Module 1	Introducing Energy Systems & Sustainability
Key Concepts	Energy systems, Sustainability
Overview	This module introduces learners to the importance of energy and its use on a global scale. It explains the problem of scarcity of fossil fuel energy resources and its economic impact on our society. It also covers the environmental problems associated with the use of fossil fuels as a primary source of energy. Finally, it introduces potential solutions to reduce the impact of excessive energy consumption on our society, climate, environment…
Aim	The overriding aim of this module is to describe our current global energy system and its associated societal, environmental and political problems.
Learning Outcomes	At the end of this module learners will be able to: • Understand the concept of sustainability • Apply the concept of sustainability in the framework of energy systems • Understand the societal, environmental, political… implications of our energy dependence • Identify possible solutions to reducing the impact of our energy dependence on our society and environment.
Units	Unit 1.1: Energy Sustainability and its Importance

	Unit 1.2: The Current global Energy System Unit 1.3: Environmental and Socio-Political Aspects of Energy Usage Unit 1.4: Towards Low-Carbon Energy Systems
Readings	Chapter 1 of course textbook
Activity	**Overview** Assignment 1.1: Watch the movie: “An inconvenient truth” by Al Gore Assignment 1.2: Watch the movie of Module 1 Quiz 1: Covers Module 1
Module 2	Primary Energy and its Usage
Key Concepts	Primary energy, Forms of energy, Energy efficiency
Overview	This module covers primary energy sources and the different forms of energy. It also discusses the difference between energy and power and the variety of units associated to them. Finally it discusses the concept of energy efficiency which allows quantification of the performance of typical energy transformation processes.
Aim	The overriding aim of this module is to introduce energy, its different forms and its different associated units and the concept of energy conversion efficiency.
Learning Outcomes	At the end of this module learners will be able to: • Identify primary sources of energy • Identify different forms of energy • Distinguish energy from power • Identify and manipulate different units associated to energy and power • Evaluate the efficiency of standard energy conversion processes
Units	Unit 2.1: Energy and Power Unit 2.2: Units and Dimensions

	Unit 2.3: Forms of Energy Unit 2.4: Energy Efficiency
Readings	Chapters 2 to 4 of course textbook
Activity	**Overview**
	Assignment 2.1: Watch the movie of Module 2 Quiz 2: Covers Module 2
Module 3	Coal Systems
Key Concepts	Coal resource, Coal boilers, Flue gases, Heat to motive power, Clean-coal technologies
Overview	This module covers the use of Coal as a primary energy resource. It describes coal mining technologies as well as the different types of boilers and furnaces used in coal combustion. It also covers the undesirable emissions within coal combustion flue gases and introduces techniques to reduce these and their impact on the environment and climate. Finally, this module describes standard technologies used in converting heat produced from coal combustion into motive power.
Aim	The overriding aim of this module is to describe the use of coal as a primary energy source, from mining to power production and post-production cleaning of flue gases.
Learning Outcomes	At the end of this module learners will be able to: • Identify different types of coal found in the ground • Understand the process of coal mining from the ground • Identify different types of furnaces and boilers used in coal combustion • Understand the operating principles of different types of coal boilers • Identify the composition of coal flue gases • Assess the impact of coal combustion emissions on the environment and climate

	• Identify mechanical systems for converting heat into motive power • Understand the operating principles of steam engines and coal power stations • Identify technologies used in “cleaning” coal combustion
Units	Unit 3.1: The Coal Resource Unit 3.2: Furnaces and Boilers Unit 3.3: Coal Combustion Flue Gases Unit 3.4: Heat to Motive Power (Steam Engines and Steam Turbines) Unit 3.5: Power Station Turbine Systems Unit 3.6: The Future of Coal-Fired Systems
Readings	Chapters 5 and 6 of course textbook
Activity	**Overview**
	Assignment 3.1: Watch the movie of Module 3 Quiz 3: Covers Module 3
Module 4	Oil and Gas Systems
Key Concepts	Oil resources, Gas resources, Pollution reduction, Oil availability
Overview	This module covers the use of oil and gas as primary energy sources. It covers ground extraction techniques as well as refinement technologies. It also covers technologies used in converting the heat from oil and gas combustion into mechanical power. It also discusses pollution problems associated with oil and gas combustion. Finally, it discusses the problem of the future availability of oil as a primary energy resource.
Aim	The overriding aim of this module is to describe the use of oil and gas as primary energy sources, from ground extraction to power production and post-production cleaning of undesired emissions.
Learning	At the end of this module learners will be able to:

Outcomes	• Identify types of oil and gas found in the ground and their major locations • Understand the extraction process of oil and gas from the ground • Understand the process of oil and gas refinement • Understand the operating principles of oil and gas engines • Identify means of reducing pollutant emissions from oil and gas engines • Understand the problem of future scarcity of oil and gas resources
Units	Unit 4.1: Oil and Gas Resources Unit 4.2: Oil and Gas Engines (SI, CI and Gas Turbine Engines) Unit 4.3: Pollution Reduction in Oil and Gas Systems Unit 4.4: Future Availability of Oil
Readings	Chapters 7 and 8 of course textbook
Activity	**Overview**
	Assignment 4.1: Watch the movie of Module 4 Quiz 4: Covers Module 4
Module 5	Electricity
Key Concepts	Electricity generation, Electricity transmission, Electricity distribution, Electricity use, Combined Heat and Power (CHP)
Overview	This module introduces electricity as a primary energy source. It covers several aspects pertaining to electricity: its small and large-scale generation from batteries or generators, its transmission, distribution and end-user consumption. It also covers the Combined Heat and Power (CHP) generation cycle and compares its performance to that of standard gas or steam cycles.
Aim	The overriding aim of this module is to cover the use of electricity as a "primary" energy source from generation to transmission, distribution and end-user consumption.

Learning Outcomes	At the end of this module learners will be able to: • Understand the process of electricity generation: Chemical (Batteries), Electromagnetic (Generators) • Appraise the ever expanding use of electricity in our daily life for lighting, traction drives, heating and cooling… • Understand the process of large-scale production of electricity • Understand the operating principle of CHP cycles
Units	Unit 5.1: Electricity Generation: Chemical (Batteries), Electromagnetic (Generators) Unit 5.2: The Expanding Uses of Electricity (Lighting, Traction Drives, Heating and Cooling) Unit 5.3: Large-Scale Electricity Generation Unit 5.4: Combined Heat and Power Unit 5.5: Transmission and Distribution
Readings	Chapter 9 of course textbook
Activity	**Overview**
	Assignment 5.1: Watch the movie of Module 5 Quiz 5: Covers Module 5
Module 6	**Nuclear Power**
Key Concepts	Radioactivity, Nuclear power production, Nuclear safety
Overview	This module covers the concept of radioactivity and its use in nuclear power production. It also covers nuclear safety, electricity generation costs from nuclear energy, the availability of nuclear resources and political issues pertaining to the widespread use of nuclear energy.
Aim	The overriding aim of this module is to understand power production from nuclear resources and its associated cost, political and safety issues.

Learning Outcomes	At the end of this module learners will be able to: • Understand the concept of radioactivity • Identify underlying processes in nuclear power production (fission and fusion) • Understand the difference between open and closed nuclear cycles • Identify technological as well as societal/political issues related to nuclear power production
Units	Unit 6.1: Radioactivity Unit 6.2: Nuclear Power Production (Nuclear Fission and Nuclear Fusion) Unit 6.3: Nuclear Fuel Cycles (Open and Closed Cycles) Unit 6.4: Nuclear Power Today (Safety, Generation Costs, Uranium Availability)
Readings	Chapters 10 and 11 of course textbook
Activity	**Overview**
	Assignment 6.1: Watch the movie of Module 6 Quiz 6: Covers Module 6
Module 7	**Towards a Sustainable Energy Future**
Key Concepts	Clean-energy technologies, Renewable energy, Energy sustainability
Overview	This module covers a wide range of solutions/measures to reach a sustainable energy future from cleaning-up fossil fuels to geo-engineering solutions, the use of Hydrogen as a fuel, reducing energy demand and renewable energy solutions.
Aim	The overriding aim of this module is to introduce a wide variety of solutions/measures to reach a sustainable energy future.
Learning Outcomes	At the end of this module learners will be able to: • Identify various solutions/measures to improve the sustainability of our current global energy system

	• Identify technologies to clean-up fossil fuel emissions • Identify different geo-engineering technologies to improve energy sustainability • Understand the use of Hydrogen as a clean fuel in different applications • Understand the importance of reducing energy demand as a measure to improve energy sustainability • Understand the impact and the use of renewable energy technologies in reaching a sustainable energy future
Units	Unit 7.1: Cleaning-Up Fossil Fuels Unit 7.2: Geo-Engineering Solutions Unit 7.3: Hydrogen Fuel (Fuel Cell Technology, Hydrogen as a Combustion Fuel) Unit 7.4: Reducing Energy Demand Unit 7.5: Renewable Energy Solutions
Readings	Chapter 14 of course textbook
Activity	**Overview**
	Assignment 7.1: Watch the movie of Module 7 Quiz 7: Covers Module 7

Course Description/Overview

This course covers the survey of energy sources, cost analysis, alternatives, environmental issue, audit techniques, and technical reporting.

Course Learning Objectives

N/A

Course Content Learning Outcomes

The course is designed to help the student understand the importance of energy management and conservation in industrial as well as in real life applications. Upon successful completion of this course the student will be able to:

1. Identify the different areas where energy conservation may be achieved: Buildings, industry, transportation...
2. Assess the importance of energy conservation in a political, environmental, ethical and societal context.
3. Apply economics methods on engineering systems in order to reduce their energy consumption.

4. Have knowledge of contemporary energy efficient systems, tools and techniques. Course Resources

Exam II	30%
Final Exam	40%
Total Points	**100**

Course Policies.

Classroom Protocol

All students must take Exams as scheduled. Failure to take an exam or the final exam during the assigned class period will result in a grade of zero on that test unless the student has personally contacted me and received permission from me to be absent from the test.

- 1- A student can miss no more than 4 sessions of instruction. By the 5th session, the instructor may ask the student to drop the course.

- Plagiarism: students caught cheating on an exam will receive a grade of Zero on the exam in the first cheating attempt and a warning. Students caught cheating for the second time in the same course will receive an F grade in the course and a second warning. A grade of zero on an exam resulting from cheating must be counted in the student's course grade.

- Any student who receives 3 warnings will be suspended

APENDIX II: The CLIMASP Course Modules Template Example

Course	**Energy Audit**
Module 1	Introduction to energy management and conservation
Key Concepts	Energy management, Energy conservation
Overview	This module introduces learners to the importance of energy and its use on a global scale. It explains the problem of scarcity of fossil fuel energy resources and its economic impact on our society. It also covers the environmental problems associated with the use of fossil fuels as a primary source of energy. It also introduces the different barriers that prevent energy conservation measures from being applied adequately. Finally, several energy management

	tools and techniques are identified and examined.
Aim	The overriding aim of this module is to convey to the learner the importance of energy use and its associated problems on a worldwide scale and most of all the urgency of applying conservation measures as a remedy to these problems.
Learning Outcomes	At the end of this module learners will be able to: • Understand the importance of energy use and its worldwide impact • Identify barriers to energy conservation • Identify energy management tools • Assess the environmental, social and economic implications of energy use
Units	Unit 1.1: Importance of energy use and its worldwide impact Unit 1.2: Barriers to energy conservation Unit 1.3: Energy management tools Unit 1.4: Environmental, social and economic implications of energy use
Readings	Chapter 1 of course textbook
Activity	**Overview** Assignment 1.1: Watch the movie: “An inconvenient truth” by Al Gore
Module 2	Energy consumption and prices
Key Concepts	Energy consumption, Energy Prices, Forecasts of energy resources availability
Overview	This module covers worldwide energy consumption and prices in different sectors of the economy: household, industry, transportation… It also covers the most common types of energy sources and provides an overview of their current availability and prices as well as a forecast of these.
Aim	The overriding aim of this module is to cover the current state of global energy

	use in different sectors of the economy and provide an overview of current and future availability of energy resources and their prices.
Learning Outcomes	At the end of this module learners will be able to: • Evaluate energy consumption by sectors of the economy • Describe global energy consumption in the past and its future projections • Assess future scarcity of fossil fuel resources and its implication on fuel prices • Understand the problem of global warming and its roots
Units	Unit 2.1: Energy consumption by sectors of the economy Unit 2.2: Energy consumption: the past and future projections Unit 2.3: Future scarcity of fossil fuel resources and its implication on fuel prices Unit 2.4: Global warming and its roots
Readings	Chapters 2 and 3 of course textbook
Activity	**Overview**
	Prepare a brief 5 minutes presentation on the availability of a given type of energy resource (Gasoline, Diesel, Coal, Renewables…), its prices, the sectors in which it is used…
Module 3	Economics methods
Key Concepts	Time value of money, Economic methods, Risk assessment, Taxes
Overview	This module covers economic aspects such as the time value of money including the effects of earning and purchasing power. It also introduces various economics methods used in the assessment of project performance (e.g. LCC, NPW, BCR, ROR…) including risk assessment. It also discusses the issue of taxes and tax subsidies related to investment in green energy

	technologies.
Aim	This overriding aim of this module is to introduce economic methods used in the evaluation of the economic performance of energy conservation measures.
Learning Outcomes	At the end of this module learners will be able to: • Understand the concept of time value of money • Apply economic methods to study the economic performance of energy conservation measures • Incorporate risk assessment in economic calculations • Understand tax subsidies related to investments in green technologies
Units	Unit 3.1: Time value of money: discounting, compounding, inflation… Unit 3.2: Overview of economic methods: o Life-Cycle Cost (LCC) o Net Present Worth (NPW) o Benefit-to-Cost Ratio (BCR) o Rate Of Return (ROR) o Discounted Payback Unit 3.3: Risk assessment Unit 3.4: Taxes and subsidies
Readings	Chapter 6 of course textbook
Activity	**Overview**
	• Homework problems • Exam I: Covers Modules 1 to 3
Module 4	Energy audits for buildings and facilities
Key Concepts	Energy conservation measures for buildings, state-of-the-art technologies

Overview	This module covers energy conservation measures for buildings and assesses their economic performance through several applied examples. It also introduces state-of-the-art technologies used in reducing energy consumption in buildings.
Aim	The overriding aim of this module is to introduce energy conservation measures for building and assess their economic performance.
Learning Outcomes	At the end of this module learners will be able to: • Apply an energy audit for a building • Identify energy conservation measures for buildings • Assess the economic performance of energy conservation measures for buildings • Identify state-of-the-art technologies used in energy conservation in buildings
Units	Unit 3.1: Energy audit types and general procedure for a detailed energy audit Unit 3.2: Energy conservation measures Unit 3.3: State-of-the-art technologies
Readings	Chapters 5 and 7 of course textbook
Activity	**Overview**
	Assignment: Apply a basic energy audit to your living place. For this, identify different applicable energy conservation measures and assess their economic potential.
Module 5	Energy efficient heating
Key Concepts	Efficient HVAC systems
Overview	This module introduces the concept of thermal comfort and how it can be utilized to minimize energy used in heating and air-conditioning. It also

	introduces various ventilation systems and corresponding energy conservation measures.
Aim	The overriding aim of this module is to teach the students how heating, ventilation and air-conditioning (HVAC) energy requirements of a building / facility can be minimized.
Learning Outcomes	At the end of this module learners will be able to: • Understand the concept of thermal comfort • Evaluate heat losses in buildings / facilities • Apply energy efficient measures to reduce the HVAC requirements of a building / facility
Units	Unit 5.1: Thermal comfort Unit 5.2: Evaluation of building heat losses Unit 5.3: Energy conservation measures and their economic potential
Readings	Chapters 8 and 11 of course textbook
Activity	**Overview**
	• Homework problems • Exam II: Covers Modules 4 to 5
Module 6	**Waste heat recovery**
Key Concepts	Heat exchangers, waste heat recovery
Overview	This module introduces different types of heat exchangers used in waste heat recovery and assesses their technological and economic impact on the systems in which they are incorporated.
Aim	The overriding aim of this module is to understand how waste heat recovery systems may be used to enhance the technological as well as the economic

	performance of energy systems.
Learning Outcomes	At the end of this module learners will be able to: • Identify waste heat recovery systems • Assess the technological impact of incorporating a waste heat recovery device into an existing energy system • Assess the economic impact of incorporating a waste heat recovery device into an existing energy system
Units	Unit 6.3: Waste heat recovery systems Unit 6.4: Economic assessment of waste heat recovery
Readings	Chapter 9 of course textbook
Activity	**Overview**
	• Homework problems
Module 7	**Combined heat and power (CHP)**
Key Concepts	Standard thermodynamic cycles, CHP cycle
Overview	This module introduces the CHP thermodynamic cycle and compares its performance to standard gas or steam cycles.
Aim	The overriding aim of this module is to understand the basic operation of CHP cycles and assess their technological as well as economic advantage compared to standard gas or steam cycles.
Learning Outcomes	At the end of this module learners will be able to: • Understand the basic operation of a CHP cycle • Assess the technological improvement of standard cycles by using CHP • Assess the economic improvement of standard cycles by using CHP
Units	Unit 7.1: Overview of the CHP thermodynamic cycle Unit 7.2: Economic assessment of CHP cycles as compared to standard steam or gas cycles

Readings	Chapter 10 of course textbook
Activity	**Overview**
	• Homework problems • Final exam (comprehensive)

Course Description/Overview

Fundamentals, design and modeling of conventional and advanced hybrid electric powertrains for a sustainable mobility.

Course Learning Objectives

Course Content Learning Outcomes

This course treats the fundamentals of the longitudinal behavior of road vehicle power trains. It gives a support for analyzing and optimizing the energy consumption and the performance of these power trains.
The conventional powertrains are studied first in order to identify their low efficiency in the real driving conditions. Then, advanced power trains configurations are proposed for moving the road transportation sector into a sustainable mobility. Hybrid electric, battery electric and fuel-cell power train configurations are analyzed in order to identify the potential of each configuration and its potential in reducing energy consumption.
Realistic mathematical models are developed for the components of these power trains (particularly the conventional and hybrid power trains) and they are compiled to complete the vehicle system that is analyzed and used to develop optimized energy management strategies, in order to optimize the energy consumption.
Several case studies are used to exemplify the methodology and show the principles and challenges associated with analyzing and optimizing complex power trains.

Upon successful completion of this course the student is expected to:

1. Be aware to the problems of sustainable mobility, focusing on passenger vehicles
2. Have knowledge about conventional and advanced power train configurations: hybrid electric, battery electric and fuel-cell power trains
3. Identify and enumerate different hybrid drive system configurations
4. Analyse and compute the energy efficiency of conventional and advanced power trains
5. Design and model conventional and advanced power trains on the perspective of computing and optimizing their energy consumption and performance

6. Discuss the advantages and disadvantages with different hybrid configurations.
7. Have knowledge about control strategies for energy optimization of complex power trains
8. Experience in using tools and techniques for placing vehicle power trains into a dynamic of sustainable development

Propulsion Systems for Hybrid Vehicles by Miller, IEE Power and Energy Series 45
Electric and Hybrid Vehicles, Design Fundamentals by Husain, CRC Press

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

The final grade will be determined based on the following percentages:

Midterm	25%
Project	40%
Final Exam	35%

Course Policies

Structure

Policy

All students must take Exams as scheduled. Failure to take an exam or the final exam during the assigned class period will result in a grade of zero on that test unless the student has personally contacted me and received permission from me to be absent from the test.

Additional Notes

- A student can miss no more than 4 sessions of instruction. By the 5th session, the instructor may ask the student to drop the course.

- Plagiarism: students caught cheating on an exam will receive a grade of Zero on the exam in the first cheating attempt and a warning. Students caught cheating for the second time in the same course will receive an F grade in the course and a second warning. A grade of zero on an exam resulting from cheating must be counted in the student's course grade.
- Any student who receives 3 warnings will be suspended.

Course Schedule

Topic	
1	Energy consumption and environmental impact of modern transportation: - Importance of energy in the society and the world economy - Challenges of world dependence on fossil fuels - Global energy consumption trends - Transportation energy consumption trends - Main solutions to reduce road transport energy consumption
2	Configuration of conventional vehicle powertrains: - Internal combustion engines - Gearbox systems - Engine Flywheel - Clutch systems - Drivelines

	- Differential - Braking systems
3	Conventional vehicle fundamentals: - Dynamic equation of motion - Tire-ground adhesion and maximum tractive effort - Powertrain tractive effort and vehicle speed - Vehicle power plant and transmission characteristics - Vehicle performance - Operating fuel consumption - Braking performance
4	Operating conditions of the internal combustion engine in the conventional powertrains: - Energy analysis of conventional powertrains - Energy analysis of internal combustion engines
5	Battery electric powertrain technologies: - Configuration of battery electric powertrains - Performance of battery electric powertrains - Energy analysis of battery electric powertrains
6	Fuel-cell powertrain technologies: - Operating principle of fuel-cells - Configuration of fuel-cell powertrains - Performance of fuel-cell powertrains - Energy analysis of fuel-cell powertrains
7	Hybrid electric powertrain technologies: - Engine stop/start during idling - Brake energy recovery - Electric boosting during accelerations - Management of the engine operating points and power-splitting

	- Driving in electric mode - Energy management strategies
8	Stop/start hybrid powertrains: - Configuration of stop-start powertrains - Energy management strategy - Sizing of the power train components - Verification of the vehicle performance - Fuel consumption
9	Series hybrid powertrains: - General concept of hybrid electric power trains - Configuration of series powertrains - Advantages and disadvantages of series powertrains - Energy management strategy - Verification of the vehicle performance - Sizing of the series powertrain components - Design example of series hybrid powertrains - Efficiency of series hybrid powertrains - Fuel consumption of series hybrid powertrains
10	Parallel hybrid power trains: - Configuration of parallel powertrains - Energy management strategy - Sizing of the powertrain components - Verification of the vehicle performance - Fuel consumption
11	Series/parallel hybrid powertrains: - Configuration of series/parallel powertrains - Energy management strategy - Sizing of the power train components - Verification of the vehicle performance

	- Fuel consumption
12	Fundamentals of regenerative braking: - Energy consumption in braking - Braking power and energy on front and rear wheels - Brake strategies for electric and hybrid electric vehicles - Antilock brake system (ABS)

APENDIX II: The CLIMASP Course Modules Template Example

Course	Advanced Powertrains
Module 1	Energy consumption and environmental impact of modern transportation
Key Concepts	Energy consumption, GHG/pollutants emissions, regulations and protocols to reduce transport emissions.
Overview	At a time where most of the world energy consumption derives from the combustion of fossil fuel, there is a growing concern that the peak oil production may be reached in the near future. The peak oil concept predicts that the world has consumed almost half of the oil reserves; consequently, with the forecasts of increasing energy consumption demand, the world will be facing a decrease in oil production, resulting in severe oil price increases. Therefore, the world's energy consumption has to move away from fossil fuels, in order to guarantee the security of energy supply, and the environmental concerns related to global warming and air pollution. The overall picture of energy consumption by sectors shows that the transportation sector accounts for one third of the total world energy consumption, with a predominance in the consumption of oil to over 96%. Therefore, the evolution of energy consumption in transportation is crucial in guaranteeing sustainable mobility, and passenger road transportation, is the key sector to manage the energy consumption trend.
Aim	This module presents an introduction on the world energy consumption and GHG/pollutants emissions of the different modes of transport. It highlights the high dependency of transport on petroleum oil products, and emphasizes the need to reduce fuel consumption in this sector, particularly the passenger

	vehicles.
Learning Outcomes	At the end of this module learners will be able to: • Assess energy consumption and emissions per transport modes • Demonstrate knowledge on protocols and regulations to reduce GHG emissions and pollutants • Identify mitigation options to reduce transport energy consumption
Units	Chapter 1: Energy consumption and environmental impact of modern transportation.
Readings	The instructor's notes and the reference books.
Activity	**Overview**
Module 2	Conventional Vehicles Fundamentals
Key Concepts	gasoline and diesel powertrains
Overview	This module presents the mathematical modeling of conventional vehicle operation fundamentals, in order to emulate the vehicle performance and fuel consumption under different driving conditions. The effort to improve the fuel economy of conventional vehicles has been an ongoing process in the automotive industry. Despite all the efforts, conventional powertrains still remain inefficient. The second part of the module analyzes the energy consumption of these powertrains in their various stages of use, and pinpoints the within sources of energy losses.

Aim	The aim of this module is to learn the modelling of conventional powertrains in order to assess the energy consumption under different driving conditions.
Learning Outcomes	At the end of this module learners will be able to: • Identify the sources of energy losses within conventional powertrains • Elaborate a mathematical model of conventional powertrains
Units	Chapter 2: Configuration of conventional vehicle powertrains Chapter 3: Conventional vehicle fundamentals Chapter 4: Operating conditions of the internal combustion engine in the conventional powertrains
Readings	The instructor's notes and the reference books.
Activity	**Overview**
	Project: Modeling of a conventional powertrain using Matlab/Simulink.
Module 3	Electric and Fuel-Cell Vehicles Fundamentals
Key Concepts	Battery electric vehicles, Hydrogen fuel-cell vehicles.
Overview	Among the potential alternative powertrains to reduce energy consumption are electric and fuel-cell vehicles. Although these powertrains show high tank-to-wheel energy efficiency, their future still faces barriers to overcome in the short and medium terms, depending primarily on technological improvements of the energy storage systems on-board, and the infrastructure for electricity and hydrogen supply. This module presents the configurations and the well-to-wheel energy analysis of battery electric and hydrogen fuel-cell vehicles.

Aim	This module aims at examining the configurations and the well-to-wheel energy analysis of battery electric and hydrogen fuel-cell vehicles.
Learning Outcomes	At the end of this module learners will be able to demonstrate knowledge on the fundamentals of battery electric and hydrogen fuel-cell vehicles.
Units	Chapter 5: Battery electric powertrain technologies. Chapter 6: Fuel-cell powertrain technologies.
Readings	The instructor's notes and the reference books.
Activity	**Overview**
	Midterm exam covering modules 1 to 3.
Module 4	Hybrid Electric Vehicles Fundamentals
Key Concepts	Hybrid electric vehicles.
Overview	As discussed in module 2, conventional vehicles present poor fuel economy and high environmental pollution. According to module 3, electric and fuel-cell vehicles show advantages over conventional vehicles in terms of energy savings and zero environmental pollution; however, the performance, especially the operation range per battery charge, is far less competitive than conventional vehicles, due to the lower energy content of the batteries compared to the energy content of gasoline. Hybrid electric vehicles, which use two power sources: an internal combustion engine and an electric machine, have the advantages of both conventional and electric vehicles, and overcome their disadvantages. This module focuses on the concept, powertrain configuration, control strategy

	and operation principles of hybrid electric vehicles.
Aim	This module aims at understanding the fundamentals and energy analysis of hybrid electric powertrains.
Learning Outcomes	At the end of this module learners will be able to: • understanding the fundamentals of hybrid electric vehicles • modeling hybrid electric powertrains • assess and optimize energy consumption of hybrid vehicles
Units	Chapter 7: Hybrid electric powertrain technologies. Chapter 8: Stop/start hybrid powertrains. Chapter 9: Series hybrid powertrains. Chapter 10: Parallel hybrid power trains. Chapter 11: Series/parallel hybrid powertrains. Chapter 12: Fundamentals of regenerative braking.
Readings	The instructor's notes and the reference books.
Activity	**Overview**
	Project: Modeling of hybrid electric powertrain using Matlab/Simulink. Final exam covering module 4.

Environmental Remediation

Department of Civil Engineering, School of Engineering

Lebanese American University

Spring Semester ……

Instructor Information

Instructor: Dr. Mazen M. Haydar
Office Location: Zakhem 502 - Byblos
Telephone:
Office Hours: After class
E-mail: mazen.haydar@lau.edu.lb
Website:

Course Identification

Course Number: CIE 526
Course Name: Environmental Remediation
Course Location:
Course Time: MW 6:00 – 7:15

Prerequisites: None
Faculty Web Page:

Course Description/Overview

This course deals with characterization of pollution in the groundwater, soil and air and developing processes based on physical, chemical and biological transformations to return contaminated environments, such as polluted waters, soils and air, to their natural conditions. The control, optimization and monitoring of environmental remediation is discussed as well as the environmental factors and mechanisms involved. In-situ and ex-situ applications are emphasized in this course.

Course Learning Objectives

The main objective of this module is to identify pollutants of concern in the groundwater, soil and air, how to investigate and characterize the extent of contamination and to identify applicable remediation measures. The course also addresses developing measures for pollution prevention and waste minimization.

Course Content Learning Outcomes

At the conclusion of this course, each student will be able to do the following:

1. Learn about water sampling techniques and how to characterize and delineate sources of groundwater contamination
2. Identify applicable remedial technologies for groundwater contamination
3. Characterize soil contamination and propose remedial solutions to address soil contaminated sites
4. Identify the main sources of air pollution and estimate emissions of pollutants.
5. Know the main standards regulating air pollution and identify applicable air pollution control technologies: particulate controls and gas controls.
6. Identify pollution prevention and waste minimization controls in various stages of a given project or design.

Course Resources

Required Course Texts and Materials

Required Resources:

Selected Readings from:
Handbook of Complex Environmental Remediation Problems, Jay Lehr, Marve Hyman, Tyler Gass, and William Seevers, McGraw-Hill, 2001.

Optional Course Texts and Materials

None.

Assignments and Grading Scheme

Grading System

Grading Policy

Evaluation of the student's final grade in the course will be based on his/her performance throughout the course and will be a combination of the following:

Item Percentage
Term Paper (final report 15%, oral presentation 5%) 20%
Test 1 20%
Test 2 20%
Comprehensive Final Exam 40%

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

Course Policies

Structure

Lecture:	Two 75-minute lectures per week
Laboratory:	None
Medium:	All material explained in class and on the whiteboard
Tests:	2 Tests-75 minutes - closed book
Final:	120 minutes, comprehensive, closed book
Term Paper:	Final report to be submitted, followed by a Class oral presentation.

Policies

Attendance
You are expected to attend all classes and arrive on time. Obtain prior clearance for planned absences.
Academic Integrity
The instructor will adhere to all LAU policies regarding academic integrity as stated http://www.lau.edu/policies.
Homework Policy
Assignments must be typed and must be turned in at the beginning of class on the day it is due, with no exceptions.
Exam Policy
No make-up for a test or a final will be given under any circumstance. In case of absence, the grade of the exam will be considered to be zero.
Cheating
Students caught cheating on an exam receive a grade of zero on the exam.

Course Schedule

Topic	Description
1	Groundwater Characterization
2	Investigative Methods
3	Water Sampling
4	Remedial Methods for Groundwater Contamination
5	Soil Characterization
6	Methods for Remediating Soil Contamination
7	Overview of Air Quality Regulations
8	Air Pollution Control Technologies: Particulate Controls
9	Air Pollution Control Technologies: Gas Controls
10	Pollution Prevention and Waste Minimization: In Design
11	Pollution Prevention and Waste Minimization: In Operation & Maintenance

APENDIX II: The CLIMASP Course Modules Template Example

Course	Environmental Remediation
Module 1	**Groundwater**
Key Concepts	Groundwater contamination, groundwater characterization, installation of groundwater monitoring wells, investigative methods and remedial methods.

Overview	In this module, we will explore why groundwater contamination is so important? What are the sources of groundwater pollution? What is the hydrology of contamination? What aspects of geochemistry are important in understanding groundwater pollution? What are the effects of these compounds on human health and the environment? What are the chemicals that have the greatest impact on groundwater? We will also explore investigative methods for dense and light non-aqueous phase liquids. Finally, we will present various remedial methods that can be applicable for DNAPLs and LNAPLs and discuss several case studies on this subject.
Aim	The main objective of this module is to understand groundwater characterization of groundwater pollution, identify the important pollutants of concern and explore respective remedial methods.
Learning Outcomes	The student shall be able to: • Determine the main groundwater contaminants of concern • Learn about water sampling techniques • Learn how to characterize and delineate source of contamination • Identify applicable remedial technologies for groundwater contamination
Units	1.1 –Groundwater Characterization 1.2 –Investigative Methods 1.3 –Remedial Methods 1.4 – Case Studies
Readings	Chapter 1 *Handbook of Complex Environmental Remediation Problems, Jay Lehr, Marve Hyman, Tyler Gass, and William Seevers, McGraw-Hill, 2001.*
Activity	Assignment: • Read the below article in order to analyze the transport and fate of contaminants. Project: • Prepare a term paper that addresses the remedial action plan implemented at a groundwater contaminated site. The paper must address the strategy

	for characterizing the pollution, the sampling plan and the remedial technology used at this site.
Module 2	**Soil Contamination**
Key Concepts	Delineation of soil contamination, soil characteristics, and remediating soil contamination.
Overview	In this module, we will introduce the soil characteristics, the soil mineralogy and organic matter. We will explore the characteristics of contaminants, chemical speciation, cation exchange capacity, and analytical challenges. We will discuss the field investigative methods to characterize soil contamination and present soil sampling techniques. Furthermore, we will evaluate the various methods for remediating soil contamination such as phytoremediation, thermal applications, chemical and biological reaction, separation, and mobilization and extraction.
Aim	The main objective of this module is to introduce soil characteristics, investigate soil contamination and propose respective remedial methods.
Learning Outcomes	The student shall be able to: • Characterize soil contamination • Propose remedial solutions to address soil contaminated sites
Units	2.1 – Soil Characteristics 2.2 – Characterization of Soil Contamination 2.3 – Remediation of Soil Contamination
Readings	Chapter 2 *Handbook of Complex Environmental Remediation Problems, Jay Lehr, Marve Hyman, Tyler Gass, and William Seevers, McGraw-Hill, 2001.*
Activity	Project: • Prepare a term paper that addresses characterization and remedial action of soil contaminated sites.
Module 3	**Discharge of Hazardous Waste into the Atmosphere and their impact on Climate Change**
Key Concepts	Air quality standards, air pollution control technologies, and air dispersion modeling.
Overview	This module will introduce sources of pollutants emitted into the atmosphere,

	hazardous air pollutants and estimation of toxic emissions. We will present the provisions for attainment and maintenance of NAAQS and national emission standards. We will explore dispersion modeling, its objectives, procedure and limitations. We will address air pollution control technologies that are divided into particulate controls and gas controls. Particulate controls such as cyclones, particulate scrubbers, filters, etc. will be presented. Gas controls such as absorption, adsorption, incineration, biofiltration, etc. will be presented as well. Finally, we will discuss the impact of climate change on the development of remediation projects and the technological advances in remediation needed to control degradation of air quality. Reciprocally, we will explore the impact of remediation on reducing the impact of climate change.
Aim	The main objective of this module is to explore the main sources of air pollutants and how to estimate their emissions and recommend respective remedial technologies, specifically particulate and gas controls.
Learning Outcomes	The student shall be able to: • Identify the main sources of air pollution and estimate emissions of pollutants. • Know the main standards regulating air pollution • Understand air dispersion modeling • Know about air pollution control technologies: particulate controls and gas controls.
Units	3.1 –Sources of Hazardous Chemicals Emitted into the Atmosphere 3.2 – Overview of Air Quality Regulations 3.3 – Dispersion Modeling 3.4 – Air Pollution Control Technologies: Particulate Controls 3.5 – Air Pollution Control Technologies: Gas Controls
Readings	Chapter 3 *Handbook of Complex Environmental Remediation Problems, Jay Lehr, Marve Hyman, Tyler Gass, and William Seevers, McGraw-Hill, 2001.*

Activity	Project: • Prepare a term paper that addresses control of hazardous air pollutants from industrial facilities. • Prepare a term paper that addresses the relationship between the formulation of climate change policies and regulations on the progress of environmental remediation. • Prepare a term paper that addresses the impact caused by air pollution and discharge of chemical pollutants on climate change.
Module 4	**Pollution Prevention and Waste Minimization**
Key Concepts	Pollution prevention, waste minimization, and environmental restoration.
Overview	In this module, we will introduce the main techniques and benefits of pollution prevention and waste minimization. When does pollution prevention apply? Which methods can be used for identifying pollution prevention opportunities in design? We will also explore methods and possible opportunities for environmental restoration.
Aim	The main objective of this module is to introduce key pollution prevention and waste minimization controls that can be implemented during design, operation and for environmental restoration.
Learning Outcomes	The student shall be able to: • Identify pollution prevention and waste minimization controls in various stages of a given project or design.
Units	4.1 – Pollution Prevention and Waste Minimization in Design 4.2 – Pollution Prevention and Waste Minimization for Maintenance & Operations 4.3 – Pollution Prevention and Waste Minimization in Environmental Restoration
Readings	Chapter 12 *Handbook of Complex Environmental Remediation Problems, Jay Lehr, Marve Hyman, Tyler Gass, and William Seevers, McGraw-Hill, 2001.*
Activity	Project: • Prepare a term paper that addresses the use of design, permits,

	environmental management and other preventive measures to reduce or control pollution.

APENDIX I: The CLIMASP Transportation Planning and Land Use Course Description

CLIMASP Course Syllabus

Course Number:
Transportation Planning and Land Use

Lebanese American University,
School of Engineering, Department of Civil Engineering,
Semester, 20XX

Instructor Information

Instructor: Dr. John Khoury
Office Location: Bassil 303, Byblos Campus
Telephone: Office: 09-547262 ext 2170
Office Hours:

E-mail: john.khoury@lau.edu.lb

Course Identification

Course Number: CIE563
Course Name: **Transportation Planning and Land Use**
Course Location: Byblos Campus
Class Times:
Prerequisites:

Course Description/Overview

Transportation planning and land use provides transportation engineers and planners with the latest knowledge, skills and tools needed to understand, plan, develop and maintain sustainable transportation practices.

This course addresses today's issues in sustainable transportation and benefits the safety, health and welfare of the public. Students will learn how to implement programs that encourage mixed use and higher density levels, develop environmental solutions to improve land use planning, review what makes a community liveable and evaluate transportation system life cycles. Interaction between transportation and land use variables, including modelling requirements, impacts, and data needs within the context of good community planning and economic development; transportation management, administration, finance, system evaluation, implementation, and integration. In addition, the student will explore the positives and negatives affecting liveability. The student will learn about sprawl and compact cities, energy issues and environmental quality, transit-oriented and traditional neighbourhood development, and mixed-use and mixed income developments. Context sensitive solutions to transportation projects will also be covered.

The course is divided into two focus areas:

- Planning and land use for liveable communities

- Environmental Issues and Impacts with economic burdens

Course Learning Outcomes

Upon successful completion of this course, students will be able to:

121. Define the main elements of planning of transportation constructed facilities
122. Understand the travel demand forecasting model
123. Develop and evaluate alternatives for liveable communities
124. Understand the impacts of alternatives on users, environment and socio-economic balance

Course Resources

Course Website(s)

Required Course Texts and Materials

- Hands-out prepared by the instructor for the class

Optional Course Texts and Materials

- Material present at the FHWA website for planning and land use (Influence of transportation infrastructure on land use), found at: https://www.fhwa.dot.gov/planning/processes/land_use/references/tranlanduse.cfm

- Case studies of land use: https://www.fhwa.dot.gov/planning/processes/land_use/case_studies/

- Tools and practices for land use integration: https://www.fhwa.dot.gov/planning/processes/land_use/land_use_tools/
- FHWA Travel Model Improvement Program at:

https://www.fhwa.dot.gov/planning/tmip/about/strategic_plan/page00.cfm
- Reports by the TMIP force under the DOT:
https://www.fhwa.dot.gov/planning/tmip/resources/sponsored_reports.cfm

Assignments and Grading Scheme

Grading System

All assignments are graded over 100

Grading Policy

Evaluation of the student's final grade in the course will be based on his/her performance throughout the course and will be a combination of the following:

Item	Percentage
Assignments/class attendance	10
Project/Presentation	20
Mid-term Exam	30
Final Exam	40

Project

The project is a major part of your course grade. You will select a topic of interest that relates to the field of study and a current industry problem, including:

- Alternative mode study and application
- Travel demand management applications and evaluations
- Transit oriented land-use designs
- Environmental issues
- Energy issues

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

This is a seminar type of course, which means that students are expected to come to ALL classes. You cannot pass the class under any circumstances if you miss more than five classes. Students are expected to arrive on time and stay until the class period ends. If you know that you have to leave early, you should notify me before class starts. You are expected to treat faculty and other students with respect. During class students are obliged to

not disrupt class by making noise and/or leaving and re-entering during class. Students who violate these minimal expectations will be asked to leave and counted as absent. You are expected to have read and thought about the assigned material before you come to class. I expect active class participation, which counts for 10% of the grade.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

APENDIX II: The CLIMASP Transportation Planning and Land Use Course Modules

Course	**Transportation Planning and Land Use**
Module 1	Urban Transportation Problems Overview
Key Concepts	Transportation problems, Planning philosophies and framework
Overview	This module talks about the different transportation issues faced in an urban setting. The symptoms of such problems are detailed along with the sources. Then the planning approach needed to solve such issues is introduced through the "Continuing Urban Transportation Planning Process" framework.
Aim	The aim of this module is to introduce students to issues they have to think off when discussing urban transportation problems and the corresponding planning requirements to solve them. Then the "travel demand forecasting" framework is briefly discussed and the data requirements are highlighted
Learning Outcomes	At the end of this module learners will be able to: Describe the urban transportation issues, their key identifiers and the urban planning framework needed to assess such issues on a continuing basis
Readings	Course hand-outs and reference material assigned in class
Activity	Overview Assignment 1: once familiar with the urban planning framework, develop a

	survey tool to address a certain transportation problem in your city.
Module 2	Travel Demand Forecasting
Key Concepts	Four step process, generation, distribution, mode choice, route assignment
Overview	This module talks about the four steps used in the overall transportation planning and forecasting problem. After the problems have been identified and the data collected about the region, the trip generation, distribution, mode choice and route choice process starts, which are at the heart of the Urban Transportation Planning framework.
Aim	The aim of this module is to introduce students to the four steps needed to conduct a transportation forecasting exercise for a region
Learning Outcomes	At the end of this module learners will be able to: Describe the urban transportation forecasting and demand projection model
Readings	Course hand-outs and reference material assigned in class
Activity	Overview Assignment 1: Trip generation example Assignment 2: Trip distribution example Assignment 3: Mode choice example Assignment 4: Route distribution example
Module 3	Alternatives Development and Strategic Evaluation
Key Concepts	Alternative development, evaluation framework
Overview	This module talks about the comprehensive transportation alternative development process and the relationship between evaluation and other planning activities. This describes the characteristics of modal alternatives, their local context in terms of goals, the concerns of the decision makers and other stakeholders, and other administrative requirements
Aim	The aim of this module is to introduce students to the full range of

	transportation alternatives in terms of modal choices and their impacts on the region
Learning Outcomes	At the end of this module learners will be able to: Describe the principles for modal alternatives development, their impacts and issues related to sensitivity of the results
Readings	Course hand-outs and reference material assigned in class
Activity	Overview Project: students will be asked to start the course project in order to later develop alternatives
Module 4	Cost of Alternatives
Key Concepts	Capital costs, Operating costs, Maintenance costs
Overview	This module talks about the comprehensive list of costs associated with the major transportation alternatives selected for analysis. Students will be introduced to typical unit costs for various types of urban transportation actions from the Characteristics of Urban Transportation Systems (CUTS), which is periodically updated by the Federal Transit Administration (FTA). These unit costs can be used to provide approximate estimates of the capital, operating, and maintenance costs of sketch-planning alternatives, subject to the caveats noted in the accompanying discussions.
Aim	The aim of this module is to introduce students to the full range of transportation project costs
Learning Outcomes	At the end of this module learners will be able to: Describe the segment unit costs for the selected transportation alternatives
Readings	Course hand-outs and reference material assigned in class
Activity	Overview Project: students will be asked to assess the costs of the various alternatives they developed for their urban transportation issue
Module 5	Impacts on transportation system users

Key Concepts	User benefits, user costs, capital costs
Overview	This module talks about the various components of user costs and benefits described previously usually makes up the major component of the economic efficiency measures in the overall evaluation. The major categories of user effects are: Time spent in travel; "out of pocket costs" including fares, tolls, parking charges; direct user borne vehicle operating costs (excluding transit operating costs); accident costs; comfort and convenience; accessibility; costs and benefits of induced or discouraged travel.
Aim	The aim of this module is to introduce students to the full range of transportation user costs and allow them to understand the difference of this cost category from the project costs.
Learning Outcomes	At the end of this module learners will be able to: Describe the different user costs for the selected transportation alternatives
Readings	Course hand-outs and reference material assigned in class
Activity	Overview Project: students will be asked to assess the user related costs of the various alternatives they developed for their urban transportation issue
Module 6	Energy, environment, and Socio economic impacts
Key Concepts	Energy issues, socio-economic impacts, environmental impacts
Overview	Transportation alternatives can affect energy required for vehicle propulsion, maintenance, and the construction of guide ways, stations, and vehicles. Transportation alternatives also can affect energy consumption through second round effects such as employment shifts to or from the suburbs, changes in auto ownership, and the use of autos left home by car-poolers or transit riders. Socio-Economic Impacts of construction and use of transportation facilities include: employment and other implications from construction and operation of transit services, land use changes and their impacts, economic development implications

Aim	The aim of this module is to introduce students to the full range of transportation alternative impacts of the society, environment, and the energy sector.
Learning Outcomes	At the end of this module learners will be able to: Describe the many impacts a major urban transportation project has and find ways to assess such impacts
Readings	Course hand-outs and reference material assigned in class
Activity	Overview Project: students will be asked to assess the energy issues, socio-economic impacts, environmental impacts of the various alternatives
Module 7	Overall merit and fairness/equity analysis
Key Concepts	Energy issues, socio-economic impacts, environmental impacts
Overview	This module will introduce the comprehensive evaluations will call for impact measures relating to: overall economic worth, environmental implication, equity, financial feasibility, legal and administrative feasibility, and social acceptance. Questions will be raised about the sensitivity of findings to uncertainties and value based assumptions, and the adequacies of alternatives and impacts considered. One key element of transportation decision-making is that many impact measures contain subject judgments: value of time, safety, comfort, quality of life, etc.
Aim	The aim of this module is to allow students to assess whether the costs of improvements are justified by the anticipated benefits, understand key differences among alternatives, and assess the distribution of the costs and benefits among the affected groups to answer the questions about fairness.
Learning Outcomes	At the end of this module learners will be able to: Describe the overall merit of major urban transportation project
Readings	Course hand-outs and reference material assigned in class
Activity	Overview Project: students will be asked to assess the overall merit of the selected

	alternative out of the various alternatives they developed and studied, using the STEAM software (Surface Transportation Efficiency Analysis Model)

APENDIX I: The CLIMASP Course Syllabus Template Example

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Course Number: CIE582/782

Infrastructures Management

Lebanese American University, Faculty of Engineering, Department of Civil Engineering

Fall Semester, 2014

Instructor Information

Instructor: Dr. Gebran Karam

Office Location: Bassil hall office 305

Telephone: Office – +961 9 547254

Office Hours: MWF 2:00 to 3:00 pm and 5:00 to 6:00 pm

E-mail: gkaram@lau.edu.lb
Website: WWW.LAU.EDU.LB

Course Identification

Course Number: CIE582 / 782
Course Name: Infrastructures Management
Course Location: University Campus
Class Times: MWF 1:00 to 1:50pm
Prerequisites: Construction Management

Faculty Web Page: WWW.LAU.EDU.LB

Course Description/Overview

General methods of engineering systems management and the different types of infrastructure. Application of different methods for the planning and analysis of complex infrastructure projects considering possible financing alternatives, engineering solutions, and overall management issues during the life cycle of the project. Review of selected case studies

Course Learning Objectives

The material in this course is structured and focused on the course learning outcomes. Assigned student work and graded student performances are based on the course learning outcomes. These outcomes are assumed to be attained by the students when 70% or more of the students (not counting withdrawals) pass the course.

Course Content Learning Outcomes

On the successful completion of this course, you will be able to:

1. Describe the issues involved in managing infrastructure facilities and systems as assets

2. Demonstrate an understanding of the methods, tools, and other resources available for infrastructure management
3. Demonstrate an understanding of the evolving institutional contexts for implementing asset management programs
4. Demonstrate an understanding of the basics of financial planning for infrastructure systems and the evolving financial instruments available
5. Conceptually design a management system for a selected facility and system
6. Conduct evaluations to determine the relative effectiveness of various management systems
7. Demonstrate an understanding of the ethical, environmental, legal, societal, and political issues involved in the development of new infrastructure systems and the management and maintenance of mature infrastructure systems.
8. Examine the importance of infrastructure choices and use the principles of engineering communications (written, oral, and visual) to present your findings.

Required Course Texts and Materials

Reading material will be assigned in classand handouts prepared by the instructor for the class.

A preliminary list of suggested references and readings is as follows:
Books:
1-Principlesof Public and Private Infrastructure Delivery – by John B. Miller - - 2000
2-Water, Wastewater, and Stormwater Infrastructure Management by Neil S. Grigg - 2012

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 4 (where 2 is the least pass mark)

Grading Policy

Grades can be based on the following: (Example)
The course grade is calculated according to the following:

Written tests / projects/ presentations	60%
Class discussions participation and assignments	10%
Final	30%
Total Points	**100**

Course Policies.

Classroom Protocol

1-Attendance of all scheduled lectures and additional sessions is mandatory
2-Computer literacy and access to internet are required and non-negotiable.
3-Self learning is a key to continuous self-development and professional improvement; through the assignments and projects, this course will try to create conditions and situations where individuals or teams will be caused to research, collect, study and synthesize information in order to acquire knowledge, know how, and design skills.

4-All students are supposed to be proficient in oral and written English communication skills. Presentation, language, and professionalism will be considered in the grading of assignments, projects, and all other course work.
5-Honesty on Assignments, Projects, Exams, and Course work:
You will be assigned individual and group work. You are also welcome, and encouraged, to work on assigned individual problems and projects with fellow students. A good way to learn the material is in small study groups. Such groups work best if members have attempted the problems individually before meeting as a group. Of course, the assignment solution, project, or work, that you turn in should reflect your own understanding, and not that of your fellow students. In other words, do not copy directly from other students. If it is obvious that such direct copying has occurred, we will disallow that homework. Individual work is required on all examinations taken in class.
Working groups will be formed at the beginning of the semester and will be asked to carry multiple assignments culminating in oral presentation and the submittal of written reports.
By attending lectures, taking exams, and presenting their work for grading all students are implicitly assumed to have read and agreed with all of the above.
As a general rule no make-up exams will be allowed. Class attendance and participation will be evaluated and included in the course grade.

Relationship of course to Program Outcomes

This course is related to the following program outcomes:

1. Delivery and Assessment of Program Outcomes: (g) ability to communicate effectively. Specifically: the ability to write documents with the context, organization, format and style fitting the intended reader and purpose; and the ability to deliver orally a presentation with timeliness, credibility, and engagement that achieve desired outcomes. (j)a knowledge of contemporary issues. Specifically the ability to identify several contemporary issues and the ability to describe the impact of contemporary issues on engineering activities.

   Assessment is accomplished in class for the communications program outcome (g) and through questions for outcome (j), similar in format to the FE examination, on the final exam. Questions are approved by the Program Assessment Committee. Attained by the students when 70% or more of the students score 70% of the points allocated to questions.

Delivery of Program Outcome: (h) the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context. Specifically the knowledge of the impact of engineering solutions ina global, economic, environmental, and societal context, and the comprehension of the impact of engineering solutions in a global, economic, environmental, and societal context

Important Dates to Remember

Topics covered and course schedule

Week	**Topic**
Week 1	Definition and types of infrastructure systems.
Week 2-3	Planning and economic decision models.
Week 3-4	Financing and delivery methods.
Week 5	Decision support systems, GIS, and knowledge mining.
Week 6-7	Examples of infrastructure management systems: transportation networks, telecommunications, water and wastewater, emergency response systems…
Week 8	Role of the civil engineer in the 21st century and Sustainability issues.
Week 9-10	Climate change and global environmental issues.
Week 10-14	Assigned case studies and projects discussion

APENDIX II: The CLIMASP Course Modules Template Example

Course	Curriculum and Hypermedia
Module 1	Curriculum definition and Types of Infrastructure
Key Concepts	Infrastructure Assets, Systems, Public and Private Utility Service Delivery
Overview	Ask the students what is Infrastructure in their opinion, define infrastructure, describe the different types of infrastructure systems in civil engineering, list the different systems, discuss the ownership and history of utilities, public versus private
Aim	Identify and describe elements, assets, and systems of infrastructure and list their types and form as public or private utilities
Learning Outcomes	Describe infrastructure assets and systems and their types
Units	N/A
Readings	As assigned
Activity	Class open discussion, followed by reading and some research to develop interactively the required definitions and descriptions before reviewing the pertinent literature
Module 2	Curriculum Planning and Economic Decision Models
Key Concepts	Life Cycle of System, Planning and conceptualization, Financial and Economic Evaluation
Overview	Define life cycle , identify planning and conceptualization as the first steps, review financial based and economic based evaluation models for infrastructure system feasibility
Aim	Describe and use different types of financial and economic evaluation models
Learning	Evaluate the financial and/or economic feasibility of system or component

Outcomes	
Units	N/A
Readings	As assigned
Activity	**Overview**
	Class open discussion, followed by review of engineering economics concepts followed by financial vs economic criteria, pick one example of infra such as a road system and develop vehicle operating cost concept and compare analyses.
Module 3	Curriculum and Financing and delivery methods
Key Concepts	Financing, taxes, loans, privatization , BOT / BOOT, PPP
Overview	Review of sources of financing for public, private, or public/private infrastructure, and exploration of different delivery methods for the construction and operation such as BOT, BOOT, PPP
Aim	Identify sources of financing for a public utility infrastructure system,
Learning Outcomes	Ability to suggest most appropriate financing scheme and to suggest delivery method for an infra system or component
Units	N/A
Readings	As assigned
Activity	**Overview**
	Class open discussion, review of available funding sources to finance a public infra project such as taxation, loans, or private funding sources and discussion of the connected delivery method to each project (public works governmental contracts, BOT, etc..); open discussion on the applicability of PPP to different types of projects
Module 4	Decision support systems, GIS, and knowledge mining

Key Concepts	Physical and Financial Modeling of Systems, GIS, and statistical analysis and databases mining and management
Overview	Introduction of the types of decision support systems, models, review of GIS concepts and data mining
Aim	Discuss and identify the key components of required decision support systems for the management and operation of any infra system
Learning Outcomes	Ability to conceptually design and specify the decision support systems required and their types for a given infrastructural system
Units	N/A
Readings	As assigned
Activity	**Overview**
	Class open discussion, review the key operations of any generic infra system and identify the types of decision support systems required, the types of IT and software, read and discuss about actual cases that use SCADA, GIS, specific O&M system models (water infra and road infra), financial operations software, inventory management, customer management databases. Group assignment to design and specify requirements for a selected type of utility or infrastructure system; presentation and discussion with class
Module 5	Examples of infrastructure management systems: transportation networks, telecommunications, water and wastewater, emergency response systems…
Key Concepts	Assets, Systems, Services delivered, Valuation of services, O&M, Efficiency
Overview	Detailed description and comparison of existing infra management solutions at the international and local level
Aim	Develop an understanding of current working models of infrastructure systems within their national, economic, and environmental contexts; identify their critical features and impacts on quality and efficiency of

	service and their current sustainability
Learning Outcomes	Understand how infrastructure systems are operated and what are their management and operations/maintenance issues depending on their geographic, social, political and economic contexts; and determine the relative effectiveness of various management systems
Units	N/A
Readings	As assigned
Activity	**Overview**
	Class open discussion, review of assigned readings on transportation, water, power, telecom, and other infrastructure systems; establishment of comparisons between different management and operations models; identification and discussion of generic issues and of contextual parameters and issues; discuss applicability of different models to the local and regional context given their particular environmental, social, economic, and political contexts as compared to models adopted in North America and Europe; Group assignment
Module 6	Role of the civil engineer in the 21st century and Sustainability issues
Key Concepts	Civil engineering challenges in modern times, environmental and economic sustainability
Overview	Presentation of the challenges of civil engineering in the coming century with emphasis on sustainability and the various issues surrounding it as pertaining to infra systems management
Aim	Develop an understanding of the challenges of practicing civil engineering in the 21st century and of the ethical, environmental, legal, societal, and political issues involved in the development of new infrastructure systems and the management and maintenance of mature infrastructure systems with particular emphasis on sustainability
Learning Outcomes	Demonstrate an understanding of the challenges of practicing civil

	engineering in the 21st century and of the ethical, environmental, legal, societal, and political issues involved in the development of new infrastructure systems and the management and maintenance of mature infrastructure systems with particular emphasis on sustainability
Units	N/A
Readings	As assigned
Activity	**Overview**
	Class open discussion, followed by presentation of the multidimensional framework of sustainability within which all infra systems must be inscribed; presentation and discussion of the ethical, environmental, legal, societal, and political issues involved in the development of new infrastructure systems and the management and maintenance of mature infrastructure systems; re-formulation of the mission of civil engineering as a steward to the environment and a guarantor of the well-being of communities and their economic prosperity and sustainability; Group assignment
Module 7	Climate change and global environmental issues
Key Concepts	Climate change, global warming, desertification, environmental challenges and constraints
Overview	Presentation of the global challenge of climate change and its environmental impacts and the interaction between human activities and climate change and their direct impact on the design and management of infra systems
Aim	Develop an understanding of the interaction between human activities and their global impact such as climate change and environmental degradation
Learning Outcomes	Demonstrate an understanding of the impact of human activities on climate change and global warming and integrate their constraints within the development and management of infrastructure systems
Units	N/A

Readings	As assigned
Activity	**Overview**
	Class open discussion, review of the debate on global warming leading to the issue of climate change and its impacts on the different types of infrastructure systems at the level of design, operations and management; discussion of the probable causes of climate change and the cumulative impact of human economic development and the role of the supporting infrastructures in that; Student research and presentation of findings in report or power point format pertaining to one particular type of infrastructure

Module 8	Assigned case studies and projects discussion
Key Concepts	Strategic infrastructure management plan
Overview	Design and development of a strategic infrastructure management plan through a guided group project integrating all concepts learned
Aim	Integrate all concepts learned and researched into one strategic development plan for a select infrastructure system with recommendations as to financing, delivery, management objectives, decision support systems, and life cycle sustainability and global impact
Learning Outcomes	Examine the importance of infrastructure development choices and use the principles of engineering as well as financing, project management and delivery, and systems design to map out a strategic development plan for one infrastructure system integrating all constraints and the multi-dimensional issues related to sustainability and global climate change
Units	N/A

Readings	N/A
Activity	**Overview**
	Guided project development on the basis of groups of no more than 4 students culminating in one power point oral presentation and the submission of a final report. The presentation are made to the whole class and discussed afterwards

Groundwater Hydrology and Pollution (CIE600) Course Syllabus

Website:

Course Identification

Course Number: CIE 600
Course Name: Groundwater Hydrology and Pollution
Course Location: Byblos Campus
Class Times: xxx
Prerequisites: Pre-requisite CIE 322 Hydraulics
Faculty Web Page:

Course Description/Overview

CIE 600 Groundwater Hydrology and Pollution [3-0, 3cr.] The objective of this course is to provide students with a thorough understanding of the subsurface environment as it pertains to the distribution and movement of groundwater and the movement and interactions of contaminants. Pre-requisite: CIE322 Hydraulics.

Course Learning Objectives

1. To provide students with information on groundwater movement and contaminant transport in the subsurface.
2. To equip students with technical tools needed to predict groundwater flow and contaminants transport in the subsurface.

Course Content Learning Outcomes

At the conclusion of this course, each student will be able to do the following:

1. Determine groundwater flow and Darcy's velocity.
2. Differentiate between different types of aquifers.
3. Determine the hydraulic conductivity for isotropic, anisotropic, homogeneous, or heterogeneous aquifer systems.
4. Understand and apply the mathematics of groundwater flow for steady and unsteady flow.
5. Construct flow nets.
6. Calculate well drawdown and aquifer parameters using well hydraulics.
7. Determine groundwater flow in the unsaturated zone
8. Determine pollutant fate and transport in porous media.
9. Understand and apply the principles of groundwater modeling.
10. Groundwater recharge calculations
11. Understand contemporary issues affecting groundwater including climate change

Course Resources

Required Course Texts and Materials

Textbook:

Freeze and J. Cherry, GROUNDWATER, Prentice Hall

Reference Textbooks:

1. C.W. Fetter, Applied Hydrogeology, 4th Edition. Prentice Hall.
2. C. W. Fetter, Contaminant Hydrogeology, 2nd Edition, Prentice hall.
3. D. Domenico and F. W. Schwartz, Physical and Chemical Hydrogeology. 2nd Edition, John Wiley and Sons, Inc.
4. M. P. Anderson and W. W. Woessner, Applied groundwater Modeling, Simulation of Flow and Advective Transport. Academic Press.
5. H. F. Wang and M. P. Anderson, Introduction to Groundwater Modeling, Finite Difference and Finite Element Methods. Academic Press.
6. P. B. Bedient, H. S. Rifai, and C. J. Newell. Groundwater Contamination, Transport and remediation, 2nd Edition, Prentice Hall PTR.

Course Learning Outcomes

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

Grading Policy

Evaluation of the student's final grade in the course will be based on his/her performance throughout the course and will be a combination of the following:

Item	*Percentage*
Homework and/or class assignments	***10***
Two Tests (25 % each)	***50***

Comprehensive Final Exam	***40***

Course Policies

Structure

Lecture	Two 75-minute lectures per week
Laboratory	None
Medium	all material explained in class and on the whiteboard
Tests	2 Tests-90 minutes each - closed book
Final	180 minutes, comprehensive, closed book
H.W.	Several H.W., solution posted after submission
Projects	Design of a system

Policy

Class Attendance	You are expected to attend all classes and arrive on time. Obtain prior clearance for planned absences and meet with the instructor after any emergency absences. It is the student's responsibility to obtain any class notes and/or homework questions in case of being absent from a lecture.
Academic Integrity	❖ LAU expects all students to maintain the highest level of integrity. Cheating or plagiarism will not be tolerated. University policies regarding academic integrity are available in

	http://www.lau.edu/policies ❖ The instructor will adhere to all LAU policies regarding academic integrity as stated. ❖ All work must be the result of students' own efforts. ❖ Students who are suspected of plagiarism or other violations of academic integrity codes will face investigation. Those found guilty will face disciplinary action. Repeated offenses will result in permanent expulsion from the University.
Homework Policy	Homework must be neat and legible or it will not be graded, and must be turned in at the beginning of class on the day it is due, with no exceptions.
Exam Policy	Make a consorted effort to be present for each test since there will not be any makeup. A student who misses a test will be given a zero grade unless the student can provide a convincing excuse. With a convincing excuse, either a make-up exam will be given or the other exams will be weighted heavier, at the instructor's discretion.
Exam Dates	**❖ Test 1 is scheduled on xxx.** **❖ Test 2 is scheduled xxx.** **❖ Final Exam is scheduled by the Registrar.**
Course Website	Syllabus, solution of homework, solution of tests, solution of previous tests, handouts, and any relevant material are placed on "courses online" at services.sea.lau.edu.lb
Cheating	A students caught cheating on an exam receives a grade of zero on the exam in the first cheating attempt and a warning. A student caught cheating for the second time in the same course receives an F grade in the course and a second warning.
Studying	❖ You need to study on a regular basis after each lecture. Do not postpone studying till just before the tests.

	❖ Solve the assigned homework as soon as it is announced in class. To benefit the most from the previous tests, solve it on your own as if it were a real test and then look at the solution. ❖ You are responsible for all the material covered in class. Any material that is in the textbook and not covered in class will not be included in the tests. ❖ Take advantage of my office hours. It is your chance to get individual attention and explanation. ❖ Finally, a well prepared student does not need to study on the night before the exam.

Course Schedule

Topic		
1	***Introduction to groundwater***	Hydrologic cycle; classification of subsurface water, types of aquifers, aquifer parameters' groundwater movement, physical properties and principles, hydraulic conductivity: homogeneous – heterogeneous, isotropic – anisotropic systems, compressibility, effective stress
2	***Flownets***	Flow nets and their use in groundwater
3	***Mathematics of groundwater***	Groundwater flow equations in the saturated and unsaturated zones

4	***Well hydraulics and groundwater recharge***	Steady state and unsteady states well hydraulics, piezometers, slug tests, groundwater recharge
5	***Contaminant mass transport***	Principles of mass transport in porous media, advection, diffusion, dispersion, soil-chemical- groundwater interactions, adsorption, biodegradation
6	***Groundwater modelling principles***	Use of numerical methods in groundwater modelling
7	***Contemporary issues and case studies***	Case studies on contemporary issues pertaining to groundwater hydrology and pollution including the effects of climate change

Groundwater Hydrology and Pollution (CIE600) Course Module

Course	**Groundwater Hydrology and Pollution**
Module 1	Introduction to groundwater
Key Concepts	Groundwater occurrence, aquifers, Darcy's law
Overview	This module goes over the hydrologic cycle, classification of subsurface water, types of aquifers, aquifer parameters', groundwater movement, physical properties and principles, hydraulic conductivity, homogeneous/heterogeneous, isotropic/anisotropic systems, and aquifer compressibility
Aim	The aim of this module is introduce the concepts of groundwater occurrence and its movement in the subsurface.
Learning Outcomes	At the end of this module students will be able to: • Acquire knowledge about groundwater occurrence and Darcy's law • Acquire knowledge about aquifers characterization
Units	Unit 1.1 Groundwater occurrence Unit 1.2: Aquifers characterization Unit 1.3: Groundwater movement
Readings	Chapter 1: Introduction (Freeze and J. Cherry, GROUNDWATER, Prentice Hall).
Activity	**Overview** Solve homework problems on aquifer characterization and groundwater movement
Module 2	Flow nets
Key Concepts	Flow nets, seepage

Overview	In this module students will learn about the different types of flow nets and their use in calculation of seepage of groundwater.
Aim	The aim of this module is to equip the student with the tools needed to predicted seepage using flow nets
Learning Outcomes	At the end of this module learners will be able to: • Construct of flow nets • Calculate seepage using flow nets
Units	Unit 2.1: Construction of flow nets Unit 2.2: Calculation of seepage using flow nets
Readings	Chapter 5: Flow Nets (Freeze and J. Cherry, GROUNDWATER, Prentice Hall)
Activity	**Overview**
	Solve homework problems pertaining to construction of flow nets and calculation of seepage using flow nets
Module 3	Mathematics of groundwater
Key Concepts	Equations of groundwater flow
Overview	In this module students will learn to derive the equations of groundwater flow from first principles and the analytical methods to solve them.
Aim	The aim of this module is to provide students with the tools to solve for groundwater flow in complicated systems
Learning Outcomes	At the end of this module learners will be able to: • Derive the groundwater equations • Solve for groundwater flow in complicated systems
Units	Unit 3.1: Derivation of groundwater flow equations Unit 3.2: Solution of groundwater equations

Readings	Chapter 2: Physical properties and principles (Freeze and J. Cherry, GROUNDWATER, Prentice Hall). A compilation of handouts.
Activity	**Overview**
	Homework problems on use of groundwater equations.
Module 4	Well hydraulics and groundwater recharge
Key Concepts	Well hydraulics, groundwater recharge
Overview	In this module students will learn about well hydraulics, pumping tests, pumping data analysis, slug tests, aquifer parameters extraction from pumping data, groundwater recharge
Aim	The aim of this module is to provide students with the knowledge to design for pumping and recharging wells.
Learning Outcomes	At the end of this module students will be able to: • Design pumping and recharge wells • Extract aquifer data from pumping tests
Units	Unit 3.1: Well hydraulics Unit 3.2: Groundwater recharge
Readings	Chapter 8: Groundwater Resource evaluation (Freeze and J. Cherry, GROUNDWATER, Prentice Hall). A compilation of handouts.
Activity	**Overview**

	Solve problems pertaining to well hydraulics and groundwater recharge.
Module 5	Contaminant mass transport
Key Concepts	Contaminant transport, advection, dispersion, biodegradation
Overview	In this module students will learn about contaminant mass transport in porous media including advection, dispersion, and biodegradation. Analysis will be conducted for both the saturated and the unsaturated zones.
Aim	The aim of this module is to equip students with the tools necessary to design solve for contaminant transport in porous media.
Learning Outcomes	At the end of this module learners will be able to do the following: • Solve for contaminant transport in porous media
Units	Unit 5.1: Mass transport in saturated media Unit 5.2: Mass transport in the vadose zone Unit 5.3: Transformation, retardation, and attenuation of contaminants
Readings	Chapter 2: Mass transport in saturated media. Chapter 3: Transformation, Retardation, and attenuation of solutes. Chapter 4: Flow and mass transport in the vadose zone. (C. W. Fetter, Contaminant Hydrogeology, 2nd Edition, Prentice hall).
Activity	**Overview**

	Solve problems on contaminant mass transport in porous media
Module 6	Groundwater modeling principles
Key Concepts	Groundwater flow models, finite difference
Overview	In this module students will learn about groundwater flow modeling incorporating finite difference methods
Aim	The aim of this module is to introduce students to groundwater flow modeling
Learning Outcomes	At the end of this module students will: • Discretise groundwater flow equations • Use finite difference method to model groundwater flow.
Units	Unit 6.1: Discretization of groundwater equations Unit 6.2: Modeling groundwater flow using finite difference methods
Readings	Chapter 1: Introduction. Chapter 2: Finite differences- Steady state flow (Laplace's equation). Chapter 3: Finite differences- Steady state flow (Poisson's equation). Chapter 4. Finite differences- Transient flow. (H. F. Wang and M. P. Anderson, Introduction to Groundwater Modeling, Finite Difference and Finite Element Methods. Academic Press)
Activity	**Overview**
	Solve groundwater flow problems using finite difference schemes
Module 7	**Contemporary issues and case studies**
Key Concepts	Climate change
Overview	This module is a collection of seminar type presentations which will go over the effects of climate change on groundwater hydrology and pollution.
Aim	The aim of this module is to help students understand the impact of climate change on groundwater.

Learning Outcomes	At the end of this module learners will be able to: • anticipate effects of climate change in groundwater design projects
Units	Unit 6.1: Effects of climate change of groundwater hydrology Unit 6.2: Effects of climate change on groundwater pollution
Readings	A compilation of hands-out
Activity	**Overview**
	Individual or group student presentations on effects of climate change on groundwater hydrology and pollution

Course Description/Overview

CIE730/CIE600 Irrigation and Drainage [3-0, 3 cr.] The principles of irrigation and drainage engineering including introduction to irrigation methods, irrigation systems evaluation, soil physical properties, evapotranspiration calculations, water flow measurements, irrigation conveyance and application, pumping, drainage, and soil-water relationships; irrigation and drainage systems design; drainage system design

Course Learning Objectives

Course Content Learning Outcomes

On the successful completion of this course, you will be able to:

1. Learn Importance of Irrigation and how to select the appropriate irrigation method
2. Calculate soil water balances & determine soil physical characteristics
3. Perform closed conduits and open channel flow hydraulic calculations
4. Determine actual and reference evapotranspiration rates and ccalculate crop water requirements
5. Evaluate Soil infiltration rates and Surface Irrigation Systems
6. Design a Sprinkle & Trickle Irrigation System
7. Calculate Spacing across drains for drainage System design

Course Resources

Attendance and Participation:	10%

Course Policies

Structure

	Description
Lecture	Two 75-minute lectures per week

Laboratory	None
Medium	all material explained in class and on the whiteboard
Tests	Two 75 minute exams
Final	120 minutes, comprehensive
H.W.	Assignments
Projects	(1) Design project

Policy

Attendance is obligatory.
Homework is to be submitted according to pre-arranged schedule

Additional Notes

- A student can miss no more than 4 sessions of instruction. By the 5th session, the instructor may ask the student to drop the course.
- Plagiarism: students caught cheating on an exam receive a grade of Zero on the exam in the first cheating attempt and a warning. Students caught cheating for the second time in the same course receive an F grade in the course and a second warning. A grade of zero on an exam resulting from cheating must be counted in the student's course grade. The zero cannot be dropped in computing the final grade in case the instructor has a policy of allowing students to drop their worst exam grade.
- Any student who receives 3 warnings will be suspended

Course Schedule

Week 1	❖ Introduction to Irrigation Methods and Systems
Week 2	❖ Hydrologic Balances
Week 3	❖ Soil and water Relationship
Week 4	❖ Basic Soil Water Physics
Week 5	❖ Measuring Soil Water Content
Week 6	❖ Water Infiltration in Soils
Week 7	❖ Crop Production Factors
Week 8	❖ Evapotranspiration Fundamentals
Week 9	❖ Evapotranspiration Equations
Week 10	❖ Pipeline & Open-Channel Hydraulics
Week 11	❖ Hydraulic Protection of Pipelines
Week 12	❖ Water Use Efficiency
Week 13	❖ Surface Irrigation Operation & Evaluation.

Week 14	❖ Sprinkle & Trickle Irrigation Operation & Evaluation
Week 15	❖ Drainage of Agricultural Lands

Course	*Irrigation and Drainage*
Module 1	Soil Physics
Key Concepts	Soil water content, potential and infiltration
Overview	Understanding soil physics: This module introduces the student to the varying water content in soils as a result of the dynamic water movement in and out of soils. Also, emphasis is stressed on soil water potentials and the resulting influx and out flux of water. Finally, the physics of water infiltration in soils is discussed
Aim	The aim of this module is to make students understand the physical properties of soils
Learning Outcomes	At the end of this module learners will be able to: • Calculate soil water content • Calculate soil water potential

	• Determine the temporal changes in infiltration
Units	Unit 1.1 Soil Overview Unit 1.2: Soil water contents Unit 1.3: Soil water potentials Unit 1.4: Water infiltration Unit 1.5: soil Chemistry
Readings	Material Provided in class
Activity	**Overview** Assignment 1.1: Solving soil water content problems Assignment 1.2: Solving soil water potential problems Assignment 1.3: Solving soil water infiltration problems
Module 2	Evapotranspiration (ET)
Key Concepts	Evaporation, Transpiration and Evapotranspiration Concepts
Overview	This module introduces the concept of ET, and the different equations used to predict ET in different regions and climatic conditions
Aim	To be familiar with ET equations and calculation
Learning Outcomes	• At the end of this module learners will be able to: • Understand the different ET equations • Be able to choose the right ET equation based on conditions • Calculate ET
Units	Unit 2.1: Get familiar with ET concepts Unit 2.2: Discuss the Penmann Monteith ET equation Unit 2.3: Discuss the FAO Heargreaves ET equation Unit 2.4: Calculate ET of different crops
Readings	Material Provided in class
Activity	**Overview**

	Assignment 2.1: Solar radiation calculation Assignment 2.2: Reference ET calculations Assignment 2.3: Crop ET calculation
Module 3	Irrigation System Design
Key Concepts	Hydraulics of closed systems
Overview	This module introduces closed/pressurized irrigation systems explaining the hydraulics of it. It will explain how to select and design a closed irrigation system
Aim	This module aims at designing a sprinkle or trickle irrigation system
Learning Outcomes	At the end of this module learners will be able to: • Select the right system • Design the operation of the selected system
Units	Unit 3.1: Sprinkle system design *Unit 3.2: Trickle System design*
Readings	Material Provided in class
Activity	**Overview**
	Assignment 3.1: Irrigation System Design Project
Module 4	Introduction to Surface Irrigation and Drainage
Key Concepts	Introducing: - Surface irrigation systems - Drainage systems
Overview	Define the principles of selection of surface irrigation systems and drainage systems
Aim	To introduce the different types of surface irrigation systems and overview of drainage systems
Learning	At the end of this module learners will be able to:

Outcomes	• Preliminary design a surface irrigation system • Preliminary design a drainage system
Units	Unit 3.1: Surface irrigation systems Unit 3.2: Drainage systems
Readings	Material Provided in class
Activity	**Overview**
	Assignment 4.1: Research and Presentations on different surface irrigation and drainage systems

Course Description/Overview

CIE788 GIS and Remote Sensing [3-0, 3 cr.] This course covers the fundamentals of sensing earth resources, data acquisition and sis, aircraft and satellite images, digital image processing, pattern recognition, feature extraction, and the geographic information systems in various applications, using GIS software including ARC-INFO and ARC-VIEW.

Course Learning Objectives

Course Content Learning Outcomes

The major objectives of this course are to introduce students to the technology of GIS, GPS and remote sensing. By the end of the course, the student will understand the multiple benefits and usage of such technology, will know how to create and manipulate spatial data, will know how to work with different coordinate systems, will know how to use and operate GPS equipment and will know how to read and extract information from satellite images.

Course Schedule

Topic	
Week 1	Introduction and Geographic Information Systems
Week 2	Fundamentals of GIS
Week 3	Data Manipulation, and display
Week 4	Queries; Tabular and Spatial
Week 5	Queries; Tabular and Spatial (continued)
Week 6	Geoprocessing and Buffers

Week 7	Geoprocessing and Buffers (continued)
Week 8	Map Layout
Week 9	Digitizing Process
Week 10	Digitizing Process (continued)
Week 11	GPS: Fundamentals of Projections
Week 12	GPS: Introduction to GPS
Week 13	Fundamentals of Remote Sensing
Week 14	Introduction to Remote Sensing data manipulation
Week 15	Applications in Remote Sensing

Course	***Fundamentals of GIS and Remote Sensing***
Module 1	Fundamentals of GIS

Key Concepts	GIS definition, concepts and technology
Overview	Understanding GIS: Many times GIS understanding is limited to the concept of car navigation software. This module will detail the concepts of GIS and enumerate many applications in which GIS is becoming a key analytical factor in different disciplines including engineering, environmental sciences, business and climatology.
Aim	The aim of this module is to make students understand the benefits of GIS and its applications in their professional life
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different types of GIS applications • Discuss how GIS technology can contribute to better problem analysis
Units	Unit 1.1 Introduce GIS concept Unit 1.2: Overview of GIS applications is different disciplines Unit 1.3: Introduce GIS components (software and data)
Readings	Principles of Geographic Information Systems; An Introductory Textbook Otto Huisman and Rolf A.De By Ch.1
Activity	**Overview** Assignment 1.1: Research on GIS applications in different fields 1. In Engineering 2. In Environmental Sciences 3. In Climatology 4. In Business Assignment 1.2: Hands on online GIS applications 1. Get Familiar with Google Earth, bing maps. Experience map navigation, and search 2. Overview of ArcGIS online system
Module 2	Introducing ArcGIS

Key Concepts	Navigation, Query, Layouts, and Editing data in ArcGIS
Overview	This module introduces ArcGIS software functionalities and how we can handle and manipulate data. Tasks involved in this module include geographic data loading, navigation, query, database analysis, data filters, data layouts and data editing
Aim	To be familiar with ArcGIS software and how to manipulate data in such environment.
Learning Outcomes	• At the end of this module learners will be able to: • Open, search and analyse Geo data sets • Create map layouts • Create new geo data sets
Units	Unit 2.1: Get familiar with loading and navigating through Geographic data Unit 2.2: Query and filter geographic data based on attributes and geography Unit 2.3: Create map templates and maps from geographic data Unit 2.4: Create new geographic data sets
Readings	Principles of Geographic Information Systems; An Introductory Textbook Otto Huisman and Rolf A.De By Ch.2 Help of ArcGIS software
Activity	**Overview**
	Assignment 2.1: Upload geo-data sets to Arc GIS Assignment 2.2: Query information in the attribute tables of the Geo data sets Assignment 2.3: Query information geographically in the Geo data sets Assignment 2.4: Classify and display data based on pre-set criteria Assignment 2.5: Create maps of classified data with legends

	Assignment 2.6: Create new geo-data sets from survey data or scanned maps
Module 3	Introducing Global Positionning Systems
Key Concepts	Understand and Operate GPS units
Overview	This module introduces GPS and explains in details how GPS data acquisition occurs. Such understanding will help users know the capabilities and limitations of GPS for better usage
Aim	This module aims at creating better GPS users and surveyors
Learning Outcomes	At the end of this module learners will be able to: • Understand how GPS functions • How to by-pass limitations to improve accuracy
Units	Unit 3.1: Theory and concepts of GPS *Unit 3.2: Errors in GPS* Unit 3.3: *Correcting Errors in GPS*
Readings	GPS Guide for beginners Garmin
Activity	**Overview**
	Assignment 3.1: Learn how to get readings using GPS units Assignment 3.2: Learn how to collect data using GPS units
Module 4	Introduction to Remote Sensing Principles
Key Concepts	Learn how aerial and satellite images can be an important tool of data collection and surveying
Overview	Define the concepts behind Electromagnetic Radiation (EMR) and how remote sensing instruments capture information using it
Aim	To introduce the newest trend in data capture in a timely manner all across the globe
Learning Outcomes	At the end of this module learners will be able to: • Understand better the EMR principles • Know theoretically how to extract information from EMR imagery

Units	Unit 3.1: Definition of Remote Sensing Unit 3.2: Principles of EMR Unit 3.3: Remote Sensing instrument specifications
Readings	Extracts from Remote Sensing Books and articles
Activity	**Overview**
	Assignment 4.1: Get first-hand experience of reading information from satellite images

APENDIX I: The CLIMASP Course Syllabus Template Example

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Course Number:ECO311

Development Economics Lebanese American University, Faculty of Economics, Department of Economics

Fall Semester, 2014

Instructor Information

Instructor: Dr. Amjad Toukan

Office Location: Business Building 1516
Telephone: Office +961 1 786456
Office Hours: T-R: 9AM – 12PM
E-mail: amjad.toukan@lau.edu.lb
Website: WWW.LAU.EDU.LB

Course Identification

Course Number: ECO 311
Course Name: Development Economics
Course Location: University Campus
Class Times: N/A
Prerequisites: N/A

Faculty Web Page: WWW.LAU.EDU.LB

Course Description/Overview

The eradication of poverty is the main objective of economic development. After reviewing the concepts of poverty and development from the standpoint of economic growth and institutions, the course will focus on the limitations of this approach, and will highlight what is needed in order to get a better picture of economic development theories for the eradication of poverty.

Course Learning Objectives

Course Content Learning Outcomes

Course Resources

Course Website(s)

Required Course Texts and Materials

Required: Development Economics (1998), by Debraj Ray, Princeton University Press. (DR). A lot of the material covered in the course will be from articles.

Optional Course Texts and Materials

Michael Todaro & Stephen Smith; Economic Development (eleventh edition, 2011).

Assignments and Grading Scheme

Grading System

Grading Scale: *The official grading scale for LAU is as follows:-*

≥ 90	A
87-89	A-
83-86	B+
80-82	B

77-79	B-
73-76	C+
70-72	C
67-69	C-
63-66	D+
60-62	D
< 59	F

Grading Policy

The course grade is calculated according to the following:

Exams I, II (25% on each) **Exam I will take place on October 28th, Exam II on December 2nd.**	50%
Final Exam (The final exam is comprehensive)	30%
Term Paper (Due at the end of the semester and details will be discussed in class)	10%
Attendance & Participation	10%
Total Points	**100**

Course Policies.

Attendance Policy: Attendance is required and checked regularly. Class participation is encouraged and rewarded. Students who miss more than the equivalent of 2 weeks of instructions (6 MWF or 4 TTh sessions or 3 Summer sessions), will lose the 5% attendance and participation grade.

According to LAU regulations, in any semester, students who miss an equivalent of 5 weeks of instructions (15 MWF or 10 TTh sessions or 8 Summer sessions) in any course for whatever reason, **will be advised to withdraw or will receive an F**.

Cheating Policy: Ethical behavior and professional manners are expected in class and during exams, in accordance with the university Student Code of Conduct. Any alleged violation of the Student Code of Conduct will be reported to the Director of Guidance or to the Dean of Students. Cell phones have to be switched off and not visible at all time during classes and exams. The minimum penalty for cases of cheating will be failing the course.

Makeup work: Requests for approval of a make-up exam should be made **in advance** of the specified date of the exam. The requests will be approved for medical situations only if the appropriate medical excuse presented to the guidance office is deemed valid **by the instructor**.

Regular attendance and participation is crucial to your success. Reading the assigned chapters/papers before class will greatly assist your understanding of the lecture. After the lecture, you are advised to study your notes and write down your questions to be clarified during my office hours.

Important Dates to Remember

Topics covered and course schedule

Deadline for withdrawal from the course with a "W" grade Oct. 22, 2014

Last day of classes: Dec. 23, 2014

Deadline for withdrawal from the course with a "WP" or "WF" grade: Nov. 25, 2014

APENDIX II: The CLIMASP Course Modules Template Example

Course	Curriculum and Hypermedia
Module 1	**The Big Picture**
Key Concepts	What is development economics?
Overview	Income and growth Historical experience Measurement issues Income distribution in developing countries The many faces of underdevelopment Human development An index of human development Per capita income and human development Some structural features Demographic characteristics Occupational and production structure Rapid rural--urban migration International trade
Aim	
Learning Outcomes	
Units	N/A
Readings	*DR, Chapters 1 and 2: Introduction, and Economic Development: An Overview.

	*The World Bank, *World Development Report*. Sen, Amartya (1988), "The Concept of Development", in H. Chenery and T. N. Srinivasan (eds.), *Handbook of Development Economics*. Sen, Amartya (1993), "Development: Which Way Now?" *The Economic Journal*, 93, (December).
Activity	
Module 2	**Growth**
Key Concepts	Modern economic growth: Basic features
Overview	Theories of economic growth The Harrod--Domar model Beyond Harrod--Domar: Other considerations The Solow model Technical progress Convergence? Unconditional convergence Level convergence: Evidence or lack thereof Unconditional convergence: A summation Conditional convergence The New Growth Theories

	Human capital and growth Another look at conditional convergence
Aim	
Learning Outcomes	
Units	N/A
Readings	
Activity	**Overview**

Course Description/Overview

ECO 320 Environmental, Resource, and Energy Economics [3-0, 3 cr]

This course introduces students to the basics of environmental and natural resource economics and the fundamentals of environmental policymaking. The first part of the course will discuss environmental pollution and policy solutions, the second part will discuss natural resource exploitation, sustainability and keys issues in energy economics. The course also highlights scientific facts that shape environmental policy debates.

Course Learning Objectives

Course Content Learning Outcomes

At the conclusion of this course, each student will be able to do the following:

1. To apply rational and critical economic thinking to environmental and natural resource problems.
2. Apply economic tools to analyze environmental policy questions and mechanisms.
3. Describe the set of policy options and instruments to overcome market failures in environmental contexts and discuss their impact.
4. Understand the concept of sustainability and its applications in this economy and in policymaking.

Course Resources

Course Website(s)

Required Course Texts and Materials

Environmental Economics and Management: Theory, Policy and Applications, 6th Edition, 2013. By Thomas, J.M. and S.J. Callan. (Main text)

AND

Hand-outs from Natural Resource and Environmental Economics, 4th Edition, 2011. By Perman, Ma, Common, Maddison, and McGilvray. (Secondary text)

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

Grading Policy

Evaluation of the student's final grade in the course will be based on his/her performance throughout the course and will be a combination of the following:

Item	Percentage
Attendance and participation	5%
Exam 1	30%
Exam 2	30%
Comprehensive Final Exam	35%

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

Course Policies

Structure

	Description
Lecture	Three 50-minute or two 75-minute lectures per week
Laboratory	None
Medium	All material explained in class and on the whiteboard
Tests	2 Exams-60 minutes - closed book
Final	120 minutes, comprehensive, closed book

Policy

Class Attendance	Attendance is required and checked regularly. Class participation is encouraged and rewarded. Students who miss more than the equivalent of 2 weeks of instructions (6 MWF or 4 TTh sessions or 3 Summer sessions), will lose the 5% attendance and participation grade. According to LAU regulations, in any semester, students who miss an equivalent of 5 weeks of instructions (15 MWF or 10 TTh sessions or 8 Summer sessions) in any course for whatever reason, will be advised to withdraw or will receive an F. Students are held responsible for all the material presented in the classroom, even during their absence.
Academic Integrity	The instructor will adhere to all LAU policies regarding academic integrity as statedhttp://www.lau.edu/policies.
Exam Policy	No make-up exam will be administrated; a student who misses an exam will have to provide a valid excuse within a week of the specified date of the exam. With a valid excuse, your final exam grade will be re-weighted
Cheating	Students are expected to conduct themselves in accordance with the highest standards of academic honesty. Academic misconduct for which a student is subject to penalty includes all forms of cheating, forgery, or plagiarism. Plagiarism is defined as the use of someone else's ideas, words, or work, as if it were one's own, without clearly acknowledging the source of that information. Any student found cheating in an exam, fabricating, falsifying, or using any other form of academic dishonesty in the preparation of a paper or a project, shall receive a zero on that exam, project or paper and will be issued a Disciplinary Warning. A student found plagiarizing or cheating for a second time shall receive an F grade for the course, as well as a second Disciplinary Warning. Refer to the policy on academic dishonesty on LAU's website

	http://www.lau.edu.lb/academics/arp/g/rules_procedures.php .

Course Schedule*

Topic	
	Module 1: Modeling Environmental Problems Over the past decades, environmental pollution problems have taken on a more significant and visible role. Businesses, households and governments are changing their behaviour in order to respond to the growing environmental challenges. To understand these changes, it is necessary to figure out how markets work and the relationship between the economy and nature. This module introduces economic analysis models to explain the strategic decision making of all stakeholders and economic conditions that define the marketplace and how it relates to pollution problems.
1	The Role of Economics in Environmental Management (chap 1, main text)
2	The Market Process (chap 2, main text)
3	Market Failure (chap 3, main text)
4	The Command and Control Approach (chap 4, main text)
5	The Market Approach (chap 5, main text)
	Learning outcomes: 1. To apply rational and critical economic thinking to environmental problems. 2. Describe the set of policy options and instruments to overcome market failures in environmental contexts and discuss their impact.

	Assessment: Exam 1
	Module 2: Environmental Management and sustainability From a technical perspective, there has always been some form of airborne and solid waste pollution. Yet such problems did not begin to be pervasive problem until the Industrial Revolution. Moreover, concerns over sustainability and the potential trade-offs between growth and the environment are rather recent. This module provides a multistep approach to learning about global air quality problems, namely climate change. The module also discusses the main challenges in international environmental governance. In addition, the module looks into practical applications of the sustainability concept at the municipal and industrial levels.
6	Global Air Quality: The cases of Climate Change and Ozone Depletion (chap 13, main text)
7	Managing Municipal Solid Waste (Chap 18, main text)
8	International Environmental Agreements and International Trade (chap 20, main text)
9	Industrial Ecology and Pollution Prevention (chap 21, main text)
	Learning outcomes: 1. Apply economic tools to analyze environmental policy questions and mechanisms. 2. Understand the concept of sustainability and its applications in this economy and in policymaking. Assessment: Exam 2
	Module 3: Natural resource exploitation The optimal use of natural resources is an important aspect of sustainable growth and ultimately development in any economy. This module explores questions relating to the efficient and optimal use of environmental resources over time. The module

	will present a treatment of stock dynamics of both renewable and non-renewable resources and will explore various policy instruments aimed at conservation or preservation.
10	The efficient and optimal use of natural resources (chap 14, secondary text)
11	The theory of optimal resource extraction: non-renewable resources (chap 15, secondary text)
12	Renewable resources (chap 17, secondary text)
	Learning outcomes: 1. Apply economic tools to analyse natural resource problems. 2. Understand the applications of the optimum principle in renewable and non-renewable resource management and the linkages with sustainability. Assessment: Final Exam
	Module 4: Energy and sustainability The linkages between energy uses and sustainability provide an important window into the economy-ecology system. This module briefly explores the main challenges in energy policy faced by governments today. The module then draws conclusions on the relationship between energy use patterns and sustainability.
13	Energy poverty, energy subsidies, energy intensities, and electricity sources and uses (hand-outs)
	Learning outcomes: 1. Apply economic tools to analyse energy problems. 2. Identify the linkages between energy use patterns and sustainability. Assessment: Final Exam

*subject to minor modifications

Course Description/Overview

This course provides an introduction to the interdisciplinary field of sustainable development, drawing on the most recent developments in social and physical sciences. The course describes the interactions between physical ecology and economic development, and it stresses the ways in which they impact each other. Ecological constraints (climate, disease ecology, physical resources such as soils and energy sources, topography and transport conditions) significantly shape the patterns of economic development, demography, and wealth and poverty. At the same time, anthropogenic activities (farming, resource depletion, demographic stresses, and energy use) change the physical environment. The course offers a rigorous treatment of the field and aims to provide students with an understanding of economic development and its relation to nature's processes.

Sachs, Jeffrey D. Common Wealth. Penguin, 2008.

Supplementary Reading

Angus Maddison, The World Economy
Introduction, Summary, and Chapters 1-3 (pp. 17-167)

Easterlin, "The Worldwide Standard of Living Since 1800," *The Journal of Economic Perspectives*, Vol. 14, No. 1, Winter 2000.

Pritchett, "Divergence Big Time," *The Journal of Economic Perspectives*, Vol. 11, No. 3, Summer 1997.

Easterlin, Richard, "Why Isn't the Whole World Developed?" *The Journal of Economic History*, Vol. 41, No. 1, March 1981.

Grading Policy

Evaluation of the student's final grade in the course will be based on his/her performance throughout the course and will be a combination of the following:

Item	Percentage
Term Paper (final report 15%, oral presentation 5%)	20%
Test 1	20%
Test 2	20%
Comprehensive Final Exam	40%

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

Course Policies

Structure

	Description
Lecture	Two 75-minute lectures per week
Laboratory	None
Medium	All material explained in class and on the whiteboard
Tests	2 Tests-75 minutes - closed book
Final	120 minutes, comprehensive, closed book
Term Paper	Final report to be submitted, followed by a Class oral presentation.

Policy

Class	You are expected to attend all classes and arrive on time. Obtain prior

Attendance	clearance for planned absences.
Academic Integrity	The instructor will adhere to all LAU policies regarding academic integrity as statedhttp://www.lau.edu/policies.
Assignment Policy	Assignments must be typed and must be turned in at the beginning of class on the day it is due, with no exceptions.
Exam Policy	No make-up for a test or a final will be given under any circumstance. In case of absence, the grade of the exam will be considered to be zero.
Cheating	Students caught cheating on an exam receive a grade of zero on the exam.

Course Schedule

Week	Topic
1, 2	**Sustainable Development:** We will look at what "sustainable" and "development" mean in the context of sustainable development. We will also look at the historic trends of the two factors which together explain humankind's pressure on Earth's ecosystem: human economic activity, and the human population.
3, 4	**Economic Growth:** We will study the AK model of economic growth, and its implications for convergence across countries. We also look at structural changes along the development path: the relative importance of agriculture, and how urbanization patterns change. In addition, we will look at relaxing some assumptions of economic growth models and look at the possibility of poverty traps.
5	**Public versus Private Goods** When do markets work, and when don't they work? What are externalities and

	how do they relate to price signals?
6	**Sustainability of Resources** Renewable resources (fisheries, forests, etc.) can be driven to depletion if not managed properly. What are the problems with open access? Is privatization the answer, or perhaps community management? Can corrective taxation be useful? What about nonrenewable resources? We will look at an important non-renewable resource: fossil fuels.
7, 8	**Climate Change** Readings to be discussed: Wally Broecker, "A Business Executive's Guide to Global Warming." James Hansen. "Can we defuse the global warming time bomb?" *Scientific American*, March 2004. Stern Review: The Economics of Climate Change (Executive Summary) Lackner, Klaus and Jeffrey D. Sachs, "A Robust Strategy for Sustainable Energy," *Brookings Papers on* *Economic Activity*, Issue 2, 2005.
9	**The Role of Scientific Research in Sustainable Development** Nelson, Richard R. "Basic Scientific Research" in The Limits of Market Organization. Richard Nelson, ed. Russell Sage Foundation: New York, 2005.
10, 11	**The Challenge of Health for All** Readings to be discussed: WHO Commission on Macroeconomics and Health, Macroeconomics and Health: Investing in Health for Economic Development, 2001. Barry Bloom, "Public Health in Transition," *Scientific American*, Vol. 293, No. 3, September 2005. Laurie Garrett, "The Next Pandemic?" *Foreign Affairs*, Vol. 84, Issue 4, July-August 2005.

12	**The Challenge of Biodiversity** Millennium Ecosystem Assessment. Ecosystems and Human Well Being: Synthesis. 2005. Class Times: N/A
Prerequisites: N/A

Faculty Web Page: WWW.LAU.EDU.LB

Course Description/Overview

The aim of the course is to review the history of curriculum development, analyse current curricular issues and develop a comprehensive curriculum based on climate change. The course introduces students to elements of curriculum theory and practice, in classical and contemporary approaches. It emphasizes the main issues related to curriculum design and models as reflected by research and the analysis of current curricular issues. Students are expected to reflect on ways various curriculum orientations may resolve modern issues or problems. They will evaluate curricula in terms of structural elements, tools, and assumptions regarding subject matter and learning. They are expected to design a comprehensive curriculum that incorporates the changes in the climate and the importance of educating youth accordingly.

Course Learning Objectives

Course Content Learning Outcomes

By the end of the course, students are expected to:

1. Discuss events related to the historical evolution of curriculum
2. Define terms associated with curriculum such as needs assessment, design, development, scope, sequence, articulation, integration, inclusion, etc.
3. Compare curriculum designs in terms of their characteristic features, strengths, and weaknesses
4. Distinguish among examples and characteristics of curriculum aims, goals, and objectives
5. Describe means of selecting and organizing content for curriculum
6. Discuss how societal/cultural influences play a role on curriculum development
7. Cite characteristics associated with comprehensive curriculum evaluation
8. Cooperate with colleagues in designing a concept-based curriculum which incorporates climate change and sustainability

Assignments and Grading Scheme

Grading System

Grading Scale: *The official grading scale for LAU is as follows:-*

≥ 90	A
87-89	A-
83-86	B+
80-82	B
77-79	B-
73-76	C+
70-72	C
67-69	C-
63-66	D+
60-62	D
≤ 59	F

Grading Policy

The course grade is calculated according to the following:

Project 1	15
Project 2	15
Project 3	15
Project 4	20
Project 5	15

Course Policies.

N/A

APENDIX II: The CLIMASP Course Modules Template Example

Course	Curriculum Design
Module 1	Curriculum Instruction
Key Concepts	Definitions of curriculum and curriculum instruction
Overview	The various curriculum approaches will be discussed at length. Some of the approaches are the following: Behavioural, Managerial, Systems, Academic, Humanistic, and Reconceptualists. A thorough discussion of the various approaches will be conducted with the focus on the incorporation of climate change and sustainability in each approach.
Aim	Introduce curriculum and instruction and the various approaches.
Learning Outcomes	At the end of this module learners will be able to: • Recognize the various approaches to curriculum design • Distinguish among examples and characteristics of curriculum aims, goals, and objectives

	• Distinguish the various levels of curriculum
Units	Levels of curriculum, relationship between curriculum and instruction, curriculum products and processes and curriculum approaches.
Readings	Reading assignments will be made available on blackboard.
Activity	**Project 1** Report on Curriculum Giants (group presentations; individual written reports)
	Acquaint yourself with the philosophers who shaped what you do/will do for a living and to understand why it is important to study curriculum development and design. Select one of the leaders in the curriculum field to research and produce a two-page hand-out presenting information about this person and his/her major contribution to research and practice in school curriculum. Prepare a five minute presentation stating which curricular approach s/he favours. This should be written up and uploaded on blackboard. (APA Style) with complete references o Ralph Tyler o William H. Kilpatrick o Herbert Spencer o Hollis Caswell o Jerome Bruner o Franklin Bobbitt o Carl Glickman o Lawrence Stenhouse o Linda Darling-Hammond o David Pratt o John Goodlad o John Dewey
Module 2	Society and Culture

Key Concepts	Bases of curriculum
Overview	This module will cover the various aspects of curriculum organization which is based on the purposes of education, i.e., the subject matter, the needs of society and culture, and the needs and interests of learners. Most examples will be on the incorporation of climate change and sustainability as one of the main topics in the curriculum.
Aim	Recognize the various aspects of curriculum organization by giving examples on climate change.
Learning Outcomes	At the end of this module learners will be able to: • Define terms associated with curriculum such as needs assessment, design, development, scope, sequence, articulation, integration, inclusion, etc. • Compare curriculum designs in terms of their characteristic features, strengths, and weaknesses. • Distinguish among examples of characteristics of curriculum aims, goals, and objectives.
Units	Culture and the curriculum, curriculum organization, society and culture
Readings	Reading assignments will be made available on blackboard.
Activity	**Project**
	Choose one of the following topics. Research it well and present it in class. Your presentation should not exceed 5 minutes. Submit a 2000-word written report (APA Style) Green School Curriculum Student-Centred Curriculum Environment and the Curriculum Climate Change and Curriculum

	Curriculum and Community involvement Extracurricular Activities in Schools Curriculum and Global Warming
Module 3	Knowledge and Subject-Matter
Key Concepts	Knowledge related to school curricula
Overview	This module will review the conceptions of knowledge keeping in mind that knowledge requires active participation by the knower and thus the importance of including the most urgent issues such as climate change in the curriculum to inform the learners.
Aim	Communicate the importance of knowledge to inform learners.
Learning Outcomes	At the end of this module learners will be able to: • Distinguish among examples of characteristics of curriculum aims, goals, and objectives. • Describe means of selecting and organizing content for curriculum.
Units	Conceptions of knowledge, cognitive learning, affective attitude, psychomotor learning, application of knowledge and subject-matter studies
Readings	Reading assignments will be made available on blackboard.
Activity	**Project** Curriculum Issues Synthesis
	This assignment aims at a first initiation in writing academic reports and reflecting on research. It also aims at enhancing your habits of library search, acquainting you with the main present curriculum issues, and developing your ability to report on readings. Select debatable curriculum issues such as the hidden curriculum, curriculum

	and the environment issues, and freer curriculum. Search for readings about the selected issues (five articles in refereed journals or chapters in books that are recognized in the field). The paper will consist of the following: o An introduction (in your words) (10 lines) o Setting the stage for the issue (one page maximum) o A summary (10 lines) and a critique (1 page) (each article) o A synthesis including reflection on the issue and its impact on curriculum development (3 to 4 pages) o Reference page (APA style) o Copies of all articles
Module 4	Society and Learners
Key Concepts	Society, learners and culture
Overview	This module gives a general overview of the various cultural issues that should be incorporated in the curriculum within the fast economic and technological changes that are happening in the world; issues like family, society, relationships, the effect of climate change, and global warming will be discussed at length.
Aim	Recognize the importance of the society and the learners and their influence on curriculum design.
Learning Outcomes	At the end of this module learners will be able to: • Discuss how societal/cultural influences play a role on curriculum development.
Units	Curriculum and community, Family, society and relationships, purposes of education and content selection, nurture, nature and interaction
Readings	Reading assignments will be made available on blackboard.

Activity	**Project** Position Paper
	Present your own argument on the following topic: Climate Change and Sustainability should be incorporated in the K to 12 Curriculum Your position paper should be around 3000 words, APA Style, with a minimum of twenty references.
Module 5	Creativity and Curriculum Development
Key Concepts	Creativity, curriculum development
Overview	The preparation of learning experiences and assessment is the culmination of a curriculum project. In this module, learners will be required to develop their own creative curriculum whereby the issues of green curriculum, climate change and sustainability, the environment and global warming are incorporated.
Aim	Create own curriculum
Learning Outcomes	At the end of this module learners will be able to: • Cite characteristics associated with comprehensive curriculum evaluation • Cooperate with colleagues in designing a concept-based curriculum which incorporates climate change and sustainability
Readings	Reading assignments will be made available on blackboard.
Activity	**Project** Curriculum Development (group presentations; individual written reports)
	Assume you are the leader of a project team developing a new K to 12 curriculum which emphasizes climate change and sustainability. Develop a master learning schedule that would show a timeline and the key steps that

	you and your team would take. Present your project to the class (7 minute presentation). Write an individual reflective critical report (1500 words; APA style) on the project.

Course Name: Environmental Impact Assessment
Course Location: Zakhem 402 - Byblos Campus
Class Times: TR 4:00 – 5:15 PM
Prerequisites: None
Faculty Web Page:

Course Description/Overview

This course explores the study and evaluation of the impacts of large scale projects on the environment taking into account environmental laws and regulations and EIA guidelines, the identification of impacts, mitigation measures, and monitoring plans. Case study involving the preparation of an EIA Report is included.

Course Learning Objectives

The aim of this course is to introduce the environmental impact assessment (EIA) process, its elements, requirements and processes. The course will explore how to assess environmental potential impacts, identify respective mitigation measures, and develop an environmental management plan.

Course Content Learning Outcomes

At the conclusion of this course, each student will be able to do the following:

1- Evaluate the impacts of projects on the environment
2- Identify environmental laws related to EIA
3- Propose mitigation measures and environmental management

4- Take part of preparing an EIA report.

Course Resources

Course Website(s)

Selected readings from:
Eccleston, C. Environmental Impact Assessment: A Guide to Best Professional Practices. Boca Raton: CRC Press, 2011.
Pain, S.W. Safety, Health, And Environmental Auditing :A Practical Guide. Boca Raton: Taylor & Francis, 2010.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

Grading Policy

Evaluation of the student's final grade in the course will be based on his/her performance throughout the course and will be a combination of the following:

Item	Percentage
Term Paper (final report 25%, oral presentation 5%)	30%
Test 1	15%
Test 2	15%
Comprehensive Final Exam	40%

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

Course Policies

Structure

Lecture	Two 75-minute lectures per week
Laboratory	None
Medium	All material explained in class and on the whiteboard
Tests	2 Tests-75 minutes - closed book
Final	120 minutes, comprehensive, closed book
Term Paper	Final report to be submitted, followed by a Class oral presentation.

Policy

Attendance

You are expected to attend all classes and arrive on time. Obtain prior clearance for planned absences.

Academic Integrity

The instructor will adhere to all LAU policies regarding academic integrity as stated http://www.lau.edu/policies.

Homework Policy

Assignments must be typed and must be turned in at the beginning of class on the day it is due, with no exceptions.

Exam Policy

No make-up for a test or a final will be given under any circumstance. In case of absence, the grade of the exam will be considered to be zero.

Cheating

Students caught cheating on an exam receive a grade of zero on the exam.

Course Schedule

Topic	Description
1	Background on environmental impact assessment
2	Law, policy, and institutional agreements
3	Public involvement
4	Screening
5	Scoping
6	Impact analysis
7	Mitigation and impact measurement
8	EIA reporting
9	Monitoring plan
10	Implementation and follow up
11	Case studies
12	Sustainability Impact Assessment
13	Strategic Environmental Assessment

APENDIX II: The CLIMASP Course Modules Template Example

Course	Environmental Impact Assessment
Module 1	**Legal and Administrative Laws**
Key Concepts	Initial environmental examination, environmental scoping, environmental impact assessment study, public hearing, analysis of alternatives, and environmental management plan.
Overview	In this module, we will explore the local laws and decrees governing the preparation of an EIA study, specifically the Lebanese Ministry of Environment Decree No. 8633. Which projects, actions or plans must undergo an EIA study? Which projects, actions or plans must undergo an initial environmental examination IIEE)? What are the main differences between an EIA study and an IEE study? What is the definition of an environmentally sensitive area? What is the definition of an environmentally sensitive receptor? What are the main requirements of an EIA study or an IEE study? We will define stakeholders and discuss the role of public hearing in the EIA process. We will address the objective of an environmental management plan (EMP) and the roles and responsibilities of various stakeholders. Also, will discuss the criteria for assessment of alternatives to a given project, action or plan. Furthermore, we will explore the main laws, decrees and conventions that might be applicable when conducting an EIA study.
Aim	The main objective of this module is to introduce the concept of environmental impact assessment, the main elements of an EIA study, the objective of such study and the laws governing EIA study preparation.
Learning Outcomes	The student shall be able to: • Identify the main requirements of Decree No. 8633

	• Determine whether an IEE or an EIA is needed for a given action.
Units	1.1 – EIA Decree 8633 1.2 – EIA Decree 8633 Annexes
Readings	*http://www.moe.gov.lb/The-Ministry/Laws-Regulations/Decrees.aspx*
Activity	Assignments: • Determine whether an IEE or an EIA is needed for a given action. • Identify environmentally sensitive areas receptors.
Module 2	**EIA Study**
Key Concepts	Environmental scoping document, public hearing, environmental baseline conditions, environmental impacts and mitigation measures, assessment of alternatives and environmental management plan.
Overview	This module will focus on how to conduct a comprehensive EIA study. We will investigate the various legal and administrative laws that may be applicable to a given project. Then, we will initiate the preparation of the environmental scoping document, which precedes the preparation of the EIA. Throughout the preparation of the environmental scoping document, we shall explore the main parameters involved in delineating the potential area of impact. In order to do so, we have to describe or quantify the baseline environmental conditions. This exercise will include biological elements (flora, fauna), climate, noise, air quality, water resources, topography, geology, waste management, cultural and historical value, visual amenity, and socio-economic conditions, etc. To each element described in the baseline environmental and socio-economic conditions, we will assess the magnitude of impacts and the methodology used for this assessment. Furthermore, we will address how to conduct a public hearing and to incorporate its results in the scoping document. The EIA study will complete the scoping document in addressing the significant environmental and socio-economic impacts. In the EIA study, mitigation measures will be provided to address these impacts. It is often that a resettlement action plan has to be prepared to mitigate socio-economic impacts. An assessment of alternatives has to be prepared in order to evaluate the impact these alternatives on the environment and costs. Finally, we will discuss the importance of preparing an

	environmental management and monitoring plan.
Aim	The main objective of this module is to breakdown the concept of environmental impact assessment study.
Learning Outcomes	The student shall be able to: • Identify applicable environmental laws and regulations. • Describe environmental and socio-economic baseline conditions • Evaluate the environmental and socio-economic impacts and prepare respective mitigation measures. • Understand the role of public hearing. • Conduct an assessment of alternatives. • Prepare an environmental management and monitoring plan.
Units	2.1 – Environmental Screening 2.2 – Environmental Scoping 2.3 – Categorization of Impacts 2.4 – Mitigation and Impact Measurement
Readings	http://elibrary.worldbank.org/doi/book/10.1596/0-8213-1844-6 Selected readings from: *Eccleston, C. Environmental Impact Assessment: A Guide to Best Professional Practices. Boca Raton: CRC Press, 2011.* *Pain, S.W. Safety, Health, And Environmental Auditing: A Practical Guide. Boca Raton: Taylor & Francis, 2010.* *Morris, P. and Therivel, R. Methods of Environmental Impact Assessment. Spon Press: London, 2001.*
Activity	Assignment: • Provide a critique for one or two case studies on environmental and social impact assessment. Potential projects include large-scale water dam, international golf course, photovoltaic power plants, etc. Project: • A group of three students will prepare a complete EIA report for a given project, program or action. The students have to select a project or program in Lebanon, contact the relevant municipalities or ministries,

	prepare a comprehensive environmental baseline assessment, study the impacts, propose mitigations, assess alternatives and prepare a comprehensive environmental management and monitoring plan. Each group will conduct an oral presentation of their work in class.
Module 3	**Sustainability Impact Assessment and Climate Change**
Key Concepts	Sustainability impact assessment (SIA), environmental management, strategic environmental assessment (SEA), environmental impact assessment, and air pollution control.
Overview	In this module, we will introduce sustainability impact assessment (SIA) and discuss the relationship the environmental management of large-scale projects, programs and action plans and climate change. We look at SIA, EIA and SEA as tools that address the control of impacts with respect to governing local, national and international laws, regulations and guidelines, including the latest regulations governing the degradation of air quality leading to climate change. Furthermore, we will explore the Lebanese Ministry of Environment Decree No. 8213 that dictates the purpose and guidelines for conducting a strategic environmental assessment. We will study the impact of conducting these assessments on national goals, which are associated with international treaties and protocols to limit degradation of air quality, climate change, and their impact on water resources.
Aim	The main objective of this module is to explore the relationship between environmental management of local, national and international projects and programs with the development of international environmental policies and regulations related to climate change.
Learning Outcomes	The student shall be able to: • Understand the objective of strategic environmental assessment • Understand the concept of sustainability impact assessment • Correlated the concept of environmental management with the formulation of international policies and treaties related to climate change.
Units	3.1 – Strategic Environmental Assessment

	3.2 – Sustainability Impact Assessment
Readings	http://www.moe.gov.lb/The-Ministry/Laws-Regulations/Decrees.aspx http://www.epa.ie/monitoringassessment/assessment/sea/ http://www.epa.gov/sustainability/analytics/sustainability-impact.htm Selected readings from: *Saunders, A. and Arts, J. (eds.) Assessing Impact: Handbook of EIA and SEA Follow-up. Earthscan: London, 2004.*
Activity	Project: • Prepare a term paper that addresses the relationship between strategic environmental assessment with developing international environmental policies and regulations. • Alternatively, prepare a term paper that addresses the relationship between sustainability impact assessment with the formulation of local environmental policies and regulations.

Course Description/Overview

This course explores human made problems in the environment parallel with concepts in environmental ethics, management and policies so as solutions are provided concerning preservation of the environment. Topics covered are toxic andsolid wastes, pollution of air, water and soil, international and national environmental ethics, management and policies.

Course Learning Objectives

The aim of this course is to introduce the main policies, regulations and standards related to water resources, soil, air and solid wastes. Also, this course will explore the role of environmental management in reducing and controlling environmental impacts.

Course Content Learning Outcomes

At the conclusion of this course, each student will be able to do the following:

1- Know about key environmental policies related to water.
2- Learn about indoor and outdoor air quality standards.
3- Learn about soil pollution and remedial actions.
4- Know about local environmental laws related to environmental protection.
5- Learn about solid waste landfills regulations.
6- Understand the concept of environmental management system.

Cheating

Students caught cheating on an exam receive a grade of zero on the exam.

Course Schedule

Topic	Description
1	Source water assessment and protection
2	Human impact on water cycle
3	Water quality criteria and regulations
4	Soil contamination
5	Air pollution
6	Indoor Air Pollution

7	Lebanese laws related to environmental impact assessment
8	Lebanese laws related to medical waste regulations
9	Lebanese laws related to deforestation
10	Solid waste landfills regulations
11	Environmental Management System

APENDIX II: The CLIMASP Course Modules Template Example

Course	Environmental Policy and Management
Module 1	**Waste Resources**
Key Concepts	Source water assessment, point source and non-point source contaminants, water criteria, and source water protection policies.
Overview	In this module, we will highlight the importance of fresh water sources

	(groundwater, springs, etc.) and the impact of their quality on water treatment costs. We will conduct a source water assessment to protect the water sources, delineated the source assessment area, identify potential contamination sources (point source and non-point sources), and determine the susceptibility of source water to contamination. We will then study the impact of human activities on the water cycle, and most specifically on watershed. Following source water assessment, we shall explore different protection measures such as land use prohibition, land acquisition, permitting and others. We will discuss the steps that can be taken on the individual level and community level to help protect water sources.We will also introduce the key water protection programs such as clean water act (CWA) and safe drinking water act (SDWA) and present water criteria for drinking, domestic usage, irrigation and recreation. We will also discuss main indicators such as maximum contaminant level (MCL) and the total daily maximum load (TDML) for surface water bodies. We will conclude with a case study addressing transport of contamination from surface water bodies to sediments and vegetative crops.
Aim	The main objective of this module is to delineate source water assessment areas and propose protection policies.
Learning Outcomes	The student shall be able to: • Know how to delineate a source water assessment area • Identify potential contaminant sources • Determine suitable source water protection policies • Know about the different water criteria
Units	1.1 - Source Water Assessment 1.2 –Impact of Human Activities on Water Cycle 1.3 –Water Criteria
Readings	http://water.epa.gov/infrastructure/drinkingwater/sourcewater/protection/sourcewaterassessments.cfm http://cis.uchicago.edu/outreach/summerinstitute/2010/documents/sti2010-lessons-how_human_activities_impact_the_water_cycle.pdf *http://water.epa.gov/scitech/swguidance/standards/criteria/*

Activity	Assignments: • Identify potential contaminants and susceptibility of contamination in a given urban or rural setting.
Module 2	**Soil Contamination**
Key Concepts	Delineation of soil contamination, soil vapor intrusion and soil remediation.
Overview	We will start with a brief introduction on potential sources of soil contamination and commonly occurring soil contaminants. We will explore the various standards related to soil criteria based on various landuses. Furthermore, we will address the different programs related to cleanup and remediation of soil contamination. These programs include a site investigation plan, a remediation action plan, and an extensive monitoring plan to ensure that any contaminated site is meeting the minimum applicable standards for remediated sites. Finally, we will evaluate potential environmental management procedures to remediate contaminated sites.
Aim	The main objective of this module is to introduce soil contamination, its transport and fate and potential remedial solutions.
Learning Outcomes	The student shall be able to: • Understand the extent of soil contamination • Know the criteria used for selecting soil remediation techniques
Units	2.1 – Soil Contamination 2.2 – Soil Clenaup Criteria
Readings	http://www.epa.gov/superfund/students/wastsite/soilspil.htm http://www.epa.gov/superfund/health/conmedia/soil/cleanup.htm

Activity	Assignment: • Evaluate soil treatment alternatives for a given urban or rural setting.
Module 3	**Air Pollution**
Key Concepts	Indoor and outdoor air pollution, air quality index, policies related to controlling air emissions.
Overview	In this module, we shall address both outdoor and indoor air pollution. We will discuss the main sources of air pollution such as power plants, cement factories, landfills, etc. and the transport and fate mechanisms of air pollution. After studying the impact of air pollution on the environment and specifically human health, we will address the need for regulating air pollution parameters. We will explore the main criteria pollutants that are regulated and their health impacts. We shall introduce the concept of air quality index that correlates between the levels of air pollution and health impacts. The Lebanese quality of index will also be addressed as well as the main efforts done locally to create a comprehensive database of air pollution measurements. Following the study of air pollution sources, their impacts and regulations, we will present policies and management measures to control and reduce air pollution. Such measures include individual initiatives and governmental policies. Indoor air pollution is of major concern due to their common occurrence in households, institutions and work places. Although indoor air pollution is not regulated, however, extensive guidelines are available to control and minimize occurrence of this pollution. ASHRAE standards are presented in order to be familiar with mechanical requirements related to air ventilation. We will address the health impacts of various indoor pollutants (microbial organisms, dust, fungi, asbestos, radon gas, etc.), their testing methods, and propose solutions to reduce the indoor air pollution to acceptable levels.
Aim	The main objective of this module is to explore the main sources of air pollutants (indoor and outdoor) and study the environmental policies (local and international) and guidelines related to the control of these pollutants.
Learning Outcomes	The student shall be able to: • Know the main criteria pollutants

	• Evaluate the advantages and disadvantages of waste transformation using composting and combustion
Units	3.1 –Outdoor Air Pollution: Sources, Concerns, and Standards 3.2 – Environmental Policies & Technologies for Reducing Outdoor Air Pollution 3.3 – Indoor Air Pollution
Readings	*http://www.epa.gov/air/criteria.html* *http://airnow.gov/index.cfm?action=aqibasics.aqi* *http://www.epa.gov/air/caa/peg/cleanup.html* *http://www.epa.gov/iaq/ia-intro.html*
Activity	Project: • Prepare a term paper that addresses indoor or outdoor air pollution policies and technologies and their impact on the environment and the economy.
Module 4	**Landfill Regulations**
Key Concepts	Landfill gas emissions, leachate discharge requirements and landfill liner regulations.
Overview	The focus of this module will be on the environmental regulations related to landfill permitting, design and operation. The social and environmental risks associated with the landfill process make it a challenge to site new landfills. To permit new landfills, one must evaluate climatic, physical, hydrogeological, social and environmental conditions of a candidate landfill site. Furthermore, all waste operations must be controlled and monitored, starting with monitoring of incoming wastes and keeping records of accepted waste quantities to monitoring the application of daily cover and maintaining leachate seeps. Landfill gas air emissions must be controlled and are regulated to ensure minimal environmental risks. Similarly, leachate discharges must be treated to meet minimal standards for discharge into sewage network or additional treatment. Additional environmental regulations are related to leachate evaporation, leachate recirculation, and maintaining safe leachate head on the liner. Periodic sampling of groundwater monitoring wells and gas monitoring wells

	should be conducted to ensure environmental groundwater and air quality standards are met during the lifetime of the landfill and in the post-closure care period. Finally, regulation related to the liner system and the leachate collection system will be explored in this module.
Aim	The main objective of this module is to introduce the main environmental regulations related to landfill liner systems, landfill operation and environmental monitoring.
Learning Outcomes	The student shall be able to: • Know the criteria for landfill siting and the design requirements • Know about environmental policies and regulations governing environmental monitoring of landfill during lifetime and in post-closure care
Units	4.1 – Regulations related to landfill liner systems 4.2 – Environmental Monitoring for Landfills
Readings	Chapters 11 and 16 *Integrated Solid Waste Management: Engineering Principles and Management issues, 1993, by George Tchobanoglous, Hilary Theisen, and Samuel A. Vigil, McGraw-Hill Eds.* *http://www.epa.gov/epawaste/nonhaz/municipal/landfill.htm*
Activity	Project: • Prepare a term paper that evaluates environmental regulations related to landfill permitting, operation, and environmental monitoring between USA, Europe and Lebanon.
Module 5	**Environmental Management**
Key Concepts	ISO certification, environmental management system, environmental policy, environmental objectives and targets, and environmental compliance.
Overview	In this module, we will present the objective of ISO certification and specifically ISO14001 that addresses environmental management systems (EMS). After presenting the main advantages of the ISO certification, we shall discuss its major requirements and operational challenges. We will introduce the concepts

	of environmental policy, environmental aspects, and environmental objectives and targets. We will explore human and financial resources and training and quality controls needed to successfully implement an EMS. Furthermore, we will address the commitment to environmental communication to satisfy environmental standards and client requirements. Finally, we will present case study on the application of EMS for a civil engineering project during design, construction and operation phases.
Aim	The main objective of this module is to explore the environmental management system requirements for complying with the ISO 14001 EMS certification.
Learning Outcomes	The student shall be able to: • Identify the main requirements of the EMS • Prepare an environmental policy • Identify environmental objectives and targets.
Units	5.1 – Environmental Management System
Readings	*Hand notes prepared by the Instructor.*
Activity	Assignment • Prepare an environmental policy and determine environmental objectives and targets for a University project.
Module 6	**Legislative Environmental Laws and Regulations**
Key Concepts	Climate change relation to solid waste management, waste to energy, and landfill greenhouse gas emissions.
Overview	The local environmental Law No. 444 is explored throughout this module. This law defines the main environmental responsibilities of the government, the private sector and individuals. It dictates the main environmental measures related to protecting surface water bodies, the groundwater, and soil and air quality. It also introduces the structure and requirements of the environmental impact assessment (EIA) studies and the process of environmental auditing. Furthermore, we will explore throughout this module various environmental laws related to the preservation of forests and compensation plans related to replantation of cleared trees. We will also explore the law of medical wastes by studying the main acceptable treatment technologies, main requirements for

	waste separation, and safe handling and storage of medical wastes.
Aim	The main objective of this module is to explore the impact of solid waste strategies on the release of air emissions and greenhouse gases and to develop sustainable measures to reduce the impact of solid wastes on climate change.
Learning Outcomes	The student shall be able to: • Identify relevant and applicable laws related to environmental management and environmental protection. • Understand the governmental and individual roles and responsibilities related to environmental protection.
Units	6.1 – Lebanese Environmental Law 6.2 – Compilations of laws and decrees related to environmental protection
Readings	http://www.moe.gov.lb/The-Ministry/Laws-Regulations.aspx
Activity	Project: • Prepare a term paper that explores the impact of local regulations and lack of environmental enforcement on environmental degradation and propose any new amendments that may contribute in enforcing environmental protection.
Module 7	**Environmental Policies on Climate Change**
Key Concepts	Climate impact on the water cycle and air quality and the environmental policies related to control of air quality and climate change.
Overview	Climate change has been the topic of the last decade. A universal target was established to control and reduce climate change due to massive impact on our lives. The Environmental policies related to the protection of air and water quality have paved the road to understand the reasons for the development of climate change and in turn to understand the impacts induced by climate change on air and water quality. In this module, we shall explore the impact of climate change of the water cycle. Also, we will explore the impact of increasing temperature on the formation of ozone and the frequency and severity of summer smogs. We will study the contribution of ozone formation and particle pollution to the

	occurrence of climate change. The types of particle pollution may dictate the type of impacts on air quality and can cause direct and indirect impact on climate change. In addition, we will present the latest international agreements related to controlling climate change and the role and responsibility of the main industrial countries in fulfilling their respective targets in reducing air pollution. Lebanon's role in controlling climate change will also be addressed in this module.
Aim	The main objective of this module is to explore the environmental policies related to controlling climate change and to study the impact of climate change on air and water quality.
Learning Outcomes	The student shall be able to: • Identify environmental policies related to climate change and air quality. • Understand the interchange between climate change and control of air emissions.
Units	7.1 – Introduction to Climate Change 7.2 – Environmental Policies Related to Climate Change
Readings	*http://www.epa.gov/climatechange/* *http://www.epa.gov/climatechange/ghgemissions/* *http://www.epa.gov/climatechange/reducing-emissions.html* *http://www.epa.gov/climatechange/science/indicators/* *http://www.epa.gov/climatechange/impacts-adaptation/* *http://www.epa.gov/climatechange/impacts-adaptation/water.html*
Activity	Project: • Prepare a term paper that addresses the impact of degrading air quality and changes in climate change on the urban and rural environment.

Course Syllabus

BIO 222

Environmental Pollution Risk & Health

Lebanese American University (LAU),

Semester, Fall 2014

Instructor Information

Instructor:	A/Prof. Christian Khalil
Office Location:	Bloc A, room 805, Jbeil Campus
Telephone:	Office – +961 9 547 262 Ext 2466
Office Hours:	Tuesday 8:00 – 14:00, Thursday 8000 – 14.00
E-mail:	Christian.khalil@lau.edu.lb
Website:	

Course Identification

Course Number:	**Bio 203**
Course Name:	**Environmental Pollution Risks and Health**
Course Location:	FREM 403 – Jbeil Campus
Class Times:	Tuesday 11:00– 12:15, Thursday 11:00 – 12:15
Prerequisites:	N/A
Faculty Web Page:	http://www.lau.edu.lb

Course Description/Overview

This course introduces the current and fundamental knowledge in the area of environmental pollution and health risks. Covered are the current global legal frameworks that affect environmental pollution and health risks. The role of the environmental hygiene professional will be explored in guest lectures and tutorials.

The aims of the course are to introduce students to the basic knowledge in environmental health risks and gradually enhance their knowledge and understanding of the key concepts in the field.

The modules will provide students with an overview of issues faced by environmental professionals including health impacts.. The modules are articulated in such a way so as to cater for students with different backgrounds as the modules gradually move from general environmental issues to more specific topics in the field

Course Learning Objectives

The learning outcomes in this course include for you to demonstrate a good understanding of environmental issues, their health and legal requirements, global warming, climate change, health risks and methods for assessing, mitigating and cleaning up environmental contamination.

At the completion of the course students are expected to have gained the essential knowledge to:

1. Managing healthy environment- policy perspective,
2. Environmental health- Legal Perspective,
3. Health and environment links,
4. Environmental Toxicology,
5. Health Risk Assessment,
6. Environmental Risk Assessment,
7. Physical Principles, Ocean and Atmosphere,
8. Food and health,

9. Climate Change, food availability and health,
10. Pollution and health,
11. Health and management systems
12. Role professional Practice issues.

Course Content Learning Outcomes

When completing this course, students will be able to

1. Use a number of databases in addition to reading a number of scientific articles introduced in the modules as additional readings. It is hoped that this exercise will help students in understanding the scientific literature and referring to it in writing their assignments and mini reports.
2. Develop an in-depth engagement with the relevant disciplinary knowledge in its interdisciplinary context. This will be facilitated by a number of guest lecture presenting topics ranging from weather to contaminated site assessments on top of the range of topics presented by the course coordinator.
3. Use analytical and critical thinking and creative problem-solving through the application of the knowledge gained in the course to some case studies scenarios. Furthermore the analytical ability of students will be assessed through the introduction of some simple mathematical formulas relevant to some aspects of environmental health.
4. Student will be challenged to engage in independent and reflective learning. The course is structured to allow students to study at their own pace especially in the distant version. The reflective learning is mainly achieved by presenting to the student the opportunity to constructively criticize one of the modules in the course and come up with innovative ideas and concepts to make the contents more interesting and motivating to future students.
5. Students will refine their skills in appropriately locating, evaluating and using the relevant information in writing their reports and weekly assignments. Students are encouraged to critically analyse the literature presented in their assignment and discouraged from copying and pasting from the web.
6. Student will develop initiative and creativity and this will be rewarded and taken into account in the marking scheme for the various assessments in this subject.

7. Some students working in the industry might find the first 2 modules not so challenging as they discuss some general aspects. This aspect of the course was needed to help cater for the diversity of students taking this course and the fact that some students lack some of the essential requirements for understanding the key concepts.
8. Students will also benefit from exposure to international concepts associated with the environmental health. The subject tries to correlate state local and international laws and regulations in order to provide the students with an overview of the global impacts resulting from the actions of individual countries..
9. Science is ever-changing and we strive in this subject to keep track of the changes and appreciate this change. All new scientific discoveries and events are considered and inserted into the subject curricula within 1 semester. Students are kept up to date with the scientific changes through news articles and additional readings and streaming videos mainly through the Blackboard portal.
10. Ethical practices and social responsibilities are important components of any curricula and this is also important in environmental health. Whole modules in the subject addresses these important aspects and familiarize students with the importance of ethical practices and the challenges faced every day by scientific professionals and how to rise to those challenge.
11. Lastly the subject aims to develop some of the skills needed for effective communication. Class students are given the opportunity to present a PowerPoint talk on a hot environmental topic they are passionate about.

Course Resources

The chapters of the textbooks (Greipsson 2011 (G); Miller and Spoolman 2012(MS)) pertaining to each lecture are provided in the following tentative schedule. You are encouraged to complete reading the chapter pertaining to a lecture before you come to that lecture

Optional Course Texts and Materials

N/AAssignments and Grading Scheme

Grading System

Grading:

Grading will be as follows:

1. 12 Weekly Module Problems 60%
2. 3 mini reports ** 40%

*Students must pass both forms of assessment to pass course.
** See list of topics for reports.

Topic Report 1:
Write a research paper on Environmental industrial pollution and health risks using a literature review. This should be supported by case studies, preferably local and international cases.

We expect students to have read at least 6 current papers in the area. Use case studies and examples where relevant to support your views.

Topic Report 2:

A case study on Environmental Pollution, Risk and Health, focusing on m and policy
Use case studies and examples where relevant to support your views.

Topic Report 3:
The students will need to select one of the course modules and critically review it, improve it and update it if needed. Students are also encouraged to expand on some of the issues mentioned in the modules. The assessment of the updated module will be based on the graduate student input, scientific accuracy and presentation. The module review should attempt to update the materials presented in the modules using books and articles and reliable information from the scientific literature. Adding figures, pictures and other

material to make the modules more interesting is also recommended. The module submitted by the students can potentially be used in updating the course notes.

There will be no make-ups for any missed exam, assignment or assessment!!

Course Policies

Student Conduct:
In this course, you will develop an appreciation of the importance of honesty and integrity in scientific conduct. You will be expected to adhere to the Lebanese American University's honor code and student code of conduct at all times. I will not tolerate any plagiarism, cheating on exams, failing to participate in group work, and engaging in disruptive behavior in the lecture. Kindly report any violations of the honor code to me as soon as possible.

Policy on Cheating and Plagiarism:
Students caught cheating on an exam/quiz/assessment will receive a grade of zero on that exam/quiz/assessment in their first cheating attempt and receive a warning. Students caught cheating for the second time will receive a grade of "F" in the course and another warning.

Plagiarism on assignments and project work is a serious offense. If plagiarism is detected, a student will be subject to penalty, similar to the cheating case, which ranges from receiving a zero on the assignment concerned to an "F" in the course in addition to a warning.

All written work submitted to me (in any form) should include the following statement *in verbatim*: "In completing this work, I have abided by the Honor Code of the Lebanese American University." The statement should be signed.

Attendance Policy:
You are expected to attend all lectures. You will be responsible for all announcements made and material covered in any class you miss. Lectures start at 8:00 AM sharp; you may be denied access to class that day if you arrive more than 10 minutes late. Once you are in class, you cannot leave for any reason. If you choose to leave, you cannot come back and you will be considered absent for that day.

Please note that missing one third the lectures implies that you will have to drop the course. This is a university policy and will be strictly enforced.

Scheduled field trips constitute part of the course. You are expected to arrive on time on the day of the field trip. We will not wait for you if you are late. **Missing a fieldtrip is equivalent to missing three lectures.** Due to the nature of fieldtrips, students are expected to obey classroom rules during these trips. Smoking in the bus will **not** be tolerated but may be allowed during rest stops. Students leaving the group at any point during the fieldtrip do so at their own risk and may be issued a warning. Students may be allowed off the bus on the way back at the instructor's discretion. **Please bear in mind that a field trip is not a picnic or a hike!!**

Withdrawal Policy:
According to the university catalog, "Students wishing to withdraw from one or more courses must follow the withdrawal procedure provided by the Registrar's Office. Students withdrawing from courses after the late registration period and before the withdrawal deadline will receive Ws for all the courses in progress." **Please note that the last day to withdraw from classes this semester (please check with registrar.) Students wishing to withdraw the course must do so by themselves.**

Other Policies:
Exams: Exams will cover all the material discussed in class (including videos, guest lectures and assigned readings). There will be no make-ups for missed exams. A missed exam will receive a grade of zero. All exam grades count and none will be dropped. You are required to bring your IDs to exams. Cell phones and pagers must be turned off and put away during exams.

Class Conduct and Participation: You are expected to be physically and mentally present in all lectures. Eating, drinking and smoking are prohibited during class time. Cell phones and pagers must be turned off or set to silent mode during the lectures. They must also be out of sight. **If I see cell phones or pagers, they leave with their owners.** Disruptive behaviour will not be tolerated in class and will be handled according to the university rules and regulations.

In-class activities may be given any time during the lecture. These may include out-door or in-door activities. They may also include short-answer questions, short essay questions or interpretation of graphs and/or tabular data.

You will not be allowed to make-up missed activities or assignments.

Difficulties and Special Needs:
If you are experiencing difficulties with course content or with anything that I can help you with, please let me know. Also inform me as soon as possible of any special needs you might have, particularly medical conditions that may require special accommodation.

Conflict Resolution:
If you are having problems with another student in the class, please bring it to my attention. If you have problems with me, please let me know as soon as you can. Any issues that we cannot resolve can be taken to the chairperson of the Department of Natural Science, Prof. Ahmad Kabbani.

Changes:
I reserve the right to make reasonable changes to this syllabus provided that I give all students registered in the class a timely notification of the changes to be made.

Disability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week of Assignment	Topic	Reading
Week 1	• Managing healthy environment-policy perspective,	Course Notes
Week 2	• Environmental health Legal Perspective	Course Notes
Week 3	• Health and environment links	Course Notes
Week 4	• Environmental Toxicology	Course Notes
Week 5	• Health Risk Assessment	Course Notes
Week 6	• Environmental Risk Assessment	Course Notes
Week 7	• Physical Principles, Ocean and Atmosphere	Course Notes

Week 8	• Food and Health	Course Notes
Week 9	• Climate Change, food availability and health,	Course Notes
Week 10	• Pollution and Health,	Course Notes
Week 11	• Health and Management Systems Issues	Course Notes
Week 12	• Role Professional Practice	Course Notes

Course	Environmental Pollution Risk & Health
Module 1	Managing healthy Environment – Policy Perspective
Key Concepts	The chapter will address the following concepts: 1. Environmental health Policies 2. Defining environment and environmental health 3. Environmental health case studies 4. Human interaction with the environment 5. The Scientific method approach
Overview	The chapter will introduce key concepts in environmental health. It will also provide an overview of the key terms relevant to the subject matter. A number of case studies will be included.
Aim	The aims of the chapters are: 1. Introduce students to key concepts in environmental health 2. Get student to understand environmental policy and the key riole they play in managing health 3. Understand key interaction of humans with their environment from a health perspective
Learning Outcomes	The learning outcomes are : 1. Student to be able to explain environmental health policies 2. Understanding environment and its connection to health 3. Student ability to understand and analyse literature in the form of case studies 4. Understanding the linkages between human interaction and the environment
Units	Chapter 1 in Provided Notes

Activity	
	Online activities on Blackboard such as: 1. Ecological foot print exercise 2. Population growth exercise **3.** Health implications from environmental pollution of a river system in China
Module 2	Environmental Health – Legal Perspective
Key Concepts	The following key concepts will be addressed: 1. Basics of Law;' 2. Law operation (case study Australian law) 3. Public health law- an International perspective
Overview	The lecture today will be divided into three distinct parts. The first part will introduce the reader to the basics of law; the second part will discuss the Law Operation, the third part will address environmental legislation while the fourth section will focus on public health laws. This approach is mainly aimed to showcase the sophisticated environmental legislation and the severe penalties for breaches which should be mirrored in public health legislation.
Aim	Introduce students to Environmental legislative requirements and their connection to Environmental Health Laws
Learning Outcomes	The learning outcomes from this chapter are : 1. Students understand the basics of law as applied to environmental and health. 2. Understanding the consequences of breaching environmental and public health legislation;

Activity	
	Online activities on Blackboard such as: 1. Identifying Legal requirements for opening a new Refinery in the USA 2. International Law as applied to companies operating Internationally **3.** Using databases to resercah Information on Environmental and Haelath Laws
Module 3	Health & Environmental Links
Key Concepts	Linking Health and Environment
Overview	With the onset of the twenty-first century, populations gained better awareness of their surroundings, especially their natural environment. We have a better appreciation of our natural environment, its importance, and the distinct cross-links between a healthy environment and population health. I would like to start this module by expanding on the definitions presented in Module 1 on Health and elucidate the underlying links with environment.
Aim	Basic understanding by students of the close linkages between Environment and health

Learning Outcomes	The students are expected to: 1. Have learned about Environment and health and the connections between the two disciplines. 2. Understand Environmental Stressors 3. Understand agricultural development health risks 4. Understand links between malnutrition and health
Units	Chapter 3 in the books
Readings& additional resources	1. Barton, B. (2002) Stress in Fishes: A Diversity of Responses with Particular Reference to Changes in Circulating Corticosteroids A Integr. Comp. Course Identification

Course Number: CIE 424
Course Name: Water Distribution and Treatment
Course Location: Byblos Campus
Class Times: xxxx
Prerequisites: Co-requisite: CIE425 Environmental Engineering - Lab, Pre-requisite CIE 322 Hydraulics, CIE424 is a pre-requisite for CIE 426 Wastewater Collection and Treatment.
Faculty Web Page:

Course Description/Overview

CIE424 Water Distribution and Treatment [3-0, 3cr.] Providing drinking water is integral to the survival and the proper development of all communities. The processes undertaken to ensure the safe and adequate drinking water supplies are covered in this course. The course is comprised mostly of seven sections. In the first section, the parameters used to identify the physical, chemical, and biological qualities of water are discussed along with local and international drinking water standards. Section two covers the methods used to estimate population growth and their use to predict water consumption. In the third section, all water storage and distribution methods are discussed in context of providing safe and adequate potable water to various communities. In section four, information on pipe material and stresses in pipes are provided. Section five covers the physical and chemical treatment of water including screening, coagulation/flocculation, sedimentation, basin design, filtration, and disinfection. In section six, the effects of climate changes on water supply is discussed along with the anticipation of those effects in the water network design. In the final section, environmental and professional ethics issues pertaining to water supply works are discussed with aim to help students make the right decisions.
Pre-requisite: CIE322 Hydraulics.

Course Learning Objectives

3. To provide students with information on water distribution and treatment.
4. To equip students with technical tools needed to design water distribution systems and treatment plants.

Course Content Learning Outcomes

At the conclusion of this course, each student will be able to do the following:

12. Understand the theory and applications for the design of water distribution systems and related appurtenances.
13. Understand methods of distribution and design criteria,
14. Understand the physical, chemical and biological water quality properties and standards;
15. Determine the quantity of water, population estimation; water use factors; fire demand; design periods,
16. Analyse and size the water treatment components: sedimentation; hindered settling; coagulation/flocculation processes; basin design; filtration; disinfection;
17. Learn basic design criteria for each water treatment process as well as to understand how to design each component.
18. Understand the effects of climate change on water supply
19. Understand professional and ethical responsibility.

Course Resources

Required Course Texts and Materials

10. **Environmental Engineering, by Peavy, Rowe, Tchobanoglos, McGraw-Hill International Editions (Required)**
11. Water Supply and Sewerage, by Terence J. McGhee sixth edition, McGraw-Hill International Editions.
12. Theory and Practice of Water and Wastewater Treatment, by R.L. Droste, John Wiley and sons.

13. Fundamentals of Hydraulic Engineering, by Alan. A. Prasuhn, Holt, Rinehart and Winston, the Dryden Press, Saunders College Publishing.

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

Grading Policy

Evaluation of the student's final grade in the course will be based on his/her performance throughout the course and will be a combination of the following:

Item	***Percentage***
Homework and/or class assignments	***4***
Two Tests (28 % each)	***56***
Comprehensive Final Exam	***40***

Course Policies

Structure

Lecture	Two 75-minute lectures per week
Laboratory	None

Medium	all material explained in class and on the whiteboard
Tests	2 Tests-90 minutes each - closed book
Final	180 minutes, comprehensive, closed book
H.W.	Several H.W., solution posted after submission
Projects	Design of a system,

Policy

Class Attendance	You are expected to attend all classes and arrive on time. Obtain prior clearance for planned absences and meet with the instructor after any emergency absences. It is the student's responsibility to obtain any class notes and/or homework questions in case of being absent from a lecture.
Academic Integrity	❖ LAU expects all students to maintain the highest level of integrity. Cheating or plagiarism will not be tolerated. University policies regarding academic integrity are available in http://www.lau.edu/policies ❖ The instructor will adhere to all LAU policies regarding academic integrity as stated. ❖ All work must be the result of students' own efforts. ❖ Students who are suspected of plagiarism or other violations of academic integrity codes will face investigation. Those found guilty will face disciplinary action. Repeated offenses will result in permanent expulsion from the University.
Homework Policy	Homework must be neat and legible or it will not be graded, and must be turned in at the beginning of class on the day it is due, with no exceptions.

Exam Policy	Make a consorted effort to be present for each test since there will not be any makeup. A student who misses a test will be given a zero grade unless the student can provide a convincing excuse. With a convincing excuse, either a make-up exam will be given or the other exams will be weighted heavier, at the instructor's discretion.
Exam Dates	❖ **Test 1 is scheduled on xxx.** ❖ **Test 2 is scheduled xxx.** ❖ **Final Exam is scheduled by the Registrar.**
Course Website	Syllabus, solution of homework, solution of tests, solution of previous tests, handouts, and any relevant material are placed on "courses online" at services.sea.lau.edu.lb
Cheating	A students caught cheating on an exam receives a grade of zero on the exam in the first cheating attempt and a warning. A student caught cheating for the second time in the same course receives an F grade in the course and a second warning.
Studying	❖ You need to study on a regular basis after each lecture. Do not postpone studying till just before the tests. ❖ Solve the assigned homework as soon as it is announced in class. To benefit the most from the previous tests, solve it on your own as if it were a real test and then look at the solution. ❖ You are responsible for all the material covered in class. Any material that is in the textbook and not covered in class will not be included in the tests. ❖ Take advantage of my office hours. It is your chance to get individual attention and explanation. ❖ Finally, a well prepared student does not need to study on the night before the exam.

Course Schedule

Topic		
1	***Water quality***	water and impurities; contaminants and pollutants; standards; and physical, chemical, and biological water quality parameters.
2	***Quantity of Water***	relation between quantity and population; population estimation; water use factors; fire demand; and design periods and flows
3	***Water supply and distribution systems***	intakes, methods of distribution, storage, flow estimation, pressures, design of networks, system maintenance, and protection of water quality in systems
4	***Pipes and conveyance systems***	conveyance and distribution, stresses in pipes, pipe material, valves, and other appurtenances
5	***Water Treatment Techniques***	purpose; sedimentation; hindered settling; scour; coagulation/flocculation processes; settling basin design; filtration; disinfection
6	***Effects of climate change on drinking water***	Climate change, effects of climate change on water supplies, anticipate effects of climate change in water supply network design
7	***Ethical / Professional Issues***	professional codes, standards and regulations applicable to environmental Engineering, ethical issues in a project or problem.

Water Distribution and Treatment (CIE424) Course Module

Course	**Water Distribution and Treatment**
Module 1	Water Quality
Key Concepts	Drinking water standards, water pollution, contaminants, water quality parameters
Overview	Topics to be covered in this module include local and international drinking water standards, description of the physical, chemical, and biological parameters used to characterize water quality, contaminates of concern in drinking water, and identification of various pathogens
Aim	The aim of this module is introduce the concepts of drinking water standards and the potential hazards resulting from various contaminants.
Learning Outcomes	At the end of this module students will be able to: • Identify and discuss the different drinking water standards • Identify and discuss the various water parameters used to characterize water quality • Identify and discuss various contaminants and pathogens found in water
Units	Unit 1.1 Drinking water standards Unit 1.2: Water quality parameters Unit 1.3: Water contaminants and pathogens
Readings	Chapter 2: Water quality: Definitions, characteristics, and perspectives (Environmental Engineering, by Peavy, Rowe, Tchobanoglos, McGraw-Hill International Editions). Various Local, EPA and WHO documents on drinking water standards.
Activity	**Overview**

	Compare and contrast various local and international drinking water standards. Solve homework problems pertaining to physical, chemical, and biological qualities of drinking water.
Module 2	Quantity of Water
Key Concepts	Water use factors, population estimation
Overview	In this module student will learn about the various factors controlling the amount of water needed by domestic, commercial, and public sectors. The module will go over the various methods used to estimate population growth and hence the amount of water needed by various communities.
Aim	The aim of this module is to equip the student with the tools needed to predicted the amount of water needed by various communities
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss factors controlling water use by various communities • Predict the amount of water needed by various communities
Units	Unit 2.1: Factors controlling water use Unit 2.2: Population growth estimation methods Unit 2.3: Estimation of water use for various communities
Readings	Chapter 2: Quantity of Water and Sewage (Water Supply and Sewerage, by Terence J. McGhee sixth edition, McGraw-Hill International Editions)
Activity	**Overview**
	Solve homework problems pertaining to population growth and estimation of water needed for various communities

Module 3	Water Supply and Distribution Systems
Key Concepts	Water supply, mass curve, water distribution
Overview	In this module the student will learn about the types of water supply and distribution methods, and the use of mass curves in the design of reservoir storage capacity using water supply and demand data.
Aim	This module aims to provide students with information on the various water distribution methods. Students will also gain the knowledge needed to design reservoirs for various communities using the mass curve and water supply and demand data.
Learning Outcomes	At the end of this module learners will be able to: • Demonstrate knowledge on the principles water distribution and storage • Design reservoirs capacity using the mass curve
Units	Unit 3.1: Methods of water distribution Unit 3.2: Mass curve Unit 3.3: Designing water reservoirs capacities
Readings	Chapter 3: Hydrology (Fundamentals of Hydraulic Engineering, by Alan. A. Prasuhn, Holt, Rinehart and Winston, the Dryden Press, Saunders College Publishing)
Activity	**Overview** Homework problems on water distribution methods and reservoir storage capacity design
Module 4	Pipes and Conveyance Systems
Key Concepts	Conveyance, stresses in pipes, pipe material, valves, appurtenances

Overview	In this module students will learn about the various types of water conveyance systems, pipes and pipe material, pipe fittings, valves, stresses in pipes
Aim	The aim of this module is to provide students with information on the various components of water conveyance systems and stresses in pipes.
Learning Outcomes	At the end of this module learners will be able to: • Demonstrate knowledge on water conveyance systems • Identify and Solve for stress in pipes
Units	Unit 3.1Water conveyance systems Unit 3.2: Stresses in pipes
Readings	Chapter 2: Aqueducts and Water Pipes (Water Supply and Sewerage, by Terence J. McGhee sixth edition, McGraw-Hill International Editions).
Activity	**Overview**
	Solve problems on identifying various water conveyance systems and stresses in pipes.
Module 5	**Water Treatment Techniques**
Key Concepts	Screening, sedimentation, flocculation, filtration, disinfection
Overview	This module will cover important concepts in water treatment techniques such as settling velocity, settling types, flocculation, sedimentation, filtration, screens, flocculator design, disinfection, and head losses in filters
Aim	The aim of this module is to equip students with the tools necessary to design water purification systems.
Learning	At the end of this module learners will be able to do the following:

Outcomes	• Screen design • Design sedimentation basins • Calculate head losses in filters • Design water disinfection systems
Units	Unit 5.1: Screens Unit 5.2: Sedimentation basins Unit 5.2: Filtration Unit 5.2: Disinfection
Readings	Chapter 11: Screening and Sedimentation. Chapter 13: Coagulation and Flocculation. Chapter 14: Filtration. Chapter 16: Disinfection (Theory and Practice of Water and Wastewater Treatment, by R.L. Droste, John Wiley and Sons).
Activity	**Overview**
	Solve design problems on screening, flocculation, sedimentation, filtration, and disinfection.
Module 6	**Effects of Climate Change on Drinking Water**
Key Concepts	Climate change, drought, soil erosion, eutrophication
Overview	Students in this module will learn about climate change and the effects of climate change on drinking water supply. Climate change is expected to lead to extreme weather patterns such as extended droughts or floods. Both of these patterns are expected to have detrimental effects on water supply. Floods may lead to soil erosion and surface runoff leading to increased discharge of fertilizers in lakes and rivers, which could lead to

	eutrophication whereas extended droughts could lead to increased stress on infrastructure. Extreme weather patterns could also make historical water data unreliable. In addition, extreme weather patterns may lead to population shift and increase or decrease in customer base.
Aim	The aim of this module is to introduce students to climate change and the effects of climate change on drinking water supply.
Learning Outcomes	At the end of this module students will: • Be able to show the effects of climate change on drinking water supply • Anticipate climate change effects in the design of water supply networks.
Units	Unit 6.1: Climate change Unit 6.2: Effects of climate change on water supply Unit 6.3: Anticipating the effects of climate change in the design of water supply networks.
Readings	A compilation of hands-out
Activity	**Overview**
	Individual or group student presentations on climate change and the effects of climate change on drinking water supplies.
Module 7	**Ethical and Professional Issues**
Key Concepts	Environmental justice, professional ethics
Overview	This module is a collection of seminar type presentations which will go over series of case studies addressing professional codes, standards and regulations applicable to environmental engineering, and ethical issues in work projects.
Aim	The aim of this module is to help students understand the ethical issues encountered in the work place and how to formulate the right decision.
Learning Outcomes	At the end of this module learners will be able to: • Apply knowledge of environmental and ethical issues in work related

	decisions
Units	Unit 6.1: Environmental justice Unit 6.2: Professional ethics
Readings	A compilation of hands-out
Activity	**Overview**
	Individual or group student presentations on environmental justice and professional ethics.

Course Identification

Course Number:	CIE 426
Course Name:	Wastewater Collection and Treatment
Course Location:	Byblos Campus
Class Times:	T Th 09:30 – 11:00 T Th 11:00 – 12:30
Prerequisites:	Co-requisite: CIE427 Environmental Engineering – SOFT, Pre-requisite CIE 424 Water Distribution and Treatment.
Faculty Web Page:	

Course Description/Overview

CIE426 Wastewater Collection and Treatment [3-0, 3 cr.] Design of sanitary and storm sewers and related appurtenances, mass balances and hydraulic flow regimes; reaction order and rates, analysis of experimental data, attached and suspended growth biological wastewater treatment systems including: activated sludge and its variations, aerated lagoons, SBR, trickling filters, RBC; basic nitrification-denitrification processes; oxygen requirements; introduction to sludge treatment and disposal. Pre-requisite: CIE 424 Water Distribution and Treatment

Course Learning Objectives

- To enable students recognize the importance of wastewater treatment in relation to health and environmental protection and to realize the impact that such an activity will have on the socio-economic status of the community.
- To provide the students with sufficient scientific and technological knowledge and familiarity of the commonly used physical, chemical, and biological wastewater treatment unit processes; and to substantiate this knowledge with engineering problem solving.
- To train students to synthesize the information learnt on unit processes into a global process that would lead to achieving the required end product as a real life application

Course Content Learning Outcomes

At the conclusion of this course, each student will be able to do the following:

20. Describe the general considerations of sewerage
21. Perform preliminary design of a wastewater collection system and storm water system.
22. Determine classes and types of reactions, rates and order and analyze experimental data
23. Apply mass balance principles to tanks and reactors with plug and completely mix flow regimes
24. Perform treatment of carbonaceous and nitrogenous organic matter
25. Size and analyse an activated sludge treatment unit

26. Size and analyse a trickling filter
27. Size and analyse a RBC treatment unit
28. Analyse the oxygen sag curve and determine pollutant concentration in an open channel.
29. Define climate change and describe its impact on wastewater treatment.

It is your chance to get individual attention and explanation. ❖ Finally, a well prepared student does not need to study on the night before the exam.

Course Schedule

Topic	
1	General Considerations of Sewerage: sources of sewage; flow fluctuation; design periods; guidelines and standards; characteristics of sewage.
2	Hydraulic Design of Sewer Systems: Preliminary investigations, design requirements and principles, sanitary sewer design, storm sewer design.
3	Reaction Kinetics: Chemical concepts of stoichiometry, chemical equilibria, bacterial growth and decay, classes and types of reactions, rates and order, analysis of experimental data, and applications.
4	Mass Balances and Hydraulic Flow Regimes: Setup of mass balances, flow analysis of CM and PF reactors, and system material balances.
5	Wastewater Treatment Systems: preliminary; primary; secondary and tertiary treatment processes; design of biological treatment units with special emphasis on aerobic biological treatment: • Suspended growth: activated sludge processes and its variations; process analysis, completely mixed vs. plug flow activated sludge treatment. • Attached growth: analysis and design of fixed film processes such as trickling filters and rotating biological contactors
6	Sludge production and treatment: brief introduction to sludge treatment methods and dewatering,
7	Nitrogen and Phosphorous Treatment design process for nitrogen and phosphorus removal, oxygen uptake.

8	Effluent Disposal in Natural Waters: dissolved oxygen variation in a stream (oxygen sag curve)
9	Contemporary Issue in Environmental Engineering and impact of engineering solutions in a global, economic, environmental, and societal context.

Course Modules

Course	Environmental Sciences
Module 1	General Considerations of Sewage and its Collection
Key Concepts	Sewage and the Collection Systems
Overview	In this module, the student will be introduced to general considerations of sewerage: sources of sewage; flow fluctuation; design periods; guidelines and standards; characteristics of sewage including the Biochemical oxygen Demand, Chemical Oxygen Demand and other parameters. Discussions will include methods of measuring these parameters and their impact on the environment and the treatment processes. Analysis of experimental data to obtain the ultimate BOD and the rate constant will be presented using different methods. Furthermore, the students will be presented with the hydraulic design of sewer systems: preliminary investigations, design requirements and principles, sanitary sewer design, storm sewer design. It is well noted that with climate

	change the precipitation intensity will be more and as a result combined sewers will be flooded more frequently. Designs shall account for climate change.
Aim	The overriding aim of this module is to make the students able to discuss the general considerations of sewage and the collection systems along with the impact of climate change on designs.
Learning Outcomes	At the end of this module learners will be able to: • Describe the general considerations of sewerage • Perform preliminary design of a wastewater collection system and storm water system.
Units	Unit …. Bio-Chemical parameters Unit …..: Collection systems
Readings	• Water Quality, by George Tchobanoglous and Edward Schroeder, Alison Wesley, • Theory and Practice of Water and Wastewater Treatment, by R.L. Droste, John Wiley and sons (Required). • Wastewater Engineering, by Metcalfe and Eddy, third edition, McGraw Hill. • Environmental Engineering, by Peavy, Rowe, Tchobanoglos, McGraw-Hill International Editions. • Water Supply and Sewerage, by Terence J. McGhee sixth edition, McGraw-Hill International Editions. • Fundamentals of Hydraulic Engineering, by Alan. A. Prasuhn, Holt, Rinehart and Winston, the Dryden Press, Saunders College Publishing
Activity	**Overview**
	Assignment: • Analysis of experimental data using Thomas, Least Squares, and Fujimoto Methods. • Design of a sample sewer network taking into consideration many

	constraints and parameters. Graded questions in test 1 and possibly in the final Exam.
Module 2	**Reaction Kinetics and Materials Balances**
Key Concepts	Reaction Kinetics and Mass Balances
Overview	Development of water quality models involves the coupling of concepts from biological and chemical reaction kinetics and stoichiometry with material balances and known physical constraints to provide useful predictive model. In this module, the students will be introduced to reaction kinetics: chemical concepts of stoichiometry, chemical equilibria, bacterial growth and decay, classes and types of reactions, rates and order, analysis of experimental data, and applications. Furthermore, the students will be introduced to the importance and application of mass Balances and hydraulic flow regimes: setup of mass balances, flow analysis of CM and PF reactors, and system material balances. Applications include hydrologic systems, fluid mechanics systems, as well as wastewater biological related applications. It is well known that climate change has an impact on temperature. In this module, the effect of temperature on reaction rate constants will be addressed. The rate of reaction will increase with an increase in temperature, which affects the treatment process.
Aim	The overriding aim of this module is to understand the reaction kinetics and apply material balances with stressing the impact of climate change and rise in temperature on the reaction rates.
Learning	Students will be able to:

Outcomes	• Determine classes and types of reactions, rates and order and analyse experimental data • Apply mass balance principles to tanks and reactors with plug and completely mix flow regimes
Units	Unit …. Reaction kinetics Unit …. Mass balances Unit …. Climate change impact
Readings	• Water Quality, by George Tchobanoglous and Edward Schroeder, Alison Wesley. Chapter 5 • Theory and Practice of Water and Wastewater Treatment, by R.L. Droste, John Wiley and sons. Chapter 10.
Activity	**Overview**
	Assignment: • Determine reaction kinetics for different types of reactions. Examples in Chapter 5 5.3 to 5.12 in Water Quality. • Write mass balances and apply then for different situation. Examples in Chapter 5 5.18 to 5.22 Water Quality. • Assessing flow regimes and their differences, Examples in Chapter 6 Water Quality, 6.8, 6.9, 6.10, and 6.13. Graded questions in test 1 and possibly in the final Exam.
Module 3	**Wastewater Treatment Systems**
Key Concepts	Biological treatment
Overview	Microbial cultures are the active agents for removing impurities from wastewater in biological treatment processes. Using micro-organisms to modify water quality under controlled circumstances requires a somewhat different emphasis. The engineer has a number of decisions to make with respect to process configuration. The most important selection relates to the

	volume and reaction rates and kinetics. Furthermore, the effluents produced by biological treatment are not suitable for potable use, and thus economic utilization of biological treatment is limited to wastewater. In this module, the student is exposed to wastewater treatment systems: preliminary; primary; secondary and tertiary treatment processes; design of biological treatment units with special emphasis on aerobic biological treatment: • Suspended growth: activated sludge processes and its variations; process analysis, completely mixed vs. plug flow activated sludge treatment. • Attached growth: analysis and design of fixed film processes such as trickling filters and rotating biological contactors • Sludge production and treatment will be introduced briefly along with sludge dewatering. Furthermore, Nitrogen and Phosphorous Treatment design process for nitrogen and phosphorus removal will be emphasized along with the oxygen uptake and the production of gases. This will be addressed from a climate change point of view and their impact on the environment. .
Aim	This module aims at examining the different biological wastewater treatment systems along with presenting the impact of varying parameters and specifically that result from climate change.
Learning Outcomes	At the end of this module learners will be able to: • Perform treatment of carbonaceous and nitrogenous organic matter • Size and analyse an activated sludge treatment unit • Size and analyse a trickling filter • Size and analyse a RBC treatment unit • Discuss briefly sludge treatment

Units	Unit ….: Attached growth *Unit ….: Suspended growth* Unit ….: Impact of parameters on treatment
Readings	• Water Quality, by George Tchobanoglous and Edward Schroeder, Alison Wesley. Chapter 14 • Theory and Practice of Water and Wastewater Treatment, by R.L. Droste, John Wiley and sons. Chapter 17.
Activity	**Overview**
	Assignment: • Analyse treatment systems and effect of parameter variation on performance. Examples in Chapter 14 in Water Quality and Examples from Theory and Practice of Water and Wastewater Treatment Chapter 17 3 thru 7, 22, 23, 24, 36. Graded questions in test 2 and possibly in the final Exam.
Key Concepts	Oxygen sag curve and pollutant concentration in an open channel.
Overview	A major aspect of water quality management involves modelling water quality changes in streams and rivers subject to inputs. The development of water quality models involves the application of mass balances and kinetic expressions to describe the response of the systems. It is important to assess the assimilative capacity of these systems, and thus predict the impact of the proposed developments and natural occurrences. In summary, this module introduces the student to these concepts in line with climate change impacts and consequences. The student will learn how to analyse the oxygen sag curve and determine pollutant concentration in an open channel.
Aim	The overriding aim of this module is the ability to analyse the oxygen sag curve

	and determine pollutant concentration in an open channel.
Learning Outcomes	At the end of this module learners will be able to: • Analyse the oxygen sag curve and determine pollutant concentration in an open channel. • Explore the effect of climate change in the sense of rising temperature on these applications.
Units	Unit …….: Water quality and Climate Change Unit …..: Natural resources deterioration
Readings	• Water Quality, by George Tchobanoglous and Edward Schroeder, Alison Wesley. Chapter 8
Activity	**Overview**
	Assignment: Analyse the oxygen sag curve, Examples in Chapter 8 Water Quality, 8.2, 8.3, 8.4 Graded questions in test 2 and possibly in the final Exam.
Key Concepts	Contemporary Issue in Environmental Engineering and impact of engineering solutions in a global, economic, environmental, and societal context.
Overview	Climate change is expected to result in increasing the temperature as well as changes in frequency and timing of precipitation events. As a result, more raw sewage will be dumped into receiving bodies of water. Minor temperature changes can have significant effects on biological reactions. Also, activated sludge aeration systems operating at high temperatures support nitrification. Many gases evolve from wastewater treatment that contribute to the green house affect. As climate change is a major concern, alternatives should reduce both greenhouse gas emissions and power consumption, making anaerobic treatment a more attractive component of novel approaches to treatment processes.

	LCA has emerged as the standard for quantifying the environmental impacts of a particular product or process. The goal of LCA is to account for the full range of environmental impacts attributable to processes. The term "life cycle" requires cradle-to-grave assessment, including raw material, production, manufacture, distribution, use and disposal. LCA is a useful decision making tool to develop holistic environmental impacts.
Aim	The overriding aim of this module is to equip students with the ability to discuss capacity to debate on water management and recycling processes, techniques and feasibility.
Learning Outcomes	At the end of this module learners will be able to: • Quantify the environmental impact of a wastewater treatment plan • Assess environmental impacts of various supplemental carbon alternatives • Assess the impacts to human health, ecosystem quality, and resources
Units	Unit ….. Wastewater treatment and climate change Unit …. Impact of engineering solutions on the environment
Readings	• *EPA documents www.epa.gov*
Activity	**Overview** • Students will be asked to prepare a report on the impact of climate change on wastewater treatment as well as the impact of wastewater treatment on climate change. • Furthermore, questions will be asked in the final exam related to this course module. • Term project: Impact of climate change on wastewater treatment.

APENDIX I: Environmental Engineering SOFT Course Syllabus

Environmental Engineering SOFT

Course Syllabus

Prerequisites: CIE426 Co

Faculty Web Page:

Course Description/Overview

Analysis and design using commercially available software: wastewater treatment plant; sizing of tanks; effluent concentration. Results visualizations and assessment: cost analysis, operation and maintenance. The following topics will be covered (not necessarily in sequential order) and contingent upon the student progress:

1- Introduction to wastewater treatment
2- Pricing and cost estimation of wastewater treatment schemes
3- Treatment of carbonaceous organic matter
4- Treatment of nutrients like nitrogen and phosphorous
5- Budding models
6- Simulation techniques
7- Editing layouts and using scenarios
8- Influent data and influent advisor
9- The define function
10- Sensitivity analysis
11- Examples of actual plans (case studies: A2O model, Bardenpho model, …)

Course Learning Objectives

The overarching goals of this course are: a) Design a civil engineering component/ system by applying standards appropriate for design including codes and regulations and incorporating multiple constraints into the design in the civil engineering areas of environmental engineering. b) Identify problem setting and related assumptions, limitations and solution requirements in the environmental engineering field. c) Formulate methods and strategies considering all relevant perspectives, solution models, and alternative solution paths. d) Use selected models, methods, and data to produce the appropriate solution. e) Use industry standard software to analyse and design engineering components.

Course Content Learning Outcomes

At the end of this course, each student will be able to do the following:

1- Build a layout and create a model for a wastewater treatment plan and assign appropriate process models and parameter values.
2- Perform cost analysis for different plant layouts and understand the impact of design criteria on costs.
3- Compile the objects into a plant model, apply simulation techniques, edit layouts, evaluate scenarios and use influent data and advisor.
4- Perform treatment of carbonaceous organic matter.
5- Perform treatment of nutrients like nitrogen and phosphorous.
6- Perform sensitivity analysis.
7- Apply the software for case studies.
8- Perform a preliminary design of the most widely used wastewater treatment unit operations and organize them into a functioning treatment system.
9- Evaluate different approaches to wastewater treatment and select the best option for local conditions.

Course Resources

Course Website(s)

Required Course Texts and Materials

- Theory and practice of water and wastewater treatment, by R.L. Droste, John Wiley and sons.
- Wastewater engineering, by Metcalfe and Eddy, third edition, McGraw Hill.
- All notes, lectures and textbooks assigned or provided by Dr. Jean Chatila for the Environmental Engineering II course.

- Hand-outs prepared for students and distributed with each session

Optional Course Texts and Materials

1. GPS-X User's Guide, GPS-X version 6.1.
2. GPS-X Tutorial Guide: A STEP-BY-STEP GUIDE FOR LEARNING AND GETTING FAMILIAR WITH GPS-X, GPS-X version 6.2

Assignments and Grading Scheme

Grading System

0 to 100 (where 70 is the least pass mark)

Grading Policy

Grades can be based on the following:

Homework / Class assignment / Participation	20
Design project	10
Two tests (20% each)	40
Comprehensive final exam	30
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Class	You are expected to attend all classes and arrive on time. Obtain

attendance	prior excuse for planned absences and meet with the instructor after any emergency absences. It is the students responsibility to obtain any class notes and / or homework questions in case of being absent from a lecture
Academic integrity	• LAU expects all students to maintain the highest level of integrity. Cheating or plagiarism will not be tolerated. University politics regarding academic integrity are available in http://www.lau.edu.lb/governance-policies/policies/ . • The instructor will adhere to all LAU policies regarding academic integrity as stated • All work must be the result of students own efforts • Students who are suspected of plagiarism or other violations of academic integrity code will face investigation. Those found guilty will face disciplinary action repeated offenses will result in permanent expulsion from the university.
Homework policy	Homework must be neat and legible or it will not be graded and must be turned in at the beginning of class on the day it is due with no exceptions
Exam policy	Make an effort to be present for each test since there will not be any makeup tests. A student who misses a test will be given a zero grade unless the student can provide a convincing excuse.
Exam dates	• Test 1 date is TBA • Test 2 date is TBA • Project will be announced with a two weeks deadline • Soft and hard copies should be submitted

	• Exam dates may be rescheduled upon the instructor's direction
Course website	Syllabus, solution of homework, solution of tests, solution of previous tests, hand-outs, and any relevant material are placed on "courses online" at services, services.sea.lau.edu.lb
Cheating	Students caught cheating on an exam will receive a grade of zero on the exam in the first cheating attempt and a warning. Students caught cheating for the second time in the same course will receive an F grade in the course and a second warning.
Studying	• You need to study on a regular basis (after each lecture) do not postpone studying till just before the tests • Solve the assigned homework as soon as it is announced in class. To benefit the most from the previous tests, solve it on your own as if it were a real test and then look at the solution. • You are responsible for all the material covered in class. Any material that is in the textbook and not covered in class will not be included in the tests. • Take advantage of my office hours. It is your chance to get individual attention and explanation. • Finally, a well prepared student does not need to study on the night before the exam.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines (Details on assignments and more bibliography are available in the course modules)
1		CapdetWorks basic waste water treatment plant layout. Editing parameters. Cost parameters
2		CapdetWorks advanced database modification. Cost override. Design override. Comparing several layouts. Sensitivity analysis. Generating a report
3		GPSX - Basic modelling. Introduction to simulation interface. Outputs and results.
4		GPSX - Creating scenarios
5		GPSX - Data input and output
6		GPSX - Automatic controllers and tuning
7		Test 1
8		GPSX - Define function
9		GPSX - Sensitivity analysis
10		GPSX - Monte Carlo analysis and probability analysis
11		GPSX – Case study : Nutrients removal : Phosphorus removal

12		GPSX – Case study : Nutrients removal : Nitrogen removal
13		Test 2
14		Review of GPSX and comparison of treatment alternatives (A2O model, Bardenpho model, CMAS with post-anoxic treatment.
15		Final exam

APENDIX II: The CLIMASP Course Modules Template Example

Course	Curriculum and Hypermedia
Module 1	Wastewater treatment plant: General overview
Key Concepts	Wastewater treatment, sludge treatment, preliminary, primary, secondary and tertiary treatments.
Overview	The students are introduced to wastewater treatment plants. A basic introduction to treatment stages: First of all an overview of preliminary treatment such screens, grit removal, equalization tank. Then primary treatment is introduced, clarification is explained. Furthermore, secondary treatments are

	explained: biological treatments (suspended growth and attached growth) along with main concepts of wasted activated sludge (WAS) and recycled activated sludge (RAS) when required. Concept of bacterial activity is introduced. Also, tertiary treatments are introduced: chlorination, filtration, UV treatment. Then sludge treatment is also introduced (anaerobic and aerobic digestion, sludge thickening, sludge drying, filter-press belts …) along with water return cycles into the treatment chain. Sludge re-use is also discussed, and students appreciate benefits of the treatment: sludge cakes, gas extraction, energy production, ecological landfill.
Aim	The aim of this module is to allow students to have a complete perspective of treatment plans and their benefits. How to create sustainable system that will provide adequate cleansing of wastewater while converting it to two needed assets: water and reusable sludge.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the different types and functions of treatment units • Discuss how wastewater treatment is a sustainable practice
Units	Unit 1.1: Wastewater treatment units Unit 1.2: Wastewater treatment chain Unit 1.3: Sludge Treatment chain Unit 1.4: Benefits of wastewater treatment
Readings	• Theory and practice of water and wastewater treatment, by R.L. Droste, John Wiley and sons. • Handouts provided for topic 1

Activity	**Overview** Assignment 1: Creating a complete wastewater treatment plant 1. Students are required to draw a fully functional treatment plant. 2. Students' knowledge and understanding of all treatment stages is evaluated through a comprehensive questionnaire. Tests 1 and 2 1. In both tests the students are required to draw and analysis treatment plants within specific case studies. Project 1. The students will work with a team to design of fully functional treatment plants within design guides and effluent targets meeting international standards.
Module 2	Costing of WWTP using CapdetWorks
Key Concepts	Running cost, fixed costs, optimization, economical criterion, sensitivity analysis, CapdetWorks
Overview	This module introduces the students to a basic pillar of sustainable development: The economical factor. For any process to be sustainable an economic analysis should take place and the project cost must always be optimized. The students will be exposed to project costs including but not limited to: building, concrete works, land, electricity, labor, chemical, managerial, equipment and technical costs. This concept is introduced through CapdetWorks software. The module also exposes the students to running costs: Operation, maintenance, material, chemical, energy, and amortization costs. Discussions of breakeven points in decision making policies. Energy-intensive systems, chemically dependent treatments, sustainability, etc… are concepts that will be integrated within this module which will allow the student to understand concepts beyond the treatment plant itself giving them a broader

	insight on the topic. The student will learn how to change parameters, both design and cost. Also the students will learn how to override a design or even a cost. Sensitivity analysis is performed in order to evaluate the effect of a design factor, or cost factor on the entire plant cost. Local and global variables are assessed that will yield changes of costs for the entire process and/or the particular unit.
Aim	The overriding aim of this module is to broaden the scope of environmental studies and integrate sustainability decision making tools such a costing
Learning Outcomes	At the end of this module learners will be able to: • Perform a costing analysis for various WWTP layouts • Understand the difference between fixed and running costs • Be able to compare several treatment schemes and evaluate the costs • Perform sensitivity analysis
Units	Unit 2.1: Drawing a WWTP and changing parameters Unit 2.2: Fixed and running costs Unit 2.3: Sensitivity analysis
Readings	• Handouts provided for topic 2

Activity	**Overview** Assignment 2.1: application using CAPDETWORKS version 2.5 of Hydromantis Inc. 1. Draw a WWTP having the following units: An influent wastewater, a preliminary treatment, a rectangular primary clarification, a plug flow activated sludge, and a UV disinfection unit. 2. Add an anaerobic digestion unit for the sludge followed by a belt-filter press unit which is connected to a hauling and land filling disposal unit. Make all necessary connections. 3. Edit the parameters as given. Assignment 2.2: advanced application using CAPDETWORKS version 2.5 of Hydromantis Inc. 1. Overriding design, safety factors and cost parameters. 2. Run sensitivity analysis and compare several layouts. 3. Run a cost analysis and note the project initial cost and the running cost by summing all 6 running costs (given in $/year). Test 1 1. In test 1 the students are required to draw and analysis a treatment plant using CapdetWorks software.
Module 3	Suspended and attached growth processes
Key Concepts	Secondary treatment, attached growth, suspended growth, biological treatment.
Overview	The students will be exposed to various secondary treatment solutions and differentiation between attached and suspended growth will be thoroughly explained. In attached growth systems, the students will look at rotating biological contactors and trickling filters. The concept of bacterial growth over a fixed medium will be discussed and modelled.

	In suspended growth systems, students will evaluate completely mix activated sludge, anoxic tank, plug flow tank, and lagoons. Student will appreciate the need to a return activate sludge flow into the system (RAS). Automatic controllers are introduced, such as controls for Dissolved Oxygen (DO) and controlling MLSS levels by regulating the wasted activated sludge flows (WAS). Students will learn how to tune a controlled to obtain realistic responses. Wastewater effluent quality will be assessed and mass flow equilibrium thoroughly discussed. The effect of flow fluctuation over the overall performance is carefully studied and the students will be able to create several data input scenarios which will simulate real-life fluctuations. Varying concentrations of BOD, COD, TKN, phosphorus are implemented into the system within the influent advisor interface. Flow fluctuation is also assessed to evaluate the response of the system. Students will learn how to obtain relevant data to compute SRT and compare it with software results. This module will introduce students to GPS-X: Creating models, controlling inputs and outputs, defining variables, creating controllers and tuning them.
Aim	This module aims at examining the relationship between influent parameters and secondary system responses.
Learning Outcomes	At the end of this module learners will be able to: • Differentiate between several secondary treatment systems • Model a realistic WWTP using GPS-X and use all of its analytical features • Understand the difference between attached and suspended growth
Units	Unit 3.1: GPS-X modelling a WWTP and running a simulation Unit 3.2: Scenarios and influent advisor interface

	Unit 3.3: Automatic controllers and tuning Unit 3.4: Define function, mass flows and SRT
Readings	• Theory and practice of water and wastewater treatment, by R.L. Droste, John Wiley and sons. • Wastewater engineering, by Metcalfe and Eddy, third edition, McGraw Hill. • All notes, lectures and textbooks assigned or provided by Dr. Jean Chatila for the Environmental Engineering II course. • Hand-outs prepared for students and distributed with each session • GPS-X User's Guide, GPS-X version 6.1. • GPS-X Tutorial Guide: A STEP-BY-STEP GUIDE FOR LEARNING AND GETTING FAMILIAR WITH GPS-X, GPS-X version 6.
Activity	**Overview** Assignment 3.1: Basic application using GPS-X version 6.2 of Hydromantis Inc 1. Design a wastewater treatment plant for 8,500 people to treat wastewater for carbonaceous BOD removal. Assume daily sewage flows (L per capita). The treated effluent shall meet the Lebanese standards for suspended solids and BOD limits. 2. The treatment process should confirm to biological extended aeration activated sludge plug flow system. 3. Calculate SRT by hand using output from the software Assignment 3.2: Basic application using GPS-X version 6.2 of Hydromantis Inc 1. Analyse / Design a wastewater treatment plant to treat

	wastewater with a flow rate of 19700 m3/d. 2. The treatment process should confirm to biological extended aeration activated sludge plug flow system. 3. Create scenarios for fluctuations Assignment 3.3: Basic application using GPS-X version 6.2 of Hydromantis Inc 1. Create a wastewater treatment plant with a primary clarifier, followed by a secondary treatment (completely mixed activated sludge) and finally a tertiary treatment for disinfection. Make all proper connections and labelling. 2. In this scenario, you will test the effect of a changing flow with varying concentrations on the outflow concentrations. Assignment 3.4: Advanced application using GPS-X version 6.2 of Hydromantis Inc 1. Create a wastewater treatment plant consisting of a secondary treatment (Plug flow activated sludge). Make all proper connections and labelling. 2. After applying all required steps, add to the report the basic steps required to obtain adequate PID parameters for tuning WAS. Report the obtained PID factors 3. Flow, WAS and MLSS fluctuations for a 50 day steady state analysis with a simulation of dynamic flow (by manually changing the flow from the controls while simulation is ongoing). Comment of the adequacy of the tuned controller 4. The fluctuations of DO in each reactor Assignment 3.5: Advanced application using GPS-X version 6.2 of Hydromantis Inc 1. Create a fictitious wastewater treatment plant consisting of a sinusoidal influent of 10000 m3/day divided into three equal

	flows: The first flow undergoes a secondary treatment with a CMAS with corresponding secondary clarifier. The second is exactly the same with a PFAS instead. And the third is similar with a trickling filter system. The effluents are combined from all three secondary tanks into one effluent. The WAS are also combined into one final WAS. 2. Define "Carbonaceous BOD5" mass flows for the main influent, all three secondary effluents (separately) and the final effluent. Draw a graph showing a 10 day simulation 3. Define "Carbonaceous BOD5" mass flows for the main influent, all three secondary effluents (separately) and the final effluent. Draw a graph showing a 10 day simulation 4. For the first train (CMAS) define a function that will calculate the required WAS for a SRT of 8 days Test 2 1. In test 2 the students are required to draw and analysis a treatment plant using GPS-X software. 2. Capacity to use all software features and analysis results is tested Final Exam 1. In the final exam the students are required to model a complete treatment plant using GPS-X software. 2. Capacity to use all software features and analysis results is tested Project The students will work with a team to design of fully functional treatment plants using GPS-X within design guides and effluent targets meeting international standards.
Module 4	Analysis tools: Sensitivity analysis and Monte Carlo analysis

Key Concepts	Sensitivity analysis, Monte Carlo analysis, probability, steady analysis, dynamic analysis
Overview	This module will allow student to explore further design tools provided by GPS-X. Sensitivity analysis will be explained: Steady state, phase dynamic and time dynamic analysis will be performed. Student will evaluate the effect of one changing parameter on another. This will provide real life decision making tools, such as sizing a clarifier in the most optimal manner to obtain a targeted removal of TSS or BOD. The student will appreciate the difference between many analysis methods. Monte-Carlo analysis will help the student asses the performance of the plant within uncertainty in design parameters. Bacterial growth in suspended growth system has a normal distribution, which will affect the effluent quality. Also beta factor for air diffusion in CMAS reactors will affect oxygenation and thus treatment, the distribution of this factor is uniform. The student will be able to integrate such parameters within the analysis and test the optimality and resilience of their plant. The student will appreciate graphically such distributions and their effects on related outputs.
Aim	The aim of this module is to allow the students to explore further features of GPS-X and use them for design or decision-making purposes.
Learning Outcomes	At the end of this module learners will be able to: • Perform a sensitivity analysis using GPS-X • Perform a Monte-Carlo analysis using GPS-X
Units	Unit 4.1: Sensitivity analysis Unit 4.2: Monte Carlo analysis
Readings	• Hand-outs prepared for students and distributed with each session • GPS-X User's Guide, GPS-X version 6.1.

	• GPS-X Tutorial Guide: A STEP-BY-STEP GUIDE FOR LEARNING AND GETTING FAMILIAR WITH GPS-X, GPS-X version 6.
Activity	**Overview** Assignment 4.1: Advanced application using GPS-X version 6.2 of Hydromantis Inc 1. Run a steady state analysis that would asses an increasing influent flow from 2000m3/day to 10000m3/day with an increment of Δ=200 2. Show results in 4 graphs a. "Primary clarifier" : TSS before and after the primary clarifier b. "Secondary clarifier" : BOD5 before and after the secondary clarifier c. "CM tank " : DO in tank d. "TSS mass flows + ID number": TSS mass flows before and after combiner before entering dewatering unit 3. Run a similar analysis with a time dynamic analysis for 1 day with only 2 runs displayed Assignment 4.2: Advanced application using GPS-X version 6.2 of Hydromantis Inc 1. Create a wastewater treatment plant that has a dysfunctional splitter. While you aim to continuously split the flow into two equal flows, your site engineer reported that the split fraction is ranging between 0.2 and 0.7 with a standard deviation of 0.05 and a mean value of 0.45 (normal distribution). Adding to this, because of maintenance in your equalization tank, the flow is also varying between 4500m3/day and 6000m3/day uniformly. 2. In a new tab, create graphs showing the BOD and free and ionized ammonia final effluent. If the acceptable limit is 20 mg/L for both,

	what's the percentage of the plant failing the BOD requirement? How about the ammonia requirement? Test 2 1. In test 2 the students are required to perform sensitivity and Monte-Carlo analysis Final Exam 1. In the final exam the students are required to perform sensitivity and Monte-Carlo analysis 2. Capacity to use all software features and analysis results is tested Project The students will work with a team to design of fully functional treatment plants using GPS-X within design guides and effluent targets meeting international standards. Design will require the use of advanced design tools.
Module 5	**Nutrient removal processes**
Key Concepts	A2O, Bardenpho process, phosphorus removal, nitrogen removal, chemical removal, biological removal
Overview	This module will discuss nutrients in wastewater (phosphorus and nitrogenous compounds). Eutrophication, blue baby syndrome, DO depletion are all consequence of nutrients disposal in water bodies. Nutrients can be removed using known systems such as A2/O process and modified Bardenpho process. Phosphorus can also be removed chemically using ferrous and ferric ions or even aluminum. Nitrogen must be removed biologically by integrating anoxic conditions. The students will be exposed to simulations using GPS-X to appreciate and explore those systems. Considerations of internal recycling, clarification,

	anoxic and oxic treatments that allow optimal growth of nutrient consuming bacteria will be explained and modelled.
Aim	The aim of this module is to expose student to real-life case studies and to help them understand the importance of nutrient removal system and how they function
Learning Outcomes	At the end of this module learners will be able to: • Appreciate nutrient removal systems • Model an A2/O process • Model a Bardenpho process • Model a chemical diffuser system and link it to a WWTP
Units	Unit 5.1: Chemical removal and anoxic tanks Unit 5.2: A2/O Process Unit 5.3: Bardenpho process
Readings	• Theory and practice of water and wastewater treatment, by R.L. Droste, John Wiley and sons. • Wastewater engineering, by Metcalfe and Eddy, third edition, McGraw Hill. • All notes, lectures and textbooks assigned or provided by Dr. Jean Chatila for the Environmental Engineering II course. • Hand-outs prepared for students and distributed with each session • GPS-X User's Guide, GPS-X version 6.1. GPS-X Tutorial Guide: A STEP-BY-STEP GUIDE FOR LEARNING AND GETTING FAMILIAR WITH GPS-X, GPS-X version 6.

Activity	**Overview** Assignment 5.1: Advanced application using GPS-X version 6.2 of Hydromantis Inc 1. Create a wastewater treatment plant consisting of an influent of 3000 m^3/day with given concentrations. The system will consist of an in-line chemical dosage followed by a completely mixed activate sludge system. Set the phosphorus effluent to a target of 2mg/L. 2. Perform a sensitivity analysis evaluating the effect of the surface area of the secondary clarifier over the effluent. Choose a range between 0 and 600 m2 with a step increment of 20. 3. Show graphs showing the results. What is the optimal surface of the clarifier to obtain desired effluent? Test 2 1. In test 2 the students are required to model a nutrient removal system Final Exam 1. In the final exam the students are required to model a nutrient removal system Project The students will work with a team to design of fully functional treatment plants using GPS-X. This system will aim to remove nutrients in the most efficient manner and students will need to provide an optimal design.

APENDIX I: The CLIMASP Course Syllabus Template Example

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

Course Number:CIE434

The Civil Engineering Profession

Lebanese American University, Faculty of Engineering, Department of Civil Engineering

Fall Semester, 2014

Instructor Information

Instructor:	Dr. Gebran Karam
Office Location:	Bassil hall office 305
Telephone:	Office – +961 9 547254
Office Hours:	MWF 2:00 to 3:00 pm and 5:00 to 6:00 pm
E-mail:	gkaram@lau.edu.lb
Website:	WWW.LAU.EDU.LB

Course Identification

Course Number:	CIE 434
Course Name:	The Civil Engineering Profession
Course Location:	University Campus
Class Times:	MF: 3:00 to 3:50 pm & MW: 4:00 to 4:50 pm
Prerequisites:	Fourth year standing

Faculty Web Page: WWW.LAU.EDU.LB

Course Description/Overview

Introduction to the history and heritage of civil engineering; specialized sub disciplines; professionalism and professional registration and societies; continuing education; impact of historical and contemporary issues on the identification, formulation, and solution of engineering problems , impact of engineering solutions on the economy, environment, political landscape, and society. The course involves teamwork researching topics related to the impact of contemporary engineering solutions.

Course Learning Objectives

The material in this course is structured and focused on the course learning outcomes. Assigned student work and graded student performances are based on the course learning outcomes. These outcomes are assumed to be attained by the students when 70% or more of the students (not counting withdrawals) pass the course

Course Content Learning Outcomes

On the successful completion of this course, you will be able to:

9. Describe the role of the Civil Engineer in society
10. Describe the history and heritage of the profession and recall the achievements of famous engineers
11. Discuss relevant and applicable rules of conduct and ethics of the profession
12. Identify and Describe the different sub-disciplines of practice
13. Discuss the future role of civil engineers and the challenges they face

14. Understand and apply the ethics and basic rules of conduct of the profession
15. Identify, research and discuss contemporary issues and challenges facing civil engineers
16. Understand an apply general recommendations for the professional practice of civil engineering

Course Resources

Course Website(s)

Required Course Texts and Materials

Civil Engineer's Handbook of Professional Practice, K.L. Hansen and K.E. Zenobia, ASCE Press-John Wiley and Sons, 2011
The Vision for Civil Engineering for 2025, ASCE 2006
Ethics, Guidelines for Professional Conduct for Civil Engineers, ASCE January 2008
The ASCE Code of Ethics, Principles, Study and Applications, ASCE 2012
Additional reading material and handouts will be given in class

Optional Course Texts and Materials

Assignments and Grading Scheme

Grading System

0 to 4 (where 2 is the least pass mark)

Grading Policy

The course grade is calculated according to the following:

Two Tests or Projects	60%
Assignments and Class Participation	10%
Final	30%
Total Points	**100**

Course Policies.

Classroom Protocol

1-Attendance of all scheduled lectures and additional sessions is mandatory
2-Computer literacy and access to internet are required and non-negotiable.
3-Self learning is a key to continuous self-development and professional improvement; through the assignments and projects, this course will try to create conditions and situations where individuals or teams will be caused to research, collect, study and synthesize information in order to acquire knowledge, know how, and design skills.
4-All students are supposed to be proficient in oral and written English communication skills. Presentation, language, and professionalism will be considered in the grading of assignments, projects, and all other course work.
5-Honesty on Assignments, Projects, Exams, and Course work:
You will be assigned individual and group work. You are also welcome, and encouraged, to work on assigned individual problems and projects with fellow students. A good way to learn the material is in small study groups. Such groups work best if members have attempted the problems individually before meeting as a group. Of course, the assignment solution, project, or work that you turn in should reflect your own understanding, and not that of your fellow students. In other words, do not copy directly from other students. If it is obvious that such direct copying has occurred, we will disallow that homework. Individual work is required on all examinations taken in class.
Working groups will be formed at the beginning of the semester and will be asked to carry multiple assignments culminating in oral presentation and the submittal of written reports.
By attending lectures, taking exams, and presenting their work for grading all students are implicitly assumed to have read and agreed with all of the above.
As a general rule no make-up exams will be allowed. Class attendance and participation will be evaluated and included in the course grade.

This course is related to the following program outcomes:

2. Delivery and Assessment of Program Outcomes: (f) an understanding of professional and ethical responsibility; specifically with respect to the importance of professional licensure. (g) an ability to communicate effectively; specifically to write a document with the context, organization, format and style fitting the intended reader and purpose. (h) the broad education necessary to understand (know and

comprehend) the impact of engineering solutions in a global, environmental, economic, and societal context. (i) a recognition of the need for, and an ability to engage in lifelong learning; specifically recognize the need, identify the resources and opportunities, and conduct inquiry an research through independent projects and open ended problems.(j) knowledge of contemporary issues; specifically to identify and describe several contemporary issues and their impact on engineering activities and practice.
Assessment is accomplished through questions, similar in format to the FE examination, on the final exam. Questions are approved by the Program Assessment Committee. Attained by the students when 70% or more of the students score 70% of the points allocated to questions.

Delivery of Program Outcome: (h) the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context. Specifically the knowledge of the impact of engineering solutions ina global, economic, environmental, and societal context, and the comprehension of the impact of engineering solutions in a global, economic, environmental, and societal context

Important Dates to Remember

Topics covered and course schedule

Week	**Topic**
Week 1	Definition and role of the Civil Engineering Profession.
Week 2-3	History and Heritage
Week 3-4	Professional and Legal organization of the profession and professional orders and societies
Week 5	Sub-disciplines of study and practice
Week 6-7	Ethics and Conduct
Week 8	Future Role of the Civil Engineer (ASCE Vision 2025)
Week 9-10	Challenges of Professional Practice and Contemporary Issues and Challenges
Week 10-14	Assigned case studies on climate change and global environmental issues and group projects discussion

APENDIX II: The CLIMASP Course Modules Template Example

Course	Curriculum and Hypermedia
Module 1	Definition and role of the Civil Engineering Profession
Key Concepts	Civil Engineering, Profession, Societal Role
Overview	Ask the students what a civil engineer does, go over the definition of the profession of engineering, and the etymology of "civil engineer"
Aim	Identify and describe the role of the Civil Engineer in society
Learning Outcomes	Describe the role of the Civil Engineer in society
Units	N/A
Readings	As assigned
Activity	Class open discussion, followed by anecdotal evidence provided by the students, and a presentation of what a "profession" is, what "civil" means when with "engineering", and what a "civil engineer" contributes to society in very general terms
Module 2	History and Heritage
Key Concepts	History, Heritage, Architecture, Builder, Civil Engineer, Historical role and common heritage, civilization
Overview	Review the recorded history of engineers and the different roles played through history and the heritage of the profession and its historical role in society
Aim	Be able to identify the particular history of civil engineering through the different historical accounts of architects and builders then civil engineers in the general history of mankind and identify the rich heritage of the profession across the centuries of recorded history and identify and describe the achievements of famous engineers
Learning	Describe the history and heritage of the profession and recall the

Outcomes	achievements of famous engineers
Units	N/A
Readings	As assigned
Activity	**Overview**
	Class open discussion, then live search on internet for the history of the profession and the accounts of great achievements of the profession; timeline of recorded history and civilizations with names and engineering projects as markers; individual assignment to research and present a famous civil engineer discussed in class and selections of students tabulated with respect to historical era, location, and achievements
Module 3	Professional and Legal organization of the profession and professional orders and societies
Key Concepts	Order of Engineers, Association, Legal Organization of the profession,
Overview	Identify the different forms under which the profession is organized in Lebanon and the USA and the applicable laws
Aim	Explore the different models of professional organization and the laws and rules that regulate it
Learning Outcomes	Identify forms of organization of the profession in Lebanon and the USA and the applicable laws
Units	N/A
Readings	As assigned
Activity	**Overview**
	Live exploration on internet of the websites of the Order of Engineers in Lebanon and the websites of the ASCE, ICE, and the NSPE and their content; reading on most relevant parts of the Engineering Law in Lebanon; discussion and comparison in class of the different

	organizational models of the "self organized" engineering profession versus common syndicates or scientific societies .
Module 4	Sub-disciplines of study and practice
Key Concepts	Sub-disciplines, specialty, study courses, areas of professional practice
Overview	Introduction of the different sub-disciplines of study and practice in Civil Engineering
Aim	Discuss and identify the different specialties of civil engineering and how they relate to the sub-disciplines of study and practice
Learning Outcomes	Identify and Describe the different sub-disciplines of practice
Units	N/A
Readings	As assigned
Activity	**Overview**
	Review of the different recognized sub-disciplines of civil engineering and how they relate to study areas and fields of specialization as well as the fields of practice to which they lead; students are asked to classify the courses of their study program under the different areas of specialty, then they are asked to select a sub-discipline and chart a course of graduate study in that area leading to specialized practice
Module 5	Ethics and Conduct
Key Concepts	Ethics, Professional Conduct, Laws
Overview	Introduction and review of the Ethics that characterize the civil engineering profession, and the required professional conduct, as well as the legal texts and laws that frame the practice
Aim	Develop a working understanding of professional ethics and conduct
Learning Outcomes	Understand and apply the ethics and basic rules of conduct of the profession

Units	N/A
Readings	As assigned
Activity	**Overview**
	Class guided reading and discussion of the ASCE Canons of Ethics as well as the relevant articles of the Law Organizing the Engineering Profession in Lebanon; review and comparison of similarities and wording; Case studies reviewed from various sources and additional ones assigned for group review, discussion/and or presentation
Module 6	Future Role of the Civil Engineer (ASCE Vision 2025)
Key Concepts	Future role of the civil engineer, multi-dimensional problem solver, steward to the environment and guarantor of the well being of the community
Overview	Presentation of the future role of the civil engineer as set in Vision 2025 of the ASCE with emphasis on sustainability and the various issues surrounding the stewardship to the environment and the maintenance of the well being of human communities
Aim	Develop an understanding of the future role of the civil engineer as set in Vision 2025 of the ASCE with emphasis on sustainability and the various issues surrounding the stewardship to the environment and the maintenance of the well being of human communities
Learning Outcomes	Demonstrate an understanding of the future role of the civil engineer as set in Vision 2025 of the ASCE with emphasis on sustainability and the various issues surrounding the stewardship to the environment and the maintenance of the well being of human communities
Units	N/A
Readings	As assigned

Activity	**Overview**
	Class guided reading of select parts of Vision 2025 and other related documents followed by open discussion of the multidimensional role of the civil engineer and the challenges the younger generation have to face; re-formulation of the mission of civil engineering as a steward to the environment and a guarantor of the well-being of communities and their economic prosperity and sustainability
Module 7	Challenges of Professional Practice and Contemporary Issues and Challenges
Key Concepts	Contemporary Issues, Challenges, Flexible and Adaptive Professional Practice
Overview	Presentation of the challenges faced by the professional practice in the coming decades, the contemporary challenges posed by demographic growth, finite resources, climate change (global warming, desertification, severe weather, environmental pollution) and the need to be flexible and adaptive and ready to reverse tradition engineering paradigms
Aim	Develop an understanding of the challenges faced by the professional practice in the coming decades, the contemporary challenges posed by demographic growth, finite resources, and the need to be flexible and adaptive and ready to reverse tradition engineering paradigms
Learning Outcomes	Identify, research and discuss contemporary issues and challenges facing civil engineers
Units	N/A
Readings	As assigned
Activity	**Overview**

	Class open discussion, review of the debate on climate change and global warming and its impacts on the practice of civil engineering at the level of design, operations and management; discussion of the probable causes of climate change and the cumulative impact of human demographic growth, finite natural resources; review of traditional "engineering design paradigms" versus the required adaptability and flexibility required i future practice where we will need to do more with less.

Module 8	Assigned case studies on climate change and global environmental issues and group projects discussion
Key Concepts	Climate change, global environmental challenges, sustainability, impact reduction, doing more with less
Overview	Research and present how one particular impact of Climate change affects the civil engineering profession in one particular field, and discuss the possible remedies or changes in practice to face the challengethrough a guided group project integrating all concepts learned
Aim	Integrate all the information received during the course into one research project about the challenges posed by Climate change to the civil engineering profession and how to face those challenges though the practice
Learning Outcomes	Identify, research and discuss a particular issue related to climate change and the challenges facing civil engineers because of it and develop general recommendations for the professional practice to remedy the impacts
Units	N/A

Readings	N/A
Activity	**Overview**
	Guided project development on the basis of groups of no more than 4 students culminating in one power point oral presentation and the submission of a final report. The presentation are made to the whole class and discussed afterwards

Solid Waste Management

Department of Civil Engineering, School of Engineering

Lebanese American University

Fall Semester ……

Instructor Information

Instructor: Dr. Mazen M. Haydar
Office Location: Engineering 702
Telephone: Office
Office Hours: After Class
E-mail: mazen.haydar@lau.edu.lb
Website:

Course Identification

Course Number: CIE 520
Course Name: Solid Waste Management
Course Location: Zakhem 404 - Byblos Campus
Class Times: TR 6:30 – 7:45 PM
Prerequisites: None
Faculty Web Page:

Course Description/Overview

This course deals with types and composition of municipal solid waste; storage, collection, and transfer of solid waste; treatment alternatives; final disposal; environmental monitoring of solid waste facilities; solid waste management; and environmental regulations related to solid waste.

Course Learning Objectives

The aim of this course is to understand the need for solid waste management, the consequences of poor solid waste management and how to develop a complete solid waste management plan, from waste characterization, to estimating storage volume, selecting waste collection system and providing safe disposal of wastes at a municipal solid waste landfill.

Course Content Learning Outcomes

At the conclusion of this course, each student will be able to do the following:

5- Estimate generated waste quantities and storage capacity.
6- Identify waste collection and transport methods.
7- Identify waste processing or treatment options (reuse, recycling, etc.).
8- Know the basic design elements of an engineered landfill.
9- Understand landfill permitting, operation, and environmental monitoring.

Course Resources

Course Website(s)

Required Course Texts and Materials

Integrated Solid Waste Management: Engineering Principles and Management issues, 1993, by George Tchobanoglous, Hilary Theisen, and Samuel A. Vigil, McGraw-Hill Eds.

Optional Course Texts and Materials

None.

Assignments and Grading Scheme

Grading System

Grading Policy

Evaluation of the student's final grade in the course will be based on his/her performance throughout the course and will be a combination of the following:

Item	Percentage
Term Paper (final report 15%, oral presentation 5%)	20%
Test 1	20%
Test 2	20%
Comprehensive Final Exam	40%

Completion of the online course evaluations is required. Students will not be able to access their course grades until they have completed the course evaluations.

Course Policies

Structure

Lecture	Two 75-minute lectures per week
Laboratory	None
Medium	All material explained in class and on the whiteboard
Tests	2 Tests-75 minutes - closed book

Final	120 minutes, comprehensive, closed book
Term Paper	Final report to be submitted, followed by a Class oral presentation.

Policy

Attendance

You are expected to attend all classes and arrive on time. Obtain prior clearance for planned absences.

Academic Integrity

The instructor will adhere to all LAU policies regarding academic integrity as stated http://www.lau.edu/policies.

Homework Policy

Assignments must be typed and must be turned in at the beginning of class on the day it is due, with no exceptions.

Exam Policy

No make-up for a test or a final will be given under any circumstance. In case of absence, the grade of the exam will be considered to be zero.

Cheating

Students caught cheating on an exam receive a grade of zero on the exam.

Course Schedule

Topic	Description
1	Types of waste
2	Solid waste composition and properties.
3	Solid waste generation and quantities.
4	Waste separation at source
5	Types of solid waste storage.
6	Solid waste collection and transport

7	Solid waste processing, recycling and reuse.
8	Landfill permitting.
9	Basics on landfill design and operation.
10	Environmental monitoring of landfills.
11	Post-closure care of landfills.
12	Leachate onsite and offsite management.
13	Landfill gas management.
14	Recycling.

APENDIX II: The CLIMASP Course Modules Template Example

Course	Solid Waste Management
Module 1	**Waste Characterization**
Key Concepts	Waste composition, waste characterization, waste sources and types.
Overview	In this module, we will introduce the sources of non-hazardous and hazardous

	solid wastes and discuss the difference between such wastes. It is important to determine which types of waste will be generated for a given development and how to develop a solid waste management plan that addresses handling, storage and treatment of the identified waste types. Waste types typically include residential, commercial, institutional, industrial, and agricultural. Other wastes, such as special wastes are becoming an important fraction of generated wastes that must be addressed with equal importance to the conventional waste types. In order to characterize the generated wastes, one must estimate their average daily generation rates. Generation rates of a given type of waste vary between countries and even between cities and neighborhoods within a given country. Thus, it is essential to study and understand the various factors, most specifically socio-economic factors that affect waste generation rates. Waste characterization requires a detailed sampling strategy in order to fully understand the physical, chemical and biological characteristic of the waste sample. Physical parameters such as unit weight, moisture content, and hydraulic conductivity; chemical parameters such as energy content; and biological parameters such as organic fraction and biodegradability factor all play an important role in selecting waste storage and processing measures. Weight-volume relationships are introduced in this module to help understand the type of physical, chemical or biological transformations needed to store, manage and treat the waste.
Aim	The main objective of this module is to introduce waste types and sources, understands their composition and analyse their properties.
Learning Outcomes	The student shall be able to: • Develop a basic waste sampling strategy for a given waste type • Understands waste composition • Understands physical, chemical and biological properties of solid wastes • Estimate waste generation rates
Units	1.1 - Sources, types, and composition of municipal solid wastes 1.2 - Physical, chemical, and biological properties of MSW

	1.3 - Solid waste generation and collection rates
Readings	Chapters 3, 4 and 6 *Integrated Solid Waste Management: Engineering Principles and Management issues, 1993, by George Tchobanoglous, Hilary Theisen, and Samuel A. Vigil, McGraw-Hill Eds.*
Activity	Assignments: • Estimate waste generation rates for a project development • Calculate waste volumes (uncompacted and compacted) • Calculate energy content of a waste sample
Module 2	**Waste Storage, Collection and Transport**
Key Concepts	Waste storage, waste separation at source, waste collection system, collection frequency, collection routes, and waste transfer stations.
Overview	It may be intuitive that solid wastes must be stored prior to collection. However, the way wastes are stored and the storage conditions may impact their treatment options and the cost of such treatment. Throughout this module, we explain the concept of waste separation at source, which results in the preservation of the physical integrity and quality of the waste resources. The socio-economic and health advantages of waste separation at source are evaluated versus that of separating wastes at a sorting facility. We shall address the various initiatives to promote waste separation at source, starting with environmental awareness to financial incentives and legislative actions. Successful examples of waste separation at source programs will be shared. Waste storage varies between urban and rural settings. It has to consider the land use and be in harmony with its surroundings in order to minimize any impacts on visual amenity. In urban environments, waste storage shall vary between low-rise, medium-rise and high-rise residential buildings in urban settings and that .The integration of waste storage rooms into the design of these buildings is evaluated in comparison with curbside waste storage and collection. The criteria for the selection of the container location, type and storage capacity is also discussed in this module. Special note will be given on the compatibility of waste containers with waste collection trucks. For high-

	rise buildings, the socio-economic and environmental benefits of installing a garbage chute (single, dual or single chute with a diverter) is evaluated versus that of providing conventional waste separation and transfer solutions. Advances in waste storage and transport have introduced the concept of pneumatic waste storage and transport. The popularity of this system is increasing in the Arabian Gulf region. If not evaluated properly, such system may be cost ineffective and may lead to several operational issues. In this module, we shall introduce the design criteria and technical requirements for such system. We shall also present several examples where such system is operational. Waste collection services are typically conducted through the municipal authorities, who in turn dictate the waste collection frequency and waste collection routes. In cases where private contractors are authorized to collect wastes, it is imperative to set criteria for the collection equipment, collection frequency and collection routes. Such criteria must be approved by the Owner of the development and the municipal authorities. The incompatibility between waste collection containers and waste collection trucks may hinder the collection process, making it time consuming and costly. In this section, we shall discuss the various waste collection methods and equipment used. We will introduce the main two types of waste collection systems: stationary and hauled collection systems, and present an evaluation of these systems in terms of labor, time and costs. Finally, we shall introduce waste transfer stations and highlight their importance in reducing waste transportation costs, which typically overburden the budget of any solid waste management system. Waste transfer stations vary in their size and design. We shall discuss the permitting requirements of these stations and evaluate the different types and designs in urban and rural settings. The importance of health and safety requirements to operate such facility is highlighted. The selection of the transfer system, whether direct load, discharge and load, or a combination of both is evaluated in terms of equipment, labor, and environmental risks.
Aim	The main objective of this module is to introduce explore various types of

	waste storage, waste separation at source, waste collection systems and waste transfer stations.
Learning Outcomes	The student shall be able to: • Design a waste storage and collection plan • Determine the type of waste collection system and the need for a waste transfer station
Units	2.1 – Waste Handling and Separation, Storage, and Processing at the Source 2.2 – Collection of Solid Waste 2.3 – Transfer and Transport
Readings	Chapters 7, 8 and 10 *Integrated Solid Waste Management: Engineering Principles and Management issues, 1993, by George Tchobanoglous, Hilary Theisen, and Samuel A. Vigil, McGraw-Hill Eds.*
Activity	Assignments: • Select the location and type of waste containers • Estimate the storage volume of waste containers • Develop a waste separation at source program • Prepare a preliminary waste collection route
Module 3	**Waste Processing and Transformation**
Key Concepts	Waste sorting plant, waste separation, waste processing, composting and combustion.
Overview	Following the collection and transfer of wastes, mixed wastes must be separated, and then their integrity and quality are evaluated in order to assess their potential for reuse or recycling. An overview of the various sorting steps to be conducted at a waste sorting plant is introduced in this module. For each waste category, conveying system and equipment needed for processing and treatment are presented. Various waste processing techniques including mechanical screening, air classification, magnetic separation, shredding, and compaction are also presented. We shall present several diagrams showing the various potential separation and processing cycle of a mixed waste sample

	(from the receiving area to shipment). This section will be closed by discussing the health and safety requirements for operating a sorting plant. The second part of this module will focus on the chemical and biological transformations that can render the waste more stabilized. The main two transformation techniques include composting and combustion. While composting is a natural process that renders the organic fraction of the waste into a stabilized compost product with almost minimal residue, combustion processes are typically more complicated and require extensive environmental monitoring and treatment. We will discuss the design criteria for composting plants, and present the main two types of composting processes (agitated and aerated). We shall evaluate these two systems in terms of space required, labor, operation, process control and duration. Furthermore, we will introduce in-vessel composting techniques that are commercially available. Finally, we will present the main criteria used to evaluate the quality of the final compost product and its market value. Combustion is considered advantageous when waste production is high with limited space for landfilling. Combustion significantly reduces the waste volume and can be used to recover significant quantities of energy. For combustion, we shall present and evaluated the main two techniques of combustion (mass derived fuel and refuse derived fuel). We shall discuss necessary control equipment needed to minimize environmental risks associated with liquid emissions, gaseous emissions and solid residues. We will conclude this section with a technical evaluation between composting, landfilling and combustion.
Aim	The main objective of this module is to introduce waste processing techniques that are commonly used at a waste sorting plant and waste transformation through composting and combustion.
Learning Outcomes	The student shall be able to: • Understand the processing line of a waste sorting plant • Evaluate the advantages and disadvantages of waste transformation using composting and combustion
Units	3.1 – Separation and Processing and Transformation of Solid Waste 3.2 – Materials Separation and Processing Technologies

	3.3 – Biological and Thermal Conversion Techniques
Readings	Chapters 9, 12, 13 and 14 *Integrated Solid Waste Management: Engineering Principles and Management issues, 1993, by George Tchobanoglous, Hilary Theisen, and Samuel A. Vigil, McGraw-Hill Eds.*
Activity	Assignments: • Identify appropriate waste separation and processing techniques for various compositions of waste streams
Module 4	**Landfill Permitting, Design , Operation and Monitoring**
Key Concepts	Landfill permitting, Landfill design and operation, waste placement, leachate management, landfill gas management, and environmental monitoring of landfills.
Overview	Not in my back yard, that is what most repeats when landfill permitting is being discussed. The social and environmental risks associated with the landfill process make it a challenge to site new landfills. In this module, we shall discuss the climatic, physical, hydrogeological, social and environmental parameters for siting a new landfill. We will briefly discuss the environmental impact assessment (EIA) process required prior to environmentally accepting a site for landfill construction. We will briefly discuss the various types of landfills and then provide an overview of the basic design elements of a municipal solid waste landfill. We shall carefully explore the liner system and leachate collection system at the bottom of the landfill, as well as the landfill cover system. The required steps for site preparation, the strategy for waste placement, and the day-to-day operations will be presented. We shall discuss the main challenges facing the operation of MSW landfills, specially odors, leachate seeps, and leachate and landfill gas management. In this module, we shall discuss the main factors affecting leachate generation rates. The hazardous nature of leachate makes it a risk to the groundwater and to any ecosystem downstream of the landfill. Thus, leachate must be adequately collected from the bottom of the landfill and not allowed to seep horizontally or infiltrate vertically downward. We shall explore the various

	elements of leachate collection system that can help maintain a safe leachate head on the liner. On-site leachate management techniques will be presented, including leachate recirculation and onsite/offsite leachate treatment. The main advantages and disadvantages of leachate reticulation will be evaluated. Furthermore, we shall present the various surface and subsurface leachate recirculation techniques and explore the results of a field-scale testing of a permeable blanket and the geotechnical sensing system installed to monitor leachate movement in the blanket. We shall explore the composition of landfill gas and discuss the importance of landfill gas management in the operation of municipal solid waste landfills, especially landfills that operate as a bioreactor. The conditions that control landfill gas generation and migration will be discussed in this section. Landfill gas collection methods and on-site treatment for the recovery of energy will be addressed as well. Finally, we shall address the various geotechnical and environmental monitoring needed throughout the life of a landfill and in post-closure care period. We will introduce the need for maintaining the landfill cover and the stormwater system. Also, we shall discuss the rationale for placing groundwater and gas monitoring wells. An evaluation of the landfill operational and maintenance life cycle will be given at the end of this section.
Aim	The main objective of this module is to introduce the safe disposal of wastes in engineered landfills, the main design criteria and landfill operational activities, landfill leachate and gas management alternatives, and landfill environmental monitoring.
Learning Outcomes	The student shall be able to: • Know the criteria for landfill siting • Understand the basic design elements of an engineered landfill • Evaluate leachate and landfill gas management alternatives • Know about environmental monitoring of landfill during lifetime and in post-closure care
Units	4.1 – Disposal of Solid Wastes 4.2 – Closure of Landfills

Readings	Chapters 11 and 16 *Integrated Solid Waste Management: Engineering Principles and Management issues, 1993, by George Tchobanoglous, Hilary Theisen, and Samuel A. Vigil, McGraw-Hill Eds.*
Activity	Assignments: • Draw cross-sections of landfill and landfill elements • Determine the location of groundwater monitoring wells • Estimate the landfill design capacity
Module 5	**Impact of Solid Waste Management on Climate Change**
Key Concepts	Climate change relation to solid waste management, waste to energy, and landfill greenhouse gas emissions.
Overview	In this module, we shall discuss the relationship between solid waste management and climate change through the direct and indirect impacts of solid waste management strategies on air quality. The uncontrolled emissions of greenhouse landfill gases to the environment can be considered the major impact of solid waste facilities on air quality, thus control measures have been developed and enforced to reduce such impacts. We shall present the recovery of landfill gas and its conversion to energy. Also, we shall explore international standards related to the control of landfill gas emissions. Other solid waste management measures that have a considerable impact on air quality include waste transportation, the use of transfer stations, and waste treatment options (specifically composting and combustion). Finally, the lack of an adequate solid waste management system has an indirect impact on air quality through uncontrolled open air burning of solid wastes and energy losses due to low recovery rates and (low recycling potential).
Aim	The main objective of this module is to explore the impact of solid waste strategies on the release of air emissions and greenhouse gases and to develop sustainable measures to reduce the impact of solid wastes on climate change.
Learning Outcomes	The student shall be able to: • Understand the main impacts of solid waste management on air

	quality and climate change. • Evaluate sustainable strategies to reduce impact of solid wastes on the use of energy and consumption of natural resources.
Units	5.1 – Landfill gas to Energy 5.2 – Impact of sustainable waste management on air quality
Readings	*Hand notes prepared by the Instructor.*
Activity	Assignments: • Estimate landfill gas rates from a typical landfill and greenhouse gas quantities generated from a typical MSW landfill. Project: • Prepare a term paper that addresses the impact of solid waste strategies on air quality and climate change. Alternatively, you may select topics related to technologies used in solid waste processing and treatment.

Course Name: Hydrology

Course Location: Byblos Campus

Class Times: T-Th 2:00-3:15

Prerequisites: Hydraulics

Faculty Web Page:

Course Description/Overview

CIE521 Hydrology [3-0, 3 cr.] Occurrence of water, precipitation, interception, depression storage, infiltration, evaporation, transpiration, snow melt, well hydraulics, stream flow, data sources, instrumentation, runoff and hydrographs, hydrograph routing, probability in hydrologic design, and introduction to hydrologic modeling. Prerequisite: CIE322 Hydraulics.

Course Learning Objectives

At the conclusion of this course, each student will be able to do the following.

1. To understand the interaction among runoff, floods, droughts, and stream water quality
2. To predict the inter-relationships between rainfall, runoff, floods, droughts, and stream quality
3. **To provide the student with a clear and thorough presentation of the theory and applications of the occurrence, distribution, movement, and properties of the water of our planet the Earth.**
4. **To learn the underlying hydrologic science and processes associated with water flow**
5. To analyze hydrological data and understand hydrological modeling
6. To learn concepts of stream flow
7. To learn the factors affecting water yield, low flows, peak flows, surface erosion, landslides, water quality, large wood, and stream quality.
8. To describe how water resources interact

Course Resources

Course Website(s)

Required Course Texts and Materials

- Material will be distributed in class. Readings will be assigned whenever necessary

Grading System

Grading Policy

Exam 1:	25%
Exam 2:	25%
Final:	35%
Assignments & Project	10%
Attendance and Participation:	5%

Course Policies

Structure

	Description
Lecture	Two 75-minute lectures per week
Laboratory	None

Medium	all material explained in class and on the whiteboard
Tests	Two 75 minute exams
Final	120 minutes, comprehensive
H.W.	Assignments
Projects	(1) Design project

Policy

Attendance is obligatory.
Homework is to be submitted according to pre-arranged schedule

Additional Notes

- A student can miss no more than 4 sessions of instruction. By the 5th session, the instructor may ask the student to drop the course.
- Plagiarism: students caught cheating on an exam receive a grade of Zero on the exam in the first cheating attempt and a warning. Students caught cheating for the second time in the same course receive an F grade in the course and a second warning. A grade of zero on an exam resulting from cheating must be counted in the student's course grade. The zero cannot be dropped in computing the final grade in case the instructor has a policy of allowing students to drop their worst exam grade.
- Any student who receives 3 warnings will be suspended

Course Schedule

Week 1	Introduction to hydrology and the hydrologic cycle
Week 2	Precipitation

Week 3	Interception and depression storage
Week 4	Infiltration
Week 5	Infiltration
Week 6	Evaporation and Transportation
Week 7	Stream flow
Week 8	Hydrologic data sources and monitoring networks
Week 9	Probability and Statistics
Week 10	Runoff and Hydrographs
Week 11	Runoff and Hydrographs
Week 12	Unit Hydrographs
Week 13	Unit Hydrographs
Week 14	Hydrograph Routing
Week 15	Groundwater Hydrology

Course	***Hydrology***
Module 1	Hydrologic Cycle
Key Concepts	Hydrologic cycle definition and concepts
Overview	Understanding the hydrologic cycle: The water cycle across the globe and across climate changes and differences
Aim	The aim of this module is to make students understand the hydrologic cycle elements
Learning Outcomes	At the end of this module learners will be able to: • Differentiate between different climates • Understand the water cycle of Earth • Determine the temporal changes in hydrology
Units	Unit 1.1 Overview
Readings	Material Provided in class
Activity	**Overview** Assignment 1.1: Readings
Module 2	Precipitation and Infiltration
Key Concepts	Precipitation, Interception, Depression Storage, and Infiltration

Overview	This module introduces the concept of Precipitation, Interception, Depression Storage, and Infiltration on top of soils. Students will learn the different steps a drop of water will go through before being stored in soil
Aim	To be familiar with The concepts of Precipitation, Interception, Depression Storage, and Infiltration
Learning Outcomes	• At the end of this module learners will be able to: • Understand the different patterns of this process • Calculate infiltration
Units	Unit 2.1: Precipitation Unit 2.2: Interception Unit 2.3: Storage Depression Unit 2.4: Infiltration
Readings	Material Provided in class
Activity	**Overview**
	Assignment 2.1: Calculate precipitation Assignment 2.2: Calculate Infiltration
Module 3	Evapotranspiration (ET)
Key Concepts	Evaporation, Transpiration and Evapotranspiration Concepts
Overview	This module introduces the concept of ET, and the different equations used to predict ET in different regions and climatic conditions
Aim	To be familiar with ET equations and calculation
Learning Outcomes	• At the end of this module learners will be able to: • Understand the different ET equations • Be able to choose the right ET equation based on conditions • Calculate ET
Units	Unit 3.1: Get familiar with ET concepts

	Unit 3.2: Discuss the Penmann Monteith ET equation Unit 3.3: Discuss the FAO Heargreaves ET equation Unit 3.4: Calculate ET of different crops
Readings	Material Provided in class
Activity	**Overview**
	Assignment 3.1: Solar radiation calculation Assignment 3.2: Reference ET calculations Assignment 3.3: Crop ET calculation
Module 4	Stream Flow and Hydrographs
Key Concepts	Introducing: - Stream flows - Probability Concepts - Runoff - Hydrographs and Unit Hydrographs
Overview	Define the principles of hydrologic analysis and hydrograph computaions
Aim	To introduce the student to the ways estimates and calculations are done as to the amount of water passing through a certain point at a given time
Learning Outcomes	At the end of this module learners will be able to: • Design a hydrograph • Make calculation pertaining to hydrographs
Units	- Unit 4.1: Stream flows - Unit 4.2: Hydrologic data sources and monitoring networks - Unit 4.3: Probability and Statistics - Unit 4.4: Runoff and Hydrographs

	- Unit 4.5: Unit Hydrographs
Readings	Material Provided in class
Activity	**Overview**
	Assignment 4.1: Design and make calculation on hydrographs using different methods

Course Description/Overview

This course introduces the organization of individual organisms into populations, communities, and ecosystems. It focuses on the interactions between living organisms and their physical environment. Concepts such as diversity, competition, natural selection, adaptation, climate changes, migration, extinction and deforestation are covered. Additionally, the course tackles concepts of environmental microbiology in relation to pollution, remediation and recycling of liquid and solid wastes.

Course Learning Objectives

This course introduces students not majoring in biology, especially civil engineering students, to the basic principles of ecology, thus enabling them to understand how organisms interact with the biotic and abiotic environment and allowing them to come up with solutions to challenges posed by expanding populations as well as development.

The specific learning objectives of this course are:

1. To understand the scientific method and its application in ecology.
2. To develop a hierarchal perspective and approach to ecology.
3. To familiarize students with the major ecological concepts, patterns and processes.
4. To familiarize students with the natural history of aquatic and terrestrial ecosystems and the environmental factors that determines the biological diversity of these environments.
5. To provide students with the scientific background necessary to critically analyze major ecological problems and their solutions

Course Content Learning Outcomes

When completing this course, students will be able to

12. Have acquired well established scientific principles and concepts that form the knowledge basis for an appropriate interaction with the natural environment.
13. Develop the scientific ability to evaluate the reliability of sources of information pertaining to ecological issues.
14. Develop the ability to analyse and interpret different representations of ecological data (graphs, charts, tables, diagrams….).
15. Develop the ability to analyse ecological problems, caused by human population growth, economic growth and development, as well as their solutions logically and critically.
16. Understand the natural history of major terrestrial and aquatic ecosystems and their inhabitants.
17. Understand the characteristics of populations, as well as the factors influencing population structure and processes.
18. Explain interactions among organisms and the evolutionary effects of the interactions on the species involved.
19. Understand the factors controlling ecological communities and ecosystems.
20. Apply the ecological principles acquired in this course when addressing problems in their field of study.
21. Have a heightened sense of ethics and morality in dealing with biodiversity, the physical environment, or people of other cultures and religions.

Course Resources

The chapters of the textbooks (Greipsson 2011 (G); Miller and Spoolman 2012(MS)) pertaining to each lecture are provided in the following tentative schedule. You are encouraged to complete reading the chapter pertaining to a lecture before you come to that lecture

Optional Course Texts and Materials

N/A

Assignments and Grading Scheme

Grading System

Grading:

Exam I	27%
Exam II	27%
Final Exam	27%
In-class Assessments and Assignments	14%
Attendance and Participation	5%

There will be no make-ups for any missed exam, assignment or assessment!!

Course Policies

Student Conduct:
In this course, you will develop an appreciation of the importance of honesty and integrity in scientific conduct. You will be expected to adhere to the Lebanese American University's honor code and student code of conduct at all times. I will not tolerate any plagiarism, cheating on exams, failing to participate in group work, and engaging in disruptive behavior in the lecture. Kindly report any violations of the honor code to me as soon as possible.

Policy on Cheating and Plagiarism:
Students caught cheating on an exam/quiz/assessment will receive a grade of zero on that exam/quiz/assessment in their first cheating attempt and receive a warning. Students caught cheating for the second time will receive a grade of "F" in the course and another warning.

Plagiarism on assignments and project work is a serious offense. If plagiarism is detected, a student will be subject to penalty, similar to the cheating case, which ranges from receiving a zero on the assignment concerned to an "F" in the course in addition to a warning.

All written work submitted to me (in any form) should include the following statement *in verbatim*: "In completing this work, I have abided by the Honor Code of the Lebanese American University." The statement should be signed.

Attendance Policy:

You are expected to attend all lectures. You will be responsible for all announcements made and material covered in any class you miss. Lectures start at 8:00 AM sharp; you may be denied access to class that day if you arrive more than 10 minutes late. Once you are in class, you cannot leave for any reason. If you choose to leave, you cannot come back and you will be considered absent for that day.

Please note that missing one third the lectures implies that you will have to drop the course. This is a university policy and will be strictly enforced.

Scheduled field trips constitute part of the course. You are expected to arrive on time on the day of the field trip. We will not wait for you if you are late. **Missing a fieldtrip is equivalent to missing three lectures.** Due to the nature of fieldtrips, students are expected to obey classroom rules during these trips. Smoking in the bus will **not** be tolerated but may be allowed during rest stops. Students leaving the group at any point during the fieldtrip do so at their own risk and may be issued a warning. Students may be allowed off the bus on the way back at the instructor's discretion. **Please bear in mind that a field trip is not a picnic or a hike!!**

Withdrawal Policy:
According to the university catalog, "Students wishing to withdraw from one or more courses must follow the withdrawal procedure provided by the Registrar's Office. Students withdrawing from courses after the late registration period and before the withdrawal deadline will receive Ws for all the courses in progress." **Please note that the last day to withdraw from classes this semester (please check with registrar.) Students wishing to withdraw the course must do so by themselves.**

Other Policies:
Exams: Exams will cover all the material discussed in class (including videos, guest lectures and assigned readings). There will be no make-ups for missed exams. A missed exam will receive a grade of zero. All exam grades count and none will be dropped. You are required to bring your IDs to exams. Cell phones and pagers must be turned off and put away during exams.

Class Conduct and Participation: You are expected to be physically and mentally present in all lectures. Eating, drinking and smoking are prohibited during class time. Cell phones and pagers must be turned off or set to silent mode during the lectures. They must also be out of sight. **If I see cell phones or pagers, they leave with their owners.** Disruptive behavior will not be tolerated in class and will be handled according to the university rules and regulations.

In-class activities may be given any time during the lecture. These may include out-door or in-door activities. They may also include short-answer questions, short essay questions or interpretation of graphs and/or tabular data.

You will not be allowed to make-up missed activities or assignments.

Difficulties and Special Needs:
If you are experiencing difficulties with course content or with anything that I can help you with, please let me know. Also inform me as soon as possible of any special needs you might have, particularly medical conditions that may require special accommodation.

Conflict Resolution:
If you are having problems with another student in the class, please bring it to my attention. If you have problems with me, please let me know as soon as you can. Any issues that we cannot resolve can be taken to the chairperson of the Department of Natural Science, Prof. Ahmad Kabbani.

Changes:
I reserve the right to make reasonable changes to this syllabus provided that I give all students registered in the class a timely notification of the changes to be made.

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

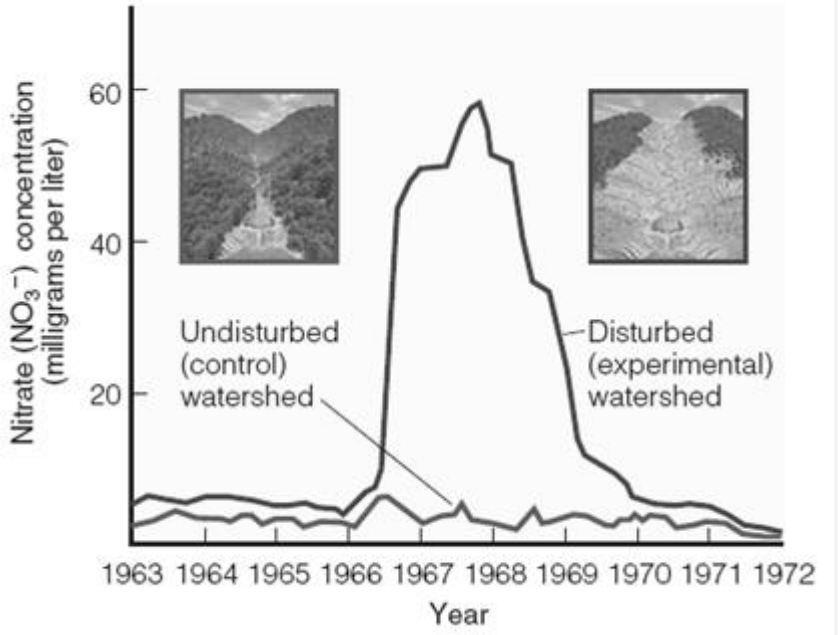
Week of Assignment	Topic	Reading
Week 1	1. Course syllabus and logistics Iintroduction	Course syllabus Chapters 2, 3

	2. Hierarchy of ecological organization 3. Scientific method and its applications in Ecology	
Week 2	1. Energy 2. Systems and how they respond to change 3. The abiotic environment: Climate	Chapters 2, 7
Week 3	The abiotic environment: climate, water, soil and light	Chapter 7 Chapter 8
Week 4	1. Populations, their growth, limits and control 2. Intraspecific and interspecific interactions	Chapter 5
Week 5, 6	1. Ecosystems 2. Ecosystem assembly and functioning	Chapter 3 Chapters 2, 5
Week 7	1. Succession 2. Major terrestrial and aquatic ecosystems	Chapter 4 Chapters 5
Week 8,9,10	1. Biodiversity 2. Ecological surveys	Chapters 4, 9, 10, Chapter 3, 7, 11, 12
Week 11	1. Ecosystem dynamics under changing climates	
Week 12	1. Environmental microbiology 2. Phytoremidiation and bioremidiation	Chapter 10
Week 13	1. Landscape ecology	Chapter 6

	2. Ecological landscape design 3. Ecological Natural hazards	
Week 14	1. Outcomes and measurements of Natural hazards 2. Doms, Roads, bridges and their ecological effects	
Week 15	Restoration ecology	Chapter 1, 14

Course	**Curriculum and Hypermedia**
Module 1	Curriculum: Different Types and Functions
Key Concepts	Curriculum theory and types, technology,
Overview	Module 1 is an introductory module where students are introduced to the course syllabus and key dates for this subject. In this module we cover an overview of ecological salient issues and introduce key concepts such as hierarchy of ecological organisations, laws of thermodynamics, population growth and the use of scientific method in ecology.
Aim	The overriding aim of this module is to introduce the subject and introduce students to scientific thinking through the discussion of the scientific method and its applications. The module also discusses ecological concepts such as the hierarchy of ecological organisation a key concept in Ecology.
Learning Outcomes	At the end of this module learners will be able to: • Use that in describing what is likely to happen in nature. • Ask a question or identify a problem to investigate.

	• Use scientific data through observation and measurement. Experiments may be used to study specific phenomena. • Understand major components of complex systems are environmental inputs, flows within the system, and outputs to the environment. • Understand law of thermodynamics • Understand population growth
Units	Chapter 2 – Hierarchy of ecological organization Chapter 3 – Scientific method and its application
Readings	
Activity	**Overview of Class Exercise** 1. In recent years, the controversy over whether humans play a major role in global warming was fueled by critics who stated "not enough good science" had been done. Using such concepts as the scientific process, peer review, and reliable science discuss why this may or may not have been an accurate statement. 2. Explain how the human body is intimately connected to the two laws of thermodynamics.



3. After looking at the figure above, explain the significant difference that occurred between 1966 and 1970 in terms of the two lines representing the control watershed and the experimental watershed.

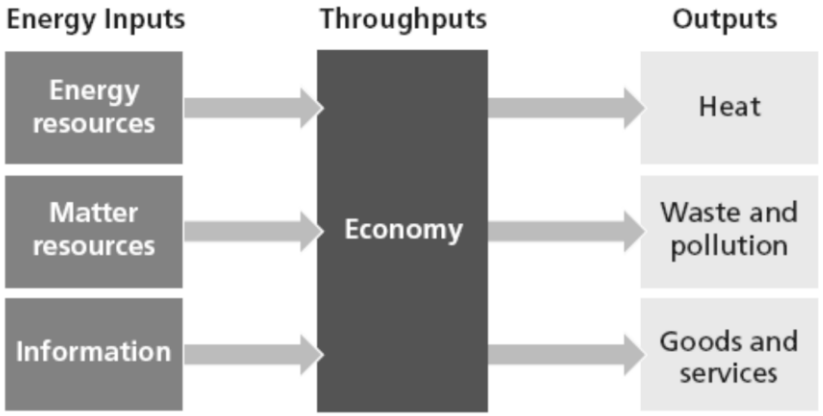
4. Much of the energy produced is lost before it can become useful. Explain how energy efficiency, or energy productivity, and the second law of thermodynamics may be useful in a discussion with another person on how to reduce CO_2 and other greenhouse gas emissions.

5. The population of any organism will increase, if the conditions are correct, until it reaches a point where the population cannot be sustained. This is a type

of feedback loop. What type of feedback loop is this and what are the conditions that cause the feedback loop to function?

6. How is the concept of an environmental threshold or tipping point important in regards to global warming?

7. Differentiate between a hypothesis, a guess, and a theory. Explain why it is important for non-scientists to understand how scientists use these terms when discussing something like global warming or evolution. Why might it be incorrect when a non-scientist dismisses a topic like these as being "just a theory"?



8. The figure above indicates the general flow within an economic system. For many years this concept has been thought of as indicative of individual nations, or subunits of nations. Now it is increasingly indicative of a global economy. What changes are occurring as a result of this change to the global economy?

	.
Module 2	Energy, systems and climate
Key Concepts	Energy, systems and climate
Overview	This chapter is building on chapter 1 and is using the scientific method and experimentation to shed some light on three key concepts: 1. Energy, 2. Systems and 3. Climate
Aim	The chapter presents the major components of complex systems, it is presenting concepts such as environmental inputs and outputs within systems in the environment. The chapter also addresses he major forms of energy such as kinetic energy and potential energy. The last part of the lecture is linking energy and systems to climate. Students are introduced to climate, its formation and its impact on ecosystems.
Learning Outcomes	At the end of this module learners will be able to: ○ Understand energy movement in Ecosystems ○ Understand ecological systems ○ Understand the basics of climate
Units	1. Chapter 2 : Energy 2. Chapter 7 systems and how they respond to change
Additional Materials	**Acid Rain The Invisible Threat (Video plus Lab)** Hands-on lab activities plus video. http://www.kelvin.com/Merchant2/merchant.mv?Screen=PROD&Store_Code=K&Product_Code=360042

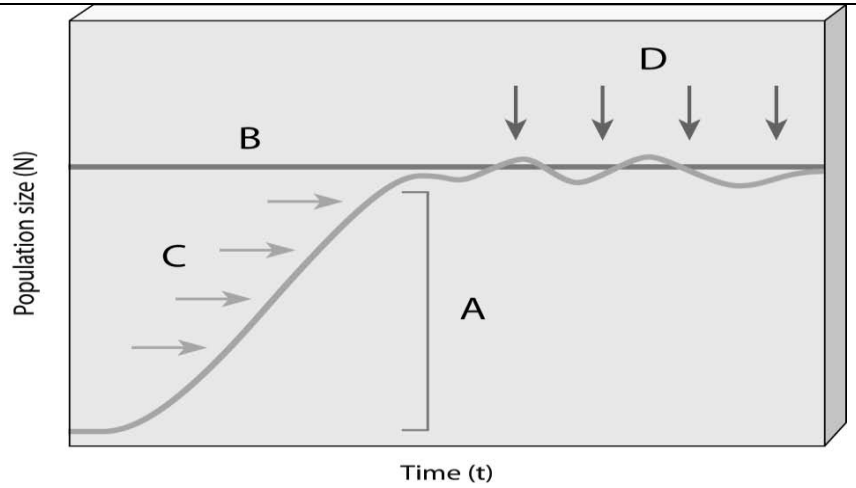
	The Particle Adventure An exploration of the fundamentals of matter from the Lawrence Berkeley Labs. http://www.particleadventure.org/
Activity	**Class Exercise Overview**
	4. Briefly summarize the component parts (e.g., heat from the tropics, dense salt water, melting ice, etc.) of the ocean currents as they travel from the North Atlantic to the Pacific and back. 5. What would be the result if the ocean's currents did not function? 6. Briefly summarize the El Niño Southern Oscillation. 7. Using the environmental factors of moisture and temperature, describe the relationship between the three types of biomes (e.g., grasslands or forests). **8.** The author indicates that attempting to strike a balance between exploitation of terrestrial natural capital and conservation of that capital is controversial. What might you say to a person whose livelihood comes from the timber industry (or mining, or agriculture making heavy use of irrigation) to encourage consideration of the ongoing degradation of the natural capital and its eventual impact on him/her?
Module 3	Climate Water soil and light
Key Concepts	Introducing the Abiotic Environment
Overview	The chapter will introduce the following key topics:

	1. Earth's weather and its linkage to atmospheric conditions such as temperature, pressure, moisture content, sunshine, cloud cover, precipitation, wind direction, and wind speed. 2. Climate is a region's long-term atmospheric conditions over decades. The two main factors in determining climate are average temperature and average precipitation. 3. The average climate—annual precipitation and temperature—determines terrestrial regions with characteristic types of natural ecological communities. According to these two factors, biomes form. 4. The major types of desert biomes are hot, medium, and cold. Human activities have created large desert cities, destroyed soil through urban development and off-road vehicles, salinized the soil through irrigation, depleted underground water supplies, disturbed land and polluted, stored toxic and radioactive wastes, and located arrays of solar cells and solar collectors. 5. The three major types of grasslands are tropical or savannas, temperate grasslands, and polar grassland/tundra. The savannas have been destroyed by grazing cattle, which destroy vegetation and kills grass through fecal droppings. The temperate grasslands have been used to grow crops and graze animals. As a result, the grasslands have disappeared. The arctic tundra has been compromised by oil drilling, mines, and military bases. 6. The three main types of forest biomes are tropical, temperate, and polar/boreal. Human activities have destroyed much of the native trees;

	grazing has compromised the vegetation and eliminated food sources for native animals. And the deforestation has changed the tropical forest's ecosystem, leading to death of plants and animals. The temperate forest has a fewer number of broadleaf trees and rich forest soil; but fires, logging, and hunting have undermined this type of forest. The evergreen firs of the polar forest support a variety of wildlife. But oil drilling and oil spills have compromised the water, the wildlife, and the vegetation in the arctic. 7. Mountain and arctic biomes play important ecological roles; they help regulate climate and effect sea levels. Mountain biome degradation arises from timber and mining extraction, from hydroelectric dams and reservoirs, from air pollution, increased tourism, and radiation from ozone depletion.
Aim	This module aims at examining the relationship between light soil and climate.
Learning Outcomes	• Understand the Abiotic Environment; • Impact of light on natural systems; • The role that soil play in the abiotic environment.
Units	• Chapter 7: Abiotic Environment • Chapter 8: Soil and light
Readings& additional resources	**After the Storm** (Documentary, free DVD or VHS) Looks at watersheds and their importance in various parts of the U.S. http://www.epa.gov/weatherchannel/video.html **Blue Planet** (Video series, Discovery Channel, 2001)

	Mammoth series, five years in the making, taking a look at the rich tapestry of life in the world's oceans. http://dsc.discovery.com/convergence/blueplanet/blueplanet.html **Conserving America: The Wetlands** (PBS, 1994) A four-part series on American Conservation of wetlands **Conserving America: The Rivers** (PBS, 1994) **Conserving America: The Challenge on the Coast** (PBS, 1994) **Conserving America: The Wetlands** (PBS, 1994) **Last Journey for the Leatherback?** Looks at the effects of overfishing on sea turtles. http://www.greentreks.org/naturalheroes/season2/lastjourney.asp **Ocean Oasis** (Documentary, San Diego Natural History Museum, 2001) Biodiversity in the Sea of Cortez, and the deserts of Baja. http://www.oceanoasis.org/toc.html **We all Live Downstream** (Documentary, 1991) A look at pollution in the Mississippi River and the effects on human health. http://www.videoproject.com/wea-281-v.html **Web Resources**

	Bridge http://www.vims.edu/bridge/ A variety of resources for teachers that may be adaptable to the college level. **Centers for Ocean Sciences Education Excellence** http://www.cosee.net/ Contains a variety of resources for ocean education. **EPA Wetlands Education** http://www.epa.gov/owow/wetlands/education/ Contains a variety of resources for teaching about the significance of wetlands.
Activity	**Overview** 1. Briefly explain the major types of organisms in aquatic life zones, giving an example of each. 2. Briefly explain why estuaries and coastal wetlands exhibit high productivity. 3. Compare and contrast estuaries and intertidal pools in terms of biodiversity. 4. Explain how the open sea can be both an area of low average primary productivity and the largest contributor to the earth's overall net primary productivity. 5. Examine figure 8-17 on page 176 of the text. Consider why global warming is likely to cause a lessening of the amount of available freshwater and how that would likely cause changes throughout the downhill flow of freshwater.



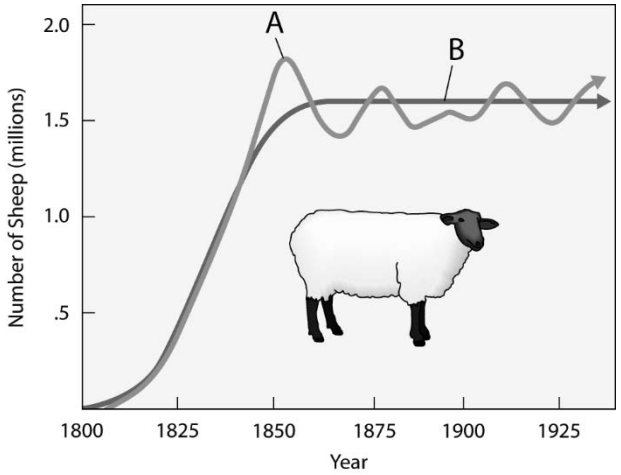
Use the Figure above to answer the following questions.

1. Choose the letter that represents when resources are not limiting and a population can grow at its intrinsic rate of increase.

2. Choose the letter that represents population size at which a population in a particular environment will stabilize when its supply of resources remains constant.

3. Choose the letter that represents limiting abiotic factors.

4. Choose the letter that represents a population's capacity for growth.



Use the Figure above to answer the following questions.

5. Choose the portion of the curve that results from reproductive time lag

6. Choose the portion of the curve that results from the biotic potential and environmental resistance.

CLIMASP COURSE SYLLABUS Environmental Microbiology

COURSE DESCRIPTION:

This course serves as a general introduction to the basic principles of applied and environmental microbiology. It introduces students

to the diversity of

microbial populations and their important roles in environmental processes in air, water, soils, and sediments. The course also covers the ecology and diversity of microbial communities in soil, water, and air and how microbial activities sustain natural ecosystems and the applications of microorganisms to solve environmental problems and public health. Topics will include wastewater treatment, bioremediation, biofilm engineering, and other applications related to

public health, agriculture, food science, and industry

The course will also focus on the

Objectives:

This course discusses the basic microbial metabolic processes, thermodynamics of growth and energy generation, and genetic and metabolic diversity. Emphasis is placed on the application of these concepts to biogeochemical cycling, subsurface microbiology, wastewater microbiology,

pollutant degradation,

microbial ecology, global warming and infectious diseases.

SIMA TOKAJIAN-Environmental Microbiology

Learning Outcomes

□

□ □

95. Know the presence and effects of microorganisms on different (environment. (
96. Know the various techniques of isolation of microorganisms. (
97. Understand the role of microbes in the soil (
98. Understand the sources and analysis of water. (
99. Understand eutrophication as resulting from water pollution by algae. (
100. Know the various types of water borne diseases and their causative (agents. (

101. Understand the sources and effects of air pollutants. (

102. Understand the geochemical roles and importance of heterotrophs and (autotrophs (**Course Resources** (1. **EnvironmentalMicrobiology**.SecondEdition,Editedby:IanL.Pepper, Charles P. Gerba, Terry Gentry and Raina M. Maier. 2009 Elsevier Inc. (

 Demonstrate that microorganisms have an indispensable role in the environment, including elemental cycles, biodegradation, etc.

Define the important microbes involved in environmental microbiology

 Identify the key roles played by microbes in the aquatic and terrestrial environment including soil structure, element cycles, metal extraction and human health.

Evaluate the effects of these microbes on human activities.

Discuss the role of microorganisms in the remediation of the environment.

Policy on Cheating and Plagiarism

Students caught cheating on an exam receive a grade of zero on the exam in their first cheating attempt and receive a warning. Students caught cheating for the second time will receive a grade of “F” in the course and another warning. Plagiarism on assignments and project work is a serious offense. If plagiarism is detected, a student will be subject to penalty, similar to the cheating case, which ranges from receiving a zero on the assignment concerned to an “F” in the course in addition to a warning.

Attendance Policy

- Studentsareheldresponsibleforallthematerialpresentedintheclassroom, even during their absence.
- Studentscanmissnomorethantheequivalentoffiveweeksofinstruction and still receive credit for that course.
- Instructorshavetherighttoimposespecificattendanceregulationsintheir courses, provided that the

above-stated limit of absences is not exceeded, and the minimum number of absences allowed is no fewer than the equivalent of two weeks of classroom instruction, after the Drop and Add period.

- InstructorswillinformtheDepartmentsChairpersonandtheGuidanceOffice, of any prolonged unexplained absence.

- Studentswhoexceedtheallowednumberofabsencesmustwithdrawfrom the course; otherwise, the course grade will be recorded as “F” (NP).

Withdrawal Policy

“Students wishing to withdraw from one or more courses must follow the withdrawal procedure provided by the Registrar’s Office. Students withdrawing from courses after the late registration period and before the withdrawal deadline will receive Ws for all the courses in progress.” ***Deadline for withdrawal from courses***:

SIMA TOKAJIAN-Environmental Microbiology

Module 1

Introduction to Environmental Microbiology

Overview

Introduce students

to important microorganisms that are involved in

environmental microbiology and describe their impact on human.

Aim

Defines the important microorganisms that are involved in environmental microbiology, the nature of the different possible environments in which they are situated, and the possible effects of microorganisms on human activities.

Learning Outcomes

Define microorganisms involved in environmental microbiology (

Describe the nature of the different environments (

Explain the impact of microorganisms on human and on natural (habitats (

Units

1.1 Environmental Microbiology 1.2 Eubacteria and Archaea 1.3 Fungi and Protozoa 1.4 Slime Molds

1.5 Algae 1.6 Viruses

Module 2

Bacterial Growth

Overview

Define bacterial growth, describe the different stages and its relevance with growth in the environment.

Aim

Learning Outcomes

Bacterial growth is a complex process that involves numerous anabolic and catabolic reactions, which result in cell division. This module describes the various stages of bacterial growth under pure culture conditions and its relevance with growth in the environment.

- Define the factors that regulate bacterial growth and metabolism (
- Identify the phases of the typical bacterial growth pattern (
- Discuss bacterial spore formation and germination and the (conditions under which each might occur (
- Explain bacterial replication (
- Describe the formation of biofilms (
- Explain factors which influence bacterial growth under laboratory (conditions e.g. pH, temperature, moisture, nutrient requirements (etc. (

- Draw and explain the bacterial growth curve. (
- Explain types of culture media (
- Identify examples of various bacteriological media (
- Explain the preparation and storage of various bacteriological (media. (

Units

2.1 Growth in a pure culture in a flask 2.2 Continuous culture 2.3 Growth in the environment

SIMA TOKAJIAN-Environmental Microbiology

Module 3	**Bacterial Communities in Natural Ecosystems**
Overview	Introducing students to bacterial communities and importance of bacterial diversity
Aim	Complex bacterial communities are found in essentially all natural ecosystems including soils, plants, and surface and ground water. This module describes the microbial communities and diversity in natural systems, functional diversity and

	resilience of bacterial communities, and importance of microbial communities as source of natural
	products.
Learning Outcomes	Explain interconnections between microdiversity, genomic diversity and metabolic potential. (Understand the ecological role or impact of microbes and microbial diversity as they relate to individuals, populations of microbes and multicellular organisms, earth systems and the biosphere. (
Units	3.1 Bacterial diversity in natural systems 3.2 Functional diversity and the resilience of bacterial communities

Module 4

Microbiology of Soil

Overview

Introducing students to the role of microorganisms in the soil environment and a basic information about the known possibilities of soil remediation.

Aim

Learning Outcomes

Characteristics of the soil environment, microbial and fauna of soil, microbial activities in soil, nitrogen cycle, carbon cycle, mineral transformation by microorganisms, ecological relationship among the soil pathogens, effect of pesticide of peptides on soil microorganisms, biodegradation and biofuel generation, effect of physical properties of soil pathogens, aspect of biogeochemical cycles.

Describe the microbial flora of the soil. (

Understand the characteristics of soil environment and factors (affecting presence and activities

of microorganisms in the soil (

Describe ecological relationship among soil microorganisms (

 Describe the structure and microbial content of soil and the activities of rhizosphere microorganisms.

Units

4.1 Soil as a microbial environment 4.2 Distribution of microorganisms in soil 4.3 Bacterial diversity in soil 4.4 Metabolism of microorganisms in soil 4.5 Interaction with the rhizospheres

SIMA TOKAJIAN-Environmental Microbiology

Module 5	**Microbiology of Water**
Overview	Give students key information about microorganisms living in potable and polluted water, diseases, indicators and transmission.

Aim	This module will help students to gain knowledge about the microbiology of water supply, microbial flora of surface and ground waters, water treatment, water supply and public health, properties of potable and polluted water and microorganisms living in polluted water.
Learning Outcomes	Identify the major components of aquatic communities. (List the properties of the aquatic environment. (Explain the properties of potable/polluted water. (Explain the various indices of water pollution. (
Units	5.1 Microbial habitats in aquatic environments 5.2 Distribution of microorganisms in water 5.3 Microbial ecology of aquatic habitats 5.4 Pollution and disease transmission in water 5.5 Microbiological examination of water

Module 6

Microbiology of Air

Overview

Introducing students to air pollutants, effects and methods of control.

Complex bacterial communities are found in essentially all natural

Aim

specificity of prevalent environmental conditions acting in the air and their influence on survival of microorganisms. Describe air pollutants due to chemicals and microbial processes and the threat associated with

biological aerosols.

ecosystems. This module helps students to understand the

Learning Outcomes

Explain air pollutants due to chemical and microbial processes (

Identify the microbial indicators used in monitoring air pollution (

List the effects of air pollutants on man, plants and animals. (

Describe the methods of controlling air pollution. (

Units

6.1 Microbial survival and diversity in air 6.2 Airborne pathogens 6.3 Aerosols and chemical pollutants 6.4 Bioaerosol control

SIMA TOKAJIAN-Environmental Microbiology

Module 7

Biogeochemical Cycling

Overview

Introducing students to

Learning Outcomes

nitrogen, sulfur, and iron.

biogeochemical cycles pertaining to carbon,

Aim

This module discusses the biogeochemical cycles pertaining to carbon, nitrogen, sulfur, and iron. Understand the carbon cycle, which involves circulation of carbon between reservoir and sink, through photosynthesis, respiration, degradation of organic compounds, and burning of fossil

fuels. Describes nitrogen cycle and nitrogen fixation through microbial activities and gives an overview on many other

important biogeochemical cycles.

Describe carbon cycle, microbial degradation of cellulose, hemicelluloses, lignin and chitin (

Describe nitrogen cycle, nitrogen fixation, ammonification, nitrification, denitrification and nitrate reduction (

Describe phosphorus cycle, phosphate immobilization and solubilisation (

Describe sulphur cycle, microbes involved in sulphur cycle (

Understand other elemental cycles: Iron and manganese (

Units

7.1 Carbon cycle 7.2 Nitrogen cycle 7.3 Sulfur cycle 7.4 Other cycles

Module 8

Wastewater Treatment

Overview

Highlight that the

primary goal of wastewater treatment is the removal

and degradation of organic matter under controlled conditions

Aim

This module describes the treatment of wastewater. Students will understand that the amount of organic matter in domestic wastes determines the degree of required biological treatment and will learn the various tests that are used to assess the amount of organic matter: biochemical oxygen demand (BOD), chemical oxygen demand (COD), and total organic carbon (TOC). The module also describes the complete sewage treatment, which is comprised of three major steps:

primary, secondary, and tertiary treatment.

Learning Outcomes

Describe the importance of indicator organisms, and explain how total coliforms are detected (

Compare and contrast primary treatment, secondary treatment, advanced treatment, and

anaerobic digestion. (

Describe liquid waste management (BOD and COD) (

Units

8.1 Wastewater treatment 8.2 Oxidation ponds 8.3 Septic tanks 8.4 Pathogens of concern

SIMA TOKAJIAN-Environmental Microbiology

Module 9

Domestic and Indoor Microbiology

Overview

Indoor environments including home, schools, workplaces, and

hospitals act as reservoirs of human pathogens.

Aim

This module provides an overview of the household and indoor sources of pathogens, their fate, and transport within the indoor environment. Students will learn that household sources of pathogens include air, food, water, and fomites and that microbial airborne pathogens can occur as bioaerosols. In addition the module highlights that food products that contain pathogens can result in human infections within

households.

Learning Outcomes

Describe the household sources of pathogens (

Identify indoor pathogens (

Define the role of fomites in disease spread (

Explain transfer of pathogens (

Units

9.1 Household sources of pathogens 9.2 Fomites role in disease spread 9.3 Transfer of pathogens

Module 10

Global Change and Microbial Infectious Diseases

Overview

Human activity directly affects the magnitude of exposure to

Learning Outcomes

environmental pathogens.

Aim

This module discusses the influence of both indigenous environmental and animal-borne pathogens on human health and infectious diseases. It also highlights the correlation between global warming and mechanisms enhancing spread of infectious disease. Urbanization and deforestation can also result in increased contact between humans and

can have a role in the increase of infectious agents.

Understand how human activities affect the magnitude of exposure to environmental pathogens (

Describe the correlation between global warming and spread of infectious diseases (

Understand the role of urbanization and deforestation in enhancing the contact between humans and infectious agents (

Units

10.1 10.2 10.3

Environmental human pathogenic microbes Routes of Exposure

Environmental change and microbial infectious diseases

Course Identification

Course Number:	ENS 20
Course Name:	Introduction to Environmental Science
Course Location:	Main Campus

Class Times: MWF 3:00-4:00
Prerequisites: None
Faculty Web Page: http://www.ndu.edu.lb/academics/fnas/deanmess.htm

Course Description/Overview

The course introduces the students to basic ecological principles followed by a focus on specific current global and regional environmental problems, their causes, effects and possible solutions. Emphasis will be on pollution, conservation and a proper use of energy resources.

Course Learning Objectives

The overarching objectives of this course are: a) Explore the basic ecological and environmental principles that explain how life on earth is sustained for billions of years. b) Use the scientific foundations gained from the previous objective in order to understand the environmental problems facing our , like global climate change, and evaluate possible solutions to these problems. c) Emphasize the importance of the concept of sustainability –the integrating theme in this course- in understanding and finding possible solutions to our environmental problems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Understand how living organisms acquire and use nutrients and energy by studying principles of ecology.
2. Examine the global distribution of biomes and threats by human activities, including global warming and climate change, due to unsustainable practices.
3. Learn about the exponential growth of human population and its impact on the environment.
4. Discuss the availability of food and prevalence of hunger and sustainable food production practices.
5. Understand the basics of environmental health to understand the risks we are facing and what can we do about them.
6. Evaluate the benefits of biodiversity, and identify threats and conservation practices associated with it.

7. Understand how the climate work and examine the evidence for climate change and its consequences.
8. Know the sources and major types of air pollution.
9. Understand the role of water, its use and management
10. Survey the causes and effects of water pollution on the ecosystem
11. Explore our options to find sustainable and environmentally friendly ways to meet our energy needs and help mitigate the effects of climate change.
12. Discuss the nature of solid, hazardous and toxic waste and explore how to sustainably shrink the waste stream.
13. Understand the concept of ecological economics and explore whether development can be sustainable

Assignments and Grading Scheme

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (*i.e.* percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A^+	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A^-	Very Good	3.7	89 - 92
B^+	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B^-	Good	2.7	77 - 79
C^+	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C^-	Passing	1.7	66 - 69
D^+	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59
UW	Unofficial Withdrawal	0.0	

The grade "*UW*" is assigned by the instructor when a registered student has never attended a class or has ceased attending and has not submitted an official course withdrawal request to the Office of the Registrar. This grade is computed as an *F* grade in the grade-point average.

Grading Policy

Grades can be based on the following: (Example)

First exam	25%
Second exam	25%
Final Exam	35%
Project and Assignments	10%
Participation and Evaluation	05%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Classes are a mix of lectures (Powerpoint presentations) and class discussions. The material related to course is presented in a clear manner that engages the students by relating abstract concepts to current everyday issues or controversies that they care about. Material and assignments will be posted on blackboard. Additional readings will be assigned from the literature on specific subjects. Field trip(s) will be planned to visit a natural wild area in Lebanon. You should record all your observations, thoughts and questions in your field journal. Your field observations will be unique to you, reflecting your personal style. For each field trip a report is expected. Includes photos and sketches with your write up.

Course Schedule

Weeks	**Topics**
Week 1	Syllabus explanation Topic 1: Understanding our environment
Week 2	Topic 1: Understanding our environment Topic 2: Matter, Energy and life
Week 3	Topic 2: Matter, Energy and life
Week 4	Topic 3: Terrestrial biomes and aquatic ecosystems
Week 5	Topic 4: Biodiversity
Week 6	Topic 4: Biodiversity Topic 5: Human populations
Week 7	Topic 5: Human populations Topic 6: Food and agriculture
Week 8	Topic 6: Food and agriculture Topic 7: Environmental health and toxicology
	Exam I: Topics 1-6

Week 9	Topic 7: Environmental health and toxicology
Week 10	Topic 8: Air, weather and climate
Week 11	Topic 9: Air pollution and ozone depletion
Week 12	Topic 10: Water use and management
	Exam II: Topics 7-9
Week 13	Water pollution
Week 14	Solid and hazardous waste Managemenr
Week 15	Ecological economy
Week 16	What then shall we do?

Course Policies
No make-up exam is allowed under normal circumstances. Consequently, a student missing an exam with no justifiable reason will lose the grade value of that exam.
Under abnormal circumstances a student is allowed a make-up exam under the following conditions:
1. The student shows that missing the exam was beyond his/her control.
2. The instructor and chairperson accept the case presented and approve of the make up.
3. The student may lose 10 points out of 100 of the grade value of the exam in question.
4. The make up exam shall be done within 10 days after the elapse of the exam date.

Assignments should be returned by the due date. Failure to do so will result in losing up to 20% of the grade.

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.

Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).

Once in class, students are expected to remain in class for the entire period.

English must be the only language spoken in class at all times.

Special needs: Any student who feels s/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Policies & Procedures

NDU's Attendance Policy
Student should attend all classes and laboratory sessions on time. A pattern of absences, whether authorized or not, and even below the maximum number (specified below), may alter one's grade substantially. The SAO alone authorizes absences. No absence absolves a student from the responsibility of acting upon the material presented during his/her absence. The maximum number absences for classes that meet on

MWF is six; the maximum number for classes that meet on TTh and in the summer is four, (or two hours per credit course). Any student whose absences exceed the maximum limits shall automatically fail the course unless the student withdraws.

Office Hours: All instructors at NDU are available for office hours during the week. Please note the office hour that your instructor has dedicated to this course to make an appointment. Just dropping by may not ensure that the professor has set aside time to assist you. Office hours may be used ideally to ask for guidance on an assignment or to ask questions concerning a subject that you were not clear on during class time.

NDU's Academic Integrity Policy

Students are expected and encouraged to be honest and to maintain the highest standards of academic integrity in their academic work and assignments at the University. They shall refrain from any academic dishonesty or misconduct including; but not limited to:

- Plagiarism; that is, the presentation of someone else's ideas, words or artistic, scientific, or technical work as one's own creation. Also, paraphrasing, summarizing, as well as well as direct quotations are considered as plagiarism, if the original source is not properly cited.
- Cheating.
- Assisting in cheating.
- Substituting a student in the taking of an examination.
- Substituting examination booklets.
- Submitting the same work for more than one course and the like. o Submitting papers written by others.
- Receiving or providing unauthorized help or assistance in any academic work or assignment. Intentional violation of program and degree requirements and regulation as established by the University.
- Dishonest reporting of computational, statistical, experimental, research, results, or the like.

Course	Introduction to Environmental Science
Module 1	Humans and sustainability: an overview
Key Concepts	Principles of sustainability, ecological footprints, Population growth, Poverty, sustainable society.
Overview	Nature has sustained itself for billions of years by relying on solar energy, biodiversity and nutrient cycling. Our survival is dependent on the energy from the sun and natural capital (natural resources and natural services). As our ecological footprint grows, we are depleting and degrading the earth's natural capital. Humans are creating environmental problems mainly due to wasteful and unsustainable resource use. Living sustainably means living off the earth's natural income without depleting or degrading the natural capital it provides.
Aim	The overriding aim of this module is to understand how our ecological footprints affecting the earth and how to live in an environmentally sustainable society.
Learning Outcomes	At the end of this module learners will be able to: • Know the three principles of sustainability. • Understand the concept of ecological footprint. • Recognize the major causes of environmental problems. • Explain the concept of an environmentally sustainable society.
Units	Unit 1.1 The three principles of sustainability. Unit 1.2: How our ecological footprints affecting the earth. Unit 1.3: Major environmental problems. Unit 1.4: Environmentally sustainable society.
Readings	Clark,W.C. (2001) A transition toward sustainability. Ecology Law Quarterly 27:1021.

	Jones, K., Scholtz, A. And Lehmer, G. Rio+10: Let the people be heard. Earth Island Journal 17:12. Louis P. Pojman and Paul Pojman (2012) *Environmental Ethics: Readings in Theory and Applications*, Sixth edition. Wadsworth, Cengage Learning. USA.
Activity	Assignment 1. Write a two-page scenarios describing what your life and that of any children you choose to have might be like 50 years from now if (a) we continue on our present path or (b) we shift to more environmentally sustainable societies throughout most of the world. 2. What are the major resource and environmental problems facing the town where you live? Which of these problems affect you directly? Have these problems gotten better or worse during the past 5 years? 3. Explain why you agree o disagree with the following propositions: a. Stabilizing population is not desirable because, without more consumers, economic growth would stop. b. The world will never run out of resources because we can use technology to find substitutes and to help us reduce resource waste
Module 2	Science, ecological principles, and sustainability
Key Concepts	Matter, energy, ecosystems, biodiversity and evolution, climate and biodiversity.
Overview	This module looks at how the laws of conservation of matter and the laws of thermodynamics affect living organisms. The lesson learned from this module

	is that we cannot violate these laws of nature that place limits on what we we can do with matter and energy resources. The principles of sustainability are emphasized in this module.
Aim	The overriding aim of this module is to understand the how the basic laws of matter and thermodynamics, in addition the principles of sustainability, applies to living organisms.
Learning Outcomes	At the end of this module learners will be able to: • Understand the laws of conservation of matter and the laws of thermodynamics and their applications to living organisms. • Recognize the major components of ecosystems and how life on earth is sustained. • Evaluate the importance of biodiversity. • Know the effects of climate on biodiversity. • Evaluate the human impacts on the environment including climate change.
Units	Unit 2.1: Science, matter, energy, and systems. Unit 2.2: Ecosystems: what are they and do they work? Unit 2.3: Biodiversity and evolution. Unit 2.4: Biodiversity: Species interactions, and population control. Unit 2.5: Climate and biodiversity. Unit 2.6: The human populations and its impact.
Readings	Pauly, D., Christensin, V. froese, R., and Palomares (2000) Fishing down aquatic food webs. American Scientist 88: 46. Lockaby, B. G., and Conner, W. H. (1999) N:P balance in wetland forests: productivity across a biogeochemical continuum. The Botanical Review 65:171.

	Becker, L., (2002) Repeated blows: Did extraterrestrial collisions capabl of causing widespread extinctions pound the earth not once, but twice-or even several times? Scientific American 286: 76. Peterson, A. T., Vieglais (2001) Predicting species invasions using ecological niche modeling: New approaches from bioinformatics attack a pressing problem. Bioscience 51: 363. Del Tredici, P. (2001) Sprouting in temperate trees: A morphological and ecological review. The Botanical Review 67:121. Beyers, J.E. (2000) Competition between two estuarine snails: Implications for invasions of exotic species. Ecology 81:1225.
Activity	**Overview**
	Assignment 1- How has the climate changed in your area where you live during the past 50 years? Investigate the beneficial and harmful effects of these changes? How have these changes benefited or harmed you personally? 2- What type of biome do you live in? What have been the major effects of human activities over the past 50 years on the characteristic vegetation and animal life normally found in the biome you live in? How is your own lifestyle affecting this biome? 3- Visit a local forest, pond or lake, choose a particular organism, and then use

	the library or the internet to describe as much as you can about its niche, including what species it depends on and what species help support its survival. Predict what might happen if your selected species disappeared from the local environment. 4- How would you respond to someone who says that because extinction is a natural process, we should not worry about the loss of biodiversity? 5- In what ways do humans occupy generalized niches and in what way do they occupy specialist niches?
Module 3	Sustaining Biodiversity
Key Concepts	Extinction of species, threats to ecosystems, sustaining sustaining biodiversity
Overview	This module focuses on the role of humans in the extinctions of species, and the impact of species extinction on humans and the environment. Emphasis will be placed on how we can protect wild species from extinction. In addition, sustaining forests and biodiversity are two topics that are discussed in details.
Aim	The aim of this module is to explore the problem of species extinction and the best practices to sustain biodiversity.
Learning Outcomes	At the end of this module students will be able to: • Know the role of humans in the extinction of species. • Evaluate the risks resulting from the rising rate of species extinction. • Recognize the best practices to protect wild species from extinction. • Know the major threats to forest ecosystems. • Understand the ecosystem approach to sustaining biodiversity.

Units	Unit 3.1: What role do humans play in the extinction of species? *Unit 3.2: Why should we care about the rising rate of species extinction?* Unit 3.3: How can we protect wild species from extinction? Unit 3.4: What are the major threats to forest ecosystems? Unit 3.5: Climate change can threaten forest ecosystem Unit 3.6: How should we manage and sustain biodiversity?
Readings	Levin, D. (2002) Hybridization and extinction: In protecting rare species, conservationists should consider the dangers of interbreeding, which compound the more well known threats to wildlife. American Scientist 90: 254. Matthews, M. (2002) When fire and forest health came to town: The forest service hopes its national fire plan can restore woodland while benefitting local economies. American Forests 107: 25. Helmuth L. (1999) Can this swamp be saved? Science News 155: 252.
Activity	
	Assignment 1- Identify examples of habitat destruction or degradation in your community that have had harmful effects on the populations of various wild plants and animal species. Develop a management plan for rehabilitating these habitats and species. 2- Choose a particular endangered animal or plant species and use the library or

	the internet to find out what is being done to protect it from extinction. Develop a protection plan for this species. 3- If ecosystems are undergoing constant change, why should we (a) establish and protect nature reserves and (b) carry out ecological restoration?S 4- Should there be a ban on the use of of-road vehicles and snowmobiles on all public land in Lebanon?
Module 4	Sustaining Natural Resources
Key Concepts	Soil and food, Pest management, water resources, mineral resources, renewable and nonrenewable energy.
Overview	The focus of this module is on natural resources that are necessary to sustain living organisms. We start with the discussion of soil as precious resources upon which agriculture is dependent, water resources, mineral resources in addition to renewable and non-renewable energy.
Aim	The aim of this module is to explore the natural resources necessary to sustain life.
Learning Outcomes	At the end of this module learners will be able to: • Discuss food security and why is it difficult to attain? • Evaluate environmental problems arising from industrialized food production. • Discuss sustainable agriculture. • Explore the importance of mineral resources. • Discuss the various forms of renewable and non-renewable energy resources.
Units	Unit 4.1: Food, soil and pest management Unit 4.2: Water resources

	Unit 4.3: Nonrenewable mineral resources energy resources. Unit 4.4: Nonrenewable energy Unit 4.5: Renewable energy and energy efficiency
Readings	Snell, M. B. (2001) Against the grain. Sierra 86:30 Finneran, K. (2001) What's food got to do with it? Issues in Science and Technology. Kerlin, K. (2001) Diamonds aren't forever E 12:54. Nanney, J. (2002) How motor efficiencies affect system desgns. Plant Engineering. Fairley, P. (2002) wind power for pennies: A light weight wind turbine is finally on the horizon and it just might be the breakthrough Technology Review 105:40.
Activity	**Overview**
	Assignment 1- What could happen to energy intensive agriculture in the industrialized countries if world oil prices rose sharply? 2- Why should it matter to people in developed countries that many people in developing countries are malnourished and hungry? What are the three most important actions in you believe should be taken to reduce hunger (a) in Lebanon (b) in the world?

	3- Develop a water conservation plan for your school and submit it to school officials. 4- How do human activities increase the harmful effects of prolonged drought? How can we reduce these effects? 5- Write a two-page scenario of what your life might be like without oil. Compare and discuss the scenarios developed by your class. 6- Make a study of energy use in your school and use the findings to develop an energy-efficiency improvement program. Present your plan to school officials.
Module 5	Sustaining Environmental Quality
Key Concepts	Air pollution, water pollution, Solid and hazardous waste, Climate change, and ozone depletion.
Overview	This module deals with aspects related to the quality of our environment. Humans are utilizing matter and energy at an exceedingly fast rate. This is creating problems of depletion of natural resources and environmental pollution. In this module we are going to discuss aspects related to water and air pollution and solid and hazardous waste management. We will emphasize global problems of climate change and ozone in our discussion.
Aim	The overriding aim of this module is to discuss several aspects related to the degradation of the environmental quality resulting from overuse of natural resources and energy.
Learning	At the end of this module learners will be able to:

Outcomes	• Know outdoor and indoor air pollution • Discuss acid deposition. • Recognize health effect of air pollution. • Discuss how the earth's temperature and climate change in the future. • Discuss the possible effects of a warmer atmosphere. • Discuss what can be done to slow projected climate change. • Recognize the problem and solutions to ozone depletion. • Discuss causes and effects of water pollution. • Discuss the problem and solutions to solid and hazardous waste
Units	Unit 5.1: Air pollution Unit 5.2: Climate change and ozone depletion Unit 5.3: Water pollution Unit 5.4: Solid and hazardous waste
Readings	Becker, R. and Henderson, V. (2000) Effects of air quality regulations on polluting industries. Journal of Political Economy 108:379. UNEP. (2013) *Climate Change* http://www.unep.org/pdf/UNEP_Profile/Climate_change.pdf Pacala, S., Socolow, R. (2004) Stabilization wedges: Solving the climate problem for the next 50 years with current technologies. Science 505:968-72. Rabalais, N, N., Turner, R. E., Scavia, D., (2002) Beyond science into policy: Gulf of Mexico hypoxia and the Mississippi River. BioScience 52:129.

	Evans, L. D. (2002) The dirt on phytoremediation. Journal of Soil and Water Conservation 57:13.
Activity	**Overview**
	Assignment 1- Congratulations! You are in charge of reducing air pollution in Lebanon. List the three most important features of your policy. 2- Suppose you become trapped in your car during a snowstorm and you have your engine and heater running to keep warm. Explain why you should roll down one of your windows just a little. 3- Do you agree or disagree with the argument by developing countries that developed countries should bear the brunt of reducing CO2 emissions because they produce much more of these emissions than developing countries? Explain. 4- Explain why developed nations are able to adapt to problems caused by increased global warming more easily than developing countries. Should developed countries provide significant aid to help developing countries adapt to the harmful effects of global warming? Explain. 5- Congratulations! You are in charge of the world. List your three most important actions for dealing with (a) global warming and climate change, (b) depletion of ozone in the stratosphere.

	6- How can a stream cleanse itself of oxygen-demanding wastes? Under what conditions will this natural cleansing system fail? 7- What hazardous wastes are produced (a) at your school and (b) in your community? What happens to these wastes?

Course Syllabus

ENS 201:

Introduction to Environmental Science

Notre Dame University-Louaize, Faculty of Natural and Applied Sciences, Department of Sciences

Fall Semester, 2014-2015

Instructor Information

Instructor:	Dr. Tanos G. Hage
Office Location:	S242, Main Campus
Telephone:	Office – 09-208725
Office Hours:	MWF 1:00-2:00
E-mail:	thage@ndu.edu.lb

Website:

Course Identification

Course Number:	ENS 20
Course Name:	Introduction to Environmental Science
Course Location:	Main Campus
Class Times:	MWF 3:00-4:00
Prerequisites:	None
Faculty Web Page:	http://www.ndu.edu.lb/academics/fnas/deanmess.htm

Course Description/Overview

The course introduces the students to basic ecological principles followed by a focus on specific current global and regional environmental problems, their causes, effects and possible solutions. Emphasis will be on pollution, conservation and a proper use of energy resources.

Course Learning Objectives

The overarching objectives of this course are: a) Explore the basic ecological and environmental principles that explain how life on earth is sustained for billions of years. b) Use the scientific foundations gained from the previous objective in order to understand the environmental problems facing our , like global climate change, and evaluate possible solutions to these problems. c) Emphasize the importance of the concept of sustainability –the integrating theme in this course- in understanding and finding possible solutions to our environmental problems.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

14. Understand how living organisms acquire and use nutrients and energy by studying principles of ecology.
15. Examine the global distribution of biomes and threats by human activities, including global warming and climate change, due to unsustainable practices.

16. Learn about the exponential growth of human population and its impact on the environment.
17. Discuss the availability of food and prevalence of hunger and sustainable food production practices.
18. Understand the basics of environmental health to understand the risks we are facing and what can we do about them.
19. Evaluate the benefits of biodiversity, and identify threats and conservation practices associated with it.
20. Understand how the climate work and examine the evidence for climate change and its consequences.
21. Know the sources and major types of air pollution.
22. Understand the role of water, its use and management
23. Survey the causes and effects of water pollution on the ecosystem
24. Explore our options to find sustainable and environmentally friendly ways to meet our energy needs and help mitigate the effects of climate change.
25. Discuss the nature of solid, hazardous and toxic waste and explore how to sustainably shrink the waste stream.
26. Understand the concept of ecological economics and explore whether development can be sustainable

Course	Introduction to Environmental Science
Module 1	Humans and sustainability: an overview
Key Concepts	Principles of sustainability, ecological footprints, Population growth, Poverty, sustainable society.
Overview	Nature has sustained itself for billions of years by relying on solar energy, biodiversity and nutrient cycling. Our survival is dependent on the energy from the sun and natural capital (natural resources and natural services). As our ecological footprint grows, we are depleting and degrading the earth's natural capital. Humans are creating environmental problems mainly due to wasteful and unsustainable resource use. Living sustainably means living off the earth's natural income without depleting or degrading the natural capital it provides.
Aim	The overriding aim of this module is to understand how our ecological footprints affecting the earth and how to live in an environmentally sustainable society.
Learning Outcomes	At the end of this module learners will be able to: • Know the three principles of sustainability. • Understand the concept of ecological footprint. • Recognize the major causes of environmental problems. • Explain the concept of an environmentally sustainable society.
Units	Unit 1.1 The three principles of sustainability. Unit 1.2: How our ecological footprints affecting the earth. Unit 1.3: Major environmental problems. Unit 1.4: Environmentally sustainable society.
Readings	Clark,W.C. (2001) A transition toward sustainability. Ecology Law Quarterly 27:1021.

	Jones, K., Scholtz, A. And Lehmer, G. Rio+10: Let the people be heard. Earth Island Journal 17:12. Louis P. Pojman and Paul Pojman (2012) *Environmental Ethics: Readings in Theory and Applications*, Sixth edition. Wadsworth, Cengage Learning. USA.
Activity	Assignment 1. Write a two-page scenarios describing what your life and that of any children you choose to have might be like 50 years from now if (a) we continue on our present path or (b) we shift to more environmentally sustainable societies throughout most of the world. 2. What are the major resource and environmental problems facing the town where you live? Which of these problems affect you directly? Have these problems gotten better or worse during the past 5 years? 3. Explain why you agree o disagree with the following propositions: a. Stabilizing population is not desirable because, without more consumers, economic growth would stop. b. The world will never run out of resources because we can use technology to find substitutes and to help us reduce resource waste
Module 2	Science, ecological principles, and sustainability
Key Concepts	Matter, energy, ecosystems, biodiversity and evolution, climate and biodiversity.
Overview	This module looks at how the laws of conservation of matter and the laws of thermodynamics affect living organisms. The lesson learned from this module

	is that we cannot violate these laws of nature that place limits on what we we can do with matter and energy resources. The principles of sustainability are emphasized in this module.
Aim	The overriding aim of this module is to understand the how the basic laws of matter and thermodynamics, in addition the principles of sustainability, applies to living organisms.
Learning Outcomes	At the end of this module learners will be able to: • Understand the laws of conservation of matter and the laws of thermodynamics and their applications to living organisms. • Recognize the major components of ecosystems and how life on earth is sustained. • Evaluate the importance of biodiversity. • Know the effects of climate on biodiversity. • Evaluate the human impacts on the environment including climate change.
Units	Unit 2.1: Science, matter, energy, and systems. Unit 2.2: Ecosystems: what are they and do they work? Unit 2.3: Biodiversity and evolution. Unit 2.4: Biodiversity: Species interactions, and population control. Unit 2.5: Climate and biodiversity. Unit 2.6: The human populations and its impact.
Readings	Pauly, D., Christensin, V. froese, R., and Palomares (2000) Fishing down aquatic food webs. American Scientist 88: 46. Lockaby, B. G., and Conner, W. H. (1999) N:P balance in wetland forests: productivity across a biogeochemical continuum. The Botanical Review 65:171.

	Becker, L., (2002) Repeated blows: Did extraterrestrial collisions capabl of causing widespread extinctions pound the earth not once, but twice-or even several times? Scientific American 286: 76. Peterson, A. T., Vieglais (2001) Predicting species invasions using ecological niche modeling: New approaches from bioinformatics attack a pressing problem. Bioscience 51: 363. Del Tredici, P. (2001) Sprouting in temperate trees: A morphological and ecological review. The Botanical Review 67:121. Beyers, J.E. (2000) Competition between two estuarine snails: Implications for invasions of exotic species. Ecology 81:1225.
Activity	**Overview**
	Assignment 1- How has the climate changed in your area where you live during the past 50 years? Investigate the beneficial and harmful effects of these changes? How have these changes benefited or harmed you personally? 2- What type of biome do you live in? What have been the major effects of human activities over the past 50 years on the characteristic vegetation and animal life normally found in the biome you live in? How is your own lifestyle affecting this biome? 3- Visit a local forest, pond or lake, choose a particular organism, and then use

	the library or the internet to describe as much as you can about its niche, including what species it depends on and what species help support its survival. Predict what might happen if your selected species disappeared from the local environment. 4- How would you respond to someone who says that because extinction is a natural process, we should not worry about the loss of biodiversity? 5- In what ways do humans occupy generalized niches and in what way do they occupy specialist niches?
Module 3	Sustaining Biodiversity
Key Concepts	Extinction of species, threats to ecosystems, sustaining sustaining biodiversity
Overview	This module focuses on the role of humans in the extinctions of species, and the impact of species extinction on humans and the environment. Emphasis will be placed on how we can protect wild species from extinction. In addition, sustaining forests and biodiversity are two topics that are discussed in details.
Aim	The aim of this module is to explore the problem of species extinction and the best practices to sustain biodiversity.
Learning Outcomes	At the end of this module students will be able to: • Know the role of humans in the extinction of species. • Evaluate the risks resulting from the rising rate of species extinction. • Recognize the best practices to protect wild species from extinction. • Know the major threats to forest ecosystems. • Understand the ecosystem approach to sustaining biodiversity.

Units	Unit 3.1: What role do humans play in the extinction of species? *Unit 3.2: Why should we care about the rising rate of species extinction?* Unit 3.3: How can we protect wild species from extinction? Unit 3.4: What are the major threats to forest ecosystems? Unit 3.5: Climate change can threaten forest ecosystem Unit 3.6: How should we manage and sustain biodiversity?
Readings	Levin, D. (2002) Hybridization and extinction: In protecting rare species, conservationists should consider the dangers of interbreeding, which compound the more well known threats to wildlife. American Scientist 90: 254. Matthews, M. (2002) When fire and forest health came to town: The forest service hopes its national fire plan can restore woodland while benefitting local economies. American Forests 107: 25. Helmuth L. (1999) Can this swamp be saved? Science News 155: 252.
Activity	
	Assignment 1- Identify examples of habitat destruction or degradation in your community that have had harmful effects on the populations of various wild plants and animal species. Develop a management plan for rehabilitating these habitats and species. 2- Choose a particular endangered animal or plant species and use the library or

	the internet to find out what is being done to protect it from extinction. Develop a protection plan for this species. 3- If ecosystems are undergoing constant change, why should we (a) establish and protect nature reserves and (b) carry out ecological restoration?S 4- Should there be a ban on the use of of-road vehicles and snowmobiles on all public land in Lebanon?
Module 4	Sustaining Natural Resources
Key Concepts	Soil and food, Pest management, water resources, mineral resources, renewable and nonrenewable energy.
Overview	The focus of this module is on natural resources that are necessary to sustain living organisms. We start with the discussion of soil as precious resources upon which agriculture is dependent, water resources, mineral resources in addition to renewable and non-renewable energy.
Aim	The aim of this module is to explore the natural resources necessary to sustain life.
Learning Outcomes	At the end of this module learners will be able to: • Discuss food security and why is it difficult to attain? • Evaluate environmental problems arising from industrialized food production. • Discuss sustainable agriculture. • Explore the importance of mineral resources. • Discuss the various forms of renewable and non-renewable energy resources.
Units	Unit 4.1: Food, soil and pest management Unit 4.2: Water resources

	Unit 4.3: Nonrenewable mineral resources energy resources. Unit 4.4: Nonrenewable energy Unit 4.5: Renewable energy and energy efficiency
Readings	Snell, M. B. (2001) Against the grain. Sierra 86:30 Finneran, K. (2001) What's food got to do with it? Issues in Science and Technology. Kerlin, K. (2001) Diamonds aren't forever E 12:54. Nanney, J. (2002) How motor efficiencies affect system desgns. Plant Engineering. Fairley, P. (2002) wind power for pennies: A light weight wind turbine is finally on the horizon and it just might be the breakthrough Technology Review 105:40.
Activity	**Overview**
	Assignment 1- What could happen to energy intensive agriculture in the industrialized countries if world oil prices rose sharply? 2- Why should it matter to people in developed countries that many people in developing countries are malnourished and hungry? What are the three most important actions in you believe should be taken to reduce hunger (a) in Lebanon (b) in the world?

	3- Develop a water conservation plan for your school and submit it to school officials. 4- How do human activities increase the harmful effects of prolonged drought? How can we reduce these effects? 5- Write a two-page scenario of what your life might be like without oil. Compare and discuss the scenarios developed by your class. 6- Make a study of energy use in your school and use the findings to develop an energy-efficiency improvement program. Present your plan to school officials.
Module 5	Sustaining Environmental Quality
Key Concepts	Air pollution, water pollution, Solid and hazardous waste, Climate change, and ozone depletion.
Overview	This module deals with aspects related to the quality of our environment. Humans are utilizing matter and energy at an exceedingly fast rate. This is creating problems of depletion of natural resources and environmental pollution. In this module we are going to discuss aspects related to water and air pollution and solid and hazardous waste management. We will emphasize global problems of climate change and ozone in our discussion.
Aim	The overriding aim of this module is to discuss several aspects related to the degradation of the environmental quality resulting from overuse of natural resources and energy.
Learning	At the end of this module learners will be able to:

Outcomes	• Know outdoor and indoor air pollution • Discuss acid deposition. • Recognize health effect of air pollution. • Discuss how the earth's temperature and climate change in the future. • Discuss the possible effects of a warmer atmosphere. • Discuss what can be done to slow projected climate change. • Recognize the problem and solutions to ozone depletion. • Discuss causes and effects of water pollution. • Discuss the problem and solutions to solid and hazardous waste
Units	Unit 5.1: Air pollution Unit 5.2: Climate change and ozone depletion Unit 5.3: Water pollution Unit 5.4: Solid and hazardous waste
Readings	Becker, R. and Henderson, V. (2000) Effects of air quality regulations on polluting industries. Journal of Political Economy 108:379. UNEP. (2013) *Climate Change* http://www.unep.org/pdf/UNEP_Profile/Climate_change.pdf Pacala, S., Socolow, R. (2004) Stabilization wedges: Solving the climate problem for the next 50 years with current technologies. Science 505:968-72. Rabalais, N, N., Turner, R. E., Scavia, D., (2002) Beyond science into policy: Gulf of Mexico hypoxia and the Mississippi River. BioScience 52:129.

	Evans, L. D. (2002) The dirt on phytoremediation. Journal of Soil and Water Conservation 57:13.
Activity	**Overview**
	Assignment 1- Congratulations! You are in charge of reducing air pollution in Lebanon. List the three most important features of your policy. 2- Suppose you become trapped in your car during a snowstorm and you have your engine and heater running to keep warm. Explain why you should roll down one of your windows just a little. 3- Do you agree or disagree with the argument by developing countries that developed countries should bear the brunt of reducing CO2 emissions because they produce much more of these emissions than developing countries? Explain. 4- Explain why developed nations are able to adapt to problems caused by increased global warming more easily than developing countries. Should developed countries provide significant aid to help developing countries adapt to the harmful effects of global warming? Explain. 5- Congratulations! You are in charge of the world. List your three most important actions for dealing with (a) global warming and climate change, (b) depletion of ozone in the stratosphere.

	6- How can a stream cleanse itself of oxygen-demanding wastes? Under what conditions will this natural cleansing system fail? 7- What hazardous wastes are produced (a) at your school and (b) in your community? What happens to these wastes?

Course Syllabus

ENS 205:

Environment, Society and Ethics

Notre Dame University-Louaize, Faculty of Natural and Applied Sciences, Department of Sciences

Spring Semester, 2013-2014

Instructor Information

Instructor: Dr. Tanos G. Hage

Office Location: S242, Main Campus

Telephone: Office – 09-208725

Office Hours:	MWF 1:00-2:00
E-mail:	thage@ndu.edu.lb
Website:	

Course Identification

Course Number:	ENS 205
Course Name:	Environment, Society and Ethics
Course Location:	Main Campus
Class Times:	MWF 3:00-4:00
Prerequisites:	None
Faculty Web Page:	http://www.ndu.edu.lb/academics/fnas/deanmess.htm

Course Description/Overview

Introduction to the environmental goods and services, impacts of population growth and economic development on the environment, the evolution of societies, community organizations and the quality of life are presented. Special focus is given to the value types and existing moral relationships between human beings and their environment, environmental ethics views, their evolution and effects on the environment and wildlife protection. Sustainability principles and the impacts of international policies, environmental management worldviews and legally binding agreements on natural resources, societies and the world's economic balance are emphasized.

Course Learning Objectives

The overarching goals of this course are: a) to provide a clear, systematic, and comprehensive introduction to the philosophical issues underlying environmental and ecological awareness. b) introduce the relevance of philosophy for environmental concerns and some traditional ethical theories and principles. c) examie attempts to extend moral standing to animals, future generations, tres, and other natural objects. d) explore comprehensive environmental and ecological philosophies such as biocentrism, ecocentrism, deep ecology and ecofeminism. e) discuss climate change ethics and sustainability.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

125. Explore the impacts of humans on the environment.
126. Understand the current concepts and controversies in relation to environmental ethics.
127. Examine the concept of human rights in the context of population pressures and the hunger of poor people around the world.
128. Distinguish between anthropocentric and non anthropocentric environmentalism.
129. Implement sustainability principles as a framework to improve the quality of life
130. Assess practical matters by addressing issues of personal character and lifestyle as well as public policy.
131. Address the issue of ethics of climate change and sustainability.

Course Resources

Required Text Book

Joseph R. DesJardins (2006) Environmental Ethics: An introduction to Environmental Philosophy. Fourth edition. Wadsworth, Cengage Learning. USA.

Assignments and Grading Scheme

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (*i.e.* percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A^{+}	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A^{-}	Very Good	3.7	89 - 92
B^{+}	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B^{-}	Good	2.7	77 - 79
C^{+}	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C^{-}	Passing	1.7	66 - 69
D^{+}	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59
UW	Unofficial Withdrawal	0.0	

The grade "*UW*" is assigned by the instructor when a registered student has never attended a class or has ceased attending and has not submitted an official course withdrawal request to the Office of the Registrar. This grade is computed as an *F* grade in the grade-point average.

Grading Policy

Grades can be based on the following: (Example)

First exam	20%
Second exam	20%
Final Exam	35%
Project and Assignments	20%
Participation and Evaluation	05%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Classes are a mix of lectures (Powerpoint presentations) and class discussions. The material related to course is presented in a clear manner that engages the students by relating abstract concepts to current everyday issues or controversies that they care about. Material and assignments will be posted on blackboard. Additional readings will be assigned from the literature on specific subjects. Field trip(s) will be planned to visit a natural wild area in Lebanon. You should record all your observations, thoughts and questions in your field journal. Your field observations will be unique to you, reflecting your personal style. For each field trip a report is expected. Includes photos and sketches with your write up.

Course Schedule

Week	Date	Topics
1-2		Science, ethic and the environment

3-4		Responsibilities to future generations: sustainable development
5-6		Responsibilities to the natural world: from anthropocentric nonanthropocentric ethics.
7-8		Biocentric ethics and the inherent value of life
9-10		The land ethics, deep ecology and ecofeminism
11-12		Environmental justice and social ecology
13-14		Climate Change and energy policy
15		Class presentations and discussions

Course Policies

No make-up exam is allowed under normal circumstances. Consequently, a student missing an exam with no justifiable reason will lose the grade value of that exam.

Under abnormal circumstances a student is allowed a make-up exam under the following conditions:

1. The student shows that missing the exam was beyond his/her control.
2. The instructor and chairperson accept the case presented and approve of the make up.
3. The student may lose 10 points out of 100 of the grade value of the exam in question.
4. The make up exam shall be done within 10 days after the elapse of the exam date.

Assignments should be returned by the due date. Failure to do so will result in losing up to 20% of the grade.

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.

Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).

Once in class, students are expected to remain in class for the entire period.

English must be the only language spoken in class at all times.

Special needs: Any student who feels s/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Policies & Procedures

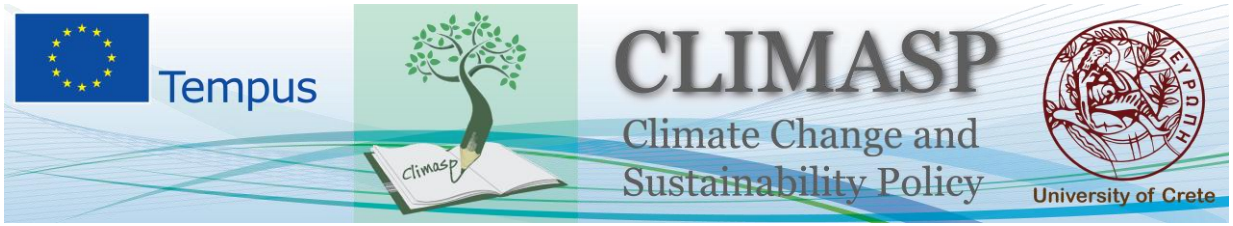
NDU's Attendance Policy
Student should attend all classes and laboratory sessions on time. A pattern of absences, whether authorized or not, and even below the maximum number (specified below), may alter one's grade substantially. The SAO alone authorizes absences. No absence absolves a student from the responsibility of acting upon the material presented during his/her absence. The maximum number absences for classes that meet on MWF is six; the maximum number for classes that meet on TTh and in the summer is four, (or two hours per credit course). Any student whose absences exceed the maximum limits shall automatically fail the course unless the student withdraws.

Office Hours: All instructors at NDU are available for office hours during the week. Please note the office hour that your instructor has dedicated to this course to make an appointment. Just dropping by may not ensure that the professor has set aside time to assist you. Office hours may be used ideally to ask for guidance on an assignment or to ask questions concerning a subject that you were not clear on during class time.

NDU's Academic Integrity Policy
Students are expected and encouraged to be honest and to maintain the highest standards of academic integrity in their academic work and assignments at the University. They shall refrain from any academic dishonesty or misconduct including; but not limited to:

- Plagiarism; that is, the presentation of someone else's ideas, words or artistic, scientific, or technical work as one's own creation. Also, paraphrasing, summarizing, as well as well as direct quotations are considered as plagiarism, if the original source is not properly cited.
- Cheating.

- Assisting in cheating.
- Substituting a student in the taking of an examination.
- Substituting examination booklets.
- Submitting the same work for more than one course and the like. o Submitting papers written by others.
- Receiving or providing unauthorized help or assistance in any academic work or assignment. Intentional violation of program and degree requirements and regulation as established by the University.
- Dishonest reporting of computational, statistical, experimental, research, results, or the like.



Course	Environment, Society and Ethics
Module 1	Science, ethics and the environment
Key Concepts	Envionmental philosophy and ethics, Interplay between science and philosophy, decision making
Overview	Humans face unprecedented environmental challenges. Faced with such a catastrophic future we are challenged with critical decisions. Relying on science and technology without any consideration to ethical and philosophical issues may lead to more problems. Environmental policy needs to be decided upon in the political arena and not by scientists because the decisions that might be taken by experts in science and technology may not be objective.
Aim	The overriding aim of this module is to understand the critical role that environmental philosophy and ethics play in order to take the proper decisions related to environmental problems.
Learning Outcomes	At the end of this module learners will be able to: • Define environmental philosophy and environmental ethics. • Understand the role of environmental ethics in decisions related to environmental problems. • Discuss the interplay between scientists and environmental ethicists to reach the proper decisions related to environmental problems.
Units	Unit 1.1 Introduction: Why philosophy Unit 1.2: Science and ethics Unit 1.3: What is environmental ethics?

	Unit 1.4: Summary and conclusions
Readings	Louis P. Pojman and Paul Pojman (2012) *Environmental Ethics: Readings in Theory and Applications*, Sixth edition. Wadsworth, Cengage Learning. USA. The Master Bibliography in Environmental ethics has been composed by Holmes Rolston at Colorado State University and can beaccessed from the ISSE's website at http://www.cep.unt.edu/ISEE.html . This site has many links to other environmental resources.
Activity	**Overview** Assignment 1. When evaluating the safety of chemical pesticides, who should determine levels of acceptable risks? Is "risk" a matter of scientific fact, or is it a matter of value? What makes an issue a value issue? 2. Identify as many different uses of the words natural and nature as you can. Which, if any, have value connotations? Are all things that are "natural" also good? What about "human nature"? What is not natural about human beings? What would be the difference between "natural" fertilizers and "nonnatural" ones? Could there be such a thing as a "natural: pesticide? 3. Is there a difference between good science and bad science? We often hear that science should be value neutral. Is this true? Can you think of any values involved in the practice of good science? 4. How is reasoning about ethical matters different from reasoning about scientific matters? How do scientists evaluate controversial claims in science? How would we evaluate controversial ethical claims?

	5. What makes a belief or statement objective? Contrast this with subjective beliefs or statements. What statements about a tree, for example, are objective? What statements about a tree are subjective?
Module 2	Responsibilities to future generations: sustainable development
Key Concepts	Sustainable development, overpopulation, consumption, environmental ethics and sustainability.
Overview	This module looks at how overpopulations and overconsumption issues raise questions related to future generations. If these trends remained unchanged the earth may face environmental and economic collapse in the next century, thus threatening the existence of future generations. The increased production of greenhouse gases and the destruction of carbon-absorbing vegetation threaten the entire planet with shifting climates and global warming. Applying traditional, standard ethical theories are unsatisfactory to tackle the above issues. Philosophical ethics are extended to answer questions related to our responsibilities toward future generations.
Aim	The overriding aim of this module is to understand the debate related to our responsibilities for future generations based on newly developed theories of environmental philosophy.
Learning Outcomes	At the end of this module learners will be able to: • Understand the impact of our actions on the quality of the environment for future generations. • Demonstrate a clear understanding of the concept of sustainable development. • Evaluate the different ideas related to our responsibilities toward maintaining a healthy environment for future generations.
Units	Unit 2.1: Introduction

	Unit 2.2: Population, consumption, and environmental ethics Unit 2.3: Do we have responsibilities to future generations? Unit 2.4: Climate change and sustainability Unit 2.5: Consumptions and sustainable development Unit 2.6: Summary and conclusions
Readings	Anne and Paul Ehrlich (1987) *Earth*. Fraklin Watts, New York Paul Ehrlich and John Holdren (1988) *The Cassandra Conference: Resources for the Human Predicament*. Texas A&M University Press, Texas Station. Herman Daly (1987) *Sustainabe Growth: An Impossible Theorem.* Massachusetts Institute of Technology Press, Boston.
Activity	**Overview**
	Assignment 1- Controversies such as those surrounding global warming and climate change involve long term predictions and therefore cannot be resolved in the short term. In light of this uncertainty, is there one reasonable course of action? What does reason advise when we must make a decision with incomplete information? 2- Do you believe that overconsumption or overpopulation plays a greater role in environmental destruction? Which problem would you address first? 3- Does more material lead to greater happiness?

	4- Many indigenous cultures were destroyed when Europeans colonized the Americas and Africa. We can only guess at what we have lost as a result of these conquests. Have we been hurt by this loss? Can people be harmed by the loss of opportunities and the loss of knowledge of which they will never be aware? Will future generations be harmed if they never know about the blue whale or never know of a wilderness area? 5- Global warming and Climate Change results primarily from using fossil fuels for energy. Americans use much more fossil fuel energy per capita than most other people. In fact According to environmental journalist Bill McKibben, "an American uses seventy times as much energy as a Bangladeshi, fifty times as much as a Malagasi, twenty times as much as Costa Rican." One result is this: "During the next decade India and China will each add to the planet about ten times as many people as the United States will-but the stress on the natural world caused by new Americans may exceed that from new Indians and Chinese combined." In light of these facts, and the importance of mitigating global warming, maybe we should combat population growth in the United States. Currently, American can claim children as a tax deduction on income taxes. Perhaps this should apply only to the first two children . What do you think?
Module 3	Responsibilities to the natural world: from anthropocentric to nonanthropocentric ethics.
Key Concepts	Moral standing, anthropocentrism versus non anthropocentrism, Animal liberation and animal rights, moral standing to nature.
Overview	This module answers two fundamendal questions related to environmental ethics. First, what is the proper ethical relationship between humans and the natural environment? Second, what is the

	philosophical basis for this relationship.? Standard ethical theories are not enough to answer the above questions. According to the traditional theories we protect the environment for our interests (human centered views or anthropocentric views). In this module we examine the shift in the philosophical perspective. Philosophers started to argue that we have direct ethical responsibilities to nature, responsibilities that do not depend on the consequences to humans. This shift can be characterized as the shift between anthropocentric to nonanthropocentric theories of ethics.
Aim	This module aims at examining shift between anthropocentric to nonanthropocentric theories of environmental ethics.
Learning Outcomes	At the end of this module students will be able to: • Understand the concept of moral standing • Evaluate the shift between anthropocentric to nonanthropecentric views about nature and the environment. • Review the animal liberation movement as discussed by Peter Singer • Explain Tom Regan's argument concerning animal righlts • Discuss the systematic ethical considerations to nonhuman natural objects.
Units	Unit 3.1: Introduction Unit 3.2: Moral standing in the western tradition Unit 3.3: Early environmental ethics Unit 3.4: Moral standing Unit 3.5: Do trees have standing? Unit 3.6: Peter Singer and the animal liberation movement Unit 3.7: Tom Regan and animal rights Unit 3.8: Ethical implications of animal welfare Unit 3.9: Critical challenges:

Readings	Peter Singer (1990) *Animal Liberation*. Second edition. Review of Books Press, New York. Tom Regan (1985) *The Case for Animal Rights* in *In Defence of Animals*. Basil Blackwell, Oxford. Roderick Nash (1989) *The rights of Nature*. University of Wisconsin Press, Madison. Eugene Haegrove (1989) *Foundations of nvironmental Ethics*. Prentice-Hall, New York.
Activity	**Overview**
	Assignment 1- Throughout the world, many laws prohibit abuse of animals. List as many reasons for these prohibitions as you can. Do any of these reasons commit you to holding that animals have a moral standing in their right:? 2- Try the following mental experiment concerning what objects have moral standing. Assume that competent adult human beings are placed at one end of a continuum and a rock at the other. Where along that continuum would you place the following: a child, a brain-dead adult, a fetus, a dolphin, a dog, an insect, an alien, a bird, a species, and a tree? Have you used a single criterion either implicitly or explicitly? 3- Do you see any morally relevant differences between domesticated and wild animals? Would Singer? Would Regan? Do you see any morally relevant differences between animals that are threatened with extinction and those that are not?

	4- Does hunting or fishing raise any moral issues? If people eat the animals they kill, does that make a difference? In many areas, deer are overpopulating local habitats. Destruction of the habitat as well as mass starvation can occur in such circumstances. Would you favor selective hunting to thin overpopulated herds?
Module 4	Biocentric ethics and the inherent value of life
Key Concepts	Ethical extensionism, instrumental versus intrinsic value, Biocentrism,
Overview	The focus of this module is to consider systematic attempts in order to develop comprehensive environmental philosophies that are not in the realm of traditional standard Philosophy. Most of the recent philosophical work on the environment breaks with standard ethical theory and strive to rethink the relationships between humans and nature. Modern philosophers are are adopting the point of view of concerned citizens seeding to articulate, develop, and defend a coherent and comprehensive environmental philosophy.
Aim	The aim of this module is to explore the recent trends in environmental philosophy and ethics by emphasizing the concept of biocentrism or the reverence to life.
Learning Outcomes	At the end of this module learners will be able to: • Understand the concept of ethical extensionism • Define the terms instrumental and intrinsic vlaues • Evaluate the importance of biocentric ethics and its application in everyday life experiences.
Units	Unit 4.1: Introduction Unit 4.2: Instrumental value and intrinsic value Unit 4.3: Biocentric ethics and the reverence for life

	Unit 4.4: Ethics and character Unit 4.5: Taylor's biocentric ethics Unit 4.6: Practical implications Unit 4.7: Challenges and developments Unit 4.8: Summary and conclusions
Readings	James Brabazon (1975) *Albert Schweitzer: A Biography*. Putnam, New York. Holmes Rolston (1988) Environmental Ethics. Temple University Press, Philadelphia. R. Edward Grumbine (1994) Environmental *Policy and Biodiversity*. Island Press, Washington, D.C.
Activity	**Overview**
	Assignment 1- We use the word value both as a noun and as verb. Certain objects are said to possess value, and humans value numerous objects. If no humans were around to do the valuing, would anything of value remain? 2- Compose a list of things that you value. Distinguish those things that you value instrumentally from those things valued for their own sake. How many different types value can you think of? 3-Like Aristotle, Taylor suggests that each species has a distinctive nature that can best be identified in terms of a characteristic activity. How else might you distinguish between species? 4- In taylor's account, does it make sense to attribute interests or goods to

	a wilderness area, to a river, or to other ecosystems? Can such things be teleological centers of life?
Module 5	The land ethics, deep ecology and ecofeminism
Key Concepts	Ecocentric ethics, ecosystems, holistic ethics, land ethics, deep ecology, ecofeminism
Overview	Some philosophers think that we should go beyond focusing mostly on individual species. They believe that we have an ethical responsibility to take a wider view and work to prevent degradation of the earth's ecosystems, biodiversity and the biosphere. This ecocentric view is devoted to helping sustain earth's biodiversity and the functioning of its life-support systems for all forms of life, now and the future. Their view is that the natural systems that we are all part of is holistic, that is, interconnected and interdependent. Ecocentric world view hold that because humans and all forms of life are interconnected parts of the earth's life support system, it is in our own self-interest not to act in ways that impair the overall system. In this module we are going to explore three examples of ecocentric environmental philosophy: Land ethics, deep ecology and ecofeminism.
Aim	The overriding aim of this module is to discuss several examples of ecocentric environmental philosophies.
Learning Outcomes	At the end of this module learners will be able to: • Define holistic ethics and ecocentric ethics. • Disccus the influence of field of ecology in developing the ideas behind ecocentric ethics. • Describe the development of Leopold's land ethics principles. • Explore the criticisms associated with the Leopold's land ethics.

	• Explain the deep ecology platform as developed by Naess and Sessions. • Identify the two ultimate norms of deep ecology: self realization and biocentric equality. • Explore the criticisms associated with deep ecology • Elaborate on the variety of approaches that comprises ecofeminism
Units	Unit 5.1: The land ethics and Leopold's holism Unit 5.2: Criticism of the land ethics Unit 5.3: The ecology platform Unit 5.4: Self-realization and biocentric equality Unit 5.5: Criticisms of deep ecology Unit 5.6: Ecofeminism: making connections Unit 5.7: Ecofeminism: Recent developments
Readings	Aldo Leopold (1949) *A Sand County Almanac*. Ballantine, New York. J. Baird Callicott (1989) *In Defence of the Land Ethic*. State University of New York Press, Albany. John Davis (1991) *Earth first!.* Pergrine Smith Books, Salt lake City. Dave Foreman (1991) *Confessions of an Eco-Warrior*. Harmony, New York. George Sessions (1995) *Deep Ecology for the Twenty-First Century*. Shambala Publishing, Boston. Janet Biehl (1991) *Rethinking Ecofeminist Politics*. South End Press, Boston.

	Greta Gaard (1993) *Ecofeminism: Women, Animals, Nature*. Temple university Press, Philadelphia.
Activity	**Overview**
	Assignment 1- Should farmers and ranchers be allowed to kill wild predetors such as coyote and wolves in order to protect their herds? How should government balance these competing interests? 2- Do you support the view that humans are equal moral citizens of the biotic community? Is there a middle ground between humans as masters of nature and humans as equal biotic citizens? 3- Leopold suggests that the ”dead earth” is an organism that does possess a certain kind of life. What exactly is the difference between a living organism and a nonliving object? Is earth itself alive? 4- Can land or an ecosystem really be characterized as healthy or unhealthy in anything other than a metaphorical way? What exactly would a healthy ecosystem be? 5- Would civil disobedience in defence of the environment ever be justified? If so, when and why? Is tree spiking a defensible means for preventing logging of old-growth forests? 6- Is the statement “This is a tall tree” anymore objective that the statement “This is a majestic tree” ? Explain how both might be defended

	as true. 7- What "different questions" might someone taking a feminist approach to science and technology ask about such issues as nuclear energy, population policy, pesticides use, and animal agriculture?
Module 6	Environmental justice and social ecology
Key Concepts	Social justice theories, personal morality versus social justice, social ecology
Overview	Justice can be understood as the first principle of social and political philosophy: How should we live together? What is the proper structure of society. Living together in a community creates benefits and burdens that exist only within community, and we cannot account for community benefits and vurdens solely in erms of individual rifhts and responsibilities. Social justice must address these questions: How should the benefits and burdens of society be distributed? How should social institutions treat people? What do people deserve from society? What type of individual is created by various social structures and institutions? This module examines the question of environmental justice in general and, more specifically, as it is understood within the philosophical perspective that has come be called social ecology. Two basic questions guide the discussion of environmental justice: Who bears the burdens of environmental harms? And who, if anyone, benefits from environmental harms? Justice demands a fair distribution of benefits and burdens.
Aim	The major focus of this module is the discussion related to environmental

	justice and social ecology.
Learning Outcomes	At the end of this module learners will be able to: • Distinguish between personal morality and social justice. • Review the theories of social justice • Discuss the link between environmental racism and environmental justice. • Understand the concept of social ecology
Units	Unit 6.1: Introduction Unit 6.2: Theories of social justice Unit 6.3: Property rights and justice Unit 6.4: Environmental justice and environmental racism Unit 6.5: Murray Bookchin's social ecology Unit 6.6: Critical reflections Unit 6.7: Summary and conclusions
Readings	1- Murray Bookchin, Dave Foreman in Steve Chase, ed. (1991) *Defending the earth*. South End Press, Boston. 2- Robert Bullard, ed. (1994) *Unequal Protection*. Sierra Club Books, San Francisco.
Activity	**Overview**
	Assignment 1- Must a public policy intentionally discriminate before it can be described as racist or sexist? Is discrimination always a matter of intent? In your opinion, what is the intent behind decisions on where to locate waste dumps? 2- Bookchin claims that human beings cannot help but be, onr should they

	seek to being "purposive interveners" in nature. That would seem to conflict with the view of many preservationists and Deep Ecologists who believe taht humans should let nature take its course. Discuss how these different theorists might evaluate policy on population control. 3- If the price of land in a rural area is less than that of comparable land in an urban area, is this land less valuable? If not, how do you determine the value of land? 4- Nomadic countries on many continents travel great distances following migrating herds of animals. Such people never settle permanently on one section of land. How might their understanding of ownership and property differ from yours? Can a concept of "private property" even exist in such a culture?
Module 7	Climate Change ethics and energy policy
Key Concepts	
Overview	This module presents a selection of 8 essays selected from the literature that deals with climate change ethics and energy policy: 1- Understanding the causes of global climate change (Pew Center on Global Climate Change). 2- Livestock's role in climate change and air pollution (UN report: Climate change and livestock). 3- Ethics and global climate change (Stephen M. Gardiner). 4- The denial industry (George Monbiot).

	5- Hoodwinked in the Hothouse: False solutions to climate change. 6- Climate justice: The emerging movement against green capitalism (Ashley Dawson). 7- Sustainability and technology solutions in the climate policy debate: The case of geologic carbon sequestration (Evelyn Wright and Paul Pojman). 8- War and Climate Change (Barry Sanders). The first three essays offer an introduction to the science behind our understanding of climate change as well as the observed and predicted impacts. Together they make the argument that urgent action is needed. But although there is a consensus that action is needed, there is a vast difference of opinion as to what that action would be. The last four essays examine the growing resistance to proposed technological solutions, examining both the proposals and the global social concerns.
Aim	The overriding aim of this module is to critically evaluate eight essays that deals the science of climate change, proposed solutions and ethical concern.
Learning Outcomes	At the end of this module learners will be able to: • Understand the phenomenon of global warming and climate change. • Evaluate the proposed solutions to mitigate the effects of climate change. • Discuss the ethical concerns in relation to climate change
Units	Refer to the eight essays listed under the overview section.
Readings	The above eight essays are published in:

	Louis P. Pojman and Paul Pojman (2012) *Environmental Ethics: Readings in Theory and Applications,* Sixth edition. Wadsworth, Cengage Learning. USA.
Activity	**Overview**
	Read and evaluate the eight essays and provide a synthesis in a review article articulating the major ideas discussed. Review the status of climate change in Lebanon in regard to impacts, mitigation and adaptation practices. What is the ethical dimension of the climate change problem in Lebanon.

Course Syllabus

BIO 314:
Ecology
Notre Dame University-Louaize, Faculty of Natural and Applied Sciences, Department of Sciences

Spring Semester, 2013-2014

Instructor Information

Instructor:	Dr. Tanos G. Hage
Office Location:	S242, Main Campus
Telephone:	Office – 09-208725
Office Hours:	MWF 1:00-2:00
E-mail:	thage@ndu.edu.lb
Website:	

Course Identification

Course Number:	BIO 314
Course Name:	Ecology
Course Location:	Main Campus
Class Times:	MWF 1:00-2:00
Prerequisites:	None
Faculty Web Page:	http://www.ndu.edu.lb/academics/fnas/deanmess.htm

Course Description

Principles of ecosystems; the interaction of organisms and their environment. Food web, energy flow and nutrient cycling in ecosystems. Factors which affect the distribution and abundance of species, wildlife resources and extinction.

Course Overview

Ecology is the study of the relationships between organisms and their environment. It is a fascinating field that tries to understand nature as a whole, with all its interactions. The scope of ecologists range from an individual organism to the study of global scale processes, such as global warming and ozone depletion. The knowledge gained from ecology helps us understand and design solutions to environmental problems and offers humanity a chance to save our biosphere. In our discussion of ecology we will emphasize the science behind it as well as its societal applications. Since ecologists view biological systems in a hierarchy, we will take this approach in

arranging the topics of our discussions. We will start with the ecology of individuals, which is the domain of physiological ecology and behavioural ecology. Population ecology is studied next; this includes adaptation, extinction, distribution and abundance of species and population growth and regulation. This will bring us to the ecology of interactions such as competition, predation and parasitism. Community ecology on the other hand is concerned with factors controlling multispecies systems. Finally the highest level of organization is the ecosystem organization which include the physical and chemical factors influencing the community and focus on subjects such as energy flow and nutrient cycling in nature. Ecologists are concerned not only with communities, populations and organisms *in nature*, but also with manmade or human influenced environments, and with the consequences of human influence *on* nature (pollution, *global climate change*). In fact, our influence is so pervasive that we would be hard pressed to find an environment that was totally unaffected by human activity. Environmental problems are now high on the political agenda and ecologists clearly have a central role to play: a *sustainable future* depends fundamentally on ecological understanding and our ability to predict or produce outcomes under different scenarios.

Course Learning Objectives

The main objectives of this course are to a) learn about the basic mechanisms that are at work in the biosphere thorough understanding of the fundamental concepts that define the field of ecology. b) Use the knowledge gained from the field of ecology to understand the impact of human activities (pollution, global warming and climate change) on the natural systems. c) Emphasize the concept of sustainable development by highlighting the link between socio-economic needs and the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

132. Learn and understand relationships among biotic and abiotic components of the environment.
133. Explore and analyze concepts related to population structure and dynamics, energy flow, nutrient cycling, interactions and succession in ecological communities and apply those concepts to real world problems.
134. Understand how scientists conduct experiments, analyze data and make conclusion about the natural world.

135. Convey scientific literature and express ecological knowledge about living things to others using oral and written communication.
136. Apply concepts learned in ecology to solve real world problems including global warming and climate change.

Course Resources

Required Course Text

M. C. Molles, Jr. (2013) *Ecology: concepts and applications*. Sixth edition, McGraw-Hill publishing company, Boston, MA
There is a website associated with this text. See: www.mmhe.com/molles6e
Hands-out prepared by the instructor, readings and assignments will be posted on blackboard.

Resources Available to Students
Library Resources: NDU Library is open to students to help you in all your research and class work. Qualified personnel are available to help you.
Writing Center: The Writing Center provides assistance to all students who wish to discuss their writing with a trained consultant. The Center is located in HA 114. An appointment is required.
Blackboard (bb) Software: Lecture material, handouts, readings and assignments will be posted on blackboard. If you are not familiar with the Blackboard system, it is recommended to attend a training session at the University Computer Services in order to know how to use the Blackboard system to enrich the academic communication with your instructor and your colleagues.

Field Observation:
Field trip(s) will be planned to visit a natural wild area in Lebanon. You should record all your observations, thoughts and questions in your field journal. Your field observations will be unique to you, reflecting your personal style. For each field trip a report is expected. Includes photos and sketches with your write up.

Grading and Evaluation

Exam I	20%
Exam II	20%
Final exam (comprehensive)	35%

Project and assignments	25%
Total	**100%**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Classes are a mix of lectures (powerpoint presentations) and discussions. The lecture topic is announced ahead of time for you in order to read assigned material before coming to class. Each lecture begins with a clear and detailed set of learning objectives. After discussing a major concept, multiple choice, and short answer questions are administered in the class to test your understanding and to pinpoint deficient areas of comprehension. This interactive approach requires your active participation. Material and assignments will be posted on blackboard and Connect Ecology-interactive webpage associated with the textbook. Additional readings will be assigned from the literature on specific subjects.

Course Schedule

Week	**Topic** (additional readings are available in the course modules)	Reading
1	Introduction to Ecology: Historical Foundations and Developing Frontiers.	Ch 1
	Natural History and Evolution	
1&2	Life on Land	Ch 2
2	Life in Water	Ch 3

2&3	Population Genetics and Natural Selection	Ch 4
	Adaptation to the Environment	
3	Temperature Relations	Ch 5
4	Water Relations	Ch 6
5	Energy and Nutrient Relations	Ch 7
	Population Ecology	
6	Population Distribution and Abundance	Ch 9
7	Population Dynamics	Ch 10
8	Population Growth	Ch 11
9	Life Histories	Ch 12
	Interactions	
9&10	Competition	Ch 13
10	Exploitation: Predation, Herbivory, Parasitism and disease	Ch 14
11	Mutualism	Ch 15
	Communities and Ecosystems	
12	Species Abundance and Diversity	Ch 16
13	Species Interactions and Community Structure	Ch 17
14	Primary Production and Energy Flow	Ch 18
15	Nutrient Cycling and Retention	Ch 19
16	Succession and Stability	Ch 20

Course Policies
No make-up exam is allowed under normal circumstances. Consequently, a student missing an exam with no justifiable reason will lose the grade value of that exam.
Under abnormal circumstances a student is allowed a make-up exam under the following conditions:
1. The student shows that missing the exam was beyond his/her control.
2. The instructor and chairperson accept the case presented and approve of the make up.
3. The student may lose 10 points out of 100 of the grade value of the exam in question.
4. The make up exam shall be done within 10 days after the elapse of the exam date.

Assignments should be returned by the due date. Failure to do so will result in losing up to 20% of the grade.

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.

Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).

Once in class, students are expected to remain in class for the entire period.

English must be the only language spoken in class at all times.

Special needs: Any student who feels s/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Policies & Procedures

NDU's Attendance Policy
Student should attend all classes and laboratory sessions on time. A pattern of absences, whether authorized or not, and even below the maximum number (specified below), may alter one's grade substantially. The SAO alone authorizes absences. No absence absolves a student from the responsibility of acting upon the material presented during his/her absence. The maximum number absences for classes that meet on MWF is six; the maximum number for classes that meet on TTh and in the summer is four, (or two hours per credit course). Any student whose absences exceed the maximum limits shall automatically fail the course unless the student withdraws.

Office Hours: All instructors at NDU are available for office hours during the week. Please note the office hour that your instructor has dedicated to this course to make an appointment. Just dropping by may not ensure that the professor has set aside time to assist you. Office hours may be used ideally to ask for guidance on an assignment or to ask questions concerning a subject that you were not clear on during class time.

NDU's Academic Integrity Policy

Students are expected and encouraged to be honest and to maintain the highest standards of academic integrity in their academic work and assignments at the University. They shall refrain from any academic dishonesty or misconduct including; but not limited to:

- Plagiarism; that is, the presentation of someone else's ideas, words or artistic, scientific, or technical work as one's own creation. Also, paraphrasing, summarizing, as well as well as direct quotations are considered as plagiarism, if the original source is not properly cited.
- Cheating.
- Assisting in cheating.
- Substituting a student in the taking of an examination.
- Substituting examination booklets.
- Submitting the same work for more than one course and the like. o Submitting papers written by others.
- Receiving or providing unauthorized help or assistance in any academic work or assignment. Intentional violation of program and degree requirements and regulation as established by the University.
- Dishonest reporting of computational, statistical, experimental, research, results, or the like.

System of Grades

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (*i.e.* percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A^{+}	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A^{-}	Very Good	3.7	89 - 92
B^{+}	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B^{-}	Good	2.7	77 - 79

C+	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C-	Passing	1.7	66 - 69
D+	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59
UW	Unofficial Withdrawal	0.0	

The grade "*UW*" is assigned by the instructor when a registered student has never attended a class or has ceased attending and has not submitted an official course withdrawal request to the Office of the Registrar. This grade is computed as an *F* grade in the grade-point average.

Course	Ecology
Module 1	Introduction to Ecology/Natural History and Evolution
Key Concepts	Ecology, biosphere, ecosystem, evolution, soil horizons, biomes, climate diagram, natural history, aquatic environments, hydrologic cycle, adaptation, allele frequency, Hardy-Weinberg principle, natural and artificial selection, genetic drift, population genetics.
Overview	The first unit of this module introduces you to the discipline of ecology, it discusses the levels of ecological organizations and provides a sampling of ecological research performed in the field and/or laboratory. Units 2 and 3 provides an overview of natural history of terrestrial and aquatic environments. Natural history is the study of how organisms in a particular area are influenced by factors such as climate, soil, soils, predators, competitors and evolutionary history. In relation to biomes, large scale patterns of climatic variation is discussed, this includes the construction of climatic diagrams. For each of the different biomes and aquatic ecosystem, geography, climate, soils (for biomes only), biology and human influences are discussed. Evolution is a unifying principle of biology (including ecology) which provides a theoretical framework to study the diversity of life. In this unit, the theory of evolution by natural selection is discussed in detail. In addition topics related to population ecology are discussed, this includes Hardy-Weinberg equilibrium model.
Aim	The aim of this module is to introduce the field of ecology, be exposed to the natural history of the biosphere by discussing biomes and aquatic ecosystems and the impact of humans on them. Finally, an overview of population genetics is presented with emphasis on the theory of evolution by natural selection and the Hardy-Weinberg equilibrium model.
Learning Outcomes	At the end of this module learners will be able to: • Define the term ecology • Comprehend the reasons behind large-Scale patterns of climate variation.

	• Recognize the importance of soil as the foundation of terrestrial biomes. • Recognize the natural history and geography of biomes. • Assess the impact of humans on terrestrial biomes. • Discuss how technology can contribute to curriculum change. • Understand the hydrologic cycle • Recognize the natural history of aquatic environments • Assess the impact of humans on aquatic environments • Explain the theory of evolution by natural selection • Apply the Hardy-Weinberg model to iidentify evolutionary forces.
Units	Unit 1.1: Introduction to ecology: historical foundations and developing fron Unit 1.2: Life on land Unit 1.3: Life in water Unit 1.4: Populations genetics and natural selection
Readings	Norris R.D., P. P. Marra, T. K. Kyser, and L. M. Ratcliffe. 2005. Tracking habitat use of a long distance migratory bird, the American *redstart Setophaga rutcilla*, using stable-carbon isotopes in cellular blood. Journal of Avian Biology 36:164-70. Nadkarni, N. M. 1981. Canopy roots: convergent evolution in rainforest nutrient cycles. Science 214:1023-24. Janzen, D. H. 1981. Guanacaste tree seed-swallowing by Costa Rican range horses. Ecology 62:587-92. Clausen, J., D. D. Keck, and W. M. Hiesey. 1940. Experimental studies on the nature of species. I. The effect of varied environments on Western North American Plants. Washington, D.C.: Carnegie Institution of Washington, Publication no. 520.

	Vila-Aiub, M. M., M. C. Balbi, P. E. Gundel, C. M. Ghersa, and S. B. Powles. 2007. Evolution of glyphosate-resistent Johnsongrass (*Sorghum halepense*) in glyphosate-resistant soybean. Weed Science 55:566-71.
Activity	**Overview** Assignments: 1- Pick a research article related to ecology from a refereed scientific journal and outline the different steps of the scientific method used by the author(s). (Information, question, hypothesis, prediction, test of hypothesis) 2- Construct climate diagram for the different regions of Lebanon (Beirut, Tripoli, Bekaa, Besharee). How are they different? Can you predict the type of biome of each region? Data for each location is provided on Blackbaord. 3. Construct a table for the different terrestrial biomes on earth and indicate the main features related to geography, climate, soils, biology, and human influences, for each biome. 4-Construct a table for the different aquatic environments and indicate the main features related to geography, structure, physical conditions, chemical conditions, biology and human influences. 5- Construct a concept map for chapter 4, populations genetics and natural selection. 6- Solve the set of problems related to Hardy-Weinberg model. The problems

	are posted on blackboard. 7- Investigate the environmental threats to the Cedar forest of Bsherri in Lebanon. Deatail some of the conservation efforts undertaken to protect this forest.
Module 2	Adaptation to the Environment
Key Concepts	Acclimation, ectotherm, endotherm, homeotherm, Poikilotherm, macroclimate and microclimate, photosynthesis, thermal neutral zone, hyperosmotic, hypoosmotic, isoosmotic, osmoregulation, relatie humidity, water potential, autotroph, chemosynthetic autotroph, heterotroph, detritivore, Mullerian and batesian mimicry, fuctional response, optimal foraging theory.
Overview	In this unit we examine the relationships between organisms and temperature. This discussion has a practical application in view of the rapidly changing climate. Water is essential for all forms of life on earth. Most organisms must expand energy to maintain their internal water. Hence the study of water relations is fundamental to living organism especially for desert organisms. In order to survive organisms must obtain energy from their environment. Autotrophs use solar energy or inorganic chemicals. However, heterotrophs must obtain energy from the food they consume. The study of energy and nutrient relations addresses this subject.
Aim	The aim of this unit is to explore adaptations to environments in relation to temperature, water, nutrient and energy relations.
Learning Outcomes	At the end of this module learners will be able to: • Learn about microclimates and the factors that influence it.

	• Understand evolutionary trade-offs. • Characterize the performance of organisms in relation to temperature. • Explain how organisms regulate their body temperature. • Explain how organisms survive extreme temperatures. • Recognize water availability in different compartment.s • Discuss water regulation on land. • Understand water and salt balance in aquatic environments. • Learn about photosynthetic autotrophs, chemosynthetic autotrophs and heterotrophs. • Explain the optimal foraging theory. • Apply the concept of energy and nutrient relations: Bioremediation
Units	Unit 2.1: Temperature relations Unit 2.2: Water relation Unit 2.3: Nutrition and energy relations
Readings	Bennett, A. F. And R. E. Lenski. 2007. An experimental test of evolutionary trade-offs during temperature adaptation. Proceedings of the National Academy of Sciences of the United states. 104 supplement 1:8649-54. Baur, B. And A. Baur. 1993. Climatic warming due to thermal radiation from an urban area as possible cause for the local extinction of a landsnail. Journal of Applied Ecology 30:333-40. Toolson, E. C. And N. F. Hadley. 1987. Energy-dependent facilitation of transcuticular water flux contributes to evaporative cooling in the sonoran desert cicada, Diceroprocta apache (Homoptera, Cicadidae). Journal of Experimental Biology 131:439-44. Tracy, R. L. And G. E. Walsberg. 2002. Kangaroo rats revisited: re-evaluating a classic case of desert survival. Oecologia 133:449-57.

	Watwood, M. E. And C. N. Dahm. 1992. Effects of aquifer environmental factors on biodegradation of organic contaminants. In Proceedings of the International Tropical Meeting on Nuclear and Hazardous Waste Management Spectrum '92. La Grange Park, III.:American Nuclear Society. White, C. S. And J. T. Markwiese. 1994. Assessment of the potential for *in situ* bioremediation of cyanide and nitrate contamination at a leach mine in central New Mexico. Journal of Soil Contamination 3:271-83.
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1- Many species of plants and animals that are associated with boreal forests also occur on mountains far to the south of the boreal forests. Using what you have learned about microclimates predict how aspect and elevation would influence their distributions on these southern mountains. 2- J. L. Mosser and colleagues found that populations of the bacterium *Sulfolobus* living at different temperatures has different optimal temperatures for sulfur oxidation. Use natural selection to explain these patterns. Design an experiment to test your explanation. Assume you can create artificial springs and regulate their temperature as you like. 3- Distinguish among vapor pressure deficit, osmotic pressure, and water potential. How can all three phenomena be expressed in the same units of measure: pascals. 4- Why are plants such as mosses living in the understory of a dense forest, which show higher rates of photosynthesis at low irradiance, unable to live in

	environments where they are exposed to full sun for long periods of time? 5- In type 3 functional response, what mechanisms may be responsible for low rates of food intake – compared to type 1 and type 2 functional response- at low food densities? 6- The data of Iriarte and colleagues suggest that prey size may favor a particular body size among pumas. However, this variation in body size also correlates well with latitude; the larger pumas live at high latitudes. Consequently, this variation in body size has been interpreted as the result of selection for efficient temperature regulation. Homeothermic animals are often larger at high latitudes, a pattern called Bergmann's rule. Larger animals, with slower surface area relative to their mass, would be theoretically better at conserving heat. Smaller animals, with higher surface area relative to their masss, would be theoretically better at keeping cool. So what determines predator size? Is predator size determined by climate, predator-prey interactions, or both? Design a study of the influence of the environment on the size of homeothermic predators.
Module 3	Populations Ecology
Key Concepts	Regular, random and clumped distributions, niche, age distribution, birth and death rate, cohort life table, geometric rate of increase, life table, numerical response, survivorship curve, carrying capacity, geometric and exponential population growth, reproductive effort, ruderal, semelparity, phenology, k selection.
Overview	In this section we are going to study aspects related to populations: a) population distribution and abundance. b) population dynamics which is

	concerned with factors influencing the expansion, decline, or maintenance of population. d) population growth. e) life histories which consists of the adaptations of an organism regarding the offsprings it produces, its survival, its age and size at reproductive maturity. Population studies is a key to manage wildlife, control pest populations and save endangered species.
Aim	The aim of this module is to understand the principles of population ecology and be able to apply these principles to real life applications. Population ecology holds the key to saving endangered species, manage wildlife and forests, understand and control disease epidemics.
Learning Outcomes	At the end of this module learners will be able to: • Learn about the effect of the environment on the distribution of species. • Recognize the factors that affect the distribution patterns of individuals within populations on small and large scales. • Apply the concepts learned to assess the level of rarity and vulnerability to extinction of populations. • Comprehend the influence of population dispersal on distribution and abundance. • Understand the temporal dynamics of populations by focusing on patterns of survival and reproduction in populations. • Apply the concepts learned in population dynamics to assess the impact of human generated pollutants on ecosystems. • Examine exponential and geometric growth • Study the effect of the environment on population growth. • Study the history, current state and projected growth of human population. • Recognize life histories: the adaptations of organisms that influence the number of offspring it produces, its survival, its size and age at reproductive maturity. • Apply the concepts learned in life histories to restore riparian forests.

Units	Unit 3.1: Population distribution and abundance Unit 3.2: Population dynamics Unit 3.3: Population growth Unit 3.4: Life histories
Readings	Huchinson, G. E. 1959. Homage to Santa Rosalia or Why are there so many kinds of animals? Amrican Naturalist 93:145-159. Caughley, G., J. Short, G. C. Grigg, and H. Nix. 1987. Biology of Populus and Its Implications for conservation and management. Ottawa:

	NRC Research Press.
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1- Cedars of Lebanon (*Cedrus libani*) occurs throughout the western chains of mountains in Lebanon. a) Check the literature and draw a map of their distribution. How do altitude and aspect affect their distribution? Are any populations of cedars of Lebanon found above an altitude of 2000 m. If not justify your answer. In the mountains of Turkey cedars of Lebanon can grow at much higher altitudes. Speculate the reason behind this difference. 2- Suppose one plant reproduces almost entirely from seeds, and that its seeds are dispersed by wind, and a second plant reproduces asexually, mainly by budding from runners. How should these two different reproductive modes affect local patterns of distribution seen in populations of the two species? 3- How might energy and nutrient relations explain the lower population densities of birds compared to comparable-sized mammals. 4- The world population is increasing at an alarming rate. Explain the impact of this rapid growth on the environment and on sustainable development. On what basis the carrying capacity of the earth is calculated? 5- Why do many populations of exotic species, such as zebra mussels, Eurasian collared doves and tree of heaven, often grow at an exponential rate for some time following their introductions into a new environment? 6- The discussion of seed size and number of focused on the advantages associated with large seeds. However, researchers revealed that the plants from

	widely separated geographic regions produce a wide variety of seed sizes. If this variation is to be maintained, what are some of the advantages associated with producing small seeds?
Module 4	Interactions
Key Concepts	Interspecific and intraspecific competition, competitive exclusion principle, exploitation, predation and herbivory, parasites and pathogens, facultative and obligate mutualism.
Overview	This module introduces the ecology of interactions by bringing biological components together. Evolutionary effects of interactions on the species will be addressed. This unit also explores the effect of interactions on the structure of the population and on properties of the ecological communities. Practical applications learned from the ecology of interactions include the study of human disturbance on ecosystems, biological pest control and the modification of food webs by humans.
Aim	The aim of this module is to introduce the major concepts related to the biology of interactions and their applications in everyday life such as biological pest control and control of invasive species.
Learning Outcomes	At the end of this module learners will be able to: • Compare and contrast intraspecific and interspecific competition. • Discuss the competitive exclusion principle. • Explain the effect of competition on the ecological and evolutionary influences on the niches of a species. • Understand the mechanisms allowing invasive species to invade communities of native species. • Recognize the extent of exploitative interactions in an ecosystem. • Appreciate the value of pest control by predators. • Explore mutualisms in nature.

	• Evaluate the benefit of mutualisms in agriculture.
Units	Unit 3.1: Competition Unit 3.2: Exploitative interactions Unit 3.3: Mutualism
Readings	1- Byers, J. E. 2000.Competition between two estuarine snails: implications for invasions of exotic species. Ecology 81:1225-12239. 2- Bryers, J. E. and L. Goldwasser. 2001. Exposing the mechanism and timing of impact of nonindigenous species on native species. Ecology 82:1330-1343. 3- Lindstrom, E. R., H. Andren, P. Angelstam, G. Cederlund, B. Hornfeldt, L. Jaderberg, P. A. Lemnell, B. Martinsson, K. Skold, and J. E. Swenson. 1994. Disease reveals the predator: sarcoptic mange, red fox predation, and prey populations. Ecology 75:1042-1049. 4- Krebs, C. J., R. Boonstra, S. Boutin, and A. R. Sinclair. 2001. What drives the 10-year cycle of snowshoe hares? BioScience 51:25-36. 5- Kalka, M. B., A. R. Smith, and E. k. V. Kalko. 2008. Bats limit arthropods and herbivory in a tropical forest. Science 320:71. 6- Isack, H. A. and H. U. Reyer. 1989. Honeyguides and honey gatherers: interspecific communication in a symbiotic relationship. Science 243:1343-1346.
Activity	**Overview**
	Assignments: (some assignments taken or modified from the textbook) 1- The competitive exclusion theory states that two species cannot occupy

	the same nice indefinitely. What is the a fundamental assumption of this principle. 2- Do resources have to be present in limited supplies for competition to shape niches? 3- Can we conclude that interspecific competition commonly restricts species to realized niches in nature, based on the results of mathematical models and laboratory experiments? 4- One of the conclusions that seems justified in light of several decades of studies of interspecific competition is that competition is a common and a strong force operating in nature, but not always and not everywhere. List the environmental circumstances in which you think intraspecifc and interspecific competition would be most likely to occur in nature. In what circumstances do you think competition is least likely to occur? How would you go about testing your ideas? 5- How could you test experimentally for the combined influence of bats and birds on numbers of arthropods on foliage, as well as their individual contributions? (Check the paper of bats in the list of references for this unit). 6- Both mathematical and laboratory models offer valuable insights into the dynamics of predator-prey systems. What are some advantages and limitations of each approach? 7- predation is one of the processes by which one organism exploits another. Others are herbivory, parasitism, and disease. What distinguishes

	each of these processes, including perdation, from the others? We can justify discussing these varied processes under the heading of exploitative interactions because each involves one organism making its living at the expense of another. By what "currency" would you measure that expense (e. g., energy, fitness)?
Module 5	**Communities and Ecosystems**
Key Concepts	Species diversity and evenness, community structure, commensalism, dominant or foundation species, food web, keystone species, ecological efficiency, net primary and secondary production, trophic level, decomposition, mineralization, eutrophication, nutrient cycling, climax community, pioneer community, primary and secondary succession.
Overview	In this unit we are going to discuss communities and ecosystems. Communities are composed of interacting species and their study is concentrated on the organisms inhabiting an area. However, the study of ecosystems includes the physical and chemical factors influencing the community as well, such as nutrient cycling and energy flow. Practical applications to community ecosystem ecology include: disturbance by humans to ecosystems, human modifications of foodwebs, altering aquatic ecosystems (eutrophication).
Aim	The aim of this unit is introduce the major principles and concepts related to community and ecosystem ecology.
Learning Outcomes	At the end of this module learners will be able to: • Recognize the factors affecting species abundance and diversity. • Study the effect of disturbance on promoting higher diversity. • Understand the effect of human activities on species diversity and abundance in urban areas.

	• Discuss the importance of food webs. • Evaluate the importance of keystone species. • Comprehend the factors limiting terrestrial primary productivity. • Define the trophic levels and energy flow in an ecosystem. • Discuss nutrient cycling and retention in an ecosystem. • Examine ecosystem changes during succession. • Evaluate the impact of invasive species on plant succession.
Units	Unit 5.1: Species abundance and diversity Unit 5.2: Species interactions and community structure Unit 5.3: Primary production and energy flow Unit 5.4: Nutrient cycling and retention Unit 5.5: Succession and stability
Readings	1- Lebo, M. E., J. E. Reuter, C. R. Goldman, N, C. L. Rhodes, N. vucinich, and D. Mosely. 1993. 11- Chapin, F. S., III, L. R. Walker, C. L. Fastie, and L. C. Sharman. 1994.

	Mechanisms of primary succession following deglaciation at Glacier Bay, Alaska. Ecological Monographs 64:149-75.
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1- Suppose you discover that the fish species inhabiting small, isolated patches of coral reef use different vertical zones on the reef face- some species live down near the sand, some live a bit higher on the reef, and some higher still. Based on this pattern of zonation, can you predict how reef structure should affect the diversity of fish living on such reefs? 2- If disturbance can foster higher species diversity, why is human disturbance often (though not always) associated with reduced species diversity? 3- According to the intermediate disturbance hypothesis, could human disturbance sustain higher levels of species diversity than in the absence of human disturbance? 4- Humans have been living in the tropical rain forests of the New World for at least 11,000 years. During this period, disturbance by humans has been a part of these tropical rain forests. Use the intermediate disturbance hypothesis to explain how recent disturbances threaten the biological diversity of these forests, while earlier disturbances apparently did not. 5- Some paleontologists have proposed that overhunting caused the extinction of many large North American mammals at the end of the Pleistocene about 11,000 and 10,000 years ago. The hunters implicated by paleontologists were a

	newly arrived predatory species, *Homo sapiens*. Offer arguments for and against this hypothesis. 6-The studies of nutrient limitations of aquatic primary production that we reviewed in class focused almost entirely on lakes within the temperate zone. Suppose you are an ecologist interested in determining whether primary production in tropical lakes is subject to similar control by nutrient availability. Design a study to find out what controls rates of primary production in tropical lakes. Use all the sources of information at your disposal, including published research, surveys of natural variation, and large- and small-scale experiments. 7- The concentration of atmospheric CO_2, which continues to rise, has been associated with an increased lignin content of the leaves of some plant species. Why is this potential change in leaf chemistry, in response to increased atmospheric CO2, an active area of research by ecosystem ecologists? 8- Many rivers around the world have been straightened and deepened to improve conditions for navigation. Side effects of these changes include increased average water velocity and decreased movement of water into shallow riverside environments such as marginal wetlands. What are the probable influences of these changes on the nutrient spiraling length? Use the model discussed by Newbold in the textbook. 9- Succession seems to lead to predictable changes in community and ecosystem structure. Predict the characteristics of a frequently disturbed community/ecosystem. What do your predictions suggest about a future biosphere increasingly disturbed by a growing human population? How does

	the intermediate disturbance hypothesis figure into your answer?
Module 6	**Global warming and Climate change**
Key Concepts	Applied ecology, global distribution of climate change, Impact of climate change on biodiversity and ecosystems.
Overview	One of the biggest future challenges to organisms, ecologists and resource managers is global climate change. Attempts to mitigate predicted changes to climate have an ecological dimension (e.g. plant more trees to soak up some of the extra carbon dioxide produced by the burning of fossil fuels), although mitigation must also focus on the economic and sociopolitical dimensions of the problem. This is discussed because the relevant issues relate to ecosystem functioning. In this module we deal with the way we can use knowledge about the ecology of individual organisms to predict and manage the consequences of global climate change such as the spread of disease and weeds and the positioning of conservation reserves. Given the pressing environmental problems we face, it is not surprising that a large number of ecologists now perform research that is applied (i.e. aimed directly at such problems) and then publish it in specialist scientific journals.
Aim	The aim of this unit is to use knowledge gained in the feild of ecology to help solve problems associated with climate change.
Learning Outcomes	At the end of this module learners will be able to: • Understand how to use the knowledge gained in ecological research to predict and manage the consequences of global climate change. • Study the impact of climate change on biodiversity • Examine the impact of climate change on the spread of disease

	• Study the impact of climate change on the spread of invasive species. • Explore how predicted global climate change is expected to affect species' distribution patterns.
Units	Unit 5.1: The global distribution of climate change Unit 5.2: Can the biota keep up with climate change? Unit 5.3: the challenge of global climate change Unit 5.4: The impact of climate change on biodiversity and ecosystems Unit 5.5: the impact of climate change on health Unit 5.6: Adaption of living organisms to climate change.
Readings	1- Beaumont, L.J. & Hughes, L. (2002) Potential changes in the distributions of latitudinally restricted Australian butterfly species in response to climate change. *Global Change Biology*, 8, 954–971. 2- Corn, P.S. (2003) Amphibian breeding and climate change: importance of snow in the mountains. *Conservation Biology*, 17, 622–625. 3- Ehleringer, J.R., Sage, R.F., Flanagan, L.B. & Pearcy, R.W. (1991) Climate change and the evolution of C4 photosynthesis. *Trends in Ecology and Evolution*, 6, 95–99. 4- Kriticos, D.J., Sutherst, R.W., Brown, J.R., Adkins, S.W. & Maywald, G.F. (2003) Climate change and the potential distribution of an invasive alien plant: *Acacia nilotica* spp. *indica* in Australia. *Journal of Applied Ecology*, 40, 111–124. 5- Law, B.E., Thornton, P.E., Irvine, J., Anthoni, P.M. & van Tuyl, S.

	(2001) Carbon storage and fluxes in ponderosa pine forests at different developmental stages. *Global Climate Change*, 7, 755–777.
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1- would you favor buildingmore nuclear power plants to reduce CO2 emissions? Why or why not? 2- Many people don't believe climate change is going on even though climate scientists have amassed a great deal of data to demonstrate it. What factors do you think influence the degree to which a person believes or doesn't climatologists' reports? 3- What is the impact of climate change on biodiversity, forestry and agriculture in Lebanon? 4- What is the difference between climate change and climate variability?4-

Student Practicum Placement

In this course you will be assigned a practicum to integrate the knowledge acquired in class to real life applications. The practicum is a short term supervised work with the assigned facility/institution. This will give you an opportunity to use your skills, knowledge and experiences in the real world and open your eyes to face new challenges that may arise in the future.

Practicum 1:

A ROCHA Lebanon, NGO.

A ROCHA Lebanon, is an NGO that was established in 1996 with the main objective of saving Ammiq wetlands in the Beqaa valley in Lebanon from destruction. The work of A ROCHA Lebanon currently focuses on three main areas: scientific studies, practical conservation, and environmental education.
After finishing your practicum with A ROCHA Lebanon, the following are expected of you:

1- You should be familiar with the overall activities related to environmental conservation.
2- More specifically, you should participate in the work done to protect migratory birds. You should be able to integrate knowledge gained in class to propose solutions to problems facing migratory birds.
3- At the end of the practicum you will write a report and give a presentation, emphasizing what you have learned from the practicum.

Practicum 2:

Organic farms in the area of Zouk Mikayel

In this practicum you will spend time with the managers of the organic vegetable farms in the area of Zouk Mikayel. You will have to familiarize yourself, and report all the cultural practices utilized in the above operations. Most importantly, you have to emphasize and document sustainable practices, like biological control of pests and maintaining the health and fertility of the soil. In your report and presentation you have to compare and contrast organic vs conventional farms and highlight the importance of sustainable practices to improve the quality of life of the society and individuals.

Practicum 3:

Ministry of Agriculture-Forestry section

The forestry sector in Lebanon is under major environmental threat that are caused by human activities, such as forest cutting and fires. After finishing your practicum at the ministry you should be able to draw a clear picture of the current status of forests in Lebanon and future plans to conserve these forests. Most importantly, you should apply the principles and concepts learned in class to conserve and use this precious natural resource sustainably. A report and a presentation are required to showcase what you have learned from this practicum.

Practicum 4:

Shouf Cedar Reserve

The Shouf Cedar Reserve is the largest nature reserve in Lebanon that covers approximately 5% of the area of Lebanon. This reserve is a haven for biodiversity. The following are the main objectives of the reserve which focuses on sustainable development of the local community:

- Natural and cultural heritage conservation of the region
- Research and monitoring
- Eco-tourism
- Environmental awareness
- Capacity building

After finishing your practicum you should write a report and give a presentation emphasizing the sustainable practices done to protect and develop the area of the resrve. Also you should integrate what you have learned in class to conserve the area using the principles of sustainability.

Practicum 5:

Ministry of the Environment

The world is facing a real threat due to climate change and global warming. The Lebanese Ministry of the Environment is conducting studies, in collaboration with UN agencies, related to emissions of greenhouse gases in Lebanon and exploring new adaptation strategies to reduce the impact of climate change and global warming on society.
After finishing this practicum you should be familiar with the work done related to the above issue. You are also required to write a report and give a presentation emphasizing the concepts learned in class and how it can be applied to reduce the impact of climate change and global warming.

Course Syllabus

BIO 324
Plant Physiology
Notre Dame University-Louaize, Faculty of Natural and Applied Sciences, Department of Sciences
Spring Semester, 2014-2015

Instructor Information

Instructor:	Dr. Tanos G. Hage
Office Location:	S242
Telephone:	Office – 09-208725
Office Hours:	MW 8:00 – 9:00
E-mail:	thage@ndu.edu.lb

Course Identification

Course Number:	BIO 324
Course Name:	Plant Physiology
Course Location:	FA 1032
Class Times:	MWF 9:00 – 10:00/F 13:00 – 15:00
Prerequisites:	BIO 212 and BIO 227
Faculty Web Page:	http://www.ndu.edu.lb

Course Description

This course covers the basic principles of plant physiology, the physiological processes of green plants and the effect of the environment on these processes. Prerequisite: BIO 212, BIO 227.

Course Overview

This is an introductory, undergraduate course in Plant Physiology. Plants are unique organisms that can manufacture their own food (biomass) from carbon dioxide, water and sunlight. In turn other organisms are dependent on this food for survival, including humans. Plants play a crucial role in our life by providing animals and humans with food, feed, paper, medicine, chemicals, energy, and beautiful landscapes. In addition plants provide ecological services such as regulation of the water cycle and climate, soil formation, nutrient recycling and air purification. Plant physiology is the study of the organization and operations of the processes in the plant that order its development and behavior. Simply put it is the study of plant functions. In this course we will concentrate on transport and translocation of water and solutes, Biochemistry and metabolism, and brief account on growth and development. Throughout the course, and in particular towards the end, concepts related to climate change and sustainability will be emphasized.

Course Learning Objectives

The main objectives of this course are to a) Gain a thorough understanding of the functioning of the plants in their environment b) Develop critical thinking skills to ask pertinent questions related to plant physiology and to go about seeking answers to those questions. c) Use the knowledge gained from Plant Physiology to understand the role of plants in ecosystems. c) Emphasize the concept of sustainable development and climate change by highlighting the link between plants, socio-economic needs and the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

137. Appreciate the important role of plants in the ecosystem and the services rendered to other organisms, including humans.
138. Understand the unique physical properties of water, the concept of water potential and its application to cell-water relations.
139. Demonstrate in-depth an understanding of the physiological processes involved in water balance in plants.
140. Describe how plants obtain and use mineral nutrients.
141. Understand the physical and chemical principles that govern the movements of molecules in solutions and how these principles apply to membranes and to biological systems.
142. Explain the role of light in photosynthesis and the processes that are involved in the synthesis of ATP and NADPH.
143. Describe the cyclic reactions that accomplish the fixation and reduction of CO2 to produce organic molecules.
144. Understand the process of translocation of photosynthates in the phloem.
145. Understand the role of plant secondary metabolites in plant defense mechanisms.
146. Cultivate basic understanding of plant growth and development.
147. Infuse the concept of sustainable development and climate change in the course.

Course Resources

Required Course Text

Taiz,L, Zeiger, E. Molles, (2006) *Plant Physiology*. Fourth edition, Sinauer Associates, Inc., Publishers, Sunderland, MA
There is a website associated with this text. See: www.plantphys.net
Hands-out prepared by the instructor, readings and assignments will be posted on blackboard.

References

Hopkins, G. and Huner, N. 2004. Introduction to Plant Physiology. 3rd ed. John Wiley & Sons.
Buchanan, B; Gruissem, W. and Jones, R. 2000. Biochemistry and Molecular Biology of Plants. American Society of Plant Physiologists.
Walter, L. 2003. Physiological Plant Ecology: Ecophysiology and Stress Physiology of functional groups. 4th ed. Springer.

Resources Available to Students

Library Resources: NDU Library is open to students to help you in all your research and class work. Qualified personnel are available to help you.

Writing Center: The Writing Center provides assistance to all students who wish to discuss their writing with a trained consultant. The Center is located in HA 114. An appointment is required.

Blackboard (bb) Software: Lecture material, handouts, readings and assignments will be posted on blackboard. If you are not familiar with the Blackboard system, it is recommended to attend a training session at the University Computer Services in order to know how to use the Blackboard system to enrich the academic communication with your instructor and your colleagues.

Grading and Evaluation

Exam I	20%
Exam II	20%
Final exam (comprehensive)	35%
Lab work and assignments	25%
Total	**100%**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Classes are a mix of lectures (powerpoint presentations) and discussions. The lecture topic is announced ahead of time for you in order to read assigned material before coming to class. Each lecture begins with a clear and detailed set of learning objectives. After discussing a major concept, multiple choice, and short answer questions are administered in the class to test your understanding and to pinpoint deficient areas of

comprehension. This interactive approach requires your active participation. Laboratory experiments are designed to parallel, augment and clarify lecture material. Assigned reading from current literature will keep you abreast with recent developments in the field. I will use blackboard to post announcements and lecture material.

Course Schedule

# Weeks	**Topic** (additional readings are available in the course modules)	Reading
1	Discussion of the syllabus.	
	Transport and Translocation of Water	
1-2	Water and plant cells.	Ch 3
3	Water balance of plants.	Ch 4
	Transport and Translocation of Solutes	
4	Mineral nutrition.	Ch 5
5	Solute transport.	Ch 6
	Biochemistry and Metabolism	

6-7	Photosynthesis: the light reactions.	Ch 7
8-9	Photosynthesis: carbon reactions.	Ch 8
10	Translocation in the phloem.	Ch 10
11	Secondary metabolites and plant defence.	Ch 13
	Growth and Development	
12	Growth and Development (Several sources)	
	Growth and Development	
13-14	Focous on climate change and sustainable development	

Course	Plant Physiology
Module 1	Transport and Translocation of Water
Key Concepts	Polarity of water molecule, Hydrogen bond, Latent heat of vaporization, cohesive and adhesive properties of water, surface tension of water, capillarity of water, Tensile strength of water, hydrostatic pressure, Diffusion of water, Fick's first law, Pressure driven bulk flow, Osmosis, Chemical potential of water, osmotic potential, Hoffler diagram, Hydraulic conductivity, aquaporins, water potential and plant growth, water in the soil, field capacity, Permanent wilting point, water movement in symplast and apoplast, root pressure, cohesion-tension theory of sap ascent, xylem cavitation, water loss in plants.
Overview	In the first unit of this module we will study the function of water in plant life and how water moves into and out of plant. In order to understand this we need to study the properties of water and the physical forces that influence water movement. In the second unit we will study the water balance in plants by discussing water status in the soil, water absorption by the roots, water transport through the xylem and water movement from the leaf to the atmosphere. Emphasis in this module will be placed on the sustainable use of water in our society.
Aim	The aim of this module is to emphasize the importance of water in the life of plants and all living organisms and to explore the adaptation of plants to hot, arid conditions.
Learning Outcomes	At the end of this module learners will be able to: • Study the structure and properties of water. • Understand water transport processes. • Learn about water movement in the soil. • Trace the movement of water from the soil to the roots. • Examine how the structure of the xylem contributes to the movement of water

	from the roots to the leaves. • Examine how plants minimize the consequences of cavitation. • Explore the driving force for leaf transpiration and the anatomical features of the leaf that regulates transpiration. • Emphasize the importance of selection of plants in sustainable use of water in agriculture.
Units	Unit 1.1: Water and plant cells. Unit 1.2: Water balance of plants.
Readings	Measuring water potential. http://5e.plantphys.net/article.php?ch=3&id=29 Calculating capillary rise http://5e.plantphys.net/article.php?ch=3&id=25 Green, P. B., and Stanton, F. W. (1967) Turgor pressure: Direct manometric measurement in single cells of *Nitella. Science* 155: 1675–1676. Heydt, H., and Steudle, E. (1991) Measurement of negative pressure in the xylem of excised roots. Effects on water and solute relations. *Planta* 184: 389–396. Malone, M., and Tomos, A. D. (1992) Measurement of gradients of water potential in elongating pea stem by pressure probe and picolitre osmometry. *J. Exp. Bot.* 43: 1325–1331. Irrigation http://5e.plantphys.net/article.php?ch=4&id=38 Leaf transpiration and water vapor gradient.

	http://5e.plantphys.net/article.php?ch=4&id=42 Zeiger, E. (1983) The biology of stomatal guard cells. *Annu. Rev. Plant Physiol.* 34: 441–475. Steudle, E. (2001) The cohesion-tension mechanism and the acquisition of water by plant roots. *Annu. Rev. Plant Physiol. Plant Mol. Biol.* 52: 847-875.
Activity	**Overview** Assignments: 1. What is the importance of the water potential concept in plant physiology? What are the components of water potential? 2. List three unique properties of water that make it such a good medium for cellular functioning, and explain how each property is useful to the plant. 4. How does water move across a largely hydrophobic plasma membrane? 5. Describe the path followed by water from the soil, through the plant and into the atmosphere. Where in the path are the important resistances to water movement? 6. Describe the casparian strip and its function. What is the most important substance in the casparian strip, from the point of view of its function? 7. What is the driving force for the movement of water from the soil to the

	top of a tree and into the atmosphere? 8- Explore the landscape on campus. Do you think that the selection of plants is appropriate for our environment in Lebanon, especially when it come to water use. Based on what you learned in this module what modifications you suggest for sustainable use of water on campus.
Module 2	Transport and Translocation of Solutes
Key Concepts	Mineral nutrition, Essential nutrients, deficiencies and plant disorders, nutrient solutions, soil and plant tissue analysis, treating nutritional deficiencies, mycorrhizal fungi facilitate nutrient uptake by roots, Passive and active transport, chemical potential, diffusion potential, Nernst equation, membrane transport processes, primary and secondary active transport, membrane transport proteins, ion transport in roots.
Overview	In this module we will discuss the essential nutrients of plants along with their deficiencies and associated plant disorders. This is followed by a discussion on treating nutritional deficiencies. In addition, the role of microbes in plant nutrition will be explored. In the second unit of this module we examine passive and active transport of solutes, transport of ions across membrane barriers, membrane transport processes and ion transport in roots.
Aim	The aim of this unit is to explore the overall topic of nutrition in plants along with transport of solutes. The effect of overuse of fertilizers on the ecosystem will be tackled along with solutions to this problem.
Learning Outcomes	At the end of this module learners will be able to: • Recognize essential nutrients, deficiencies, and plant disorders.

	• Learn how to treat nutritional deficiencies. • Discuss the importance of soil properties, root structure and mycorrhizal symbiotic relationships to plant mineral nutrition. • Recognize the difference between passive and active transport of solutes. • Study the factors that influence the passive distribution of ions across a membrane. • Understand membrane transport processes. • Recognize the impact of overuse of chemical fertilizers on the environment.
Units	Unit 2.1: Mineral nutrition Unit 2.2: Solute transport
Readings	Symptoms of deficiency inessential minerals. http://5e.plantphys.net/article.php?ch=5&id=289 Raghothama, K. G. Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1. What does a plant need to grow from seed and complete its life cycle? What is the difference between the requirements of a plant and an animal? 2. What is an essential element? How many have been identified? What is the difference between an essential element and a beneficial one? Provide an example of each. 3. What is a nutrient solution? Why is it more convenient to use liquid medium, as opposed to soil, to grow plants in nutritional studies? In nutrient solutions, nitrogen can be supplied as NH_4^+ or NO_3^-. Which one would use in a nutritional study? 4. What is the difference between a macronutrient and a micronutrient? Provide a reason for the inability of plant physiologists to identify micronutrients in early nutritional studies. Why is it difficult to supply iron in nutrient solutions? What is the best way to overcome this difficulty? 5. What is a mineral deficiency? How can a mineral deficiency be

	recognized? How can farmers benefit from nutrient analysis? 6. What is meant by the term "active transport"? What is the difference between "primary" and "secondary" active transport? 7. What is the meaning of the Nernst equation? If the current carried by K^+ ions diffusing through a K^+ channel is plotted against the membrane potential, at what potential will the direction of current reverse? 8. Both membrane channels and carriers show changes in protein conformation. What is the role of such conformation changes (a) in channels, and (b) in carriers? 9. How can the operation of the plasma membrane H^+-ATPase affect (a) the diffusion of K^+ through membrane channels, and (b) the accumulation of sugars from the apoplast into the cell? 10. Overuse of chemical fertilizers in Lebanon is contributing to water and soil pollution. Investigate the extent of this problem. 11. How can we sustainably maintain the fertility of the soil? Based on what you studied in this module, devise a plan to be used by a farmer to achieve this objective.
Module 3	Biochemistry and Metabolism
Key Concepts	Thylakoid reactions, Light as a particle and a wave, absorption spectrum, antenna complex, reaction center complex, quantum yield, Photosystem I and II, enhancement effect, red drop effect, antenna funnels energy to the

	reaction center, Light harvesting complex I and II, electron transport, ATP synthesis by chemiosmotic mechanism. The Calvin cycle, Light regulate the Calvin cycle, Rubisco activity and light, photorespiration, CO2 concentrating mechanisms: C4 carbon cycle and CAM. Pathways of translocation, P. Protein bodies, companion cells, source to sink pathway, pressure flow model, phloem loading and unloading, photosynthate distribution: allocation and partitioning.
Overview	In this module we will discuss the process of photosynthesis in plants, translocation of sugars in the phloem and secondary metabolites and plant defence. In photosynthesis we are going to explore the light reactions and carbon dioxide fixation reactions. Emphasis will be placed on food security and the role of agriculture in sustainable production of food. The translocation of sugars will be discussed with emphasis on accumulating sugars in storage organs to be used as a source of food. Finally we will explore the large number of secondary metabolites produced in plants, their role in plants for defence and the potential sustainable use of these compounds by society in medicine and industry.
Aim	The aim of this module is to appreciate the role of plants as producers of biomass and food. In exploring the biochemistry of the process of photosynthesis, we are interested in sustainably increasing food production to satisfy the need of increasing world population. In exploring the biosynthetic pathways of secondary metabolites, we will be able to tap this great resource to be used in medicine and industry.
Learning Outcomes	At the end of this module learners will be able to: • Study the organization of the photosynthetic apparatus • Comprehend the organization of light-absorbing antenna systems • Examine the organization of the photosynthetic apparatus

	• Understand the mechanisms of electron transport • Study proton transport and ATP Synthesis in the chloroplast • Explore the Calvin cycle • Understand the regulation of the Calvin cycle • Understand the process of photorespiration • Examine the synthesis of starch and sucrose. • Apply what we studied in photosynthesis to sustainably increase food production. • Examine the pathway and patterns of translocation of photosynthates in the phoem. • Discuss Phloem loading and unloading. • Understand the allocation and partitioning of photosynthates. • Explore ways to increase storage of starch in edible portion of the plant. • Discuss the mechanism of by which plants protect themselves against pests. • Emphasize the use of disease and insect resistant plants to reduce the unsustainable use of pesticides.
Units	Unit 3.1: Photosynthesis: the light reactions. Unit 3.2: Photosynthesis: carbon reactions. Unit 3.3: Translocation in the phloem. Unit 3.4: Secondary metabolites and plant defence.
Readings	The distribution of chlorophylls and other photosynthetic pigments. http://5e.plantphys.net/article.php?ch=7&id=67

The Shikimic Acid Pathway. http://5e.plantphys.net/article.php?ch=13&id=23 Unraveling the function of secondary metabolites. http://5e.plantphys.net/article.php?ch=13&id=313
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1. What is an action spectrum? What is the relationship between the action

	spectrum for photosynthesis and the absorption spectrum of chlorophyll? 2. Photosynthesis in oxygen-evolving organisms is said to involve two distinct photosystems. Describe the two photosystems and provide two lines of experimental evidence that led to their discovery. 3. What is the role of electron transport in oxygen-evolving photosynthesis? Name the final electron donor and final electron acceptor in photosynthesis. Describe the path traveled by an electron in the electron transport process. 4. Describe the process of ATP synthesis at the thylakoid membrane. Name the reactants, the energy source and the role of light in the process. Can ATP synthesis take place in thylakoid membranes kept in the dark? Explain your answer. 5. The term "dark reactions" was used for many years to describe the reactions for incorporating CO_2in photosynthesis. Why was this term considered appropriate at the time and why is it considered inappropriate now? 6. Photorespiration is generally considered to be a wasteful process that decreases the yield of C_3plants. What experiment would you propose to minimize the role of photorespiration in plants? 7. What would be the consequence in each of the following if the thioredoxins in chloroplasts were reduced not by ferredoxin but by NADPH as is the case for their cytosol counterparts? Assume NADPH is

	constant. Explain your answer. A. Rate of starch synthesis. B. Hexose monophosphate pool in chloroplasts in the dark. C. Synthesis of malate in C_4 plants. D. Synthesis of malate in CAM plants assuming an adequate supply of phosphoenolpyruvate. E. Activity of Rubisco. 8. A sucrose molecule has been synthesized in the chloroplast stroma of a mesophyll cell. Describe the path that the sucrose molecule would follow if it is to become part of the sucrose pool in a developing seed. 9. What is a typical velocity of sap moving in the phloem? Can phloem sap move at that velocity by diffusion? 10. Describe the pressure-flow model of translocation in the phloem. Does water move down its water potential gradient in this model? 11. Explain the concepts of source and sink in phloem transport. Leaves are said to be sinks early in development and to become sources as they attain photosynthetic competence. What experiments would you design to study the leaf transition from sink to source? 12. How do secondary metabolites differ from primary metabolites? 13. Discuss the main functions of secondary metabolites in plants and relate these functions to their sites of accumulation in the plant.

	14. What are terpenes, chemically, and how are they synthesized? Give one example each of how mono- and triterpenes serve as feeding deterrents to insects. 15. Apply what you learned in this module to prepare a report on the best practices to produce food sustainably.
Module 4	Growth and Development
Key Concepts	Sporophytic development, embryogenesis, vegetative development, the origins of polarity in embryogenesis, axial polarity of plant, intercellular communication, shoot apical meristem development, root apical meristem development, vegetative organogenesis, types of senesce, programmed cell death.
Overview	This module is concerned with the morphological and anatomical changes during development along with the biochemical and molecular mechanisms underlying these changes. This includes both the vegetative as well as the reproductive phases of the life of plants.
Aim	The aim of this module is to understand the mechanisms that regulate the development of the plant from embryogenesis through vegetative and reproductive stages.
Learning Outcomes	At the end of this module learners will be able to: • Discuss the major stages of sporophytic development. • Study the origins of polarity in embryogenesis. • Understand the function of shoot apical meristem. • Understand the function of root apical meristem. • Discuss the process of vegetative organogenesis • Understand the process of senescence and programmed cell death of plants

Units	Unit 3.1: Growth and development
Readings	Division Plane Determination in Plant Cells - Laurie G. Smith, Division of Biological Sciences, University of California, San Diego (May 2006). http://5e.plantphys.net/article.php?ch=16&id=225 Plant Meristems: A Historical Overview - Ian Sussex, Department of Molecular, Cellular, and Developmental Biology, Yale University (May 2006). http://5e.plantphys.net/article.php?ch=16&id=169 Watanabe, A., Hamada, K., Yokoi, H., and Watanabe, A. (1994) Biophysical and differential expression of cytosolic glutamine synthetase genes of radish during seed germination and senescence of cotyledons. *Plant Mol. Biol*. 26: 1807–1817. Ryu, S. B., and Wang, X. (1995) Expression of phospholipase D during castor bean leaf senescence. *Plant Physiol*. 108: 713–719. McLean, B. G., Hempel, F. D., and Zambryski, P. C. (1997) Plant intercellular communication via plasmodesmata. *Plant Cell* 9: 1043–1054. Bleecker, A. B., and Patterson, S. E. (1997) Last exit: Senescence, abscission, and meristem arrest in *Arabidopsis*. *Plant Cell* 9: 1169–1179.

	Barlow, P. W. (1994) Evolution of structural initial cells in apical meristems of plants. *J. Theor. Biol.* 169: 163–177.
Activity	**Overview**
	Assignments: (some assignments are taken or modified from the textbook) 1- What are the three main stages of sporophytic (that is, diploid generation) development in plants? 2- What are the five stages of embryogenesis in Arabidopsis*?* 3- What essential features of the mature plant are established during embryogenesis, and at what stage in embryogenesis is each feature determined? 4- Using a labeled diagram, show how the apical–basal organization of tissues in Arabidopsis seedlings is derived from earlier embryonic stages. 5- Compare and contrast "position-dependent" cell division patterns during plant embryogenesis with "lineage-dependent" cell division patterns during animal embryogenesis. 6- What is the evidence that the hormone auxin may serve as a signaling agent during plant embryogenesis?

	7- What mutation in Arabidopsis causes the formation of vascular tissue consisting of xylem, but no phloem. 8- Discuss how the intercellular movement of a transcription factor is involved in the differentiation of cortical and endodermal cells in Arabidopsis. 9- What is the primary function of the *CLAVATA* genes, and what type of proteins do they encode? Diagram a model for CLV1 and CLV3 action and regulation at the molecular level. What is the nature of the extracellular signal regulating CLV1?
Module 5	Focus on Climate Change and Sustainability
Key Concepts	.
Overview	One of the major challenges facing our society is forecasting the response of plants and their ecosystems to climate change. The rapid environmental changes caused by humans may cause the extinction of many plant species due to the lack of sufficient genetic diversity to adapt successfully to the rapid environmental changes. In this module we are going to review articles published in a special issue of Plant Physiology [(December 2012, 160 (4)] about pants and climate change. The article provide an overview on the current advances in relation to the response of plants to rapid climate change.
Aim	The aim of this unit is to explore our current understanding of the abrupt changes in climate on the health of plants and their ecosystems along with their impact on society.
Learning Outcomes	At the end of this module learners will be able to: • Recognize the impact of climate change on plant-insect interactions. • Evaluate the influence of climate change on global crop productivity and its effect on society.

	• Recognize the physiological traits for improving heat tolerance in wheat. • Understand the consequences of climate Warming and altered precipitation patterns for plant-insect and multitrophic Interactions. • Know the evolutionary and ecological responses to anthropogenic climate Change: • Discuss therole of plants in the effects of global change on nutrient Availability.
Units	Unit 2.1: \plant insect interactions and climate change. Unit 2.2: Crop productivity and climate change. Unit 2.3: Heat tolerance in wheat. Unit 2.4: Evolutionary and ecological responses to climate change. Unit 2.5: Role of plants in the effects of climate change on nutrient availability.
Readings	Climate Change: Resetting Plant-Insect Interactions *Plant Physiol. 2012 160: 1677-1685. First Published on October 5, 2012; doi:10.1104/pp.112.206219* The Role of Plants in the Effects of Global Change on Nutrient Availability and Stoichiometry in the Plant-Soil System *Plant Physiol. 2012 160: 1741-1761. First Published on October 31, 2012; doi:10.1104/pp.112.20878.*
Activity	**Overview**
	1. A group of 2-3 students choose a review article from list of articles above and present it in the class as a PowerPoint presentation.

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

CEN xxx: Environmental Pollution and Control

NDU-Louaize, Faculty of Engineering, DCEE

Fall 2015

Instructor Information

Instructor: Elsy Ibrahim/Sophia Ghanimeh, Assistant Professor

Office Location: Faculty of Engineering, HA 363/HA367

Telephone: Office – +961.9.208427

Office Hours: Tuesday 2:00 – 3:00 p.m./Wednesday 2:00 – 3:00 p.m.

E-mail: eibrahim@ndu.edu.lb/ sghanimeh@ndu.edu.lb

Website:

http://www.ndu.edu.lb/academics/faculty_research/fe/elsy~ibrahim/profile.htm

http://www.ndu.edu.lb/academics/faculty_research/fe/sophia~ghanimeh/profile.htm

Course Identification

Course Number: CEN xxx

Course Name: Environmental Pollution and Control

Course Location: E xxx

Class Times: MWF 1:00 – 2:00 p.m.

Prerequisites: None

Faculty Web Page: http://www.ndu.edu.lb/academics/fe/intro.htm

Course Description/Overview

Concepts and principles to identify and control water, air and noise pollution. This course also provides knowledge on solid waste and hazardous waste management, and the effects of pollution to general health.

Course Learning Objectives

The overreaching goals of this course are to provide:

a) Ability to understand pollution control technologies and insights into basic environmental assessment components

b) Ability to design basic units for the treatment of waste streams and assess their impact on the receiving water body.

c) Ability to design basic facilities for the processing and disposal of municipal solid waste

d) Ability to design basic facilities for the control of air pollution

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Discover correctly the knowledge related to public health and environmental pollution

2. Apply the concept and principles to control or mitigate the environmental pollution appropriately

3. Design systems to control environmental pollution from an engineering perspective

Course Resources

Assignments and Grading Scheme

Grading System

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (i.e. percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A+	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A-	Very Good	3.7	89 - 92
B+	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B-	Good	2.7	77 - 79
C+	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C-	Passing	1.7	66 - 69
D+	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59

Grading Policy

Grades are based on the following:

Tests (2 tests x 22.5 points each)	45%
Final Exam	30%
Project	20%
Class attendance/participation	5%
Total Points	**100**

Tests and Final Exams (75%): Two tests cover class presentation and assignments. The final exam is comprehensive.

Course Project (20%): Each team project (3 students) will entail analyzing a local environmental problem and/or designing a facility to treat a stream of water, wastewater, solid waste or air, then writing a report (15%) and presenting the significant findings orally (5%).

Class participation (5%): Students are expected to attend all sessions and participate actively in class discussions.

Course Policies

Late Assignments

While understanding that we all are busy with school, work, and family, your decision to register for this course is an indication that you have made it a high priority. Thus, extensions of assignment due dates are given only in extreme situations (death of a close family member, hospitalization, etc.) and require documentation on your part. Otherwise, due dates are fixed and non-negotiable. All assignments should be submitted on or before the assigned due date. Assignments past the due date will not be accepted for full credit. Examples of unreasonable extensions for an assignment include frequent computer malfunctions, outside class-work, or job responsibilities that inhibit meeting the required deadlines. If you anticipate missing a deadline on an assignment, you should send an e-mail to your instructor before the deadline. Unexcused assignments submitted after the due date may be returned ungraded or assigned a lower evaluation. Whether an extension is allowed will be at the instructor's discretion.

Classroom Protocol

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.

Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).
Once in class, students are expected to remain in class for the entire period.
English must be the only language spoken in class at all times.

Dissability

Any student who feels she/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Important Dates to Remember

Test 1: Thursday, December 11, 2014
Test 2: Thursday, February 05, 2015
Project Repot submittal: Monday, January 05, 2015
Project Presentations: Monday, January 12, 2015

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines
1	Sep. 25	Syllabus Introduction : Overview of various chapters
2	Sep. 29	Chemical & Physical Processes
3	Oct. 06	Wastewater Treatment: Physical Processes
4	Oct. 13	Wastewater Treatment: Aerobic Biological Processes
5	Oct. 20	Wastewater Treatment: Anaerobic Biological Processes (sludge treatment)
6	Oct. 27	Water Treatment: Coagulation/Flocculation, Filtration
7	Nov. 3	Water Treatment: Membrane Processes, Disinfection
8	Nov. 10	Water Quality: Oxygen Depletion and Impacts of Nutrients/Pollutants Discharge

9	Nov. 17	Solid Waste Management: Collection and Material Recovery
10	Nov. 24	Solid Waste Management: Collection and Material Recovery
11	Dec. 01	Solid Waste Management: Disposal (Landfilling)
12	Dec. 08	Air Resources Engineering: Criteria Pollutant and Particulate Emission Control
13	Dec. 15	Project Guidance
14	Jan. 05	Built Environment: Sustainable Engineering Design
15	Jan. 08	Introduction to EIA: Local Regulations and EIA Reporting
16	Jan. 12	Project Presentations

Course	Environmental Pollution and Control
Module 1	Water and Wastewater Treatment and Discharge
Key Concepts	Contaminants, Physical/Biological/Chemical Treatment, Oxygen Depletion
Overview	This module introduces the students to main contaminants in water and wastewater and addresses key processes to remove them. The impact of wastes discharge into natural water streams is also considered. Questions to be addressed in this module include the following: How to design a wastewater (secondary) treatment plant? What is the impact of discharging the effluent of a wastewater treatment plant into a nearby water body? How to reduce water turbidity and hardness?
Aim	The students should be able to design the basic components of a wastewater treatment plant (up to the secondary treatment level). They should understand the main concepts of water treatment: coagulation/flocuulation, hardness removal, filtration, membrane processes and disinfection. In addition, the students should be able to calculate the oxygen deficit induced by wastewater disposal and assess its impact, along with the impact of other pollution-related phenomena, on the aquatic fauna and flora.
Learning Outcomes	At the end of this module learners will be able to: • Design a wastewater secondary treatment plant • Identify key water treatment concepts through: identifying the components of physical processing units and calculating dosing requirements in chemical processing units • Quantify the impact of pollution on water streams.

Units	Unit 1.1 Physical and chemical processes Unit 1.2: Wastewater treatment Unit 1.3: Water treatment Unit 1.4: Water quality
Readings	Mihelcic and Zimmerman, 2010, 1th Edition, John Wiley & Sons, Inc., Chapters 3, 4, 11, 10 and 8.
Activity	*Quiz 1: Chemical and Physical Processes* This quiz is crucial to assess the students' assimilation of the newly introduced concepts of chemical and physical processes in environmental design. Unsatisfactory entails revisiting chapters 3 and 4. *Field Trip 1: Water/Wastewater Treatment Plant*
Module 2	Solid Waste Management
Key Concepts	Collection, Material Recovery Facility, Landfill
Overview	This module introduces the students to different waste sources and components. It considers collection, processing and disposal of municipal solid waste with emphasis on material recovery facilities.
Aim	The students should be able to see the big picture of solid waste management and identify its various components.
Learning Outcomes	At the end of this module learners will be able to: • Categorize solid wastes by type and source, identify the different components of waste and calculate waste generation.

	• Design the basic components of a material recovery facility. • Provide basic design requirements of a landfill
Units	Unit 2.1: Waste generation and characterization Unit 2.2: Collection and material recovery Unit 2.2: Disposal
Readings	Mihelcic and Zimmerman, 2010, 1th Edition, John Wiley & Sons, Inc., Chapter 13.
Activity	*Team Project and Presentation* The students are asked to work, in teams of three, on an assigned project that includes a design component toward solving a local environmental problem. A full technical report should be submitted and an oral presentation needs to be delivered (by all team members).

Module 3	Air Pollution Control, Built Environment and Impacts Assessment
Key Concepts	Pollutant Criteria, Sustainable Design, EIA
Overview	This module introduces the students to air pollution and control concepts and addresses key sustainability issues in engineering design. Also, it covers basic processes and reporting components in environmental impact assessments.
Aim	At this stage, the students should be able to link all environmental risks of a project (including water, wastes and air related issues) into one assessment report and know how to incorporate it into their design concepts.
Learning Outcomes	At the end of this module learners will be able to: • Identify air criteria pollutants, their source and impacts • Apply basic concepts for the design of particulate emissions control systems. • Identify key requirements for a sustainable design. • Identify the major constituents of an EIA report
Units	Unit 3.1: Air pollution and particulate emissions control Unit 3.2: Built environment Unit 3.2: Environmental impact assessment
Readings	Mihelcic and Zimmerman, 2010, 1th Edition, John Wiley & Sons, Inc., Chapters 12 and 14.

Activity	*Field Trip 2: Solid Waste Processing and Disposal* This trip should include the material recovery facility and the composting plant in Beirut (the largest in the country), in addition to a local landfill.

Course Identification

Course Number: ENG xxx

Course Name:	Renewable Energy Technologies
Course Location:	E 107
Class Times:	MWF 1:00 – 2:00 p.m.
Prerequisites:	No Prerequistes
Faculty Web Page:	http://www.ndu.edu.lb/academics/fe/intro.htm

Course Description/Overview

Principles of renewable technologies for sustainable future. Process design, energy analysis, engineering economics and environmental assessment of renewable energy systems and techniques and applications of solar, wind, biomass, geothermal, hydro-electric, wave and tidal energy technologies. More emphasis is given to solar energy technologies to convert solar radiation into heat or electricity.

Course Learning Objectives

The overreaching goals of this course are to provide:

a) Ability to recognize the need of renewable energy technologies and their role in the global and local context.
b) Ability to distinguish between the sustainable energy sources and fossil energy sources.
c) Ability to describe the principles of renewable energy production from various renewable sources.
d) Ability to conduct a preliminary evaluation of the performance of an energy conversion system for maximum efficiency

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Learn various aspects of renewable energy technologies in an economic, environmental, and societal context
2. Apply fundamental concepts of engineering to identify the appropriate renewable energy systems required for specific applications.
3. Compare various technologies and propose the best possible energy conversion system for a particular location.

Assignments and Grading Scheme

Grading System

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (i.e. percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A+	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A-	Very Good	3.7	89 - 92
B+	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B-	Good	2.7	77 - 79
C+	Satisfactory	2.3	73 - 76

C	Satisfactory	2.0	70 - 72
C-	Passing	1.7	66 - 69
D+	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59

Grading Policy

Grades are based on the following:

Midterm	30%
Project	30%
Final Exam	30%
Class attendance/participation	10%
Total Points	**100**

Exams (60%): Two exams cover class presentation and assignments. The final exam is comprehensive.

Project (30%): One project covers a local case study

Class participation (10%): Students are expected to attend all sessions and participate actively in class discussion.

Course Policies

Late Assignments

While understanding that we all are busy with school, work, and family, your decision to register for this course is an indication that you have made it a high priority. Thus, extensions of assignment due dates are given only in extreme situations (death of a close family member, hospitalization, etc.) and require documentation on your part. Otherwise, due dates are fixed and non-negotiable. All assignments should be submitted on or before the assigned due date. Assignments past the due date will not be accepted for full credit. Examples of unreasonable extensions for an assignment include frequent computer malfunctions, outside class-work, or job responsibilities that inhibit meeting the required deadlines. If you anticipate missing a deadline on an assignment, you should send an e-mail to your instructor before the deadline. Unexcused assignments submitted after the due date may be returned ungraded or assigned a lower evaluation. Whether an extension is allowed will be at the instructor's discretion.

Classroom Protocol

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.
Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).
Once in class, students are expected to remain in class for the entire period.
English must be the only language spoken in class at all times.

Dissability

Any student who feels s/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Important Dates to Remember

Midterm Exam: Monday, November 03, 2014
Project Repot submittal: Friday, December 19, 2014
Project Presentations: Monday, January 12, 2015

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines
0	Sep. 26	*Syllabus*
1	Sep. 29	*Introduction:* Energy consumption & Demand, Renewable vs fossil energy sources *Overview of Renewable Energy Technologies:* Renewable energy sources, Advantages and benefits, Available technologies and challenges.
2	Oct. 06	*Solar energy:* Solar radiation
3	Oct. 13	*Solar energy:* fundamentals of thermal exchange
4	Oct. 20	*Solar energy:* Solar thermal systems
5	Oct. 27	*Solar energy:* fundamentals of photovoltaic

6	Nov. 03	*Solar energy:* photovoltaic systems
7	Nov. 10	*Biomass and Bioenergy:* Biomass resources
8	Nov. 17	*Biomass and Bioenergy:* Conversion technologies
9	Nov. 24	*Wind energy:* : Resources
10	Dec. 01	*Wind energy:* Turbines and power generating systems
11	Dec. 08	*Geothermal energy:* Resources
12	Dec. 15	*Geothermal energy:* Principles, operation and recovery of energy
13	Jan. 05	*Energy economics*
14	Jan. 12	*Environmental assessments*
15	Jan. 19	*Project*

Course	**Renewable Energy Technologies**
Module 1	Solar Energy
Key Concepts	Solar radiation, Thermal, PV
Overview	The students will be introduced to the fundamentals of solar radiation. The difference between solar thermal (to produce heat) and solar photovoltaic (to produce electricity) will be highlighted. Students have to develop a basic understanding of the impact of various types of modules and their orientations on the choice of the best system to be applied. Questions to be addressed in this module include the following: What is the existent local legislation? Is there any governmental support (incentives) to promote solar energy application? What are the environmental impacts of each solution?
Aim	The overriding aim of this module is to turn students able to suggest the best solar system for a certain application and to be able to do a preliminary design of the solar

	system.
Learning Outcomes	At the end of this module learners will be able to: • Identify the best solar system for a given application. • Conduct a preliminary design of solar systems.
Units	Unit 1.1 An Overview Unit 1.2: Thermal Unit 1.3: Photovoltaic
Readings	Schaeffer, J. 2007. *Real Goods Solar Living Sourcebook: The Complete Guide to Renewable Energy Technologies and Sustainable Living*, 30th Anniversary Ed., Gaiam
Activity	*Assignment 1: Identifying the different types of solar energy systems* 1. Go to the NDU's Library Web Site (www.ndu.edu.lb). Select a reliable reference on renewable energy and write a report up to two pages on the solar applications in buildings.
Module 2	Outdoor Air Pollution Control & Process Design
Key Concepts	Solar, Biomass, Wind, Geothermal
Overview	To select a system to produce heat or electricity from renewable resources, students need to understand the physical properties of different types of systems, and he environmental impact. The available technologies will be presented and discussed.
Aim	The overriding aim of this module is to enhance students' understanding of the renewable energy systems (Solar, biomass, wind and geothermal) used to reduce the dependence on fossil fuel systems.
Learning Outcomes	At the end of this module learners will be able to: • Identify and describe the different types of renewable energy systems. • Select the proper system for a specific application
Units	Unit 2.1: Biomass applications Unit 2.2: Wind energy applications Unit 2.2: Geothermal energy applications

	Unit 2.3: Solar vs. Biomass vs. Wind vs. Geothermal: A comparison
Readings	Schaeffer, J. 2007. *Real Goods Solar Living Sourcebook: The Complete Guide to Renewable Energy Technologies and Sustainable Living*, 30th Anniversary Ed., Gaiam Aldo Da Rosa, A. 2013. *Fundamentals of Renewable Energy Processes* (Third Edition), edited by Academic Press, Boston, 2013, Pages i-ii, ISBN 9780123972194, http://dx.doi.org/10.1016/B978-0-12-397219-4.00019-9.
Activity	*Assignment 2: Sustainable energy project* 1. A group/individual sustainable energy project to suggest and study the feasibility of renewable energy projects across the University campus. 2. Students will closely work with NDU physical plant to seek help on energy related data for their projects 3. Students will have then to perform a short demonstration on this device in class.
Module 3	Energy, Economics and Environmental Assessments
Key Concepts	Economics, EIA
Overview	General design considerations (process flow charts, engineering economics, and cost estimation) will be presented.
Aim	The overriding aim of this module is to expand the students' understandings of and reasoning skills related to renewable energy choices, issues, and policies in the context of the varied social, economic and environmental implications of production, distribution and use.
Learning Outcomes	At the end of this module learners will be able to: • Assess alternative energy sources • Conduct environmental impact assessment for a selected design
Units	*Unit 3.1:* Technical and economical assessment of renewable technology Unit 3.4: Environmental impact assessments and sustainability issues
Readings	Schaeffer, J. 2007. *Real Goods Solar Living Sourcebook: The Complete Guide to Renewable Energy Technologies and Sustainable Living*, 30th Anniversary Ed., Gaiam

Activity	*Assignment 3: Comparative analysis and environmental assessment* 41. Use a multi-criteria approach to assess different options for a specific application considering the energy, economics and environmental impacts 42. Conduct an EIA for the best renewable energy system selected 43. Your findings will be discussed in class using a short presentation (PowerPoint) of five minutes.

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

CEN 462: Environmental Engineering

NDU-Louaize, Faculty of Engineering, DCEE

Fall 2014

Instructor Information

Instructor: Elsy Ibrahim/Sophia Ghanimeh, Assistant Professor

Office Location: Faculty of Engineering, HA 363/HA367

Telephone: Office – +961.9.208427

Office Hours: Tuesday 2:00 – 3:00 p.m./Wednesday 2:00 – 3:00 p.m.

E-mail: eibrahim@ndu.edu.lb/ sghanimeh@ndu.edu.lb

Website:

http://www.ndu.edu.lb/academics/faculty_research/fe/sophia~ghanimeh/profile.htm

Course Identification

Course Number:	CEN 462
Course Name:	Environmental Engineering
Course Location:	E 107
Class Times:	MWF 10:00 – 11:00 a.m.
Prerequisites:	CEN 462 – Environmental Engineering
Faculty Web Page:	http://www.ndu.edu.lb/academics/fe/intro.htm

Course Description/Overview

Quantitative evaluation of the environmental, economic, and technical problems involved in control of pollutants of the air, water, and land.

Course Learning Objectives

The overreaching goals of this course are to provide:

e) Ability to design basic units for the treatment of waste streams and assess their impact on the receiving water body.

f) Ability to design basic facilities for the processing and disposal of municipal solid waste.

g) General understanding of air pollution control technologies and insights into basic environmental assessment components and sustainable design concept.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Acquire the fundamentals of water quality assessment and standards.

2. Learn the basics of water treatment processes.

3. Learn the basics of wastewater treatment processes.

4. Learn the essentials of solid waste collection, treatment, and disposal.

5. Learn the essentials of air pollution emissions and their control.

6. Apply environmental engineering basics and environmental impact assessment to real problems (project).

Course Resources

Assignments and Grading Scheme

Grading System

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (i.e. percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A+	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A-	Very Good	3.7	89 - 92
B+	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B-	Good	2.7	77 - 79
C+	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C-	Passing	1.7	66 - 69
D+	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59

Grading Policy

Grades are based on the following:

Tests (2 tests x 22.5 points each)	45%
Final Exam	30%
Project	20%
Class attendance/participation	5%
Total Points	**100**

Tests and Final Exams (75%): Two tests cover class presentation and assignments. The final exam is comprehensive.

Course Project (20%): Each team project (3 students) will entail analyzing a local environmental problem and/or designing a facility to treat a stream of water, wastewater, solid waste or air, then writing a report (15%) and presenting the significant findings orally (5%).

Class participation (5%): Students are expected to attend all sessions and participate actively in class discussions.

Course Policies

Late Assignments

While understanding that we all are busy with school, work, and family, your decision to register for this course is an indication that you have made it a high priority. Thus, extensions of assignment due dates are given only in extreme situations (death of a close family member, hospitalization, etc.) and require documentation on your part. Otherwise, due dates are fixed and non-negotiable. All assignments should be submitted on or before the assigned due date. Assignments past the due date will not be accepted for full credit. Examples of unreasonable extensions for an assignment include frequent computer malfunctions, outside class-work, or job responsibilities that inhibit meeting the required deadlines. If you anticipate missing a deadline on an assignment, you should send an e-mail to your instructor before the deadline. Unexcused assignments submitted after the due date may be returned ungraded or assigned a lower evaluation. Whether an extension is allowed will be at the instructor's discretion.

Classroom Protocol

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.
Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).
Once in class, students are expected to remain in class for the entire period.
English must be the only language spoken in class at all times.

Dissability

Any student who feels she/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Important Dates to Remember

Test 1: Thursday, December 11, 2014
Test 2: Thursday, February 05, 2015
Project Repot submittal: Monday, January 05, 2015
Project Presentations: Monday, January 12, 2015

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines
1	Sep. 25	Syllabus Introduction : Overview of various chapters
2	Sep. 29	Chemical & Physical Processes
3	Oct. 06	Wastewater Treatment: Physical Processes
4	Oct. 13	Wastewater Treatment: Aerobic Biological Processes
5	Oct. 20	Wastewater Treatment: Anaerobic Biological Processes (sludge treatment)
6	Oct. 27	Water Treatment: Coagulation/Flocculation, Filtration
7	Nov. 3	Water Treatment: Membrane Processes, Disinfection
8	Nov. 10	Water Quality: Oxygen Depletion and Impacts of Nutrients/Pollutants Discharge
9	Nov. 17	Solid Waste Management: Collection and Material Recovery
10	Nov. 24	Solid Waste Management: Collection and Material Recovery
11	Dec. 01	Solid Waste Management: Disposal (Landfilling)
12	Dec. 08	Air Resources Engineering: Criteria Pollutant and Particulate Emission Control
13	Dec. 15	Project Guidance
14	Jan. 05	Built Environment: Sustainable Engineering Design
15	Jan. 08	Introduction to EIA: Local Regulations and EIA Reporting

16	Jan. 12	Project Presentations

Course	Environmental Engineering
Module 1	Water and Wastewater Treatment and Discharge
Key Concepts	Contaminants, Physical/Biological/Chemical Treatment, Oxygen Depletion
Overview	This module introduces the students to main contaminants in water and wastewater and addresses key processes to remove them. The impact of wastes discharge into natural water streams is also considered. Questions to be addressed in this module include the following: How to design a wastewater (secondary) treatment plant? What is the impact of discharging the effluent of a wastewater treatment plant into a nearby water body? How to reduce water turbidity and hardness?
Aim	The students should be able to design the basic components of a wastewater treatment plant (up to the secondary treatment level). They should understand the main concepts of water treatment: coagulation/flocuulation, hardness removal, filtration, membrane processes and disinfection. In addition, the students should be able to calculate the oxygen deficit induced by wastewater disposal and assess its impact, along with the impact of other pollution-related phenomena, on the aquatic fauna and flora.
Learning Outcomes	At the end of this module learners will be able to: • Design a wastewater secondary treatment plant • Identify key water treatment concepts through: identifying the components of physical processing units and calculating dosing requirements in chemical processing units • Quantify the impact of pollution on water streams.

Units	Unit 1.1 Physical and chemical processes Unit 1.2: Wastewater treatment Unit 1.3: Water treatment Unit 1.4: Water quality
Readings	Mihelcic and Zimmerman, 2010, 1th Edition, John Wiley & Sons, Inc., Chapters 3, 4, 11, 10 and 8.
Activity	*Quiz 1: Chemical and Physical Processes* This quiz is crucial to assess the students' assimilation of the newly introduced concepts of chemical and physical processes in environmental design. Unsatisfactory entails revisiting chapters 3 and 4. *Field Trip 1: Water/Wastewater Treatment Plant*
Module 2	Solid Waste Management
Key Concepts	Collection, Material Recovery Facility, Landfill
Overview	This module introduces the students to different waste sources and components. It considers collection, processing and disposal of municipal solid waste with emphasis on material recovery facilities.
Aim	The students should be able to see the big picture of solid waste management and identify its various components.
Learning Outcomes	At the end of this module learners will be able to: • Categorize solid wastes by type and source, identify the different components of waste and calculate waste generation.

	• Design the basic components of a material recovery facility. • Provide basic design requirements of a landfill
Units	Unit 2.1: Waste generation and characterization Unit 2.2: Collection and material recovery Unit 2.2: Disposal
Readings	Mihelcic and Zimmerman, 2010, 1th Edition, John Wiley & Sons, Inc., Chapter 13.
Activity	*Team Project and Presentation* The students are asked to work, in teams of three, on an assigned project that includes a design component toward solving a local environmental problem. A full technical report should be submitted and an oral presentation needs to be delivered (by all team members).

Module 3	Air Pollution Control, Built Environment and Impacts Assessment
Key Concepts	Pollutant Criteria, Sustainable Design, EIA
Overview	This module introduces the students to air pollution and control concepts and addresses key sustainability issues in engineering design. Also, it covers basic processes and reporting components in environmental impact assessments.
Aim	At this stage, the students should be able to link all environmental risks of a project (including water, wastes and air related issues) into one assessment report and know how to incorporate it into their design concepts.
Learning Outcomes	At the end of this module learners will be able to: • Identify air criteria pollutants, their source and impacts • Apply basic concepts for the design of particulate emissions control systems. • Identify key requirements for a sustainable design. • Identify the major constituents of an EIA report
Units	Unit 3.1: Air pollution and particulate emissions control Unit 3.2: Built environment Unit 3.2: Environmental impact assessment
Readings	Mihelcic and Zimmerman, 2010, 1th Edition, John Wiley & Sons, Inc., Chapters 12 and 14.

Activity	*Field Trip 2: Solid Waste Processing and Disposal* This trip should include the material recovery facility and the composting plant in Beirut (the largest in the country), in addition to a local landfill.

Course Syllabus

BIO 314:
Ecology
Notre Dame University-Louaize, Faculty of Natural and Applied Sciences, Department of Sciences

Spring Semester, 2013-2014

Instructor Information

Instructor: Dr. Tanos G. Hage
Office Location: S242, Main Campus

Course Identification

Course Number: BIO 314

Course Name:	Ecology
Course Location:	Main Campus
Class Times:	MWF 1:00-2:00
Prerequisites:	None
Faculty Web Page:	http://www.ndu.edu.lb/academics/fnas/deanmess.htm

Course Description

Principles of ecosystems; the interaction of organisms and their environment. Food web, energy flow and nutrient cycling in ecosystems. Factors which affect the distribution and abundance of species, wildlife resources and extinction.

Course Overview

Ecology is the study of the relationships between organisms and their environment. It is a fascinating field that tries to understand nature as a whole, with all its interactions. The scope of ecologists range from an individual organism to the study of global scale processes, such as global warming and ozone depletion. The knowledge gained from ecology helps us understand and design solutions to environmental problems and offers humanity a chance to save our biosphere. In our discussion of ecology we will emphasize the science behind it as well as its societal applications. Since ecologists view biological systems in a hierarchy, we will take this approach in arranging the topics of our discussions. We will start with the ecology of individuals, which is the domain of physiological ecology and behavioural ecology. Population ecology is studied next; this includes adaptation, extinction, distribution and abundance of species and population growth and regulation. This will bring us to the ecology of interactions such as competition, predation and parasitism. Community ecology on the other hand is concerned with factors controlling multispecies systems. Finally the highest level of organization is the ecosystem organization which include the physical and chemical factors influencing the community and focus on subjects such as energy flow and nutrient cycling in nature. Ecologists are concerned not only with communities, populations and organisms *in nature*, but also with manmade or human influenced environments, and with the consequences of human influence *on* nature (pollution, *global climate change*). In fact, our influence is so pervasive that we would be hard pressed to find an environment that was totally unaffected by human activity. Environmental problems are now high on the political agenda and ecologists clearly have a central role to play: a *sustainable future* depends fundamentally on ecological understanding and our ability to predict or produce outcomes under different scenarios.

Course Learning Objectives

The main objectives of this course are to a) learn about the basic mechanisms that are at work in the biosphere thorough understanding of the fundamental concepts that define the field of ecology. b) Use the knowledge gained from the field of ecology to understand the impact of human activities (pollution, global warming and climate change) on the natural systems. c) Emphasize the concept of sustainable development by highlighting the link between socio-economic needs and the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

148. Learn and understand relationships among biotic and abiotic components of the environment.
149. Explore and analyze concepts related to population structure and dynamics, energy flow, nutrient cycling, interactions and succession in ecological communities and apply those concepts to real world problems.
150. Understand how scientists conduct experiments, analyze data and make conclusion about the natural world.
151. Convey scientific literature and express ecological knowledge about living things to others using oral and written communication.
152. Apply concepts learned in ecology to solve real world problems including global warming and climate change.

Course Resources

Required Course Text

M. C. Molles, Jr. (2013) *Ecology: concepts and applications*. Sixth edition, McGraw-Hill publishing company, Boston, MA
There is a website associated with this text. See: www.mmhe.com/molles6e
Hands-out prepared by the instructor, readings and assignments will be posted on blackboard.

Resources Available to Students

Library Resources: NDU Library is open to students to help you in all your research and class work. Qualified personnel are available to help you.
Writing Center: The Writing Center provides assistance to all students who wish to discuss their writing with a trained consultant. The Center is located in HA 114. An appointment is required.
Blackboard (bb) Software: Lecture material, handouts, readings and assignments will be posted on blackboard. If you are not familiar with the Blackboard system, it is recommended to attend a training session at the University Computer Services in order to know how to use the Blackboard system to enrich the academic communication with your instructor and your colleagues.

Field Observation:
Field trip(s) will be planned to visit a natural wild area in Lebanon. You should record all your observations, thoughts and questions in your field journal. Your field observations will be unique to you, reflecting your personal style. For each field trip a report is expected. Includes photos and sketches with your write up.

Grading and Evaluation

Exam I	20%
Exam II	20%
Final exam (comprehensive)	35%
Project and assignments	25%
Total	**100%**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Classes are a mix of lectures (powerpoint presentations) and discussions. The lecture topic is announced ahead of time for you in order to read assigned material before coming to class. Each lecture begins with a clear and detailed set of learning objectives. After discussing a major concept, multiple choice, and short answer questions are administered in the class to test your understanding and to pinpoint deficient areas of comprehension. This interactive approach requires your active participation. Material and assignments will be posted on blackboard and Connect Ecology-interactive webpage associated with the textbook. Additional readings will be assigned from the literature on specific subjects.

Course Schedule

Week	**Topic** (additional readings are available in the course modules)	Reading
1	Introduction to Ecology: Historical Foundations and Developing Frontiers.	Ch 1
	Natural History and Evolution	
1&2	Life on Land	Ch 2
2	Life in Water	Ch 3
2&3	Population Genetics and Natural Selection	Ch 4
	Adaptation to the Environment	
3	Temperature Relations	Ch 5
4	Water Relations	Ch 6

5	Energy and Nutrient Relations	Ch 7
	Population Ecology	
6	Population Distribution and Abundance	Ch 9
7	Population Dynamics	Ch 10
8	Population Growth	Ch 11
9	Life Histories	Ch 12
	Interactions	
9&10	Competition	Ch 13
10	Exploitation: Predation, Herbivory, Parasitism and disease	Ch 14
11	Mutualism	Ch 15
	Communities and Ecosystems	
12	Species Abundance and Diversity	Ch 16
13	Species Interactions and Community Structure	Ch 17
14	Primary Production and Energy Flow	Ch 18
15	Nutrient Cycling and Retention	Ch 19
16	Succession and Stability	Ch 20

Course Policies
No make-up exam is allowed under normal circumstances. Consequently, a student missing an exam with no justifiable reason will lose the grade value of that exam.
Under abnormal circumstances a student is allowed a make-up exam under the following conditions:
1. The student shows that missing the exam was beyond his/her control.
2. The instructor and chairperson accept the case presented and approve of the make up.
3. The student may lose 10 points out of 100 of the grade value of the exam in question.
4. The make up exam shall be done within 10 days after the elapse of the exam date.

Assignments should be returned by the due date. Failure to do so will result in losing up to 20% of the grade.

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.

Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).

Once in class, students are expected to remain in class for the entire period.

English must be the only language spoken in class at all times.

Special needs: Any student who feels s/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Policies & Procedures

NDU's Attendance Policy
Student should attend all classes and laboratory sessions on time. A pattern of absences, whether authorized or not, and even below the maximum number (specified below), may alter one's grade substantially. The SAO alone authorizes absences. No absence absolves a student from the responsibility of acting upon the material presented during his/her absence. The maximum number absences for classes that meet on MWF is six; the maximum number for classes that meet on TTh and in the summer is four, (or two hours per credit course). Any student whose absences exceed the maximum limits shall automatically fail the course unless the student withdraws.

Office Hours: All instructors at NDU are available for office hours during the week. Please note the office hour that your instructor has dedicated to this course to make an appointment. Just dropping by may not ensure that the professor has set aside time to assist you. Office hours may be used ideally to ask for guidance on an assignment or to ask questions concerning a subject that you were not clear on during class time.

NDU's Academic Integrity Policy

Students are expected and encouraged to be honest and to maintain the highest standards of academic integrity in their academic work and assignments at the University. They shall refrain from any academic dishonesty or misconduct including; but not limited to:

- Plagiarism; that is, the presentation of someone else's ideas, words or artistic, scientific, or technical work as one's own creation. Also, paraphrasing, summarizing, as well as well as direct quotations are considered as plagiarism, if the original source is not properly cited.
- Cheating.
- Assisting in cheating.
- Substituting a student in the taking of an examination.
- Substituting examination booklets.
- Submitting the same work for more than one course and the like. o Submitting papers written by others.
- Receiving or providing unauthorized help or assistance in any academic work or assignment. Intentional violation of program and degree requirements and regulation as established by the University.
- Dishonest reporting of computational, statistical, experimental, research, results, or the like.

System of Grades

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (*i.e.* percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A^+	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A^-	Very Good	3.7	89 - 92
B^+	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B^-	Good	2.7	77 - 79

C+	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C-	Passing	1.7	66 - 69
D+	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59
UW	Unofficial Withdrawal	0.0	

The grade "*UW*" is assigned by the instructor when a registered student has never attended a class or has ceased attending and has not submitted an official course withdrawal request to the Office of the Registrar. This grade is computed as an *F* grade in the grade-point average.

Course	Ecology
Module 1	Introduction to Ecology/Natural History and Evolution
Key Concepts	Ecology, biosphere, ecosystem, evolution, soil horizons, biomes, climate diagram, natural history, aquatic environments, hydrologic cycle, adaptation, allele frequency, Hardy-Weinberg principle, natural and artificial selection, genetic drift, population genetics.
Overview	The first unit of this module introduces you to the discipline of ecology, it discusses the levels of ecological organizations and provides a sampling of ecological research performed in the field and/or laboratory. Units 2 and 3 provides an overview of natural history of terrestrial and aquatic environments. Natural history is the study of how organisms in a particular area are influenced by factors such as climate, soil, soils, predators, competitors and evolutionary history. In relation to biomes, large scale patterns of climatic variation is discussed, this includes the construction of climatic diagrams. For each of the different biomes and aquatic ecosystem, geography, climate, soils (for biomes only), biology and human influences are discussed. Evolution is a unifying principle of biology (including ecology) which provides a theoretical framework to study the diversity of life. In this unit, the theory of evolution by natural selection is discussed in detail. In addition topics related to population ecology are discussed, this includes Hardy-Weinberg equilibrium model.
Aim	The aim of this module is to introduce the field of ecology, be exposed to the natural history of the biosphere by discussing biomes and aquatic ecosystems and the impact of humans on them. Finally, an overview of population genetics is presented with emphasis on the theory of evolution by natural selection and the Hardy-Weinberg equilibrium model.

Learning Outcomes	At the end of this module learners will be able to: • Define the term ecology • Comprehend the reasons behind large-Scale patterns of climate variation. • Recognize the importance of soil as the foundation of terrestrial biomes. • Recognize the natural history and geography of biomes. • Assess the impact of humans on terrestrial biomes. • Discuss how technology can contribute to curriculum change. • Understand the hydrologic cycle • Recognize the natural history of aquatic environments • Assess the impact of humans on aquatic environments • Explain the theory of evolution by natural selection • Apply the Hardy-Weinberg model to identify evolutionary forces.
Units	Unit 1.1: Introduction to ecology: historical foundations and developing fron Unit 1.2: Life on land Unit 1.3: Life in water Unit 1.4: Populations genetics and natural selection
Readings	Norris R.D., P. P. Marra, T. K. Kyser, and L. M. Ratcliffe. 2005. Tracking habitat use of a long distance migratory bird, the American *redstart Setophaga rutcilla*, using stable-carbon isotopes in cellular blood. Journal of Avian Biology 36:164-70. Nadkarni, N. M. 1981. Canopy roots: convergent evolution in rainforest nutrient cycles. Science 214:1023-24. Janzen, D. H. 1981. Guanacaste tree seed-swallowing by Costa Rican range horses. Ecology 62:587-92.

	Clausen, J., D. D. Keck, and W. M. Hiesey. 1940. Experimental studies on the nature of species. I. The effect of varied environments on Western North American Plants. Washington, D.C.: Carnegie Institution of Washington, Publication no. 520. Vila-Aiub, M. M., M. C. Balbi, P. E. Gundel, C. M. Ghersa, and S. B. Powles. 2007. Evolution of glyphosate-resistent Johnsongrass (*Sorghum halepense*) in glyphosate-resistant soybean. Weed Science 55:566-71.
Activity	**Overview** *Assignments:* 1- Pick a research article related to ecology from a refereed scientific journal and outline the different steps of the scientific method used by the author(s). (Information, question, hypothesis, prediction, test of hypothesis) 2- Construct climate diagram for the different regions of Lebanon (Beirut, Tripoli, Bekaa, Besharee). How are they different? Can you predict the type of biome of each region? Data for each location is provided on BlackBoard. 3. Construct a table for the different terrestrial biomes on earth and indicate the main features related to geography, climate, soils, biology, and human influences, for each biome. 4-Construct a table for the different aquatic environments and indicate the main features related to geography, structure, physical conditions, chemical conditions, biology and human influences.

	5- Construct a concept map for chapter 4, populations genetics and natural selection. 6- Solve the set of problems related to Hardy-Weinberg model. The problems are posted on blackboard. 7- Investigate the environmental threats to the Cedar forest of Bsherri in Lebanon. Deatail some of the conservation efforts undertaken to protect this forest.
Module 2	Adaptation to the Environment
Key Concepts	Acclimation, ectotherm, endotherm, homeotherm, Poikilotherm, macroclimate and microclimate, photosynthesis, thermal neutral zone, hyperosmotic, hypoosmotic, isoosmotic, osmoregulation, relatie humidity, water potential, autotroph, chemosynthetic autotroph, heterotroph, detritivore, Mullerian and batesian mimicry, fuctional response, optimal foraging theory.
Overview	In this unit we examine the relationships between organisms and temperature. This discussion has a practical application in view of the rapidly changing climate. Water is essential for all forms of life on earth. Most organisms must expand energy to maintain their internal water. Hence the study of water relations is fundamental to living organism especially for desert organisms. In order to survive organisms must obtain energy from their environment. Autotrophs use solar energy or inorganic chemicals. However, heterotrophs must obtain energy from the food they consume. The study of energy and nutrient relations addresses this subject.

Aim	The aim of this unit is to explore adaptations to environments in relation to temperature, water, nutrient and energy relations.
Learning Outcomes	At the end of this module learners will be able to: • Learn about microclimates and the factors that influence it. • Understand evolutionary trade-offs. • Characterize the performance of organisms in relation to temperature. • Explain how organisms regulate their body temperature. • Explain how organisms survive extreme temperatures. • Recognize water availability in different compartment.s • Discuss water regulation on land. • Understand water and salt balance in aquatic environments. • Learn about photosynthetic autotrophs, chemosynthetic autotrophs and heterotrophs. • Explain the optimal foraging theory. • Apply the concept of energy and nutrient relations: Bioremediation
Units	Unit 2.1: Temperature relations Unit 2.2: Water relation Unit 2.3: Nutrition and energy relations
Readings	Bennett, A. F. And R. E. Lenski. 2007. An experimental test of evolutionary trade-offs during temperature adaptation. Assessment of the potential for *in situ* bioremediation of cyanide and nitrate contamination at a leach mine in central New Mexico. Journal of Soil Contamination 3:271-83.
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1- Many species of plants and animals that are associated with boreal forests also occur on mountains far to the south of the boreal forests. Using what you have learned about microclimates predict how aspect and elevation would influence their distributions on these southern mountains. 2- J. L. Mosser and colleagues found that populations of the bacterium *Sulfolobus* living at different temperatures has different optimal temperatures for sulfur oxidation. Use natural selection to explain these patterns. Design an experiment to test your explanation. Assume you can create artificial springs and regulate their temperature as you like. 3- Distinguish among vapor pressure deficit, osmotic pressure, and water

	potential. How can all three phenomena be expressed in the same units of measure: pascals. 4- Why are plants such as mosses living in the understory of a dense forest, which show higher rates of photosynthesis at low irradiance, unable to live in environments where they are exposed to full sun for long periods of time? 5- In type 3 functional response, what mechanisms may be responsible for low rates of food intake – compared to type 1 and type 2 functional response- at low food densities? 6- The data of Iriarte and colleagues suggest that prey size may favor a particular body size among pumas. However, this variation in body size also correlates well with latitude; the larger pumas live at high latitudes. Consequently, this variation in body size has been interpreted as the result of selection for efficient temperature regulation. Homeothermic animals are often larger at high latitudes, a pattern called Bergmann's rule. Larger animals, with slower surface area relative to their mass, would be theoretically better at conserving heat. Smaller animals, with higher surface area relative to their masss, would be theoretically better at keeping cool. So what determines predator size? Is predator size determined by climate, predator-prey interactions, or both? Design a study of the influence of the environment on the size of homeothermic predators.
Module 3	Populations Ecology
Key Concepts	Regular, random and clumped distributions, niche, age distribution, birth and death rate, cohort life table, geometric rate of increase, life table, numerical response, survivorship curve, carrying capacity, geometric and

	exponential population growth, reproductive effort, ruderal, semelparity, phenology, k selection.
Overview	In this section we are going to study aspects related to populations: a) population distribution and abundance. b) population dynamics which is concerned with factors influencing the expansion, decline, or maintenance of population. d) population growth. e) life histories which consists of the adaptations of an organism regarding the offsprings it produces, its survival, its age and size at reproductive maturity. Population studies is a key to manage wildlife, control pest populations and save endangered species.
Aim	The aim of this module is to understand the principles of population ecology and be able to apply these principles to real life applications. Population ecology holds the key to saving endangered species, manage wildlife and forests, understand and control disease epidemics.
Learning Outcomes	At the end of this module learners will be able to: • Learn about the effect of the environment on the distribution of species. • Recognize the factors that affect the distribution patterns of individuals within populations on small and large scales. • Apply the concepts learned to assess the level of rarity and vulnerability to extinction of populations. • Comprehend the influence of population dispersal on distribution and abundance. • Understand the temporal dynamics of populations by focusing on patterns of survival and reproduction in populations. • Apply the concepts learned in population dynamics to assess the impact of human generated pollutants on ecosystems. • Examine exponential and geometric growth • Study the effect of the environment on population growth. • Study the history, current state and projected growth of human

	population. • Recognize life histories: the adaptations of organisms that influence the number of offspring it produces, its survival, its size and age at reproductive maturity. • Apply the concepts learned in life histories to restore riparian forests.
Units	Unit 3.1: Population distribution and abundance *Unit 3.2: Population dynamics* Unit 3.3: Population growth Unit 3.4: Life histories
Readings	Huchinson, G. E. 1959. Homage to Santa Rosalia or Why are there so many kinds of animals? Amrican Naturalist 93:145-159. Caughley, G., J. Short, G. C. Grigg, and H. Nix. 1987. E. and T. M. Hinckley, eds. Biology of Populus and Its Implications for conservation and management. Ottawa: NRC Research Press.
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. *1- Cedars of Lebanon (Cedrus libani) occurs throughout the western chains of mountains in Lebanon. a) Check the literature and draw a map of their distribution. How do altitude and aspect affect their distribution? Are any populations of cedars of Lebanon found above an altitude of 2000 m. If not justify your answer. In the mountains of Turkey cedars of Lebanon can grow at much higher altitudes. Speculate the reason behind this difference.* *2- Suppose one plant reproduces almost entirely from seeds, and that its seeds are dispersed by wind, and a second plant reproduces asexually, mainly by budding from runners. How should these two different reproductive modes affect local patterns of distribution seen in populations of the two species?* *3- How might energy and nutrient relations explain the lower population densities of birds compared to comparable-sized mammals.* *4- The world population is increasing at an alarming rate. Explain the impact of this rapid growth on the environment and on sustainable development. On what basis the carrying capacity of the earth is calculated?* *5- Why do many populations of exotic species, such as zebra mussels, Eurasian collared doves and tree of heaven, often grow at an exponential rate for some*

	time following their introductions into a new environment? *6- The discussion of seed size and number of focused on the advantages associated with large seeds. However, researchers revealed that the plants from widely separated geographic regions produce a wide variety of seed sizes. If this variation is to be maintained, what are some of the advantages associated with producing small seeds?*
Module 4	Interactions
Key Concepts	Interspecific and intraspecific competition, competitive exclusion principle, exploitation, predation and herbivory, parasites and pathogens, facultative and obligate mutualism.
Overview	This module introduces the ecology of interactions by bringing biological components together. Evolutionary effects of interactions on the species will be addressed. This unit also explores the effect of interactions on the structure of the population and on properties of the ecological communities. Practical applications learned from the ecology of interactions include the study of human disturbance on ecosystems, biological pest control and the modification of food webs by humans.
Aim	The aim of this module is to introduce the major concepts related to the biology of interactions and their applications in everyday life such as biological pest control and control of invasive species.
Learning Outcomes	At the end of this module learners will be able to: • Compare and contrast intraspecific and interspecific competition. • Discuss the competitive exclusion principle. • Explain the effect of competition on the ecological and evolutionary influences on the niches of a species.

	• Understand the mechanisms allowing invasive species to invade communities of native species. • Recognize the extent of exploitative interactions in an ecosystem. • Appreciate the value of pest control by predators. • Explore mutualisms in nature. • Evaluate the benefit of mutualisms in agriculture.
Units	Unit 3.1: Competition Unit 3.2: Exploitative interactions Unit 3.3: Mutualism
Readings	1- Byers, J. E. 2000.Competition between two estuarine snails: implications for invasions of exotic species. Ecology 81:1225-12239. 2- Bryers, J. E. and L. Goldwasser. 2001. Exposing the mechanism and timing of impact of nonindigenous species on native species. Ecology 82:1330-1343. 3- Lindstrom, E. R., H. Andren, P. Angelstam, G. Cederlund, B. Hornfeldt, L. Jaderberg, P. A. Lemnell, B. Martinsson, K. Skold, and J. E. Swenson. 1994. Disease reveals the predator: sarcoptic mange, red fox predation, and prey populations. Ecology 75:1042-1049. 4- Krebs, C. J., R. Boonstra, S. Boutin, and A. R. Sinclair. 2001. What drives the 10-year cycle of snowshoe hares? BioScience 51:25-36. 5- Kalka, M. B., A. R. Smith, and E. k. V. Kalko. 2008. Bats limit arthropods and herbivory in a tropical forest. Science 320:71. 6- Isack, H. A. and H. U. Reyer. 1989. Honeyguides and honey gatherers: interspecific communication in a symbiotic relationship. Science 243:1343-1346.

Activity	**Overview**
	Assignments: (some assignments taken or modified from the textbook) 1- The competitive exclusion theory states that two species cannot occupy the same nice indefinitely. What is the a fundamental assumption of this principle. 2- Do resources have to be present in limited supplies for competition to shape niches? 3- Can we conclude that interspecific competition commonly restricts species to realized niches in nature, based on the results of mathematical models and laboratory experiments? 4- One of the conclusions that seems justified in light of several decades of studies of interspecific competition is that competition is a common and a strong force operating in nature, but not always and not everywhere. List the environmental circumstances in which you think intraspecifc and interspecific competition would be most likely to occur in nature. In what circumstances do you think competition is least likely to occur? How would you go about testing your ideas? 5- How could you test experimentally for the combined influence of bats and birds on numbers of arthropods on foliage, as well as their individual contributions? (Check the paper of bats in the list of references for this unit).

	6- Both mathematical and laboratory models offer valuable insights into the dynamics of predator-prey systems. What are some advantages and limitations of each approach? 7- predation is one of the processes by which one organism exploits another. Others are herbivory, parasitism, and disease. What distinguishes each of these processes, including perdation, from the others? We can justify discussing these varied processes under the heading of exploitative interactions because each involves one organism making its living at the expense of another. By what "currency" would you measure that expense (e. g., energy, fitness)?
Module 5	**Communities and Ecosystems**
Key Concepts	Species diversity and evenness, community structure, commensalism, dominant or foundation species, food web, keystone species, ecological efficiency, net primary and secondary production, trophic level, decomposition, mineralization, eutrophication, nutrient cycling, climax community, pioneer community, primary and secondary succession.
Overview	In this unit we are going to discuss communities and ecosystems. Communities are composed of interacting species and their study is concentrated on the organisms inhabiting an area. However, the study of ecosystems includes the physical and chemical factors influencing the community as well, such as nutrient cycling and energy flow. Practical applications to community ecosystem ecology include: disturbance by humans to ecosystems, human modifications of foodwebs, altering aquatic ecosystems (eutrophication).
Aim	The aim of this unit is introduce the major principles and concepts related to community and ecosystem ecology.

Learning Outcomes	At the end of this module learners will be able to: • Recognize the factors affecting species abundance and diversity. • Study the effect of disturbance on promoting higher diversity. • Understand the effect of human activities on species diversity and abundance in urban areas. • Discuss the importance of food webs. • Evaluate the importance of keystone species. • Comprehend the factors limiting terrestrial primary productivity. • Define the trophic levels and energy flow in an ecosystem. • Discuss nutrient cycling and retention in an ecosystem. • Examine ecosystem changes during succession. • Evaluate the impact of invasive species on plant succession.
Units	Unit 5.1: Species abundance and diversity Unit 5.2: Species interactions and community structure Unit 5.3: Primary production and energy flow Unit 5.4: Nutrient cycling and retention Unit 5.5: Succession and stability
Readings	1- Lebo, M. E., J. E. Reuter, C. R. Goldman, N, C. L. Rhodes, N. vucinich, and D. Mosely. 1993. C. Sharman. 1994. Mechanisms of primary succession following deglaciation at Glacier Bay, Alaska. Ecological Monographs 64:149-75.
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1- Suppose you discover that the fish species inhabiting small, isolated patches of coral reef use different vertical zones on the reef face- some species live down near the sand, some live a bit higher on the reef, and some higher still. Based on this pattern of zonation, can you predict how reef structure should affect the diversity of fish living on such reefs? 2- If disturbance can foster higher species diversity, why is human disturbance often (though not always) associated with reduced species diversity? 3- According to the intermediate disturbance hypothesis, could human disturbance sustain higher levels of species diversity than in the absence of human disturbance? 4- Humans have been living in the tropical rain forests of the New World for at least 11,000 years. During this period, disturbance by humans has been a part of these tropical rain forests. Use the intermediate disturbance hypothesis to explain how recent disturbances threaten the biological diversity of these

	forests, while earlier disturbances apparently did not. 5- Some paleontologists have proposed that overhunting caused the extinction of many large North American mammals at the end of the Pleistocene about 11,000 and 10,000 years ago. The hunters implicated by paleontologists were a newly arrived predatory species, *Homo sapiens*. Offer arguments for and against this hypothesis. 6-The studies of nutrient limitations of aquatic primary production that we reviewed in class focused almost entirely on lakes within the temperate zone. Suppose you are an ecologist interested in determining whether primary production in tropical lakes is subject to similar control by nutrient availability. Design a study to find out what controls rates of primary production in tropical lakes. Use all the sources of information at your disposal, including published research, surveys of natural variation, and large- and small-scale experiments. 7- The concentration of atmospheric CO_2, which continues to rise, has been associated with an increased lignin content of the leaves of some plant species. Why is this potential change in leaf chemistry, in response to increased atmospheric CO2, an active area of research by ecosystem ecologists? 8- Many rivers around the world have been straightened and deepened to improve conditions for navigation. Side effects of these changes include increased average water velocity and decreased movement of water into shallow riverside environments such as marginal wetlands. What are the probable influences of these changes on the nutrient spiraling length? Use the model discussed by Newbold in the textbook.

	9- Succession seems to lead to predictable changes in community and ecosystem structure. Predict the characteristics of a frequently disturbed community/ecosystem. What do your predictions suggest about a future biosphere increasingly disturbed by a growing human population? How does the intermediate disturbance hypothesis figure into your answer?
Module 6	**Global warming and Climate change**
Key Concepts	Applied ecology, global distribution of climate change, Impact of climate change on biodiversity and ecosystems.
Overview	One of the biggest future challenges to organisms, ecologists and resource managers is global climate change. Attempts to mitigate predicted changes to climate have an ecological dimension (e.g. plant more trees to soak up some of the extra carbon dioxide produced by the burning of fossil fuels), although mitigation must also focus on the economic and sociopolitical dimensions of the problem. This is discussed because the relevant issues relate to ecosystem functioning. In this module we deal with the way we can use knowledge about the ecology of individual organisms to predict and manage the consequences of global climate change such as the spread of disease and weeds and the positioning of conservation reserves. Given the pressing environmental problems we face, it is not surprising that a large number of ecologists now perform research that is applied (i.e. aimed directly at such problems) and then publish it in specialist scientific journals.
Aim	The aim of this unit is to use knowledge gained in the field of ecology to help solve problems associated with climate change.
Learning Outcomes	At the end of this module learners will be able to: • Understand how to use the knowledge gained in ecological research to predict and manage the consequences of global climate change.

	• Study the impact of climate change on biodiversity • Examine the impact of climate change on the spread of disease • Study the impact of climate change on the spread of invasive species. • Explore how predicted global climate change is expected to affect species' distribution patterns.
Units	Unit 5.1: The global distribution of climate change Unit 5.2: Can the biota keep up with climate change? Unit 5.3: the challenge of global climate change Unit 5.4: The impact of climate change on biodiversity and ecosystems Unit 5.5: the impact of climate change on health Unit 5.6: Adaption of living organisms to climate change.
Readings	1- Beaumont, L.J. & Hughes, L. 	5- Law, B.E., Thornton, P.E., Irvine, J., Anthoni, P.M. & van Tuyl, S. (2001) Carbon storage and fluxes in ponderosa pine forests at different developmental stages. *Global Climate Change*, 7, 755–777.
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1- would you favor building more nuclear power plants to reduce CO2 emissions? Why or why not? 2- Many people don't believe climate change is going on even though climate scientists have amassed a great deal of data to demonstrate it. What factors do you think influence the degree to which a person believes or doesn't climatologists' reports? 3- What is the impact of climate change on biodiversity, forestry and agriculture in Lebanon? 4- What is the difference between climate change and climate variability?4-

Student Practicum Placement

In this course you will be assigned a practicum to integrate the knowledge acquired in class to real life applications. The practicum is a short term supervised work with the assigned facility/institution. This will give you an opportunity to use your skills, knowledge and experiences in the real world and open your eyes to face new challenges that may arise in the future.

Practicum 1:

A ROCHA Lebanon, NGO.

A ROCHA Lebanon, is an NGO that was established in 1996 with the main objective of saving Ammiq wetlands in the Beqaa valley in Lebanon from destruction. The work of A ROCHA Lebanon currently focuses on three main areas: scientific studies, practical conservation, and environmental education.
After finishing your practicum with A ROCHA Lebanon, the following are expected of you:

4- You should be familiar with the overall activities related to environmental conservation.
5- More specifically, you should participate in the work done to protect migratory birds. You should be able to integrate knowledge gained in class to propose solutions to problems facing migratory birds.
6- At the end of the practicum you will write a report and give a presentation, emphasizing what you have learned from the practicum.

Practicum 2:

Organic farms in the area of Zouk Mikayel

In this practicum you will spend time with the managers of the organic vegetable farms in the area of Zouk Mikayel. You will have to familiarize yourself, and report all the cultural practices utilized in the above operations. Most importantly, you have to emphasize and document sustainable practices, like biological control of pests and maintaining the health and fertility of the soil. In your report and presentation you have to compare and contrast organic vs conventional farms and highlight the importance of sustainable practices to improve the quality of life of the society and individuals.

Practicum 3:

Ministry of Agriculture-Forestry section

The forestry sector in Lebanon is under major environmental threat that are caused by human activities, such as forest cutting and fires. After finishing your practicum at the ministry you should be able to draw a clear picture of the current status of forests in Lebanon and future plans to conserve these forests. Most importantly, you should apply the principles and concepts learned in class to conserve and use this precious natural resource sustainably. A report and a presentation are required to showcase what you have learned from this practicum.

Practicum 4:

Shouf Cedar Reserve

The Shouf Cedar Reserve is the largest nature reserve in Lebanon that covers approximately 5% of the area of Lebanon. This reserve is a haven for biodiversity. The following are the main objectives of the reserve which focuses on sustainable development of the local community:

- Natural and cultural heritage conservation of the region
- Research and monitoring
- Eco-tourism
- Environmental awareness
- Capacity building

After finishing your practicum you should write a report and give a presentation emphasizing the sustainable practices done to protect and develop the area of the resrve. Also you should integrate what you have learned in class to conserve the area using the principles of sustainability.

Practicum 5:

Ministry of the Environment

The world is facing a real threat due to climate change and global warming. The Lebanese Ministry of the Environment is conducting studies, in collaboration with UN agencies, related to emissions of greenhouse gases in Lebanon and exploring new adaptation strategies to reduce the impact of climate change and global warming on society.
After finishing this practicum you should be familiar with the work done related to the above issue. You are also required to write a report and give a presentation emphasizing the concepts learned in class and how it can be applied to reduce the impact of climate change and global warming.

Course Syllabus

BIO 324
Plant Physiology
Notre Dame University-Louaize, Faculty of Natural and Applied Sciences, Department of Sciences
Spring Semester, 2014-2015

Instructor Information

Instructor:	Dr. Tanos G. Hage
Office Location:	S242
Telephone:	Office – 09-208725
Office Hours:	MW 8:00 – 9:00
E-mail:	thage@ndu.edu.lb

Course Identification

Course Number:	BIO 324

Course Name:	Plant Physiology
Course Location:	FA 1032
Class Times:	MWF 9:00 – 10:00/F 13:00 – 15:00
Prerequisites:	BIO 212 and BIO 227
Faculty Web Page:	http://www.ndu.edu.lb

Course Description

This course covers the basic principles of plant physiology, the physiological processes of green plants and the effect of the environment on these processes. Prerequisite: BIO 212, BIO 227.

Course Overview

This is an introductory, undergraduate course in Plant Physiology. Plants are unique organisms that can manufacture their own food (biomass) from carbon dioxide, water and sunlight. In turn other organisms are dependent on this food for survival, including humans. Plants play a crucial role in our life by providing animals and humans with food, feed, paper, medicine, chemicals, energy, and beautiful landscapes. In addition plants provide ecological services such as regulation of the water cycle and climate, soil formation, nutrient recycling and air purification. Plant physiology is the study of the organization and operations of the processes in the plant that order its development and behavior. Simply put it is the study of plant functions. In this course we will concentrate on transport and translocation of water and solutes, Biochemistry and metabolism, and brief account on growth and development. Throughout the course, and in particular towards the end, concepts related to climate change and sustainability will be emphasized.

Course Learning Objectives

The main objectives of this course are to a) Gain a thorough understanding of the functioning of the plants in their environment b) Develop critical thinking skills to ask pertinent questions related to plant physiology and to go about seeking answers to those questions. c) Use the knowledge gained from Plant Physiology to understand the role of plants in ecosystems. c) Emphasize the concept of sustainable development and climate change by highlighting the link between plants, socio-economic needs and the environment.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

153. Appreciate the important role of plants in the ecosystem and the services rendered to other organisms, including humans.
154. Understand the unique physical properties of water, the concept of water potential and its application to cell-water relations.
155. Demonstrate in-depth an understanding of the physiological processes involved in water balance in plants.
156. Describe how plants obtain and use mineral nutrients.
157. Understand the physical and chemical principles that govern the movements of molecules in solutions and how these principles apply to membranes and to biological systems.
158. Explain the role of light in photosynthesis and the processes that are involved in the synthesis of ATP and NADPH.
159. Describe the cyclic reactions that accomplish the fixation and reduction of CO2 to produce organic molecules.
160. Understand the process of translocation of photosynthates in the phloem.
161. Understand the role of plant secondary metabolites in plant defense mechanisms.
162. Cultivate basic understanding of plant growth and development.
163. Infuse the concept of sustainable development and climate change in the course.

Course Resources

Required Course Text

Taiz,L, Zeiger, E. Molles, (2006) *Plant Physiology*. Fourth edition, Sinauer Associates, Inc., Publishers, Sunderland, MA
There is a website associated with this text. See: www.plantphys.net
Hands-out prepared by the instructor, readings and assignments will be posted on blackboard.

References

Hopkins, G. and Huner, N. 2004. Introduction to Plant Physiology. 3rd ed. John Wiley & Sons.
Buchanan, B; Gruissem, W. and Jones, R. 2000. Biochemistry and Molecular Biology of Plants. American Society of Plant Physiologists.
Walter, L. 2003. Physiological Plant Ecology: Ecophysiology and Stress Physiology of functional groups. 4th ed. Springer.

Resources Available to Students

Library Resources: NDU Library is open to students to help you in all your research and class work. Qualified personnel are available to help you.

Writing Center: The Writing Center provides assistance to all students who wish to discuss their writing with a trained consultant. The Center is located in HA 114. An appointment is required.

Blackboard (bb) Software: Lecture material, handouts, readings and assignments will be posted on blackboard. If you are not familiar with the Blackboard system, it is recommended to attend a training session at the University Computer Services in order to know how to use the Blackboard system to enrich the academic communication with your instructor and your colleagues.

Grading and Evaluation

Exam I	20%
Exam II	20%
Final exam (comprehensive)	35%
Lab work and assignments	25%
Total	**100%**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Classes are a mix of lectures (powerpoint presentations) and discussions. The lecture topic is announced ahead of time for you in order to read assigned material before coming to class. Each lecture begins with a clear and detailed set of learning objectives. After discussing a major concept, multiple choice, and short answer questions are administered in the class to test your understanding and to pinpoint deficient areas of

comprehension. This interactive approach requires your active participation. Laboratory experiments are designed to parallel, augment and clarify lecture material. Assigned reading from current literature will keep you abreast with recent developments in the field. I will use blackboard to post announcements and lecture material.

Course Schedule

# Weeks	**Topic** (additional readings are available in the course modules)	Reading
1	Discussion of the syllabus.	
	Transport and Translocation of Water	
1-2	Water and plant cells.	Ch 3
3	Water balance of plants.	Ch 4
	Transport and Translocation of Solutes	
4	Mineral nutrition.	Ch 5
5	Solute transport.	Ch 6
	Biochemistry and Metabolism	

6-7	Photosynthesis: the light reactions.	Ch 7
8-9	Photosynthesis: carbon reactions.	Ch 8
10	Translocation in the phloem.	Ch 10
11	Secondary metabolites and plant defence.	Ch 13
	Growth and Development	
12	Growth and Development (Several sources)	
	Growth and Development	
13-14	Focus on climate change and sustainable development	

Course	Plant Physiology
Module 1	Transport and Translocation of Water
Key Concepts	Polarity of water molecule, Hydrogen bond, Latent heat of vaporization, cohesive and adhesive properties of water, surface tension of water, capillarity of water, Tensile strength of water, hydrostatic pressure, Diffusion of water, Fick's first law, Pressure driven bulk flow, Osmosis, Chemical potential of water, osmotic potential, Hoffler diagram, Hydraulic conductivity, aquaporins, water potential and plant growth, water in the soil, field capacity, Permanent wilting point, water movement in symplast and apoplast, root pressure, cohesion-tension theory of sap ascent, xylem cavitation, water loss in plants.
Overview	In the first unit of this module we will study the function of water in plant life and how water moves into and out of plant. In order to understand this we need to study the properties of water and the physical forces that influence water movement. In the second unit we will study the water balance in plants by discussing water status in the soil, water absorption by the roots, water transport through the xylem and water movement from the leaf to the atmosphere. Emphasis in this module will be placed on the sustainable use of water in our society.
Aim	The aim of this module is to emphasize the importance of water in the life of plants and all living organisms and to explore the adaptation of plants to hot, arid conditions.
Learning Outcomes	At the end of this module learners will be able to: • Study the structure and properties of water. • Understand water transport processes. • Learn about water movement in the soil. • Trace the movement of water from the soil to the roots. • Examine how the structure of the xylem contributes to the movement of water from the roots to the leaves. • Examine how plants minimize the consequences of cavitation. • Explore the driving force for leaf transpiration and the anatomical features of the leaf that regulates transpiration.

	• Emphasize the importance of selection of plants in sustainable use of water in agriculture.
Units	Unit 1.1: Water and plant cells. Unit 1.2: Water balance of plants.
Readings	Measuring water potential. http://5e.plantphys.net/article.php?ch=3&id=29 Calculating capillary rise http://5e.plantphys.net/article.php?ch=3&id=25 Green, P. B., and Stanton, F. W. (1967) Turgor pressure: Direct manometric measurement in single cells of *Nitella. Science* 155: 1675–1676. Heydt, H., and Steudle, E. (1991) Measurement of negative pressure in the xylem of excised roots. Effects on water and solute relations. *Planta* 184: 389–396. Leaf transpiration and water vapor gradient. http://5e.plantphys.net/article.php?ch=4&id=42 Malone, M., and Tomos, A. D. (1992) Measurement of gradients of water potential in elongating pea stem by pressure probe and picolitre osmometry. *J. Exp. Bot.* 43: 1325–1331. Irrigation http://5e.plantphys.net/article.php?ch=4&id=38 Steudle, E. (2001) The cohesion-tension mechanism and the acquisition of water by plant roots. *Annu. Rev. Plant Physiol. Plant Mol. Biol.* 52: 847-875. Zeiger, E. (1983) The biology of stomatal guard cells. *Annu. Rev. Plant*

	Physiol. 34: 441–475.
Activity	**Overview** *Assignments:* 1. What is the importance of the water potential concept in plant physiology? What are the components of water potential? 2. List three unique properties of water that make it such a good medium for cellular functioning, and explain how each property is useful to the plant. 4. How does water move across a largely hydrophobic plasma membrane? 5. Describe the path followed by water from the soil, through the plant and into the atmosphere. Where in the path are the important resistances to water movement? 6. Describe the casparian strip and its function. What is the most important substance in the casparian strip, from the point of view of its function? 7. What is the driving force for the movement of water from the soil to the top of a tree and into the atmosphere? 8- Explore the landscape on campus. Do you think that the selection of plants is appropriate for our environment in Lebanon, especially when it come to water use. Based on what you learned in this module what modifications you suggest for sustainable use of water on campus.
Module 2	Transport and Translocation of Solutes

Key Concepts	Mineral nutrition, Essential nutrients, deficiencies and plant disorders, nutrient solutions, soil and plant tissue analysis, treating nutritional deficiencies, mycorrhizal fungi facilitate nutrient uptake by roots, Passive and active transport, chemical potential, diffusion potential, Nernst equation, membrane transport processes, primary and secondary active transport, membrane transport proteins, ion transport in roots.
Overview	In this module we will discuss the essential nutrients of plants along with their deficiencies and associated plant disorders. This is followed by a discussion on treating nutritional deficiencies. In addition, the role of microbes in plant nutrition will be explored. In the second unit of this module we examine passive and active transport of solutes, transport of ions across membrane barriers, membrane transport processes and ion transport in roots.
Aim	The aim of this unit is to explore the overall topic of nutrition in plants along with transport of solutes. The effect of overuse of fertilizers on the ecosystem will be tackled along with solutions to this problem.
Learning Outcomes	At the end of this module learners will be able to: • Recognize essential nutrients, deficiencies, and plant disorders. • Learn how to treat nutritional deficiencies. • Discuss the importance of soil properties, root structure and mycorrhizal symbiotic relationships to plant mineral nutrition. • Recognize the difference between passive and active transport of solutes. • Study the factors that influence the passive distribution of ions across a membrane. • Understand membrane transport processes. • Recognize the impact of overuse of chemical fertilizers on the environment.
Units	Unit 2.1: Mineral nutrition

	Unit 2.2: Solute transport
Readings	Symptoms of deficiency inessential minerals. http://5e.plantphys.net/article.php?ch=5&id=289 Raghothama, K. G. (2000) Phosphorus acquisition; plant in the driver's seat! *Trends in Plant Science* 5: 412-413. Fox, T. C., and Guerinot, M. L. (1998) Molecular biology of cation transport plants. *Annu. Rev. Plant Physiol. Plant Mol. Biol*. 49: 669-696. Baker, A. J. M., and Brooks, R. R. (1989) Terrestrial higher plants which hyperaccumulate metallic elements—A review of their distribution, ecology and phytochemistry. *Biorecovery* 1: 81–126. ABC transporters in plants http://5e.plantphys.net/article.php?ch=6&id=54 Bush, D. S. (1995) Calcium regulation in plant cells and its role in signaling. *Annu. Rev. Plant Physiol. Plant Mol. Biol.* 46: 95-122. Hedrich, R., and Schroeder, J. I. (1989) The physiology of ion channels and electrogenic pumps in higher plants. *Annu. Rev. Plant Physiol*. 40: 539-56
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1. What does a plant need to grow from seed and complete its life cycle? What is the difference between the requirements of a plant and an animal?

	2. What is an essential element? How many have been identified? What is the difference between an essential element and a beneficial one? Provide an example of each. 3. What is a nutrient solution? Why is it more convenient to use liquid medium, as opposed to soil, to grow plants in nutritional studies? In nutrient solutions, nitrogen can be supplied as NH_4^+ or NO_3^-. Which one would use in a nutritional study? 4. What is the difference between a macronutrient and a micronutrient? Provide a reason for the inability of plant physiologists to identify micronutrients in early nutritional studies. Why is it difficult to supply iron in nutrient solutions? What is the best way to overcome this difficulty? 5. What is a mineral deficiency? How can a mineral deficiency be recognized? How can farmers benefit from nutrient analysis? 6. What is meant by the term "active transport"? What is the difference between "primary" and "secondary" active transport? 7. What is the meaning of the Nernst equation? If the current carried by K^+ ions diffusing through a K^+ channel is plotted against the membrane potential, at what potential will the direction of current reverse? 8. Both membrane channels and carriers show changes in protein conformation. What is the role of such conformation changes (a) in channels, and (b) in carriers? 9. How can the operation of the plasma membrane H^+-ATPase affect (a) the

	diffusion of K^+ through membrane channels, and (b) the accumulation of sugars from the apoplast into the cell? 10. Overuse of chemical fertilizers in Lebanon is contributing to water and soil pollution. Investigate the extent of this problem. 11. How can we sustainably maintain the fertility of the soil? Based on what you studied in this module, devise a plan to be used by a farmer to achieve this objective.
Module 3	Biochemistry and Metabolism
Key Concepts	Thylakoid reactions, Light as a particle and a wave, absorption spectrum, antenna complex, reaction center complex, quantum yield, Photosystem I and II, enhancement effect, red drop effect, antenna funnels energy to the reaction center, Light harvesting complex I and II, electron transport, ATP synthesis by chemiosmotic mechanism. The Calvin cycle, Light regulate the Calvin cycle, Rubisco activity and light, photorespiration, CO2 concentrating mechanisms: C4 carbon cycle and CAM. Pathways of translocation, P. Protein bodies, companion cells, source to sink pathway, pressure flow model, phloem loading and unloading, photosynthate distribution: allocation and partitioning.
Overview	In this module we will discuss the process of photosynthesis in plants, translocation of sugars in the phloem and secondary metabolites and plant defence. In photosynthesis we are going to explore the light reactions and carbon dioxide fixation reactions. Emphasis will be placed on food security and the role of agriculture in sustainable production of food. The translocation of sugars will be discussed with emphasis on accumulating sugars in storage organs to be used as a source of food. Finally we will explore the large number of secondary metabolites produced in plants,

	their role in plants for defence and the potential sustainable use of these compounds by society in medicine and industry.
Aim	The aim of this module is to appreciate the role of plants as producers of biomass and food. In exploring the biochemistry of the process of photosynthesis, we are interested in sustainably increasing food production to satisfy the need of increasing world population. In exploring the biosynthetic pathways of secondary metabolites, we will be able to tap this great resource to be used in medicine and industry.
Learning Outcomes	At the end of this module learners will be able to: • Study the organization of the photosynthetic apparatus • Comprehend the organization of light-absorbing antenna systems • Examine the organization of the photosynthetic apparatus • Understand the mechanisms of electron transport • Study proton transport and ATP Synthesis in the chloroplast • Explore the Calvin cycle • Understand the regulation of the Calvin cycle • Understand the process of photorespiration • Examine the synthesis of starch and sucrose. • Apply what we studied in photosynthesis to sustainably increase food production. • Examine the pathway and patterns of translocation of photosynthates in the phoem. • Discuss Phloem loading and unloading. • Understand the allocation and partitioning of photosynthates. • Explore ways to increase storage of starch in edible portion of the plant. • Discuss the mechanism of by which plants protect themselves against pests. • Emphasize the use of disease and insect resistant plants to reduce

	the unsustainable use of pesticides.
Units	Unit 3.1: Photosynthesis: the light reactions. *Unit 3.2:* Photosynthesis: carbon reactions. Unit 3.3: Translocation in the phloem. Unit 3.4: Secondary metabolites and plant defence.
Readings	The distribution of chlorophylls and other photosynthetic pigments. http://5e.plantphys.net/article.php?ch=7&id=67 Chlorophyll biosynthesis. http://5e.plantphys.net/article.php?ch=7&id=76 Yachandra, V. 	Unraveling the function of secondary metabolites. http://5e.plantphys.net/article.php?ch=13&id=313
Activity	**Overview**
	Assignments: some assignments are taken or modified from the textbook. 1. What is an action spectrum? What is the relationship between the action spectrum for photosynthesis and the absorption spectrum of chlorophyll? 2. Photosynthesis in oxygen-evolving organisms is said to involve two distinct photosystems. Describe the two photosystems and provide two lines of experimental evidence that led to their discovery. 3. What is the role of electron transport in oxygen-evolving photosynthesis? Name the final electron donor and final electron acceptor in photosynthesis. Describe the path travelled by an electron in the electron transport process. 4. Describe the process of ATP synthesis at the thylakoid membrane. Name the reactants, the energy source and the role of light in the process. Can ATP synthesis take place in thylakoid membranes kept in the dark? Explain your answer. 5. The term "dark reactions" was used for many years to describe the reactions for incorporating CO_2in photosynthesis. Why was this term considered appropriate at the time and why is it considered inappropriate

	now? 6. Photorespiration is generally considered to be a wasteful process that decreases the yield of C_3plants. What experiment would you propose to minimize the role of photorespiration in plants? 7. What would be the consequence in each of the following if the thioredoxins in chloroplasts were reduced not by ferredoxin but by NADPH as is the case for their cytosol counterparts? Assume NADPH is constant. Explain your answer. A. Rate of starch synthesis. B. Hexose monophosphate pool in chloroplasts in the dark. C. Synthesis of malate in C_4 plants. D. Synthesis of malate in CAM plants assuming an adequate supply of phosphoenolpyruvate. E. Activity of Rubisco. 8. A sucrose molecule has been synthesized in the chloroplast stroma of a mesophyll cell. Describe the path that the sucrose molecule would follow if it is to become part of the sucrose pool in a developing seed. 9. What is a typical velocity of sap moving in the phloem? Can phloem sap move at that velocity by diffusion? 10. Describe the pressure-flow model of translocation in the phloem. Does water move down its water potential gradient in this model? 11. Explain the concepts of source and sink in phloem transport. Leaves

	are said to be sinks early in development and to become sources as they attain photosynthetic competence. What experiments would you design to study the leaf transition from sink to source? 12. How do secondary metabolites differ from primary metabolites? 13. Discuss the main functions of secondary metabolites in plants and relate these functions to their sites of accumulation in the plant. 14. What are terpenes, chemically, and how are they synthesized? Give one example each of how mono- and triterpenes serve as feeding deterrents to insects. 15. Apply what you learned in this module to prepare a report on the best practices to produce food sustainably.
Module 4	Growth and Development
Key Concepts	Sporophytic development, embryogenesis, vegetative development, the origins of polarity in embryogenesis, axial polarity of plant, intercellular communication, shoot apical meristem development, root apical meristem development, vegetative organogenesis, types of senesce, programmed cell death.
Overview	This module is concerned with the morphological and anatomical changes during development along with the biochemical and molecular mechanisms underlying these changes. This includes both the vegetative as well as the reproductive phases of the life of plants.
Aim	The aim of this module is to understand the mechanisms that regulate the development of the plant from embryogenesis through vegetative and

	reproductive stages.
Learning Outcomes	At the end of this module learners will be able to: • Discuss the major stages of sporophytic development. • Study the origins of polarity in embryogenesis. • Understand the function of shoot apical meristem. • Understand the function of root apical meristem. • Discuss the process of vegetative organogenesis • Understand the process of senescence and programmed cell death of plants
Units	Unit 3.1: Growth and development
Readings	Division Plane Determination in Plant Cells - Laurie G. Smith, Division of Biological Sciences, University of California, San Diego (May 2006). http://5e.plantphys.net/article.php?ch=16&id=225 Plant Meristems: A Historical Overview - Ian Sussex, Department of Molecular, Cellular, and Developmental Biology, Yale University (May 2006). http://5e.plantphys.net/article.php?ch=16&id=169 Watanabe, A., Hamada, K., Yokoi, H., and Watanabe, A. B., and Wang, X. (1995) Expression of phospholipase D during castor bean leaf senescence. *Plant Physiol*. 108: 713–719.

	McLean, B. G., Hempel, F. D., and Zambryski, P. C. (1997) Plant intercellular communication via plasmodesmata. *Plant Cell* 9: 1043–1054. Bleecker, A. B., and Patterson, S. E. (1997) Last exit: Senescence, abscission, and meristem arrest in *Arabidopsis*. *Plant Cell* 9: 1169–1179. Barlow, P. W. (1994) Evolution of structural initial cells in apical meristems of plants. *J. Theor. Biol.* 169: 163–177.
Activity	**Overview**
	Assignments: (some assignments are taken or modified from the textbook) 1- What are the three main stages of sporophytic (that is, diploid generation) development in plants? 2- What are the five stages of embryogenesis in Arabidopsis*?* 3- What essential features of the mature plant are established during embryogenesis, and at what stage in embryogenesis is each feature determined? 4- Using a labelle diagram, show how the apical–basal organization of tissues in Arabidopsis seedlings is derived from earlier embryonic stages. 5- Compare and contrast "position-dependent" cell division patterns during plant embryogenesis with "lineage-dependent" cell division

	patterns during animal embryogenesis. 6- What is the evidence that the hormone auxin may serve as a signaling agent during plant embryogenesis? 7- What mutation in Arabidopsis causes the formation of vascular tissue consisting of xylem, but no phloem. 8- Discuss how the intercellular movement of a transcription factor is involved in the differentiation of cortical and endodermal cells in Arabidopsis. 9- What is the primary function of the *CLAVATA* genes, and what type of proteins do they encode? Diagram a model for CLV1 and CLV3 action and regulation at the molecular level. What is the nature of the extracellular signal regulating CLV1?
Module 5	Focus on Climate Change and Sustainability
Key Concepts	.
Overview	One of the major challenges facing our society is forecasting the response of plants and their ecosystems to climate change. The rapid environmental changes caused by humans may cause the extinction of many plant species due to the lack of sufficient genetic diversity to adapt successfully to the rapid environmental changes. In this module we are going to review articles published in a special issue of Plant Physiology [(December 2012, 160 (4)] about pants and climate change. The article provide an overview on the current advances in relation to the response of plants to rapid climate change.
Aim	The aim of this unit is to explore our current understanding of the abrupt changes in climate on the health of plants and their ecosystems along with their

	impact on society.
Learning Outcomes	At the end of this module learners will be able to: • Recognize the impact of climate change on plant-insect interactions. • Evaluate the influence of climate change on global crop productivity and its effect on society. • Recognize the physiological traits for improving heat tolerance in wheat. • Understand the consequences of climate Warming and altered precipitation patterns for plant-insect and multitrophic Interactions. • Know the evolutionary and ecological responses to anthropogenic climate Change: • Discuss therole of plants in the effects of global change on nutrient Availability.
Units	Unit 2.1: \plant insect interactions and climate change. Unit 2.2: Crop productivity and climate change. Unit 2.3: Heat tolerance in wheat. Unit 2.4: Evolutionary and ecological responses to climate change. Unit 2.5: Role of plants in the effects of climate change on nutrient availability.
Readings	Climate Change: Resetting Plant-Insect Interactions *Plant Physiol. 2012 160: 1677-1685. First Published on September 12, 2012; doi:10.1104/pp.112.204750* The Influence of Climate Change on Global Crop Productivity *Plant Physiol. 2012 160: 1686-1697. First Published on October 10, 2012;*

Activity	**Overview**
	1. A group of 2-3 students choose a review article from list of articles above and present it in the class as a PowerPoint presentation.

Course Syllabus

ENS 205:

Environment, Society and Ethics

Notre Dame University-Louaize, Faculty of Natural and Applied Sciences, Department of Sciences

Spring Semester, 2013-2014

Instructor Information

Instructor:	Dr. Tanos G. Hage
Office Location:	S242, Main Campus
Telephone:	Office – 09-208725
Office Hours:	MWF 1:00-2:00
E-mail:	thage@ndu.edu.lb
Website:	

Course Identification

Course Number:	ENS 205
Course Name:	Environment, Society and Ethics
Course Location:	Main Campus
Class Times:	MWF 3:00-4:00
Prerequisites:	None
Faculty Web Page:	http://www.ndu.edu.lb/academics/fnas/deanmess.htm

Course Description/Overview

Introduction to the environmental goods and services, impacts of population growth and economic development on the environment, the evolution of societies, community organizations and the quality of life are presented. Special focus is given to the value types and existing moral relationships between human beings and their environment, environmental ethics views, their evolution and effects on the environment and wildlife protection. Sustainability principles and the impacts of international policies, environmental management worldviews and legally binding agreements on natural resources, societies and the world's economic balance are emphasized.

Course Learning Objectives

The overarching goals of this course are: a) to provide a clear, systematic, and comprehensive introduction to the philosophical issues underlying environmental and ecological awareness. b) introduce the relevance of philosophy for environmental concerns and some traditional ethical theories and principles. c) examine attempts to extend moral standing to animals, future generations, trees, and other natural objects. d) explore comprehensive environmental and ecological philosophies such as biocentrism, ecocentrism, deep ecology and ecofeminism. e) discuss climate change ethics and sustainability.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

164. Explore the impacts of humans on the environment.
165. Understand the current concepts and controversies in relation to environmental ethics.
166. Examine the concept of human rights in the context of population pressures and the hunger of poor people around the world.
167. Distinguish between anthropocentric and non anthropocentric environmentalism.
168. Implement sustainability principles as a framework to improve the quality of life
169. Assess practical matters by addressing issues of personal character and lifestyle as well as public policy.
170. Address the issue of ethics of climate change and sustainability.

Course Resources

Required Text Book

Joseph R. DesJardins (2006) Environmental Ethics: An introduction to Environmental Philosophy. Fourth edition. Wadsworth, Cengage Learning. USA.

Assignments and Grading Scheme

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (*i.e.* percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A^{+}	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A^{-}	Very Good	3.7	89 - 92
B^{+}	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B^{-}	Good	2.7	77 - 79
C^{+}	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C^{-}	Passing	1.7	66 - 69
D^{+}	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59
UW	Unofficial Withdrawal	0.0	

The grade "*UW*" is assigned by the instructor when a registered student has never attended a class or has ceased attending and has not submitted an official course withdrawal request to the Office of the Registrar. This grade is computed as an *F* grade in the grade-point average.

Grading Policy

Grades can be based on the following: (Example)

First exam	20%
Second exam	20%
Final Exam	35%
Project and Assignments	20%
Participation and Evaluation	05%
Total Points	**100**

Course Policies

Late Assignments

It is essential that papers and other assignments be completed and submitted on time. Once the due date is past, without notice and justification, the submission is not accepted.

Classroom Protocol

Classes are a mix of lectures (Powerpoint presentations) and class discussions. The material related to course is presented in a clear manner that engages the students by relating abstract concepts to current everyday issues or controversies that they care about. Material and assignments will be posted on blackboard. Additional readings will be assigned from the literature on specific subjects. Field trip(s) will be planned to visit a natural wild area in Lebanon. You should record all your observations, thoughts and questions in your field journal. Your field observations will be unique to you, reflecting your personal style. For each field trip a report is expected. Includes photos and sketches with your write up.

Course Schedule

Week	Date	Topics
1-2		Science, ethic and the environment
3-4		Responsibilities to future generations: sustainable development
5-6		Responsibilities to the natural world: from anthropocentric nonanthropocentric ethics.
7-8		Biocentric ethics and the inherent value of life
9-10		The land ethics, deep ecology and ecofeminism
11-12		Environmental justice and social ecology
13-14		Climate Change and energy policy
15		Class presentations and discussions

Course Policies

No make-up exam is allowed under normal circumstances. Consequently, a student missing an exam with no justifiable reason will lose the grade value of that exam.

Under abnormal circumstances a student is allowed a make-up exam under the following conditions:

1. The student shows that missing the exam was beyond his/her control.
2. The instructor and chairperson accept the case presented and approve of the make up.
3. The student may lose 10 points out of 100 of the grade value of the exam in question.

4. The make up exam shall be done within 10 days after the elapse of the exam date.

Assignments should be returned by the due date. Failure to do so will result in losing up to 20% of the grade.

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.

Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).

Once in class, students are expected to remain in class for the entire period.

English must be the only language spoken in class at all times.

Special needs: Any student who feels s/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Policies & Procedures

NDU's Attendance Policy
Student should attend all classes and laboratory sessions on time. A pattern of absences, whether authorized or not, and even below the maximum number (specified below), may alter one's grade substantially. The SAO alone authorizes absences. No absence absolves a student from the responsibility of acting upon the material presented during his/her absence. The maximum number absences for classes that meet on MWF is six; the maximum number for classes that meet on TTh and in the summer is four, (or two hours per credit course). Any student whose absences exceed the maximum limits shall automatically fail the course unless the student withdraws.

Office Hours: All instructors at NDU are available for office hours during the week. Please note the office hour that your instructor has dedicated to this course to make an appointment. Just dropping by may not ensure that the professor has set aside time to assist you. Office hours may be used ideally to ask for guidance on an assignment or to ask questions concerning a subject that you were not clear on during class time.

NDU's Academic Integrity Policy

Students are expected and encouraged to be honest and to maintain the highest standards of academic integrity in their academic work and assignments at the University. They shall refrain from any academic dishonesty or misconduct including; but not limited to:

- Plagiarism; that is, the presentation of someone else's ideas, words or artistic, scientific, or technical work as one's own creation. Also, paraphrasing, summarizing, as well as well as direct quotations are considered as plagiarism, if the original source is not properly cited.
- Cheating.
- Assisting in cheating.
- Substituting a student in the taking of an examination.
- Substituting examination booklets.
- Submitting the same work for more than one course and the like. o Submitting papers written by others.
- Receiving or providing unauthorized help or assistance in any academic work or assignment. Intentional violation of program and degree requirements and regulation as established by the University.
- Dishonest reporting of computational, statistical, experimental, research, results, or the like.

Course	Environment, Society and Ethics
Module 1	Science, ethics and the environment
Key Concepts	Environmental philosophy and ethics, Interplay between science and philosophy, decision making
Overview	Humans face unprecedented environmental challenges. Faced with such a catastrophic future we are challenged with critical decisions. Relying on science and technology without any consideration to ethical and philosophical issues may lead to more problems. Environmental policy needs to be decided upon in the political arena and not by scientists because the decisions that might be taken by experts in science and technology may not be objective.
Aim	The overriding aim of this module is to understand the critical role that environmental philosophy and ethics play in order to take the proper decisions related to environmental problems.
Learning Outcomes	At the end of this module learners will be able to: • Define environmental philosophy and environmental ethics. • Understand the role of environmental ethics in decisions related to environmental problems. • Discuss the interplay between scientists and environmental ethicists to reach the proper decisions related to environmental problems.
Units	Unit 1.1 Introduction: Why philosophy Unit 1.2: Science and ethics Unit 1.3: What is environmental ethics? Unit 1.4: Summary and conclusions
Readings	Louis P. Pojman and Paul Pojman (2012) *Environmental Ethics: Readings in Theory and Applications*, Sixth edition. Wadsworth, Cengage Learning. USA. The Master Bibliography in Environmental ethics has been composed by

	Holmes Rolston at Colorado State University and can beaccessed from the ISSE's website at http://www.cep.unt.edu/ISEE.html . This site has many links to other environmental resources.
Activity	**Overview** Assignment 1. When evaluating the safety of chemical pesticides, who should determine levels of acceptable risks? Is "risk" a matter of scientific fact, or is it a matter of value? What makes an issue a value issue? 2. Identify as many different uses of the words natural and nature as you can. Which, if any, have value connotations? Are all things that are "natural" also good? What about "human nature"? What is not natural about human beings? What would be the difference between "natural" fertilizers and "nonnatural" ones? Could there be such a thing as a "natural: pesticide? 3. Is there a difference between good science and bad science? We often hear that science should be value neutral. Is this true? Can you think of any values involved in the practice of good science? 4. How is reasoning about ethical matters different from reasoning about scientific matters? How do scientists evaluate controversial claims in science? How would we evaluate controversial ethical claims? 5. What makes a belief or statement objective? Contrast this with subjective beliefs or statements. What statements about a tree, for example, are objective? What statements about a tree are subjective?
Module 2	Responsibilities to future generations: sustainable development

Key Concepts	Sustainable development, overpopulation, consumption, environmental ethics and sustainability.
Overview	This module looks at how overpopulations and overconsumption issues raise questions related to future generations. If these trends remained unchanged the earth may face environmental and economic collapse in the next century, thus threatening the existence of future generations. The increased production of greenhouse gases and the destruction of carbon-absorbing vegetation threaten the entire planet with shifting climates and global warming. Applying traditional, standard ethical theories are unsatisfactory to tackle the above issues. Philosophical ethics are extended to answer questions related to our responsibilities toward future generations.
Aim	The overriding aim of this module is to understand the debate related to our responsibilities for future generations based on newly developed theories of environmental philosophy.
Learning Outcomes	At the end of this module learners will be able to: • Understand the impact of our actions on the quality of the environment for future generations. • Demonstrate a clear understanding of the concept of sustainable development. • Evaluate the different ideas related to our responsibilities toward maintaining a healthy environment for future generations.
Units	Unit 2.1: Introduction Unit 2.2: Population, consumption, and environmental ethics Unit 2.3: Do we have responsibilities to future generations? Unit 2.4: Climate change and sustainability Unit 2.5: Consumptions and sustainable development Unit 2.6: Summary and conclusions

Readings	Anne and Paul Ehrlich (1987) *Earth*. Franklin Watts, New York Paul Ehrlich and John Holdren (1988) *The Cassandra Conference: Resources for the Human Predicament*. Texas A&M University Press, Texas Station. Herman Daly (1987) *Sustainable Growth: An Impossible Theorem.* Massachusetts Institute of Technology Press, Boston.
Activity	**Overview**
	Assignment 1- Controversies such as those surrounding global warming and climate change involve long term predictions and therefore cannot be resolved in the short term. In light of this uncertainty, is there one reasonable course of action? What does reason advise when we must make a decision with incomplete information? 2- Do you believe that overconsumption or overpopulation plays a greater role in environmental destruction? Which problem would you address first? 3- Does more material lead to greater happiness? 4- Many indigenous cultures were destroyed when Europeans colonized the Americas and Africa. We can only guess at what we have lost as a result of these conquests. Have we been hurt by this loss? Can people be harmed by the loss of opportunities and the loss of knowledge of which they will never be aware? Will future generations be harmed if they never know about the blue whale or never know of a wilderness area?

	5- Global warming and Climate Change results primarily from using fossil fuels for energy. Americans use much more fossil fuel energy per capita than most other people. In fact According to environmental journalist Bill McKibben, "an American uses seventy times as much energy as a Bangladeshi, fifty times as much as a Malagasi, twenty times as much as Costa Rican." One result is this: "During the next decade India and China will each add to the planet about ten times as many people as the United States will-but the stress on the natural world caused by new Americans may exceed that from new Indians and Chinese combined." In light of these facts, and the importance of mitigating global warming, maybe we should combat population growth in the United States. Currently, American can claim children as a tax deduction on income taxes. Perhaps this should apply only to the first two children. What do you think?
Module 3	Responsibilities to the natural world: from anthropocentric to nonanthropocentric ethics.
Key Concepts	Moral standing, anthropocentrism versus non anthropocentrism, Animal liberation and animal rights, moral standing to nature.
Overview	This module answers two fundamental questions related to environmental ethics. First, what is the proper ethical relationship between humans and the natural environment? Second, what is the philosophical basis for this relationship? Standard ethical theories are not enough to answer the above questions. According to the traditional theories we protect the environment for our interests (human-centered views or anthropocentric views). In this module we examine the shift in the philosophical perspective. Philosophers started to argue that we have direct ethical responsibilities to nature, responsibilities that do not depend on the consequences to humans. This shift can be characterized as the shift between anthropocentric to nonanthropocentric theories of ethics.

Aim	This module aims at examining shift between anthropocentric to nonanthropocentric theories of environmental ethics.
Learning Outcomes	At the end of this module students will be able to: • Understand the concept of moral standing • Evaluate the shift between anthropocentric to nonanthropecentric views about nature and the environment. • Review the animal liberation movement as discussed by Peter Singer • Explain Tom Regan's argument concerning animal rights • Discuss the systematic ethical considerations to nonhuman natural objects.
Units	Unit 3.1: Introduction *Unit 3.2: Moral standing in the western tradition* Unit 3.3: Early environmental ethics Unit 3.4: Moral standing Unit 3.5: Do trees have standing? Unit 3.6: Peter Singer and the animal liberation movement Unit 3.7: Tom Regan and animal rights Unit 3.8: Ethical implications of animal welfare Unit 3.9: Critical challenges:
Readings	Peter Singer (1990) *Animal Liberation*. Second edition. Review of Books Press, New York. Tom Regan (1985) *The Case for Animal Rights* in *In Defence of Animals*. Basil Blackwell, Oxford. Roderick Nash (1989) *The rights of Nature*. University of Wisconsin Press, Madison.

	Eugene Haegrove (1989) *Foundations of nvironmental Ethics*. Prentice-Hall, New York.
Activity	**Overview**
	Assignment 1- Throughout the world, many laws prohibit abuse of animals. List as many reasons for these prohibitions as you can. Do any of these reasons commit you to holding that animals have a moral standing in their right:? 2- Try the following mental experiment concerning what objects have moral standing. Assume that competent adult human beings are placed at one end of a continuum and a rock at the other. Where along that continuum would you place the following: a child, a brain-dead adult, a fetus, a dolphin, a dog, an insect, an alien, a bird, a species, and a tree? Have you used a single criterion either implicitly or explicitly? 3- Do you see any morally relevant differences between domesticated and wild animals? Would Singer? Would Regan? Do you see any morally relevant differences between animals that are threatened with extinction and those that are not? 4- Does hunting or fishing raise any moral issues? If people eat the animals they kill, does that make a difference? In many areas, deer are overpopulating local habitats. Destruction of the habitat as well as mass starvation can occur in such circumstances. Would you favor selective hunting to thin overpopulated herds?

Module 4	Biocentric ethics and the inherent value of life
Key Concepts	Ethical extensionism, instrumental versus intrinsic value, Biocentrism.
Overview	The focus of this module is to consider systematic attempts in order to develop comprehensive environmental philosophies that are not in the realm of traditional standard Philosophy. Most of the recent philosophical work on the environment breaks with standard ethical theory and strive to rethink the relationships between humans and nature. Modern philosophers are are adopting the point of view of concerned citizens seeding to articulate, develop, and defend a coherent and comprehensive environmental philosophy.
Aim	The aim of this module is to explore the recent trends in environmental philosophy and ethics by emphasizing the concept of biocentrism or the reverence to life.
Learning Outcomes	At the end of this module learners will be able to: • Understand the concept of ethical extensionism • Define the terms instrumental and intrinsic vlaues • Evaluate the importance of biocentric ethics and its application in everyday life experiences.
Units	Unit 4.1: Introduction Unit 4.2: Instrumental value and intrinsic value Unit 4.3: Biocentric ethics and the reverence for life Unit 4.4: Ethics and character Unit 4.5: Taylor's biocentric ethics Unit 4.6: Practical implications Unit 4.7: Challenges and developments Unit 4.8: Summary and conclusions
Readings	James Brabazon (1975) *Albert Schweitzer: A Biography*. Putnam, New York.

	Holmes Rolston (1988) Environmental Ethics. Temple University Press, Philadelphia. R. Edward Grumbine (1994) Environmental *Policy and Biodiversity*. Island Press, Washington, D.C.
Activity	**Overview**
	Assignment 1- We use the word value both as a noun and as verb. Certain objects are said to possess value, and humans value numerous objects. If no humans were around to do the valuing, would anything of value remain? 2- Compose a list of things that you value. Distinguish those things that you value instrumentally from those things valued for their own sake. How many different types value can you think of? 3-Like Aristotle, Taylor suggests that each species has a distinctive nature that can best be identified in terms of a characteristic activity. How else might you distinguish between species? 4- In Taylor's account, does it make sense to attribute interests or goods to a wilderness area, to a river, or to other ecosystems? Can such things be teleological centers of life?
Module 5	The land ethics, deep ecology and ecofeminism
Key Concepts	Ecocentric ethics, ecosystems, holistic ethics, land ethics, deep ecology, ecofeminism
Overview	Some philosophers think that we should go beyond focusing mostly on

	individual species. They believe that we have an ethical responsibility to take a wider view and work to prevent degradation of the earth's ecosystems, biodiversity and the biosphere. This ecocentric view is devoted to helping sustain earth's biodiversity and the functioning of its life-support systems for all forms of life, now and the future. Their view is that the natural systems that we are all part of is holistic, that is, interconnected and interdependent. Ecocentric worldview holds that because humans and all forms of life are interconnected parts of the earth's life support system, it is in our own self-interest not to act in ways that impair the overall system. In this module we are going to explore three examples of ecocentric environmental philosophy: Land ethics, deep ecology and ecofeminism.
Aim	The overriding aim of this module is to discuss several examples of ecocentric environmental philosophies.
Learning Outcomes	At the end of this module learners will be able to: • Define holistic ethics and ecocentric ethics. • Discuss the influence of field of ecology in developing the ideas behind ecocentric ethics. • Describe the development of Leopold's land ethics principles. • Explore the criticisms associated with the Leopold's land ethics. • Explain the deep ecology platform as developed by Naess and Sessions. • Identify the two ultimate norms of deep ecology: self realization and biocentric equality. • Explore the criticisms associated with deep ecology • Elaborate on the variety of approaches that comprises ecofeminism
Units	Unit 5.1: The land ethics and Leopold's holism

	Unit 5.2: Criticism of the land ethics Unit 5.3: The ecology platform Unit 5.4: Self-realization and biocentric equality Unit 5.5: Criticisms of deep ecology Unit 5.6: Ecofeminism: making connections Unit 5.7: Ecofeminism: Recent developments
Readings	Aldo Leopold (1949) *A Sand County Almanac*. Ballantine, New York. J. Baird Callicott (1989) *In Defence of the Land Ethic*. State University of New York Press, Albany. John Davis (1991) *Earth first!* Pergrine Smith Books, Salt lake City. Dave Foreman (1991) *Confessions of an Eco-Warrior*. Harmony, New York. George Sessions (1995) *Deep Ecology for the Twenty-First Century*. Shambala Publishing, Boston. Janet Biehl (1991) *Rethinking Ecofeminist Politics*. South End Press, Boston. Greta Gaard (1993) *Ecofeminism: Women, Animals, Nature*. Temple university Press, Philadelphia.
Activity	**Overview**
	Assignment 1- Should farmers and ranchers be allowed to kill wild predetors such as coyote and wolves in order to protect their herds? How should government balance these competing interests?

	2- Do you support the view that humans are equal moral citizens of the biotic community? Is there a middle ground between humans as masters of nature and humans as equal biotic citizens? 3- Leopold suggests that the ”dead earth” is an organism that does possess a certain kind of life. What exactly is the difference between a living organism and a nonliving object? Is earth itself alive? 4- Can land or an ecosystem really be characterized as healthy or unhealthy in anything other than a metaphorical way? What exactly would a healthy ecosystem be? 5- Would civil disobedience in defence of the environment ever be justified? If so, when and why? Is tree spiking a defensible means for preventing logging of old-growth forests? 6- Is the statement “This is a tall tree” anymore objective that the statement “This is a majestic tree” ? Explain how both might be defended as true. 7- What “different questions” might someone taking a feminist approach to science and technology ask about such issues as nuclear energy, population policy, pesticides use, and animal agriculture?
Module 6	Environmental justice and social ecology
Key Concepts	Social justice theories, personal morality versus social justice, social ecology

Overview	Justice can be understood as the first principle of social and political philosophy: How should we live together? What is the proper structure of society? Living together in a community creates benefits and burdens that exist only within community, and we cannot account for community benefits and burdens solely in terms of individual rights and responsibilities. Social justice must address these questions: How should the benefits and burdens of society be distributed? How should social institutions treat people? What do people deserve from society? What type of individual is created by various social structures and institutions? This module examines the question of environmental justice in general and, more specifically, as it is understood within the philosophical perspective that has come be called social ecology. Two basic questions guide the discussion of environmental justice: Who bears the burdens of environmental harms? And who, if anyone, benefits from environmental harms? Justice demands a fair distribution of benefits and burdens.
Aim	The major focus of this module is the discussion related to environmental justice and social ecology.
Learning Outcomes	At the end of this module learners will be able to: • Distinguish between personal morality and social justice. • Review the theories of social justice • Discuss the link between environmental racism and environmental justice. • Understand the concept of social ecology
Units	Unit 6.1: Introduction Unit 6.2: Theories of social justice Unit 6.3: Property rights and justice Unit 6.4: Environmental justice and environmental racism Unit 6.5: Murray Bookchin's social ecology

	Unit 6.6: Critical reflections Unit 6.7: Summary and conclusions
Readings	1- Murray Bookchin, Dave Foreman in Steve Chase, ed. (1991) *Defending the earth*. South End Press, Boston. 2- Robert Bullard, ed. (1994) *Unequal Protection*. Sierra Club Books, San Francisco.
Activity	**Overview**
	Assignment 1- Must a public policy intentionally discriminate before it can be described as racist or sexist? Is discrimination always a matter of intent? In your opinion, what is the intent behind decisions on where to locate waste dumps? 2- Bookchin claims that human beings cannot help but be, or should they seek to being "purposive interveners" in nature. That would seem to conflict with the view of many preservationists and Deep Ecologists who believe that humans should let nature take its course. Discuss how these different theorists might evaluate policy on population control. 3- If the price of land in a rural area is less than that of comparable land in an urban area, is this land less valuable? If not, how do you determine the value of land? 4- Nomadic countries on many continents travel great distances following migrating herds of animals. Such people never settle permanently on one section of land. How might their understanding of ownership and property differ from yours? Can a concept of "private property" even exist in such a culture?

Module 7	Climate Change ethics and energy policy
Key Concepts	
Overview	This module presents a selection of 8 essays selected from the literature that deals with climate change ethics and energy policy: 1- Understanding the causes of global climate change (Pew Center on Global Climate Change). 2- Livestock's role in climate change and air pollution (UN report: Climate change and livestock). 3- Ethics and global climate change (Stephen M. Gardiner). 4- The denial industry (George Monbiot). 5- Hoodwinked in the Hothouse: False solutions to climate change. 6- Climate justice: The emerging movement against green capitalism (Ashley Dawson). 7- Sustainability and technology solutions in the climate policy debate: The case of geologic carbon sequestration (Evelyn Wright and Paul Pojman). 8- War and Climate Change (Barry Sanders). The first three essays offer an introduction to the science behind our understanding of climate change as well as the observed and predicted impacts. Together they make the argument that urgent action is needed.

	But although there is a consensus that action is needed, there is a vast difference of opinion as to what that action would be. The last four essays examine the growing resistance to proposed technological solutions, examining both the proposals and the global social concerns.
Aim	The overriding aim of this module is to critically evaluate eight essays that deals the science of climate change, proposed solutions and ethical concern.
Learning Outcomes	At the end of this module learners will be able to: • Understand the phenomenon of global warming and climate change. • Evaluate the proposed solutions to mitigate the effects of climate change. • Discuss the ethical concerns in relation to climate change
Units	Refer to the eight essays listed under the overview section.
Readings	The above eight essays are published in: Louis P. Pojman and Paul Pojman (2012) *Environmental Ethics: Readings in Theory and Applications,* Sixth edition. Wadsworth, Cengage Learning. USA.
Activity	**Overview**
	Read and evaluate the eight essays and provide a synthesis in a review article articulating the major ideas discussed. Review the status of climate change in Lebanon in regard to impacts, mitigation and adaptation practices. What is the ethical dimension of the climate change problem in Lebanon.

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

CEN 461: Water Pollution Control and Treatment

NDU-Louaize, Faculty of Engineering, DCEE

Fall 2014

Instructor Information

Instructor: Sophia Ghanimeh, Assistant Professor

Office Location: Faculty of Engineering, HA 367

Telephone: Office +961.9.208427

Office Hours: Tuesday 12:00 – 1:00 p.m.

E-mail: sghanimeh@ndu.edu.lb

Website: http://www.ndu.edu.lb/academics/faculty_research/fe/sophia~ghanimeh/profile.htm

Course Identification

Course Number: CEN 461

Course Name: Water Pollution Control and Treatment

Course Location: FA 1018

Class Times: TTh 1:30 – 3:00 p.m.

Prerequisites: CEN 462 – Environmental Engineering

Faculty Web Page: http://www.ndu.edu.lb/academics/fe/intro.htm

Course Description/Overview

Fundamental principles and engineering application of physical, chemical, and biological processes (like sedimentation, filtration, coagulation, flocculation, membranes, aerobic, anaerobic biological processes) are discussed.

Course Learning Objectives

The overreaching goals of this course are to provide:

h) Ability to design potable water treatment plants.

i) Ability to design treatment facilities for domestic wastewater.

j) Knowledge of resource conservation and sustainability aspects of water and wastewater management and biosolids processing and reuse.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Learn the basics of physical processes and apply them in the design of the treatment units addressed in this course.

2. Learn the basics of chemical processes and apply them in the design of the treatment units addressed in this course.

3. Learn the fundamentals and design concepts of aerobic and anaerobic biological treatment technologies.

4. Learn essential disinfection processes.

5. Be able to define an adequate process scheme for treating raw water and wastewater.

6. Perceive wastewater treatment as a resource conservation alternative by learning about the recycling and reuse of water and biosolids.

Course Resources

Course Website(s)

- WS1: http://www.epa.org
- WS2: http://www.eea.europa.eu/themes/water

Optional Course Texts and Materials

- Reynolds, T. D., and P. A. Richards, 1996. *Unit Operations and Processes in Environmental Engineering.* 2nd ed. Boston, MA: PWS Publishing Company. ISBN: 0534948847.

Assignments and Grading Scheme

Grading System

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (i.e. percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A+	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A-	Very Good	3.7	89 - 92
B+	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B-	Good	2.7	77 - 79
C+	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C-	Passing	1.7	66 - 69

D+	**Passing**	**1.3**	**63 - 65**
D	**Lowest Passing**	**1.0**	**60 - 62**
F	**Failure**	**0.0**	**0 - 59**

Grading Policy

Grades are based on the following:

Exams (Midterm and Final)	65%
Projects/Assignment	30%
Class attendance/participation	5%
Total Points	**100**

Midterm and Final Exams (60%): Two exams cover class presentation and assignments. The final exam is comprehensive.

Course Projects (30%): Two projects (15% each) are designed to cover (1) water and (2) wastewater treatment design. In each project, every team (5 students) will propose a creative design to solve/manage a water/wastewater problem, then write a report and present it orally (10%) and critically review the proposal of another group (5%).

Class participation (5%): Students are expected to attend all sessions and participate actively in class discussion.

Course Policies

Late Assignments

While understanding that we all are busy with school, work, and family, your decision to register for this course is an indication that you have made it a high priority. Thus, extensions of assignment due dates are given only in extreme situations (death of a close family member, hospitalization, etc.) and require documentation on your part. Otherwise, due dates are fixed and non-negotiable. All assignments should be submitted on or before the assigned due date. Assignments past the due date will not be accepted for full credit. Examples of unreasonable extensions for an assignment include frequent computer malfunctions, outside class-work, or job responsibilities that inhibit meeting the required deadlines. If you anticipate missing a deadline on an assignment, you should send an e-mail to your instructor before the deadline. Unexcused assignments submitted after the due date may be returned ungraded or assigned a lower evaluation. Whether an extension is allowed will be at the instructor's discretion.

Classroom Protocol

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.
Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).
Once in class, students are expected to remain in class for the entire period.
English must be the only language spoken in class at all times.

Dissability

Any student who feels s/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Important Dates to Remember

Midterm Exam: Monday, December 01, 2014
Water Project Repot submittal: Thursday, October 30, 2014
Wastewater Project Repot submittal: Monday, January 05, 2015

Course Schedule

No. of weeks	*Topic covered*	*Reading assignment*
0.5	Introduction to water supply and wastewater treatment Course syllabus	Chapter 1 & notes or textbook of CEN 462
0.5	Wastewater characteristics and water standards	Chapter 2 & notes
0.5	Review of process analysis	Chapter 4 (4-1 to 4-3, 4-6 & 4-7)
Water Treatment		
1	Physical unit operations: Filtration using granular media and membrane technology	Chapter 11 (11-3, 11-4, 11-6, 11-7)
1.5	Chemical unit operations: Removal of turbidity, softening, adsorption and ion exchange	Chapter 11 & notes (11-7 to 11-9)
0.5	Disinfection	Chapter 12
1	Water week: Presentation of the student teams water projects Seminar delivered by a guest speaker Field trip to a water treatment plant	
Wastewater Treatment		
1	Physical unit operations: Screening, size reduction, flow equalization, sedimentation, flotation	Chapter 5 (5-1 to 5-3,5-5 to 5-7,5-10)
	Mid-Term Exam	
1	Introduction to biological treatment	Chapter 7
1.5	Aerobic biological processes (suspended growth): Activated sludge process, SBR and MBR	Chapter 8
0.5	Aerobic biological processes (attached growth): Trickling filters	Chapter 9 (9-1, 9-2)
1.5	Anaerobic biological processes: sludge management	Chapter 10

		(10-1 to 10-4) Chapter 14
1	Introduction to wastewater treatment software Class application	
1	Tertiary treatment: removal of phosphorus, heavy metals and nitrogen	Chapter 6 (6-1 to 6-5) Chapter 8 (8-5)
1	Wastewater week: Presentation of the student teams wastewater projects Seminar delivered by a guest speaker Field trip to a wastewater treatment plant	
1	Water and biosolids reuse	Chapter 13
	Final Exam	

Course	**Water Pollution Control and Treatment**
Module 1	Water Treatment
Key Concepts	Filtration, membranes, chemical treatment, disinfection
Overview	This module introduces the students to the concepts of depth filtration and the design of granular filters. It addresses also membrane filtration and the related commercial applications. Basic chemical treatment and disinfection methods are considered. The main question to be addressed in this module is: how to provide adequate treatment of groundwater, surface water or wastewater plant effluent to produce high-quality water?
Aim	The students should be able to describe the major components of a water treatment plant. They should understand the main concepts of water treatment: coagulation/flocuulation, hardness removal, ion exchange,

	filtration and disinfection. In addition, the students should be able to understand the operational requirements and challenges of state-of-the-art membrane technologies.
Learning Outcomes	At the end of this module learners will be able to: • Define the units needed for a water treatment plant • Identify the components of filtering units, including membrane elements, and calculate dosing requirements in chemical processing and disinfection units
Units	Unit 1.1 Granular and membrane filtration Unit 1.2: Chemical treatment Unit 1.3: Disinfection
Readings	Reynolds, T. D., and P. A. Richards, 1996. *Unit Operations and Processes in Environmental Engineering.* 2nd ed. Boston, MA: PWS Publishing Company. ISBN: 0534948847.
Activity	Water Week: This activity includes 3 components: 1. Field trip This trip includes a visit to a water treatment plant where the students get the chance to see commercial-scale applications and discuss operational aspects with the technical team 2. Meeting with a water professional A guest speaker, with a long experience in water treatment projects, will be invited to share a case study with the students. 3. Project #1 The student teams will submit and orally present their water treatment project proposals and critically review the proposal submitted by another team.

Course	Water Pollution Control and Treatment
Module 2	Wastewater Treatment and Sludge Management
Key Concepts	Physical treatment, aerobic and anaerobic biological treatment, tertiary treatment, Biosolids reuse
Overview	This module introduces the students to major wastewater treatment principles including: preliminary treatment, sedimentation and aerobic and anaerobic treatment, including membrane applications. Also, it covers the different aspects of sludge processing and reuse. The main question to be addressed in this module is: how to reuse the spent water and wastewater biosolids, as means to conserve Earth's resources and promote sustainable development?
Aim	The students should be able to address the different aspects of wastewater management, including generation and characteristics of wastewater, selection of treatment processes and design of individual treatment units. Similarly, the students should be able to quantify and characterize sludge generation, select the appropriate processing methods and design the corresponding treatment units. Most importantly, the students should be aware of the importance of water recycling as a main component of sustainable development and an efficient mean for adaptation to climate change.
Learning Outcomes	At the end of this module learners will be able to: • Identify and design the units needed for a wastewater treatment plant • Identify and design sludge treatment units • Place water and organics recycling in the bigger picture of sustainable development and climate change adaptation.
Units	Unit 1.1 Aerobic treatment processes Unit 1.2: Anaerobic treatment processes

	Unit 1.3: Tertiary treatment of wastewater Unit 1.4: Sludge processing
Readings	Reynolds, T. D., and P. A. Richards, 1996. *Unit Operations and Processes in Environmental Engineering.* 2nd ed. Boston, MA: PWS Publishing Company. ISBN: 0534948847.
Activity	Wastewater Week: This activity includes 3 components: 1. Field trip This trip includes a visit to a commercial-scale wastewater treatment plant and entails discussions with the plant personnel. 2. Meeting with a wastewater professional A guest speaker, with a long experience in wastewater treatment projects, will be invited to share a case study with the students. 3. Project #2 The student teams will submit and present a wastewater treatment proposal and critically review the proposal submitted by another team.

TEMPUS CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

PAD 421

Fiscal and Budgetary Policies of Lebanon
Notre Dame University, Faculty of Law and Political Science,
Fall Semester, 2014

Instructor Information

Instructor: Dr. Georges Labaki
Office Location: Zouk Campus
Telephone: Office – 09 218 950 Ext: 2464
Office Hours: T, 9;30-11 AM
E-mail: glabaki@ndu.edu.lb
Website:

Course Identification

Course Number: PAD 421
Course Name: Fiscal and Budgetary Policies of Lebanon
Course Location: University Campus
Class Times: T, 11-12 AM
Prerequisites:
Faculty Web Page:

Course Description/Overview

The course provides a solid background in the study of the main rules governing the Lebanese Budgetary and Fiscal Legislation. A special emphasis is placed on the current financial situation of the Public Finance sector and the policies aiming at curbing the current deficit and the role of Taxes in the promotion of a clean environment specially in terms of renewable sources of energy, housings, industry, tourism, and business.

Course Learning Objectives

By the end of the semester a student should have:

1- Examined the basic budget and fiscal theories.
2- Consider the various types of taxes, the ways in which they are classified, and their characteristic features and the role of the tax system in developing sustainable development.
3- A good understanding of the basic powers and functions of public finance and their role in developing sustainability.
4- Identified the major budgetary and public finance problems faced by Lebanon such as the public debt, the tax pressure, and the role of interest groups in shaping tax policies and the need to focus on such issues like environment and preservation of natural resources.
5- Explored the citizen's role and duties as a voter defending his/her rights to benefit from government funds especially when it comes to sustainability.
6- To provide a good background in the Lebanese Budgetary and Fiscal Policies.
7- To acquaint students with the legal context of Public Finance legislation and to public policy-making.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1- To understand the significance of budgetary and Fiscal processes.
2- To explain the concept of public finance, its significance and implications for citizens and their quality of life.
3- To identify a working vocabulary in the discipline, definition of basic terms and concepts especially in terms of tax expenditures dedicated to sustainability.
4- To explain the discipline of Taxation, its scope, significance, components, and theoretical foundations and the role of interest groups in finding resources and their application in sustainable projects specially at the local level.
5- To be able to create or to be a member of advocacy groups involved in the development of sustainable projects.

Course Resources

Required Course Texts and Materials

Required text books : -Koteiche, Abdel Latif,(2009) The Budget of the State: A Comparative Study, Beirut, Al-Halabi.

- The Code of Taxation, Lebanese Official Journal, 2008.

-The Lebanese Public Accounting Law, Lebanese Official Journal.

Additional Reading:

BOOKS:

- El Gemayel, Antoine, (1985), The Lebanese Legal System, Washington D.C., Georgetown University, International Law Institute.

- Labaki, Georges, (1989),La Fiscalité et le Financement de l"Habitat au Liban,
Paris, L.G.D.J.
-Awada, Hassan,.(n.d.) , Public Finance: A Comparative Study (latest edition), Beirut, Dar-al-Nahda-al-Arabiya.

-Koteiche, Abdel-Raouf,(2007) Income Tax in Lebanon
Beirut, Dar-al-Khulud.

-Chibli, Khatar,(1994), Public Finance, 5th edition, Beirut, Dar-al-Manshurat-al-Hukukiyat, Sader.

- The Lebanese Ministry of Finance Reports and Publications

- Prasard Monica, (2008), The Politics of Free Markets: The Rise of Neoliberal Economic Politics in Britain, Germany, and the US, University of Chicago Press.

- CRS Reports, (2008), The Congressional Appropriation Process: An Introduction, US, The Library of Congress.

- Dye, Thomas, (2008), Understanding Public Policy, (2008), New Jersey, Prentice Hall.

- Rosen, Harvey, (2005), Public Finance, seventh Edition, US, McGrawHill.

Articles and reports

- Labaki, Georges: The Public Finance Crisis, Aouraak Fikr-al-Lubnani, Beirut, Vol. I, 1996.

- Public Finance and Development Policy in Lebanon, Notre Dame University Palma Review, Vol. 2, Spring, 1993.

- The Lebanese Budget of 1994, Palma Review, Vol.2, Issue, no 3,1994.

- The Role of the State under globalization, Byblos Journal, 2008

- Annual Reports of the Lebanese Central Bank.

- Annual Reports of the Beirut Chamber of Commerce

- Monthly Reports of the Lebanese Ministry of Finance.

- The Annual Report of the Account Bureau, Beirut, latest 3 years.

- The Lebanese Budget, for 2005, Lebanese Official Journal.

- Project of the Budget , 2012, 2013.

-Investor's Guide, Etudes et Consultations Economiques, Beirut, (Annual Report).

Readings must be done prior to the class session listed in the distribution of readings. Readings will be part of the exam.

Assignments and Grading Scheme

Weekly Schedule:

Week 1 Introduction
Approaches to Public Budgeting
The Budget as an instrument of Public Policy
Budgetary Strategies and Political Games
The role of the state in to days world
Dye, Ch.2,3
Labaki, G.; The New Role of the State, The Journal of Lebanese Public Administration, Beirut, Board of Civil Service, Vol. 1, 2000.

Weeks 2&3 History of the Lebanese Public Finance since World War I.
The characteristics of the Budget
Koteiche, Abdel-Latif, p.5-127

Week 4 Preparation and approval of the Budget
Role of advocacy groups in the vote of appropriations

Koteiche, Abdel-Latif, p.131-206

Week 5 Nomenclature of the Lebanese Budget
Classification of Expenditures and Taxes
Public policies related to environment
Public Accounting Law
Decisions of the Minister of Finance

Week 6 Implementation and Control of the Budget
Implementation of the Budget
Control of the Budget
Administrative control
Judicial Control
Political Control
Koteiche, Abdel-Latif, p. 296-417

Week 7 Case Studies: The Lebanese Budget of 2005
The Project of the Budgets of 2010 and 2011.
Comparative approach with US and French Budgets
Official Journal of the Lebanese Republic
US and French Legislations
Test I

Week8 The Public Accounting Law
The Lebanese Accounting Law
Koteiche. Abdel-Latif,p. 240-287

Week 9 The Lebanese Tax System

Tax on the Profit of Industrial, Commercial and
Non-Commercial Entreprises
Lebanese Income Tax Law

Week 10 The Lebanese Tax System
Taxes on Salaries and Wages
Lebanese Income Tax Law
Taxes in favor of sustainable development

Week 11 The Income Tax
Tax on Income from Movable Capital
Lebanese Income Tax Law
Environmental taxes
Test II

Week 12 The Value Added Tax
Lebanese VAT Law

Week 13 The Buildings Tax
The Succession and Gifts Tax
Other Direct Taxes
Lebanese Tax Laws

Week 14 Indirect Taxes

(Tax on Inflammables, Cement, and Customs Duties...)
Lebanese Indirect Tax Laws

Week 15 Evaluation of the Lebanese Budgetary and Fiscal System
Means for solving the Lebanese Public Debt
IMF and World Bank Reports
Instructor notes
Conclusion

FINAL EXAM

BREAKDOWN		
#	TOPIC	% of Final Grade
1	Attendance & Class Participation	10%
2	Group/Individual Project & Class Presentation	20%
3	Mid-term Exam	35%
4	Final Exam	35%
Total		100%

Assessment Description:

- Class Participation: includes discussing instructor's presentations, assigned readings, exercises, and case studies etc. that are apt to make the course more enjoyable for both the students and the instructor. Students are expected to read the assigned material and come to class fully prepared to participate in the discussion of the material assigned for that day. Active participation and contribution is expected from each student, noting that discussion of a given subject matter is one of the most effective methods of learning. Since class participation plays a role in the final grade, it is essential that students do not only read the assignments but properly comprehend the material.

- Attendance: Students are expected to attend all classes. Absence, excused or not, does not absolve a student from the responsibility for the work done or for any announcement made during his/her absence. The maximum absences allowed are according to university policy 6 hrs of class work (6 MWF session or 4 TTh sessions).

- Group/Individual Project: Research and fact-finding assignments, which constitute an integral part of the course, are designed to allow the student to apply course concepts, learn how to interact within the group and others, and understand the challenges of working in a competitive and changing environment. The assigned projects shall be conducted either individually or in groups. The Group/Individual Project shall be submitted in soft copy, and hard copy on A4 paper, font 12 Times New Roman, double spacing.

- Class Presentation: Students are required to make specific Class Presentations as will be assigned by the Course Instructor.

- Exams: All exams will be closed book and closed notes. The exam will cover material from lectures, assigned readings, and issues discussed in class. No makeup or early exam will be given, except in very exceptional circumstances. The exams will be designed in a way to assess the students' knowledge and absorption of the course material covered in the assigned readings and instructor's presentations.

Course Schedule

Course	Fiscal and Budgetary Policies
Module 1	What are Public Finance and Taxes?
Key Concepts	Understanding of the basic concepts of public finance and taxes
Overview	The concept of Public Finance and Taxation is difficult to new students especially in the role of the budget in shaping policies and its political impact on citizens. Questions to be addressed in this module include the following: What is the nature and function of Public Finance and the Tax System? Why is it important to meld the theory and practice in Public Finance? What are the major classifications of theories in the field? How has deficits been a catalyst for policy change?
Aim	The overriding aim of this module is to turn students able to discourse on public finance theories, types and functions.
Learning Outcomes	At the end of this module learners will be able to: -Identify the different types of taxes -Discuss how taxes can contribute to sustainable development?
Units	Unit 1.1 Taxes as a Body of Knowledge Unit 1.2: The Tax system as a Process Unit 1.3: Taxes as a practice Unit 1.4: The Context of Public Finance and Taxation
Readings	-Koteiche, Abdel-Raouf,(2007) Income Tax in Lebanon Beirut, Dar-al-Khulud. -Chibli, Khatar,(1994), Public Finance, 5th edition, Beirut, Dar-al-Manshurat-al-Hukukiyat, Sader.

Activity	Overview
	Assignment 1 : Reflecting Upon Public Finance and Tax systems 1. What are the major theories in Public Finance and Taxation? 2. Which theories and approaches are applied abroad? Which ones promote sustainability? To which extend they are successful? 3. " *Assignment 2: Applying Theory* 1. Which theory are you most attracted to? Why? 2. Which theory is applicable in Lebanon? Why? 3. What challenges or obstacles do you face in applying the chosen theory in Lebanon especially when it comes to environment protection? *Assignment 3: Survey* Conduct a brief survey on people awareness about the importance of Public Finance in their life and their expectations

Module 2	Approaches to green taxes infusion in Public Finance
Key Concepts	Understanding budgetary choices
Overview	Financing is key for implementation of green tax policies. This module will outline a whole- approach to infuse green taxes in Public Finance that includes highlights some of the key challenges that must be addressed to make the widespread adoption of the whole-school approach to taxes nature friendly a reality. Questions to be addressed in this module are: -Budgetary preparation processes -How public policy choices are made in the budget? -How to infuse new green taxes in the budget?
Aim	The aim of this module is to enhance understandings of the processes and practices that advance a whole approach to modern taxation.
Learning Outcomes	At the end of this module learners will be able to: -Identify major public policy issues and expenditures

	-Understand the processes to *initiate* a green taxation oriented action plan
Units	Unit 2.1: Clarifying the concept of Public choices Unit 2.2: The processes to initiate climate tax action plans Unit 2.3: The means to implement a whole green taxation approach in the budget Unit 2.3: Examples of approaches to green taxes in the budget. Example to be taken from developed countries experience.
Readings	- CRS Reports, (2008), The Congressional Appropriation Process: An Introduction, US, The Library of Congress. - Dye, Thomas, (2008), Understanding Public Policy, (2008), New Jersey, Prentice Hall. - Rosen, Harvey, (2005), Public Finance, seventh Edition, US, McGrawHill.
Activity	**Overview**
	Design an action plan to establish a list of much needed climate protection oriented projects both at the national and local levels. This list is to be drawn after consultation with stakeholders at national and local levels.
Module 3	Major Lebanese taxes and their contribution to environment protection
Key Concepts	Taxes impact on nature protection, Tariffs, Public choices
Overview	

	Taxes play a major role in promoting of a green environment. There is need to find out what are the major component of the Lebanese tax system, their importance, their impact, the beneficiaries, and the extent to which they are pro or anti environment.
Aim	Awareness about current taxes and future taxes enhancing a clean climate
Learning Outcomes	At the end of this module learners will be able to: Demonstrate knowledge on the principles of taxation policies, and their role in an environment friendly implementation
Units	Unit 3.1: List of Lebanese Taxes Unit 3.2: List of Tax expenditures and their cost Unit 3.3: Designing a new friendly tax policy Unit 3.4: Developing an action plan Unit 3.5: Assessing the thematic instruction
Readings	- El Gemayel, Antoine, (1985), The Lebanese Legal System, Washington D.C., Georgetown University, International Law Institute. - Labaki, Georges, (1989),La Fiscalité et le Financement de l"Habitat au Liban, Paris, L.G.D.J. -Awada, Hassan,.(n.d.) , Public Finance: A Comparative Study (latest edition), Beirut, Dar-al-Nahda-al-Arabiya.
Activity	**Overview** *Assignment 1: Generating Themes* 44. Think of 5 possible themes dealing with taxes aimed at supporting a friendly environment. 45. Next consider whether these themes are important in your

	community at the national and local level 46. Choose one item that is the most important to your country. Explain how does it fit into your community's and personal interest?
Module 4	Advocacy in public policy choices
Key Concepts	Taxes, advocacy, rights , empowerment
Overview	In our times, most countries are suffering from severe financial crisis. Most countries are looking for means to fuel their economies while under looking environmental taxes. Thus, there is a need to improve advocacy to advance environment plans financing and implementation
Aim	The overriding aim of this module is first to explore the potentialities for environmental advocacy, empowerment and capacity building and second to learn to write advocacy proposal techniques
Learning Outcomes	At the end of this module learners will be able to: Demonstrate knowledge on the concept of budget advocacy Plan and develop an advocacy plan
Units	Unit 3.1: Setting advocacy principles Unit 3.2: Developing advocacy choices Unit 3.3: Doing research Unit 3.4: Writing a working frame proposal
Readings	- Prasard Monica, (2008), The Politics of Free Markets: The Rise of Neoliberal Economic Politics in Britain, Germany, and the US, University of Chicago Press. - CRS Reports, (2008), The Congressional Appropriation Process: An Introduction, US, The Library of Congress.

	- Dye, Thomas, (2008), Understanding Public Policy, (2008), New Jersey, Prentice Hall. - Rosen, Harvey, (2005), Public Finance, seventh Edition, US, McGrawHill.
Activity	**Overview**
	Prepare a research advocacy proposal
Module 5	**Production of a written tax proposal aimed at SD implementation**
Key Concepts	Environmental taxes, public choices, development
Overview	There is a need for setting a strategy aimed at convincing public authorities to adopt plans for adoption of green taxes with specific choices as well budgeting and implantation. This final project shall be disseminated in the community to create awareness and promote action plans for green taxes promotion at both national and local levels
Aim	The overriding aim of this module is to equip students with the capacity to act for environmental taxes implementation
Learning Outcomes	At the end of this module learners will be able to: Set an environmental taxes promotion strategy Work with others in groups Be active members in society
Units	Unit 5.1: Drafting the strategy

	Unit 5.2: Be ready for its implementation
Readings	- The Role of the State under globalization, Byblos Journal, 2008 - Annual Reports of the Lebanese Central Bank. - Annual Reports of the Beirut Chamber of Commerce - Monthly Reports of the Lebanese Ministry of Finance. - The Annual Report of the Account Bureau, Beirut, latest 3 years. - The Lebanese Budget, for 2005, Lebanese Official Journal. Windows Movie Maker free online video tutorials from Atomic Learning are available at http://www.atomiclearning.com/moviemaker2. These tutorials are very helpful in learning the various features of Movie Maker. (You will need the QuickTime video player to view the Atomic Learning tutorials. If needed, click on QuickTime to download the latest version.)
Activity	**Overview**
	Prepare the proposal and up load it on the Internet

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

CEN 560: Air Pollution Engineering

NDU-Louaize, Faculty of Engineering, DCEE

Fall 2015

Instructor Information

Instructor: Talal Salem, Assistant Professor

Office Location: Faculty of Engineering E216

Telephone: Office – +961.9.208427

Office Hours: Wednesday 2:00 – 3:00 p.m.

E-mail: tsalem@ndu.edu.lb

Website: http://www.ndu.edu.lb/academics/faculty_research/fe/salem~talal/profile.htm

Course Identification

Course Number: CEN 560

Course Name: Air Pollution Engineering

Course Location: E 107

Class Times: MWF 3:00 – 4:00 p.m.

Prerequisites: CEN 462 – Environmental Engineering
Faculty Web Page: http://www.ndu.edu.lb/academics/fe/intro.htm

Course Description/Overview

Characterization of sources, emissions, transport, transformation, effects, and control of air pollutants.

Course Learning Objectives

The overreaching goals of this course are to provide:
a) Ability to select control systems, components, or processes to meet standards and regulations.
b) Ability to identify, formulate, and solve air pollution engineering problems.
c) Ability to understand the impact of air pollution control solutions in a global and societal context.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Apply fundamental concepts of engineering to solve air pollution problems.
2. Learn various aspects of air pollution in an economic, environmental, and societal context.
3. Identify appropriate systems to control gas phase and particulate air pollutants emissions.
4. Understand the impact of engineering solutions to global air quality problems.

Course Resources

Course Website(s)

- WS1: http://www.epa.org
- WS2: http://www.eea.europa.eu/themes/air
- WS3: http://www.who.org

Required Course Texts and Materials

- TX: Cooper, 2010, *Air Pollution Control - A Design Approach*, 4th Ed., Waveland Press

Optional Course Texts and Materials

- Vallero, D., 2008, *Fundamentals of Air Pollution*, 4th Ed., Academic Press
- Davis W., 2000, *Air Pollution Engineering Manual*, 2nd Ed., Wiley Interscience
- Godish, T., 2004, *Air Quality*, 4th Ed., Lewis Publishers

Assignments and Grading Scheme

Grading System

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (i.e. percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A+	Outstanding	4.0	97-100
A	Excellent	4.0	93 - 96
A-	Very Good	3.7	89 - 92
B+	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B-	Good	2.7	77 - 79
C+	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C-	Passing	1.7	66 - 69
D+	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59

Grading Policy

Grades are based on the following:

Exams (2 exams x 30 points each)	60%
Project	30%
Class attendance/participation	10%
Total Points	**100**

Midterm and Final Exams (60%): Two exams cover class presentation and assignments. The final exam is comprehensive.

Course Project (30%): Each team project (3 students) will entail conducting a research on a local air quality problem, then writing a report (15%) and presenting the significant findings orally (15%).

Class participation (10%): Students are expected to attend all sessions and participate actively in class discussion.

Course Policies

Late Assignments

While understanding that we all are busy with school, work, and family, your decision to register for this course is an indication that you have made it a high priority. Thus, extensions of assignment due dates are given only in extreme situations (death of a close family member, hospitalization, etc.) and require documentation on your part. Otherwise, due dates are fixed and non-negotiable. All assignments should be submitted on or before the assigned due date. Assignments past the due date will not be accepted for full credit. Examples of unreasonable extensions for an assignment include frequent computer malfunctions, outside class-work, or job responsibilities that inhibit meeting the required deadlines. If you anticipate missing a deadline on an assignment, you should send an e-mail to your instructor before the deadline. Unexcused assignments submitted after the due date may be returned ungraded or assigned a lower evaluation. Whether an extension is allowed will be at the instructor's discretion.

Classroom Protocol

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.
Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).
Once in class, students are expected to remain in class for the entire period.
English must be the only language spoken in class at all times.

Dissability

Any student who feels s/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Important Dates to Remember

Midterm Exam: Wednesday, December 02, 2015
Project Repot submittal: Monday, January 04, 2015
Project Presentations: Friday, January 16, 2015

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines
1	Sep. 25	*Syllabus* *Air Pollution Essentials:* Earth's Atmosphere, Definitions & Types of Pollutants, Regulations.
2	Sep. 28	*Air Pollution Essentials:* Causes, Sources & Effects, Ideal gas Law.
3	Oct. 05	*Air Pollution Essentials:* Concentration Measurements in Gases.
4	Oct. 12	*Physics & Chemistry of Air Pollution:* Air Pollution Physics.
5	Oct. 19	*Physics & Chemistry of Air Pollution:* Systems & Processes.
6	Oct. 26	*Physics & Chemistry of Air Pollution:* Characterization, Air Quality.
7	Nov. 02	*Process Design:* Design Considerations, Engineering Economics.
8	Nov. 09	*Process Design:* Equipment Cost Consideration.
9	Nov. 16	*Air Pollution and Meteorology:* Ambient Air Sampling.
10	Nov. 23	*Air Pollution and Meteorology:* Analysis & Measurement.
11	Nov. 30	*Preventing & Controlling Air Pollution:* Preventing Air Pollution.

12	Dec. 07	*Preventing & Controlling Air Pollution:* Engineering Control Concepts.
13	Dec. 14	*Mobile Sources:* Vehicle Emissions, Emission Controls.
14	Jan. 04	*Indoor Air Quality:* Pollutants of Concern, Source Control & Ventilation.
15	Jan. 11	*Indoor Air Quality:* Practical Solutions to IAQ Problems. *Projects Presentations.*

Course	**Air Pollution Engineering**
Module 1	Control Program History and Human Health
Key Concepts	Climate Change, Regulation, Health
Overview	It is for students to develop a fundamental understanding of the background of legislation related to outdoor and indoor air pollution, and the impact of various pollutants on the climate change and health of humans. Questions to be addressed in this module include the following: What is the existent legislation? What are considered to be the criteria air pollutants? What are the impacts of each pollutant on the respiratory system?
Aim	The overriding aim of this module is to turn students able to discuss the possible future developments of air pollution management and a sustainable policy.
Learning Outcomes	At the end of this module learners will be able to: • Identify and discuss the influences that are affecting the development of air quality management programs and air pollution control legislation. • Identify the components of the human respiratory system and how air pollution

	affects it.
Units	Unit 1.1 An Overview Unit 1.2: NAAQS & Types of Pollutants Unit 1.3: Human Health
Readings	Cooper, 2010, *Air Pollution Control - A Design Approach*, 4th Ed., Waveland Press, pp. 1–69
Activity	*Assignment 1: Understanding the magnitude of air pollution problems* 2. Go to the World health Organization's Web Site (www.who.org). Select a particular air pollutant, and write a report up to two pages on the global magnitude of the problem on climate change and human health and what engineered or policy solutions are needed to deal with this problem. 3. You will have then to prepare a short presentation (PowerPoint) of five minutes to discuss the problem and the suggested solutions.
Module 2	Outdoor Air Pollution Control & Process Design
Key Concepts	PM, Gas emission, Control
Overview	To design or select a system to control outdoor air pollution, students need to understand the physical and chemical properties of different types of emission, and the sampling techniques. The available technologies will be presented and discussed. General design considerations (process flow charts, engineering economics, and cost estimation) will be presented.
Aim	The overriding aim of this module is to enhance students' understanding of the

	processes used in controlling outdoor particulates and gaseous emissions.
Learning Outcomes	At the end of this module learners will be able to: • Identify and describe the control devices for particulate emissions. • Identify and describe the control equipments for gaseous emissions
Units	Unit 2.1: What is process design? Unit 2.2: Control of stationary sources Unit 2.2: Control of mobile sources Unit 2.3: Control of gaseous emissions
Readings	Cooper, 2010, *Air Pollution Control - A Design Approach*, 4th Ed., Waveland Press, pp. 75–134 EPA, *Introduction to Air Pollution Control*, available on: http://www.epa.gov/eogapti1/course_format.html
Activity	*Assignment 2: Measuring particulate concentrations* 4. The equipment shown in figure is available at the environmental laboratory of the Department of Civil & Environmental Engineering of NDU-Louaize. You have to do research about the equipment and explain what it is used for. **5.** You will have then to perform a short demonstration on this device in

	class.
Module 3	Indoor Air Pollution Control
Key Concepts	Ventilation, Sources, Sick Building Syndrome
Overview	We spend most of our time in indoor spaces. The impact of indoor air pollution on our health might be more critical than that of outdoor pollutants because of the time of exposure to contaminants. The different types of pollutants of concern will be presented and discussed. Students will be introduced to methods of estimation and design of needed rates of ventilation in a room.
Aim	The overriding aim of this module is to enhance the students' understandings of the impact of indoor air pollution and to provide them with the information needed to propose solutions to the problem.
Learning Outcomes	At the end of this module learners will be able to: • Identify and describe the control devices for indoor emissions.
Units	*Unit 3.1: Sick Building Syndrome* Unit 3.2: Factors influencing IAQ Unit 3.3: Control of indoor emissions Unit 3.4: Material Balance Model
Readings	Cooper, 2010, *Air Pollution Control - A Design Approach*, 4th Ed., Waveland Press, pp. 695–720 EPA, *Introduction to Air Pollution Control*, available on: http://www.epa.gov/eogapti1/course_format.html
Activity	*Assignment 3: Estimating the indoor air quality of the classroom* 47. Use the ASHRAE's Web Site (www.ashrea.org) to find the values of

	the ventilation rate needed to have a good air quality inside the classroom where the lectures are being given. Write a report up to two pages on the sources of emission in this room and what engineered can be used to deal with this problem 48. Your findings will be discussed in class using a short presentation (PowerPoint) of five minutes.

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

CEN 466: Environmental Pollution and Control

NDU-Louaize, Faculty of Engineering, DCEE

Fall 2015

Instructor Information

Instructor: Elsy Ibrahim/Sophia Ghanimeh, Assistant Professor

Office Location: Faculty of Engineering, HA 363/HA367

Telephone: Office – +961.9.208427

Office Hours: Tuesday 2:00 – 3:00 p.m./Wednesday 2:00 – 3:00 p.m.

E-mail: eibrahim@ndu.edu.lb/ sghanimeh@ndu.edu.lb

Website:

http://www.ndu.edu.lb/academics/faculty_research/fe/elsy~ibrahim/profile.htm

http://www.ndu.edu.lb/academics/faculty_research/fe/sophia~ghanimeh/profile.htm

Course Identification

Course Number: CEN 466
Course Name: Environmental Pollution and Control
Course Location: E 107
Class Times: MWF 1:00 – 2:00 p.m.
Prerequisites: None
Faculty Web Page: http://www.ndu.edu.lb/academics/fe/intro.htm

Course Description/Overview

Concepts and principles to identify and control water, air and noise pollution. This course also provides knowledge on solid waste and hazardous waste management, and the effects of pollution to general health.

Course Learning Objectives

The overreaching goals of this course are to provide:

k) Ability to understand pollution control technologies and insights into basic environmental assessment components

l) Ability to design basic units for the treatment of waste streams and assess their impact on the receiving water body.

m) Ability to design basic facilities for the processing and disposal of municipal solid waste

n) Ability to design basic facilities for the control of air pollution

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Discover correctly the knowledge related to public health and environmental pollution

2. Apply the concept and principles to control or mitigate the environmental pollution appropriately

3. Design systems to control environmental pollution from an engineering perspective

Course Resources

Course Website(s)

- WS1: http://www.epa.org
- WS2: http://ec.europa.eu/environment/index_en.htm
- WS3: http://www.who.org

Required Course Texts and Materials

- Mihelcic and Zimmerman, 2010, *Environmental engineering: fundamentals, sustainability, design*, 1th Edition, John Wiley & Sons, Inc., ISBN-13: 978-0470165058

Optional Course Texts and Materials

- Vesilind, Morgan, and Heine, 2010, Introduction to environmental engineering, Cengage Learning, 3rd edition, ISBN-13: 978-0495295853.
- Metcalf & Eddy, 2003, Wastewater engineering: Treatment and reuse, 4th Edition, McGraw-Hill.
- Tchobanoglous, Theisen, and Vigil, 1993, *Integrated solid waste management: engineering principles and management issues,* McGraw-Hill.

Assignments and Grading Scheme

Grading System

The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (i.e. percentage equivalent, and the 4.0 point maximum).

Grade	Description	Quality Point Value	Percentage Equivalent
A+	Outstanding	4.0	97-100

A	Excellent	4.0	93 - 96
A-	Very Good	3.7	89 - 92
B+	Good	3.3	85 - 88
B	Good	3.0	80 - 84
B-	Good	2.7	77 - 79
C+	Satisfactory	2.3	73 - 76
C	Satisfactory	2.0	70 - 72
C-	Passing	1.7	66 - 69
D+	Passing	1.3	63 - 65
D	Lowest Passing	1.0	60 - 62
F	Failure	0.0	0 - 59

Grading Policy

Grades are based on the following:

Tests (2 tests x 22.5 points each)	45%
Final Exam	30%
Project	20%
Class attendance/participation	5%
Total Points	**100**

Tests and Final Exams (75%): Two tests cover class presentation and assignments. The final exam is comprehensive.

Course Project (20%): Each team project (3 students) will entail analyzing a local environmental problem and/or designing a facility to treat a stream of water, wastewater, solid waste or air, then writing a report (15%) and presenting the significant findings orally (5%).

Class participation (5%): Students are expected to attend all sessions and participate actively in class discussions.

Course Policies

Late Assignments

While understanding that we all are busy with school, work, and family, your decision to register for this course is an indication that you have made it a high priority. Thus, extensions of assignment due dates are given only in extreme situations (death of a close family member, hospitalization, etc.) and require documentation on your part. Otherwise, due dates are fixed and non-negotiable. All assignments should be submitted on or before the assigned due date. Assignments past the due date will not be accepted for full credit. Examples of unreasonable extensions for an assignment include frequent computer malfunctions, outside class-work, or job responsibilities that inhibit meeting the required deadlines. If you anticipate missing a deadline on an assignment, you should send an e-mail to your instructor before the deadline. Unexcused assignments submitted after the due date may be returned ungraded or assigned a lower evaluation. Whether an extension is allowed will be at the instructor's discretion.

Classroom Protocol

Mobile phones should be turned off and out of sight (i.e. not face-up on the desk but preferably inside purses, backpacks, briefcases, etc. or face down on the desk). Phones may not be answered.
Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).
Once in class, students are expected to remain in class for the entire period.
English must be the only language spoken in class at all times.

Dissability

Any student who feels she/he may need an accommodation due to a disability should contact the instructor privately to discuss those specific needs.

Important Dates to Remember

Test 1: Thursday, December 11, 2014
Test 2: Thursday, February 05, 2015
Project Repot submittal: Monday, January 05, 2015
Project Presentations: Monday, January 12, 2015

Course Schedule

Week	Date	Topics, Reading, Assignments and Deadlines
1	Sep. 25	Syllabus

		Introduction : Overview of various chapters
2	Sep. 29	Chemical & Physical Processes
3	Oct. 06	Wastewater Treatment: Physical Processes
4	Oct. 13	Wastewater Treatment: Aerobic Biological Processes
5	Oct. 20	Wastewater Treatment: Anaerobic Biological Processes (sludge treatment)
6	Oct. 27	Water Treatment: Coagulation/Flocculation, Filtration
7	Nov. 3	Water Treatment: Membrane Processes, Disinfection
8	Nov. 10	Water Quality: Oxygen Depletion and Impacts of Nutrients/Pollutants Discharge
9	Nov. 17	Solid Waste Management: Collection and Material Recovery
10	Nov. 24	Solid Waste Management: Collection and Material Recovery
11	Dec. 01	Solid Waste Management: Disposal (Landfilling)
12	Dec. 08	Air Resources Engineering: Criteria Pollutant and Particulate Emission Control
13	Dec. 15	Project Guidance
14	Jan. 05	Built Environment: Sustainable Engineering Design
15	Jan. 08	Introduction to EIA: Local Regulations and EIA Reporting
16	Jan. 12	Project Presentations

Course	Environmental Pollution and Control
Module 1	Water and Wastewater Treatment and Discharge
Key Concepts	Contaminants, Physical/Biological/Chemical Treatment, Oxygen Depletion
Overview	This module introduces the students to main contaminants in water and wastewater and addresses key processes to remove them. The impact of wastes discharge into natural water streams is also considered. Questions to be addressed in this module include the following: How to design a wastewater (secondary) treatment plant? What is the impact of discharging the effluent of a wastewater treatment plant into a nearby water body? How to reduce water turbidity and hardness?
Aim	The students should be able to design the basic components of a wastewater treatment plant (up to the secondary treatment level). They should understand the main concepts of water treatment: coagulation/flocuulation, hardness removal, filtration, membrane processes and disinfection. In addition, the students should be able to calculate the oxygen deficit induced by wastewater disposal and assess its impact, along with the impact of other pollution-related phenomena, on the aquatic fauna and flora.
Learning Outcomes	At the end of this module learners will be able to: • Design a wastewater secondary treatment plant • Identify key water treatment concepts through: identifying the components of physical processing units and calculating dosing requirements in chemical processing units • Quantify the impact of pollution on water streams.

Units	Unit 1.1 Physical and chemical processes Unit 1.2: Wastewater treatment Unit 1.3: Water treatment Unit 1.4: Water quality
Readings	Mihelcic and Zimmerman, 2010, 1th Edition, John Wiley & Sons, Inc., Chapters 3, 4, 11, 10 and 8.
Activity	*Quiz 1: Chemical and Physical Processes* This quiz is crucial to assess the students' assimilation of the newly introduced concepts of chemical and physical processes in environmental design. Unsatisfactory entails revisiting chapters 3 and 4. *Field Trip 1: Water/Wastewater Treatment Plant*
Module 2	Solid Waste Management
Key Concepts	Collection, Material Recovery Facility, Landfill
Overview	This module introduces the students to different waste sources and components. It considers collection, processing and disposal of municipal solid waste with emphasis on material recovery facilities.
Aim	The students should be able to see the big picture of solid waste management and identify its various components.
Learning Outcomes	At the end of this module learners will be able to: • Categorize solid wastes by type and source, identify the different components of waste and calculate waste generation.

	• Design the basic components of a material recovery facility. • Provide basic design requirements of a landfill
Units	Unit 2.1: Waste generation and characterization Unit 2.2: Collection and material recovery Unit 2.2: Disposal
Readings	Mihelcic and Zimmerman, 2010, 1th Edition, John Wiley & Sons, Inc., Chapter 13.
Activity	*Team Project and Presentation* The students are asked to work, in teams of three, on an assigned project that includes a design component toward solving a local environmental problem. A full technical report should be submitted and an oral presentation needs to be delivered (by all team members).

Module 3	Air Pollution Control, Built Environment and Impacts Assessment
Key Concepts	Pollutant Criteria, Sustainable Design, EIA
Overview	This module introduces the students to air pollution and control concepts and addresses key sustainability issues in engineering design. Also, it covers basic processes and reporting components in environmental impact assessments.
Aim	At this stage, the students should be able to link all environmental risks of a project (including water, wastes and air related issues) into one assessment report and know how to incorporate it into their design concepts.
Learning Outcomes	At the end of this module learners will be able to: • Identify air criteria pollutants, their source and impacts • Apply basic concepts for the design of particulate emissions control systems. • Identify key requirements for a sustainable design. • Identify the major constituents of an EIA report
Units	Unit 3.1: Air pollution and particulate emissions control Unit 3.2: Built environment Unit 3.2: Environmental impact assessment
Readings	Mihelcic and Zimmerman, 2010, 1th Edition, John Wiley & Sons, Inc., Chapters 12 and 14.

Activity	*Field Trip 2: Solid Waste Processing and Disposal* This trip should include the material recovery facility and the composting plant in Beirut (the largest in the country), in addition to a local landfill.

CLIMASP COURSE SYLLABUS TEMPLATE

Course Syllabus

ENG 360: Renewable Energy Technologies
NDU-Louaize, Faculty of Engineering, DCEE
Fall 2014

Instructor Information

Instructor: Talal Salem, Assistant Professor
Office Location: Faculty of Engineering E216
Telephone: Office – +961.9.208427
Office Hours: Friday 2:00 – 3:00 p.m.
E-mail: tsalem@ndu.edu.lb
Website: http://www.ndu.edu.lb/academics/faculty_research/fe/salem~talal/profile.htm

Course Identification

Course Number: ENG xxx

Course Name:	Renewable Energy Technologies
Course Location:	E 107
Class Times:	MWF 1:00 – 2:00 p.m.
Prerequisites:	No Prerequistes
Faculty Web Page:	http://www.ndu.edu.lb/academics/fe/intro.htm

Course Description/Overview

Principles of renewable technologies for sustainable future. Process design, energy analysis, engineering economics and environmental assessment of renewable energy systems and techniques and applications of solar, wind, biomass, geothermal, hydro-electric, wave and tidal energy technologies. More emphasis is given to solar energy technologies to convert solar radiation into heat or electricity.

Course Learning Objectives

The overreaching goals of this course are to provide:

e) Ability to recognize the need of renewable energy technologies and their role in the global and local context.

f) Ability to distinguish between the sustainable energy sources and fossil energy sources.

g) Ability to describe the principles of renewable energy production from various renewable sources.

h) Ability to conduct a preliminary evaluation of the performance of an energy conversion system for maximum efficiency

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

1. Learn various aspects of renewable energy technologies in an economic, environmental, and societal context

2. Apply fundamental concepts of engineering to identify the appropriate renewable energy systems required for specific applications.

3. Compare various technologies and propose the best possible energy conversion system for a particular location.

Course	**Renewable Energy Technologies**
Module 1	Solar Energy
Key Concepts	Solar radiation, Thermal, PV
Overview	The students will be introduced to the fundamentals of solar radiation. The difference between solar thermal (to produce heat) and solar photovoltaic (to produce electricity) will be highlighted. Students have to develop a basic understanding of the impact of various types of modules and their orientations on the choice of the best system to be applied. Questions to be addressed in this module include the following: What is the existent local legislation? Is there any governmental support (incentives) to promote solar energy application? What are the environmental impacts of each solution?
Aim	The overriding aim of this module is to turn students able to suggest the best solar system for a certain application and to be able to do a preliminary design of the solar

	system.
Learning Outcomes	At the end of this module learners will be able to: • Identify the best solar system for a given application. • Conduct a preliminary design of solar systems.
Units	Unit 1.1 An Overview Unit 1.2: Thermal Unit 1.3: Photovoltaic
Readings	Schaeffer, J. 2007. *Real Goods Solar Living Sourcebook: The Complete Guide to Renewable Energy Technologies and Sustainable Living*, 30th Anniversary Ed., Gaiam
Activity	*Assignment 1: Identifying the different types of solar energy systems* 4. Go to the NDU's Library Web Site (www.ndu.edu.lb). Select a reliable reference on renewable energy and write a report up to two pages on the solar applications in buildings.
Module 2	Outdoor Air Pollution Control & Process Design
Key Concepts	Solar, Biomass, Wind, Geothermal
Overview	To select a system to produce heat or electricity from renewable resources, students need to understand the physical properties of different types of systems, and the environmental impact in terms of climate change and CO_2 emissions. The available technologies will be presented and discussed.
Aim	The overriding aim of this module is to enhance students' understanding of the renewable energy systems (Solar, biomass, wind and geothermal) used to reduce the dependence on fossil fuel systems.
Learning Outcomes	At the end of this module learners will be able to: • Identify and describe the different types of renewable energy systems. • Select the proper system for a specific application
Units	Unit 2.1: Biomass applications Unit 2.2: Wind energy applications

	Unit 2.2: Geothermal energy applications Unit 2.3: Solar vs. Biomass vs. Wind vs. Geothermal: A comparison
Readings	Schaeffer, J. 2007. *Real Goods Solar Living Sourcebook: The Complete Guide to Renewable Energy Technologies and Sustainable Living*, 30th Anniversary Ed., Gaiam Aldo Da Rosa, A. 2013. *Fundamentals of Renewable Energy Processes* (Third Edition), edited by Academic Press, Boston, 2013, Pages i-ii, ISBN 9780123972194, http://dx.doi.org/10.1016/B978-0-12-397219-4.00019-9.
Activity	*Assignment 2: Sustainable energy project* 6. A group/individual sustainable energy project to suggest and study the feasibility of renewable energy projects across the University campus. 7. Students will closely work with NDU physical plant to seek help on energy related data for their projects 8. Students will have then to perform a short demonstration on this device in class.
Module 3	Energy, Economics and Environmental Assessments
Key Concepts	Economics, EIA, Policy
Overview	General design considerations (process flow charts, engineering economics, and cost estimation) will be presented.
Aim	The overriding aim of this module is to expand the students' understandings of and reasoning skills related to renewable energy choices, issues, and policies in the context of the varied social, economic and environmental implications of production, distribution and use.
Learning Outcomes	At the end of this module learners will be able to: • Assess alternative energy sources • Conduct environmental impact assessment for a selected design
Units	*Unit 3.1:* Technical and economical assessment of renewable technology Unit 3.4: Environmental impact assessments and sustainability issues
Readings	Schaeffer, J. 2007. *Real Goods Solar Living Sourcebook: The Complete Guide to Renewable Energy Technologies and Sustainable Living*, 30th Anniversary Ed., Gaiam

Activity	*Assignment 3: Comparative analysis and environmental assessment* 49. Use a multi-criteria approach to assess different options for a specific application considering the energy, economics and environmental impacts 50. Conduct an EIA for the best renewable energy system selected 51. Your findings will be discussed in class using a short presentation (PowerPoint) of five minutes.

Course Syllabus

FOREIGN DIRECT INVESTMENT

FDI 626

Notre Dame University, Faculty of Law and Political Science,
FALLSemester, 2014-2015

Instructor Information

Instructor: Dr. Georges Labaki
Office Location: Zouk Campus
Telephone: Office – 09 218 950 Ext: 2464
Office Hours: F 4-5 PM
E-mail: glabaki@ndu.edu.lb
Website:

Course Identification

Course Number: FDI 626
Course Name: Foreign Direct Investment
Course Location: University Campus
Class Times: F, 5-8 PM
Prerequisites:
Faculty Web Page:

Course Description/Overview

A study of FDI in developed as well as in developing countries. Topics covered: international business transactions including: the legal form of FDI (Joint Ventures, offshore, holdings and joint stock companies), laws governing access to foreign markets, mergers and acquisitions, arbitration, political risk, investments in renewable sources of energy, sustainable investments, arbitration, promotion of fait trade, and strategies in foreign investments, trends and patterns, regional and international inflow of FDI. The course is supplemented by case studies on FDI in the USA, Europe, China, and Japan

Course Learning Objectives

Highly interactive, the objectives for the FDI course are:

1- To allow students to have a basic understanding of FDIs and to show how firms do business among the more of 197 countries of the world.

2. To provide ample opportunities for relating theories to realities of everyday life through numerous case studies.

3- To study the impact of international organizations on world investments.

4- To be able to allow the assessment of the impact of FDIs on climate change, natural resources, the environment, developed and developing countries.

5- To possess the ability to discuss means for critical analysis of FDIs policy issues specially in the area of climate change and their impact on human development.

6-To be able to create or to be a member of advocacy groups involved in the development of fair trade with respect to environment and climate change protection.

7-To be able to assess and write policy papers intended to encourage SD in international investments.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

By the end of this course students will be able to:

6- To understand key concepts in Foreign Direct Investment.
7- To explain the significance and implications of FDIs on nations and people specially when it comes to climate change and the protection of environment.
8- To identify the major issues related to FDIs impact on environment and climate change.
9- To explain the major rule of FDIs, their scope, significance, components, theoretical bases and its many changing patterns.

5- To find alternative ways of international trade focusing on ESD and preservation of natural resources and better policies concerning climate change.
6-To be able to write policy papers and work with groups advocating for fair trade and for a better sharing of resources and protection of climate change effects.

Grading Scheme

BREAKDOWN		
#	TOPIC	% of Final Grade
1	Attendance & Class Participation	10%
2	Group/Individual Project & Class Presentation	40%
3	Paper	20%
4	Final Exam	30%

Total	100%

Assessment Description:

- Class Participation: includes discussing instructor's presentations, assigned readings, exercises, and case studies etc. that are apt to make the course more enjoyable for both the students and the instructor. Students are expected to read the assigned material and come to class fully prepared to participate in the discussion of the material assigned for that day. Active participation and contribution is expected from each student, noting that discussion of a given subject matter is one of the most effective methods of learning. Since class participation plays a role in the final grade, it is essential that students do not only read the assignments but properly comprehend the material.

- Attendance: Students are expected to attend all classes. Absence, excused or not, does not absolve a student from the responsibility for the work done or for any announcement made during his/her absence. The maximum absences allowed are according to university policy 6 hrs of class work (6 MWF session or 4 TTh sessions).

- Group/Individual Project: Research and fact-finding assignments, which constitute an integral part of the course, are designed to allow the student to apply course concepts, learn how to interact within the group and others, and understand the challenges of working in a competitive and changing environment. The assigned projects shall be conducted either individually or in groups. The Group/Individual Project shall be submitted in soft copy, and hard copy on A4 paper, font 12 Times New Roman, double spacing.

- Class Presentation: Students are required to make specific Class Presentations as will be assigned by the Course Instructor.

Paper:

Term Paper: Each student is supposed to write a paper, approximately 20 to 30 pages in length, related to the course material. You must submit a two-page summary of the topic that you have chosen for the paper along with a list of references that will be featured in your paper no later April, 9. The completed paper is due on June, 9. The paper must be typed and double spaced. Plagiarism will not be tolerated under any circumstances, and will lead to an "F" for their papers.

The term paper will be graded according to its organization, quality of thinking, originality, use of the English language, number of references, length,...

- Exams: All exams will be closed book and closed notes. The exam will cover material from lectures, assigned readings, and issues discussed in class. No makeup or early exam will be given, except in very exceptional circumstances. The exams will be designed in a way to assess the students' knowledge and absorption of the course material covered in the assigned readings and instructor's presentations.

Course Schedule

Week 1

Definition of FDI
Types of FDI
Ray, A. Ch. 5

Week 2

Conditions required attracting FDI
The place dedicated to environmental and climate change issues
Supervision of FDI and their impact on climate change
Arbitration

- Graham, J. & Spaulding B., *Understanding FDI*, c. City Bank, 2007.

Ray, A. Ch. 5

Weeks 3&4

Laws Governing Access to Foreign Markets
Role of sustainable Development principles
- Augusti et Al., *International Business Law and Its Environment*, US International Thomson Publishing, 2001, Ch 11.
- Ray, Ch. 7

Course Syllabus

PUBLIC INTERNATIONAL LAW

IAF 401

Notre Dame University, Faculty of Political Science, Public Administration and Diplomacy

SPRING Semester, 2012-2013

Instructor Information

Instructor: Dr. Georges Labaki
Office Location: B 266 The Green Building
Telephone: 09 218 950 Ext: 2464
Office Hours: M 12:00-1:00 PM
E-mail: glabaki@ndu.edu.lb
Website: ndu.edu.lb

Course Identification

Course Number: IAF 401
Course Name: PUBLIC INTERNATIONAL LAW
Course Location: HA 303
Class Times: MWF 11-12:00
Prerequisites: N/A
Faculty Web Page: http://www.ndu.edu.lb/academics/fpspad/intro.htm

Course Description/Overview

Course Objectives: A study of the sources and development of international law, with special emphasis given to current trends and problems. A critical evaluation of contemporary problems of world order is provided, covering legal issues, war, and economic development.

Topics include: the role of the state in the current international legal system, treaties, peaceful solutions of problems, the preservation of natural resources, the law of the sea, the law of war, ethics, and state credibility in the international system.

Course Learning Objectives

This course aims at providing the following learning objectives:

-Identify the sources, principles, concepts and law-making procedures which underpin the international legal system;

-Understand the international environmental law negotiation process;

-Examine and interpret the content of environmental l laws treaties.

-Differentiate the role of main actors involved in the development of international environmental law;

-The understanding of major legal challenges faced by the international community today.

- To examine and evaluate the practical application of international law and its response to contemporary international issues.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

Learning Outcome 1

Demonstrate a good knowledge of the nature of the basic institutional structure of international society and of the nature of Statehood;

Learning Outcome 2

Explain how international law is made and the relationship between international law and municipal law;

Learning Outcome 3

Demonstrate an awareness of the political, social, economic and other factors that affect international law-making processes;

Learning Outcome 4

Demonstrate the ability to explain how the rules of public international law would apply to a particular case and to critically examine questions about a substantive area of international law.

Learning Outcome 5

To be able to analyze and critically evaluate the principles, sources and vocabulary of international law, and to use the special terminology of international law

Learning Outcome 6

Demonstrate, when discussing and writing about any particular rule of international an ability to say whether the rule in question derives from a treaty or custom;

Students will receive a series of numerical grades throughout the semester. At the end of the semester the grand total of the number grades will be converted into a letter grade according to the university grading system as posted in the catalogue.

Grades are based on the following:

Writing Assignments	10%
Final Exam	40%
Term paper	40%
Class attendance	5%
Class participation	5%
Total Points	**100%**

Each student is supposed to write a paper, approximately 25 to 30 pages in length, related to the course material. You must submit a two-page summary of the topic that you have chosen for the paper along with a list of references that will be featured in your paper no later than April 7th. The completed paper is due on May, 11. The paper must be typed and double spaced. Plagiarism will not be tolerated under any circumstances, and will lead to an "F" for their papers. The term paper will be graded according to its organization, quality of thinking, originality, use of the English language, number of references, length,

Course Policies

Assessment Description:

- Class Participation: includes discussing instructor's presentations, assigned readings, exercises, and case studies etc. that are apt to make the course more enjoyable for both the students and the instructor. Students are expected to read the assigned material and come to class fully prepared to participate in the discussion of the material assigned for that day. Active participation and contribution is expected from each student, noting that discussion of a given subject matter is one of the most effective methods of learning. Since class participation plays a role in the final grade, it is essential that students do not only read the assignments but properly comprehend the material.

- Attendance: Students are expected to attend all classes. Absence, excused or not, does not absolve a student from the responsibility for the work done or for any announcement made during his/her absence. The maximum absences allowed are according to university policy 6 hrs of class work (6 MWF session or 4 TTh sessions).

- Group/Individual Project: Research and fact-finding assignments, which constitute an integral part of the course, are designed to allow the student to apply course concepts, learn how to interact within the group and others, and understand the challenges of working in a competitive and changing environment. The assigned projects shall be conducted either individually or in groups. The Group/Individual Project shall be submitted in soft copy, and hard copy on A4 paper, font 12 Times New Roman, double spacing.

- Class Presentation: Students are required to make specific Class Presentations as will be assigned by the Course Instructor.

Paper:

Term Paper: Each student is supposed to write a paper, approximately 20 to 30 pages in length, related to the course material. You must submit a two-page summary of the topic that you have chosen for the paper along with a list of references that will be featured in your paper no later than March, 9. The completed paper is due on May , 30. The paper must be typed and double spaced. Plagiarism will not be tolerated under any circumstances, and will lead to an "F" for their papers.
The term paper will be graded according to its organization, quality of thinking, originality, use of the English language, number of references, length,...
Exams: All exams will be closed book and closed notes. The exam will cover material from lectures, assigned readings, and issues discussed in class. No makeup or early exam will be given, except in very exceptional circumstances. The exams will be designed in a way to assess the students' knowledge and absorption of the course material covered in the assigned readings and instructor's presentations.

Final Exam		

Course	
Module 1	What is the Scope of Public International Law?
Key Concepts	Understanding of the basic concepts of Public International Law
Overview	Under globalization public international law is a key element in shaping international policies. Its impact on states is critical. Questions to be addressed in this module include the following: What is Public international law? What does it encompass? Why is it important to meld the theory and practice? What are the major classifications of theories in the field?
Aim	The overriding aim of this module is to turn students able to discourse on public international law foundations, areas, and volume.
Learning Outcomes	At the end of this module learners will be able to: • Identify the different elements of public international law

	• Discuss how public international law can contribute to sustainable development preserving resources for future generations?
Units	Unit 1.1 Public International evolution since the nineties Unit 1.2: The trends in Public International Law Unit 1.3: The UN Charter Unit 1.4: The current Context of public international law within globalization
Readings	-Von Glahn Ch1-3

Activity	**Overview** *Assignment 1 : Reflecting Upon current trends in public international law* 1. What are the major theories related to public international law especially in relation to the state role? 2. Which ones promote sustainability? To which extend they are successful? 3. What is the role of the state in todays world? *Assignment 2: Applying Theory* 6. Which theory are you most attracted to? Why?

	7. What challenges are faced with in applying your chosen theory on different states especially when it comes to sustainable development?
Module 2	The environment of international trade
Key Concepts	UN, statehood, sovereignty, diplomacy
Overview	The current shift in public international law has been promoted since the beginning of the nineties. It is giving a growing role to human rights, governance, democracy through advocacy and the reduction of state sovereignty.
Aim	The aim of this module is to enhance the understanding of the role of the international community in a context of globalization
Learning Outcomes	At the end of this module learners will be able to: -Identify the foundations of public international law -Understand the growing role of international and regional organizations at the expense of the state role
Units	Unit 2.1: Clarifying the concept of international law

	Unit 2.2: The role of international organizations Unit 2.3: The role of regional organizations
Readings	Von Glahn, Ch. 4-6
Activity	**Overview**
	A detailed research on the evolution of Public International Law since the nineties
Module 3	Public International Law and its impact on ESD
Key Concepts	Law of the sea, law of the air, environmental treaties, protected zones
Overview	The major principles of public international law are based on state sovereignty, state commitment through treaties, and their obligations to act peacefully
Aim	Awareness about the issues enhancing ESD
Learning Outcomes	At the end of this module learners will be able to: Demonstrate knowledge of public international law impact on sustainability
Units	Unit 3.1: Major principles of public international law related to sustainability *Unit 3.2: Their implementation* Unit 3.3:Their impact on sustainable development
Readings	Von Glahn Ch 9-15
Activity	**Overview**
	Assignment 1: Generating Themes **56. Consider one of the indicated themes of this module.**

	57. Next explain the modalities of its implementation **58. Explain which impact it has en SD?** **59. Next consider whether this theme is important at the national and local level of your country**
Module 4	**Approaches to SD infusion in public international law**
Key Concepts	**Advocacy, empowerment, capacity building, international lobbying**
Overview	**In our times, many states are suffering from inappropriate development, inequality, pollution, and economic crisis. Those countries are looking for means to restore their economies while under looking SD. Thus, there is a need to improve advocacy to advance SD in public international law.**
Aim	**The aim of this module is first to explore the potentialities for SD advocacy, empowerment and capacity building at the international level.**
Learning Outcomes	**At the end of this module learners will be able to develop an advocacy action plan preserving resources for future generations**
Units	**Unit 3.1: Setting advocacy principles** **Unit 3.2: Developing advocacy choices** **Unit 3.3: Doing research** **Unit 3.4: Writing a proposal**
Readings	**- Prasard Monica, (2008), The Politics of Free Markets: The Rise of Neoliberal Economic Politics in Britain, Germany, and the US, University of Chicago Press.** **- John H. Jackson and Al., (2002), Legal Problems of International economic Relations,**

	U.S.A., west Group, 4th edition.
Activity	**Overview** **Prepare a research advocacy proposal** ***Assignments: Generating Themes*** **1. Consider one of the indicated themes of this module.** **2. Next explain the modalities of its implementation** **3. Explain which impact it has en SD?** **4. Next consider whether this theme is important at the national and local level of your country**

Module 5	Advocacy in public international law
Key Concepts	ESD , treaties, public choices, development
Overview	There is a need for setting a strategy aimed at convincing international and regional trade organizations to adopt plans for SD with specific choices. This final project shall be disseminated at the global level to create awareness and promote action plans for SD promotion at both national and local levels.
Aim	The overriding aim of this module is to equip students with the capacity to act for SD implementation in cooperation with international advocacy groups.
Learning Outcomes	At the end of this module learners will be able to: Set an SD strategy in public international law Work with others in groups

	Be active members in society
Units	Unit 5.1: Drafting the strategy Unit 5.2: Work for its implementation Unit. 5.3: Lobbying national and international decisions makers and civil society for its implementation
Readings	Von Glahn Ch 18-23
Activity	Overview
	Prepare the working plan and up load it on Y tube

Grading Scheme

BREAKDOWN		
#	TOPIC	% of Final Grade
1	Attendance & Class Participation	10%

2	Group/Individual Project & Class Presentation	40%
3	Paper	20%
4	Final Exam	30%
Total		100%

Assessment Description:

- Class Participation: includes discussing instructor's presentations, assigned readings, exercises, and case studies etc. that are apt to make the course more enjoyable for both the students and the instructor. Students are expected to read the assigned material and come to class fully prepared to participate in the discussion of the material assigned for that day. Active participation and contribution is expected from each student, noting that discussion of a given subject matter is one of the most effective methods of learning. Since class participation plays a role in the final grade, it is essential that students do not only read the assignments but properly comprehend the material.

- Attendance: Students are expected to attend all classes. Absence, excused or not, does not absolve a student from the responsibility for the work done or for any announcement made during his/her absence. The maximum absences allowed are according to university policy 6 hrs of class work (6 MWF session or 4 TTh sessions).

- Group/Individual Project: Research and fact-finding assignments, which constitute an integral part of the course, are designed to allow the student to apply course concepts, learn how to interact within the group and others, and understand the challenges of working in a competitive and changing environment. The assigned projects shall be conducted either individually or in groups. The Group/Individual Project shall be submitted in soft copy, and hard copy on A4 paper, font 12 Times New Roman, double spacing.

- Class Presentation: Students are required to make specific Class Presentations as will be assigned by the Course Instructor.

Paper:

Term Paper: Each student is supposed to write a paper, approximately 20 to 30 pages in length, related to the course material. You must submit a two-page summary of the topic that you have chosen for the paper along with a list of references that will be featured in your paper no later than November 9. The completed paper is due on December , 30. The paper must be typed and double spaced. Plagiarism will not be tolerated under any circumstances, and will lead to an "F" for their papers.

The term paper will be graded according to its organization, quality of thinking, originality, use of the English language, number of references, length,...

- Exams: All exams will be closed book and closed notes. The exam will cover material from lectures, assigned readings, and issues discussed in class. No makeup or early exam will be given, except in very exceptional circumstances. The exams will be designed in a way to assess the students' knowledge and absorption of the course material covered in the assigned readings and instructor's presentations.

Course Schedule

SYLLABUS

Session 1 &2

Introduction

Contract Basis

Contract Formation

Common Law Countries

Civil law Countries

Importance of environment protection

Impact of climate change on business

Sessions 3 & 4

The Pre-contractual Process

Confidentiality Agreements

Letters of Intent

Enforceability of Preliminary Agreements

Pre-contractual Liability

Climate change issues

Session 5

Drafting of Contracts- Acquisition Agreements Stock vs. Asset Transactions
Representations and Warranties
Covenants
Conditions to Closing
Indemnities
Impact assessment of climate change on the contract

Session 5&6

Negotiating International Commercial Contract

Basics of a Successful Negotiation
Forms of Negotiations: Contest vs. Consensus
Principled Negotiation
The Importance of Process and Culture
Language
Breach of Contract
Articles related to climate change

Session 7

Case Study: Sale of US Turbine Equipment to China

Session 8&9

Joint Ventures, Distribution, Agency and licensing agreements

Structuring International Commercial Relationships

Key Provisions in Formation Agreements
Provisions related to climate change

Session 10

Arbitration
Choice of Law and Forum
Dispute Resolution
Bribery, Fraud and Corruption

Session 11&12

Forms of Corporate merger

Planning and Strategic Issues

Organizing Merger and Acquisition

Timing

Impact assessment on climate change

Session 13&14

Legal Structuring

Anti trust Guidelines

Session 15

Merger Types and Characteristics

Importance of issues related to climate change

Case Studies of Restructuring and M&A Activity

Conclusion

Course	**International Business Transactions**
Module 1	What is the Scope of International Business Trnsactions?
Key Concepts	Understanding of the basic concepts of international business transactions
Overview	Under globalization international business transactions are a key element in shaping domestic policies. Aim	The aim of this module is to enhance the understanding of the role of markets in international business transactions in a context of globalization
Learning Outcomes	At the end of this module learners will be able to: -Identify the foundations of international business international transactions

	-Understand the growing role of international and regional organizations at the expense of the state role in the economy
Units	Unit 2.1: Clarifying the concept of international business transactions Unit 2.2: The role of international organizations Unit 2.3: The role of regional organizations
Readings	-John H. Jackson and Al., (2002), Legal Problems of International economic Relations, U.S.A., west Group, 4th edition. – John h. Jackson, (2002) Documents Supplement to Legal Problems of International , Economic Relations U.S.A., West Group, 2002.
Activity	**Overview**
	A detailed research on international and regional role of organizations in international business transactions
Module 3	International business transactions principals and their impact on climate change
Key Concepts	Free trade, subsidies, technical barriers to trade, standards, most favoured nation rules, elimination of quotas
Overview	The major principles of international business transactions are:

	International contracting, merger and acquisition, negotiations of international contracts, Most favoured nation rules, Joint venture, licensing, choice of law and forum, arbitration..
Aim	Awareness about current taxes and future taxes enhancing climate protection
Learning Outcomes	At the end of this module learners will be able to: Demonstrate knowledge on the principles of the basic principles of international business transactions and their impact on climate change
Units	Unit 3.1: Major principles of international business transactions Unit 3.2: Their implementation Unit 3.3:Their impact on climate change
Readings	-Folsom, H Ralph, (2001) International Trade and Investment, Second Edition USA, West Group. - John H. Jackson and Al., (2002), Legal Problems of International economic Relations, U.S.A., west Group, 4th edition. – John h. Jackson, (2002) Documents Supplement to Legal Problems of International , Economic Relations U.S.A., West Group, 2002.
Activity	**Overview**

	Assignment 1: Generating Themes 60. Consider one of the indicated themes of this module. 61. Next explain the modalities of its implementation 62. Explain which impact it has on climate change? 63. Next consider whether this theme is important at the national and local level of your country
Module 4	Approaches to climate change protection infusion in international business transactions
Key Concepts	Advocacy, empowerment, capacity building, international lobbying
Overview	In our times, the majority of states are suffering from severe financial crisis due to lack of competitively. Those countries are looking for means to restore their economies while under looking climate change. Thus, there is a need to improve advocacy to advance climate protection in international trade
Aim	The aim of this module is first to explore the potentialities for climate change advocacy, empowerment and capacity building at the international level.
Learning Outcomes	At the end of this module learners will be able to develop an advocacy action plan preserving resources for future generations
Units	Unit 3.1: Setting advocacy principles Unit 3.2: Developing advocacy choices Unit 3.3: Doing research Unit 3.4: Writing a proposal
Readings	- Prasard Monica, (2008), The Politics of Free Markets: The Rise of Neoliberal Economic Politics in Britain, Germany, and the US, University of

	Chicago Press. - John H. Jackson and Al., (2002), Legal Problems of International economic Relations, U.S.A., west Group, 4th edition.
Activity	**Overview**
	Prepare a research advocacy proposal
Module 5	Advocacy in international trade
Key Concepts	ESD , taxes, public choices, development
Overview	There is a need for setting a strategy aimed at convincing international and regional trade organizations to adopt plans for climate change protection with specific choices. This final project shall be disseminated at the global level to create awareness and promote action plans for climate change protection promotion at both national and local levels.
Aim	The overriding aim of this module is to equip students with the capacity to act for climate change protection plans implementation in cooperation with international advocacy groups.
Learning Outcomes	At the end of this module learners will be able to: Set an SD strategy in international business transactions Work with others in groups Be active members in society
Units	Unit 5.1: Drafting the strategy Unit 5.2: Work for its implementation

Readings	- Hoeber, R. Et. Al., (1982), Contemporary Business Law, Second Edition. New York, Mc graw-Hill Book Company -Annual Reports of the World Trade Organization.
Activity	**Overview**
	Prepare the working plan and up load it on the Internet

Operations Management, Sustainability and Supply Chain Management

Notre Dame University-Louaize
Faculty of Business Administration and Economics

Fall 2014

Instructor Information

Instructor:	Dr. Atef H. Harb
Office Location:	Faculty of Business Administration and Economics
Telephone:	09-208308
Office Hours:	MW T TH 8-9 AM
E-mail:	aharb@ndu.edu.lb
Website:	www.ndu.edu.lb

Course Identification

Course Number:	**BAD 429**
Course Name:	**Operations Management**
Course Location:	University Campus
Class Times:	MWF 9:00-10:00 am
Prerequisites:	Senior Standing
Faculty Web Page:	http://www.ndu.edu.lb

Course Description/Overview

This course introduces the concepts, techniques and methodologies of modern operations, production management, sustainability and business decision making using quantitative analysis. The subjects spans from forecasting to production scheduling, from facility location and layout, from Sustainability and supply chain Management to staffing. It aims at providing modern time managers the necessary tools for rational and objective decisions in contemporary competitive and highly demanding business environments.

Students will be asked to visit some Lebanese industries in order to apply the different theories and techniques of Production and Operations Management.

Case studies are essential to the teaching of practical and applied subjects such as Operations Management. To make life easier for students, I have gathered a collection of case studies covering a wide variety of Operations Management issues in many different settings. The aim of these cases is to promote discussion as to how operations managers might improve their operations and contribute to corporate objectives, and by so doing equip future and practicing managers with the skills and techniques needed to be better able to understand and manage operations. So, using case studies will help students develop a range of different skills.

Video Clips: Approximately 30 Video Clips (3 hours) will be presented in class, first, to provide some insight into a particular operations concept, second, to take students on site to a real plant or operations; and, third to hear from real managers and operators of the critical importance of operations concepts to business today and to learn about the relation between operations Management and Sustainability.

A computer package in applied management science (WINQSB and OMS) will be used and applied to the different topics/chapters of this course. Professional guest speakers might be invited to the course to share knowledge and experience.

After completing this course students should be able to:

- Discuss the subject of operations management using convincing arguments supporting specific ideas through weekly presentations.
- Learn the purpose and need of operations management and the role of operations managers
- Appreciate topics related to production and operations management such as logistics and supply chain management, change management, e-procurement and product design
- Detect the potential of high-tech and IT for future development and the development of the 'information society'.
- Improve critical thinking to the strategic cultural, legal and ethical issues facing business organizations in their daily use of the 10-operations management decisions.
- Analyze how best an organization can make strategic use of the facilities provided by the operations management concept and international standards in order to achieve its goals.
- Gain practice in communicating ideas and concepts in written/oral forms.

PS. Matrix outlining the relationship between ILOs and Program's Goals and Outcomes are included in the Course Notebook.

Learning Strategies and contents of the course

- Highly interactive course.
- Pin-up involving students' presentations and group discussion and evaluation.
- Understanding of given handouts, and enhance interpretation and reasoning abilities.
- Reports on Readings and Cases.
- It also relies on weekly lectures by the professor; the students will then be required to contribute to discussions based on readings, give presentations to the class on a regular basis and discuss their findings within small groups as well as whole class discussions.

Duration: one semester of 15 weeks and 45 hours.

The course consists of several topics given over 45 hours of face-to-face lectures/problem solving. The learning hours are subdivided as follows:

Contact hours (including phase-tests assessment)	45
Directed readings and preparation	30
Final case and further private study and exam preparation	105
Total	**180 hrs**

Course Resources

Required Text Book/s

- Probability and Statistics, Morris H. DeGroot and Mark J. Schervish, 3rd edition, 2006, Addison Wesley.

- Journal of Operations Management, Washington, D.C.: American Production and inventory control society, c2007

Readings must be done prior to the class session listed in the distribution of readings. Readings will be part of the exams.

In addition students are advised to research in the library periodicals. Supplementary reading will be assigned relevant to each assigned schematic and project.

Resources Available to Students

- Library Resources: NDU Library is open to students to help you in all your research and class work. Qualified personnel are available to help you.

- Writing Center: The Writing Center provides assistance to all students who wish to discuss their writing with a trained consultant. The Center is located in HA 114. An appointment is required.

- Blackboard (bb) Software: If you are not familiar with the Blackboard system, it is recommended to attend a training session at the University Computer Services in order to know how to use the Blackboard system to enrich the academic communication with your instructor and your colleagues

- Computer Center For "WINQSB' and "OMS"

s

Assignments and Grading Scheme

Evaluation of Attendance & Attitude will be included within each project; i.e. pin-up seriousness, process of project development, presentations, involvement and interaction with classmates, etc.

Assignments	**05%**
Project (Report (15%), Presentation (5%))	**20%**
Cases (Preparation, Presentation and Discussion)	**10%**
Midterm Exam	**30%**
Final Exam (Comprehensive (idea and Concept))	**35%**

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Date	Topics/Description

Week 1	**Introduction**
Week 2	**Chapter 1. Production and Operations Management.** **Case Study**

Website:	ndu.edu.lb

Course Identification

Course Number:	IAF 401
Course Name:	PUBLIC INTERNATIONAL LAW
Course Location:	HA 303
Class Times:	MWF 11-12:00
Prerequisites:	N/A

Faculty Web Page: http://www.ndu.edu.lb/academics/fpspad/intro.htm

Course Description/Overview

Course Objectives: A study of the sources and development of international law, with special emphasis given to current trends and problems. A critical evaluation of contemporary problems of world order is provided, covering legal issues, war, and economic development.

Topics include: the role of the state in the current international legal system, treaties, peaceful solutions of problems, the preservation of natural resources, the law of the sea, the law of war, ethics, and state credibility in the international system.

Course Learning Objectives

This course aims at providing the following learning objectives:

-Identify the sources, principles, concepts and law-making procedures which underpin the international legal system;

-Understand the international environmental law negotiation process;

-Examine and interpret the content of environmental l laws treaties.

-Differentiate the role of main actors involved in the development of international environmental law;

-The understanding of major legal challenges faced by the international community today.

- To examine and evaluate the practical application of international law and its response to contemporary international issues.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

Learning Outcome 1
Demonstrate a good knowledge of the nature of the basic institutional structure of international society and of the nature of Statehood;

Learning Outcome 2
Explain how international law is made and the relationship between international law and municipal law;

Learning Outcome 3

Demonstrate an awareness of the political, social, economic and other factors that affect international law-making processes;

Learning Outcome 4
Demonstrate the ability to explain how the rules of public international law would apply to a particular case and to critically examine questions about a substantive area of international law.

Learning Outcome 5
To be able to analyze and critically evaluate the principles, sources and vocabulary of international law, and to use the special terminology of international law

Learning Outcome 6

Demonstrate, when discussing and writing about any particular rule of international an ability to say whether the rule in question derives from a treaty or custom;

What are the major classifications of theories in the field?
Aim	The overriding aim of this module is to turn students able to discourse on public international law foundations, areas, and volume.
Learning Outcomes	At the end of this module learners will be able to: • Identify the different elements of public international law • Discuss how public international law can contribute to sustainable development preserving resources for future generations?
Units	Unit 1.1 Public International evolution since the nineties Unit 1.2: The trends in Public International Law

	Unit 1.3: The UN Charter Unit 1.4: The current Context of public international law within globalization
Readings	-Von Glahn Ch1-3

Activity	**Overview**
	Assignment 1 : Reflecting Upon current trends in public international law 1. What are the major theories related to public international law especially in relation to the state role? 2. Which ones promote sustainability? To which extend they are successful? 3. What is the role of the state in todays world? *Assignment 2: Applying Theory* 10. Which theory are you most attracted to? Why? 11. What challenges are faced with in applying your chosen theory on different states especially when it comes to sustainable development?

Module 2	The environment of international trade
Key Concepts	UN, statehood, sovereignty, diplomacy
Overview	The current shift in public international law has been promoted since the beginning of the nineties. It is giving a growing role to human rights, governance, democracy through advocacy and the reduction of state sovereignty.
Aim	The aim of this module is to enhance the understanding of the role of the international community in a context of globalization
Learning Outcomes	At the end of this module learners will be able to: -Identify the foundations of public international law -Understand the growing role of international and regional organizations at the expense of the state role
Units	Unit 2.1: Clarifying the concept of international law Unit 2.2: The role of international organizations Unit 2.3: The role of regional organizations

Readings	Von Glahn, Ch. 4-6
Activity	**Overview**
	A detailed research on the evolution of Public International Law since the nineties
Module 3	Public International Law and its impact on ESD
Key Concepts	Law of the sea, law of the air, environmental treaties, protected zones
Overview	The major principles of public international law are based on state sovereignty, state commitment through treaties, and their obligations to act peacefully
Aim	Awareness about the issues enhancing ESD
Learning Outcomes	At the end of this module learners will be able to: Demonstrate knowledge of public international law impact on sustainability
Units	Unit 3.1: Major principles of public international law related to sustainability *Unit 3.2: Their implementation* Unit 3.3:Their impact on sustainable development
Readings	Von Glahn Ch 9-15
Activity	**Overview**
	Assignment 1: Generating Themes **64. Consider one of the indicated themes of this module.** **65. Next explain the modalities of its implementation** **66. Explain which impact it has en SD?** **67. Next consider whether this theme is important at the national and local level of your country**

Module 4	**Approaches to SD infusion in public international law**
Key Concepts	**Advocacy, empowerment, capacity building, international lobbying**
Overview	**In our times, many states are suffering from inappropriate development, inequality, pollution, and economic crisis. Those countries are looking for means to restore their economies while under looking SD. Thus, there is a need to improve advocacy to advance SD in public international law.**
Aim	**The aim of this module is first to explore the potentialities for SD advocacy, empowerment and capacity building at the international level.**
Learning Outcomes	**At the end of this module learners will be able to develop an advocacy action plan preserving resources for future generations**
Units	**Unit 3.1: Setting advocacy principles** **Unit 3.2: Developing advocacy choices** **Unit 3.3: Doing research** **Unit 3.4: Writing a proposal**
Readings	**- Prasard Monica, (2008), The Politics of Free Markets: The Rise of Neoliberal Economic Politics in Britain, Germany, and the US, University of Chicago Press.** **- John H. Jackson and Al., (2002), Legal Problems of International economic Relations, U.S.A., west Group, 4th edition.**
Activity	**Overview** **Prepare a research advocacy proposal** ***Assignments: Generating Themes***

	5. **Consider one of the indicated themes of this module.** 6. **Next explain the modalities of its implementation** 7. **Explain which impact it has en SD?** 8. **Next consider whether this theme is important at the national and local level of your country**

Module 5	Advocacy in public international law
Key Concepts	ESD , treaties, public choices, development
Overview	There is a need for setting a strategy aimed at convincing international and regional trade organizations to adopt plans for SD with specific choices. This final project shall be disseminated at the global level to create awareness and promote action plans for SD promotion at both national and local levels.
Aim	The overriding aim of this module is to equip students with the capacity to act for SD implementation in cooperation with international advocacy groups.
Learning Outcomes	At the end of this module learners will be able to: Set an SD strategy in public international law Work with others in groups Be active members in society
Units	Unit 5.1: Drafting the strategy Unit 5.2: Work for its implementation Unit. 5.3: Lobbying national and international decisions makers and civil society for its implementation

Readings	Von Glahn Ch 18-23
Activity	Overview
	Prepare the working plan and up load it on Y tube

BAD 429

Operations Management, Sustainability and Supply Chain Management

Notre Dame University-Louaize
Faculty of Business Administration and Economics
Fall 2014

Instructor Information

Instructor: Dr. Atef H. Harb
Office Location: Faculty of Business Administration and Economics

Telephone: 09-208308
Office Hours: MW T TH 8-9 AM
E-mail: aharb@ndu.edu.lb
Website: www.ndu.edu.lb

Course Identification

Course Number: **BAD 429**
Course Name: **Operations Management**
Course Location: University Campus
Class Times: MWF 9:00-10:00 am
Prerequisites: Senior Standing
Faculty Web Page: http://www.ndu.edu.lb

Course Description/Overview

This course introduces the concepts, techniques and methodologies of modern operations, production management, sustainability and business decision making using quantitative analysis. The subjects spans from forecasting to production scheduling, from facility location and layout, from Sustainability and supply chain Management to staffing. It aims at providing modern time managers the necessary tools for rational and objective decisions in contemporary competitive and highly demanding business environments. Students will be asked to visit some Lebanese industries in order to apply the different theories and techniques of Production and Operations Management.

Case studies are essential to the teaching of practical and applied subjects such as Operations Management. To make life easier for students, I have gathered a collection of case studies covering a wide variety of Operations Management issues in many different settings. The aim of these cases is to promote discussion as to how operations managers might improve their operations and contribute

to corporate objectives, and by so doing equip future and practicing managers with the skills and techniques needed to be better able to understand and manage operations. So, using case studies will help students develop a range of different skills.

Video Clips: Approximately 30 Video Clips (3 hours) will be presented in class, first, to provide some insight into a particular operations concept, second, to take students on site to a real plant or operations; and, third to hear from real managers and operators of the critical importance of operations concepts to business today and to learn about the relation between operations Management and Sustainability.

A computer package in applied management science (WINQSB and OMS) will be used and applied to the different topics/chapters of this course. Professional guest speakers might be invited to the course to share knowledge and experience.

After completing this course students should be able to:

- Discuss the subject of operations management using convincing arguments supporting specific ideas through weekly presentations.
- Learn the purpose and need of operations management and the role of operations managers
- Appreciate topics related to production and operations management such as logistics and supply chain management, change management, e-procurement and product design
- Detect the potential of high-tech and IT for future development and the development of the 'information society'.
- Improve critical thinking to the strategic cultural, legal and ethical issues facing business organizations in their daily use of the 10-operations management decisions.
- Analyze how best an organization can make strategic use of the facilities provided by the operations management concept and international standards in order to achieve its goals.
- Gain practice in communicating ideas and concepts in written/oral forms.

PS. Matrix outlining the relationship between ILOs and Program's Goals and Outcomes are included in the Course Notebook.

Learning Strategies and contents of the course

- Highly interactive course.

- Pin-up involving students' presentations and group discussion and evaluation.
- Understanding of given handouts, and enhance interpretation and reasoning abilities.
- Reports on Readings and Cases.
- It also relies on weekly lectures by the professor; the students will then be required to contribute to discussions based on readings, give presentations to the class on a regular basis and discuss their findings within small groups as well as whole class discussions.

Duration: one semester of 15 weeks and 45 hours.

The course consists of several topics given over 45 hours of face-to-face lectures/problem solving. The learning hours are subdivided as follows:

Contact hours (including phase-tests assessment)		45
Directed readings and preparation	30	
Final case and further private study and exam preparation		105
Total	**180 hrs**	

Course Resources

Required Text Book/s

- Jay Heizer and Barry Render: Operations Management, Sustainability and Supply Chain Management, 11TH Edition (Global Edition). Prentice Hall, 2014. **(Mandatory)**
- Handout, 2013, Prepared by Dr. Atef H. Harb**.**

Recommended Readings/other Readings:

- Operations Management: focusing on quality and competitiveness, Russel and Taylor, 2nd Edition and 3rd Edition, 1998 and 2000.

- Operations Management, Reid and Sanders, 2002. John Wiley and Sons
- Production and Operations Management, An Applied Modern approach, J.S. Martinich, 1999, John Wiley and Sons.
- Production and Operations Management, Shuka, P.K., 229 pages, McGraw-Hill, 2000.
- Practical Operations Management, Hayes, Mike, 249 pages, Philip Allan, 1988.
- Project Management: a Managerial Approach, J. R. Meredith and Samuel J. Mantel, Jr., 2005.
- Journal of Operations Management: issues from December 2005- December 2007), Washington, D.C.: American Production and Inventory Control Society.
- Production and Operations Management concepts, Models, and Behavior, Everett E. Adam and Ronald J. Ebert, Prentice Hall, 1986.
- Operations Management: Strategy and Analysis. Lee J. K. and Larry P. R., 4th edition, Reading, Mass.: Addison-Wesley, 1996.
- Quantitative Methods for Decision Makers, Third Edition, Prentice Hall, Mik Wisniewski, 2005, Prentice Hall.
- Quantitative Methods for business Decisions with Cases 1988, Lawrence L. Lapin, 5th ed., 1991, NY.
- Operations Research: an introduction, Hamdy A. Taha. 5th edition, 1992, NY., Macmillan.
- Probability and Statistics, Morris H. DeGroot and Mark J. Schervish, 3rd edition, 2006, Addison Wesley.
- Journal of Operations Management, Washington, D.C.: American Production and inventory control society, c2007

Readings must be done prior to the class session listed in the distribution of readings. Readings will be part of the exams.

In addition students are advised to research in the library periodicals. Supplementary reading will be assigned relevant to each assigned schematic and project.

Resources Available to Students

- Library Resources: NDU Library is open to students to help you in all your research and class work. Qualified personnel are available to help you.

- Writing Center: The Writing Center provides assistance to all students who wish to discuss their writing with a trained consultant. The Center is located in HA 114. An appointment is required.

- Blackboard (bb) Software: If you are not familiar with the Blackboard system, it is recommended to attend a training session at the University Computer Services in order to know how to use the Blackboard system to enrich the academic communication with your instructor and your colleagues

- Computer Center For "WINQSB' and "OMS"

s

Assignments and Grading Scheme

Evaluation of Attendance & Attitude will be included within each project; i.e. pin-up seriousness, process of project development, presentations, involvement and interaction with classmates, etc.

Assignments	**05%**
Project (Report (10%), Presentation (5%))	**15%**
Cases (Preparation, Presentation and Discussion)	**10%**
Exam 1	**20%**
Exam 2	**20%**
Final Exam (Comprehensive (idea and Concept))	**30%**

Dissability

Students who have disabilities should have a confidential appointment to discuss their need for accommodations. Establishing reasonable accommodations should be considered on a case-by-case basis.

Important Dates to Remember

Course Schedule

Date	Topics/Description
Week 1	**Introduction**
Week 2	**Chapter 1. Production and Operations Management.** **Case Study**
Week 3	**Chapter 2. Introduction to the software and Operations strategy in a global environment.** **Assignment.** **(Deadline for project proposal)**
Week 4	**Chapter 3. Introduction to Project Management as an Operation Management Decision only (1 hour).** **Chapter 4: Forecasting**

	Case /Assignment
Week 5	**Chapter 5. Product design and operations.** **Assignment**
Week 6	***Chapter 6. Managing Quality.*** ***Case study***
Week 7	**Chapter 7. Capacity planning and facility location.** **Assignment/Case**
Week 8	**Chapter 8. Selecting the process structure and Technology.** **Case study**
Week 9	**MIDTRERM EXAM (CH. 1…5)**
Week 10	**Chapter 10. Human resources and job design.** **Case study**
Week 11	**Chapters 11 and 12. Inventory Management and Supply Chain (Introduction)** **Case study**
Weeks 12 and 13	**Chapter 16. Just in Time (JIT), Lean Production, and the Toyota Production system (TPS). Introduction. Case study** **Deadline to submit the projects (Hard and Soft copies)**
Weeks 14 and 15	**Random selection of teams.** **Presentation of Projects (Random Selection of Teams)**
	Final Exam (From Ch. 6 till the end of the semester)

Course	Operations Management
Module 1	Introduction to Operations Management and Sustainability
	This Module will include the following Topics: **-Operations and productivity** **-The Global Environment and Operations Strategy** **-How to Manage Projects** **-The Forecasting Process** **-Ethics, Social Responsibility and Sustainability. New Challenges In Operations Management.** **Assessment and Evaluation:** **-One Exam** **-2 Cases** **- 4 Assignments** **Book and Articles: Operations Management, Sustainability and Supply Chain Management, Heizer and Render, 2014.** **The International Journal Of Operations Management.** **The Aim of this Module is to introduce the Concept Of Operations Management and how it is linked to Sustainability and Supply Chain Management.**
Module 2	Product Design, Sustainability and International Standards

	In the Second Module, We will Explore The following Topics: **-Product Design and Sustainability** **-Quality Management and International Standards** **- Statistical Process Control** **- Capacity Planning and Layout Decisions** **-Job Design and Work Environment** **Assessment and Evaluation:** **-One Exam** **-One Case Study** **- Different Assignments for different topics** **The Same Material will be used for the Readings, Articles and Cases.** **This Module explores the Ideas of "Designing Operations" including the Quality Management and International Standards**
Module 3	Supply Chain Management, JIT, Maintenance and the Toyota

	Production System
	Topics will cover: **-Supply Chain Management and Modelling** **-Inventory Management** **-Aggregate Scheduling** **-Material Requirements Planning and ERP** **-JIT, Lean Operations, and the Toyota Production System** **-Maintenance and Reliability Decisions** **Assessment and Evaluation:** **One Exam** **One Article (project) linked to the topic of Operations Management and Sustainability.** **This module gives student all the required information to understand the concept of Supply Chain Management and Supply Chain Modelling including Inventory Management, JIT and the Toyota Production system.**
Module 4	Videos about sustainability at Frito-Lay, Regal Marine. Building Sustainability at the Orlando Magic's Center. Green Manufacturing and sustainability At Frito-lay. Empowerment at Hard Rock Cafe.
	3 Hours of Videos linked to Operations Management, Sustainability and Supply Chain Management will be viewed, discussed and analyzed in class. **The Videos will be about American and European Companies.** Approximately 30 Video Clips (3 hours) will be presented in class and in different sessions, first, to provide some insight into a particular operations concept, second, to take students on site to a real plant or

	operations; and, third to hear from real managers, operations Managers and Decision Makers of the critical importance of operations concepts to business today and to learn about the relation between operations Management and Sustainability vis-à-vis the Renewable and non Renewable Resources and Climate Change.

ECN

climate change economics and sustainability policy

FBAE MWF None http://www.ndu.edu.lb

Course Description/Overview

With contemporary economic, demographic, and technological developments around the world, the global environmental repercussions are becoming widespread. This course provides an introduction to the complex world of climate change economics and sustainability policy. It is about the way human decisions affect the quality of the environment; about how human values and institutions shape our demands for quality improvement; and, about how to design effective economic and development policies to bring

about these improvements. Environmental issues are inter-related in complex ways and have important ethical, political, economic, social and technical dimensions. This course will develop in students an in-depth understanding of climate change economics and sustainability policy. It covers topics in climate change economics, with a focus on the sustainability of human-economic activities and their impact on the natural environment.

1

Course Learning Objectives

The overarching goals of this course are: a) to provide a critical approach to climate change economics;

b) to assess climate change in the context of sustainability;

c) to examine the process through which international environmental policies are made;

d) to discuss the scientific controversies related to estimating the human and environmental impacts of climate change and the policy options available for addressing these impacts;

e) to use essential tools of environmental economic /policy analysis, including the assessment of trade-offs, benefits, costs, cost-effectiveness, feasibility.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

a) Use basic tools to discuss the impacts of human-environment interactions b) Analyze climate change economic issues at the microeconomic level c) Analyze policy options available for addressing the impacts of climate change d) Apply the economic concepts learned to the analysis of real-world problems

Grading System The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (i.e. percentage equivalent, and the 4.0 point maximum).

•

Grade Description

A^+ Outstanding A Excellent A^- Very Good B^+ Good

B Good B^- Good C^+ Satisfactory C Satisfactory C^- Passing D^+ Passing D Lowest Passing F Failure UW Unofficial Withdrawal

Quality Point Value

4.0 4.0 3.7 3.3 3.0 2.7 2.3 2.0 1.7 1.3 1.0 0.0 0.0 The grade "UW" is assigned by the instructor when a registered student has never attended a class or has ceased attending and has not submitted an official course withdrawal request to the Office of the Registrar. This grade is computed as an F grade in the grade-point average.

Percentage Equivalent

97-100 93-96 89-92 85-88 80-84 77-79 73-76 70-72 66-69 63-65 60-62 0-59

3

Grading Policy

Tasks Participation & class work 10% Research paper 15% Presentation 10% Mid Term 25% Final Exam 40% Total 100%

Assessment

The assessment will call upon students to demonstrate:

- Thorough understanding of the acquired knowledge.
- Critical thinking and complex problem solving ability.

Assessments: In addition to the Mid Term and Final examinations, there are the following assessments:

One of the important course requirements is a research paper of approximately 15 pages (double-spaced, font: times new roman 12). The paper can address any issue of interest relevant to climate change economics and policy. Students should make an appointment to see me and have a topic approved before November 21st (at the latest). In class, as we go through the first half of the semester, I'll highlight possible paper topics as they come up in readings or discussions. Towards the end of the semester, each student will give a brief oral presentation on the results of the research for the paper.

The objectives of this assignment are: 1) Contribute to the awareness-raising of decision-makers concerning the importance of climate change, 2) Promote the environmental assessment principles and integration of systematic environmental and socio-economic evaluation into national policy-making; 3) Contribute to the elaboration of common methods for such socioeconomic assessments.

Course Policies

NDU's Attendance Policy

Students should attend all classes on time. The maximum number of absences for this class is six per semester. Any student whose absences exceed the maximum limits shall automatically fail the course unless the student withdraws. No absence absolves a student from the responsibility of acting upon the material presented during his/her absence.

Make-up Exams

There are no make-ups for missed tests or for the final examination. Failure to sit for a scheduled test and/or final exam will result in an F on the test/exam. A student may be excused in exceptional cases if the student presents a valid documented

excuse (from the SAO in case of illness) to the chairperson of the department within 72 hours of the scheduled exam date. In such a case, a make-up exam will be given in accordance with the NDU academic rules and procedures.

Late Assignments

Late regular home assignments are not accepted. A penalty of 10% for every 24 hours of delay is put into effect for late assignments.

Office Hours

I am available for office hours during the week MWF at ... PM. Office hours may be used ideally to ask for guidance on an assignment or to ask questions concerning a subject that you were not clear on during class time. I encourage you to see me during my office hours if you are having difficulty with the class material or if you would like to discuss a research topic of interest to you. If you need to reach me at a time outside of office hours, you should send me an email in advance to schedule an appointment.

Classroom Protocol

- While understanding that we all are busy, your decision to register for this course is an indication that you have made it a high priority. Thus, extensions of assignment due dates are given only in extreme situations (death of a close family member, hospitalization, etc.) and require documentation on your part. Otherwise, due dates are fixed and non-negotiable. All assignments should be submitted on or before the assigned due date. Assignments past the due date will not be accepted for full credit. Examples of unreasonable extensions for an assignment include frequent computer malfunctions, outside class-work, or job responsibilities that inhibit meeting the required deadlines. If you anticipate missing a deadline on an assignment, you should send me an e-mail before the deadline. Unexcused assignments submitted after the due date may be returned ungraded or assigned a lower evaluation. Whether an extension is allowed will be at the instructor's discretion.

- All assignments must be typewritten and submitted in a professional manner. I reserve the right to return, for resubmission, any work that is not neat, legibly, and professionally submitted.

- Mobile phones should be turned off and out of sight. Phones may not be answered.

- Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).

- Once in class, students are expected to remain in class for the entire period.

- English must be the only language spoken in class at all times.

- Students must check their NDU email daily as this is the means used by the instructor to communicate. Students will receive notice via NDU email when the instructor posts announcements on the course's Blackboard. NDU's Academic Integrity Policy Students are expected and encouraged to be honest and to maintain the highest standards of academic integrity in their academic work and assignments at the

University. They shall refrain from any academic dishonesty or misconduct including; but not limited to:

- Plagiarism: the presentation of someone else's ideas, words or artistic, scientific, or technical work as one's own creation. Also, paraphrasing, summarizing, as well as well as direct

quotations are considered as plagiarism, if the original source is not properly cited.

- Cheating and assisting in cheating.
- Substituting a student in the taking of an examination.
- Substituting examination booklets.
- Submitting the same work for more than one course and the like or submitting papers written by others.
- Receiving or providing unauthorized help or assistance in any academic work or assignment. Intentional violation of program and degree requirements and regulation as established by the University.
- Dishonest reporting of computational, statistical, experimental, research, results, or the like. Disability Special needs: Any student who feels s/he may need an accommodation due to a disability should contact me to discuss those specific needs. Important Dates to Remember The date of Mid Term is announced in class, it will be on January 4. The final exam will be scheduled by the university at the end of the semester . Reading and writing assignments will be due on a regular basis and they will be announced in class and on blackboard. All important deadlines will be available on Blackboard and in the course schedule below.

Course	Climate change Economics and Sustainability Policy
Module 1	Introduction: Climate change economics and policy
Key Concepts	IPAT identity, Kaya identity, climate change economics, sustainability policy
Overview	Anthropogenic climate change represents perhaps the most significant and challenging global tragedy of the commons confronting the world's policymakers. This course begins with a module that explains anthropogenic greenhouse gas emissions as a function of a number of economic variables
Aim	The overriding aim of this module is to turn students able to discourse on climate change economics and sustainability policy.
Learning Outcomes	At the end of this module learners will be able to: 1. Understand the concept of IPAT (Impact = Population × Affluence × Technology) 2. Define the KAYA identity (Carbon Dioxide Emissions = Population × (GDP/Population) × (Energy/GDP) × (CO2 /Energy). 3. Understand economic rationality and the concept of climate change 4. understanding the complex factors influencing changes in carbon dioxide emissions

Units	Unit 1. Fundamental economic Concepts Unit 2. The relationship between environment and economics Unit 3. Natural ecosystems and their services Unit 4. Environmental problems as social dilemmas Unit 5. Values associated with the environment
Readings	Assigned readings from various websites
Activity	Ask students to browse the sites below: • World Meteorological Organization (WMO) • United Nations (UN) • United Nations Environment Programme (UNEP), (Geneva, Nairobi) • United Nations Framework Convention on Climate Change (UNFCCC) • United Nations and Climate Change • Convention on Biological Diversity (CBD) • Convention on Long-Range Transboundary Air Pollution • Global Environment Facility (GEF) • Linkages by International Institute for Sustainable Development (IISD) • IPCC Data Distribution Centre • The Ozone Secretariat, UNEP • United Nations Convention to Combat Desertification
Module 2	Sustainability and Climate Change
Key Concepts	Pillars of sustainability, climate change, mitigation, adaptation, The Millennium Development Goals of the United Nations, ecosystems and human well-being
Overview	In this module, we examine the nature and scope of sustainability in relation to climate change. We begin with a definition of sustainability and a discussion of its relationship to other fields of study. We emphasize strategies to ensure sustainability of both natural ecosystems and human well-being by integrating economic, environmental, social and cultural aspirations. The Millennium Development Goals of the United Nations and

	the Millennium Ecosystem Assessment reports will be used to illustrate the integration of information from natural and social sciences and to harmonize the use of ecosystem services with human needs

9

Aim	The aims of this module are to: 1) distinguish between the different dimensions of sustainability, 2) introduce the Millennium Development Goals of the United Nations , 3) explore decision-making options that can harmonize the use of ecosystem goods and service with human needs
Learning Outcomes	At the end of this module, learners will be able to: • Distinguish between sustainability dimensions • Assess the status of the Millennium Development Goals of the United Nations in their country / surroundings • Examine decision-making to mitigate and adapt to climate change
Units	Unit 1. Sustainability Unit 2. The relationship between sustainability and economics Unit 3. the Millennium Development Goals of the United Nations Unit 4. The Millennium Ecosystem Assessment Unit 5. How to make decisions to mitigate and adapt to climate change
Readings	Millennium Ecosystem Assessment for the Arab region http://gis.cedare.int/arabma/docs/MA_final%20full%20Report_Low.pdf
Activity	Discussion related to the application of economic principles to environmental issues, such as climate change

Module 3	Human transformation of the Earth: drivers of change
Key Concepts	Drivers of change: Demographic, economic, sociopolitical, scientific and technological, cultural and religious. Benefits and Costs of Climate Change Mitigation , Threats caused by climate change, Policy Initiatives
Overview	In this module, we discuss- in a holistic view-the different drivers of change for the transformation of the earth (including climate change) * Demographic drivers (population size, age and gender structure, and spatial distribution) * Economic drivers (national and per capita income, macroeconomic policies, international trade) * Sociopolitical (democratization, roles of women and local communities, role of private sector) * Scientific and technological (research and development, adoption of new technologies) *Cultural and religious (choices individuals make about what and how to consume and what they value).
Aim	The aims are to discuss in a holistic view-the drivers of change for the transformation of the earth (including climate change); understand the threats caused by global climate change on humans and other living things through impacts on ecosystem functioning, biodiversity, capital productivity, and human health; analyze economically estimates of mitigation benefits, improved understanding of costs in the presence of various market distortions or imperfections, better tools for making policy choices under uncertainty, and alternate mechanisms for allowing flexibility in policy responses.

Learning Outcomes	At the end of this module, learners will be able to: Identify drivers of change Understand the threats caused by global climate change on well-being of humans and other living things through impacts on ecosystem functioning, biodiversity, capital productivity, and human health Analyze economically estimates of mitigation benefits, improved understanding of costs in the presence of various market distortions or imperfections, better tools for making policy choices under uncertainty, and alternate mechanisms for

	allowing flexibility in policy responses.
Units	Unit 1: Drivers of change Unit 2: Assessing the Benefits and Costs of Climate Change Mitigation Unit 3: Dealing with Uncertainty of climate policy Unit 4: International Policy Coordination
Readings	• Millennium Ecosystem Assessment Reports http://maweb.org • Impacts of the Kyoto Protocol on U.S. Energy Markets and Economic Activity (www.eia.doe.gov/oiaf/kyoto/kyotorpt.html): Comprehensive 1998 economic analysis of the costs of complying with the Kyoto Protocol, sponsored

	by the U.S. Energy Information Administration
Activity	Write a two-page essay in which you summarize what is known about global climate change. Discuss how the complexity, the long-term nature of the problem, the diffusion of the benefits, the uncertainty regarding global warming effects, and the international nature of any effective solution make this one of the most important, controversial, and challenging environmental policy problems we face today.
Module 4	Global Climate Change: Science, Policy, and Economics
Key Concepts	Greenhouse Gas Emissions and Global Climate Change , modeling Carbon Dioxide emissions, trends in greenhouse gas emissions, global climate change predictions, evidence regarding climate change, international action on Climate Change: The Earth Summit , The Kyoto Protocol
Overview	This module shows that human activity has increased concentrations of carbon dioxide in the atmosphere. According to the Intergovernmental Panel on Climate Change (IPCC), the present carbon dioxide concentration in the atmosphere has not been exceeded during the past 650,000 years, and likely not during the past 20 million years. The current rate of increase is unprecedented during at least the past 20,000 years. Climate models are extremely complex, and so as our understanding of the world's climate improves, so too will our ability to model and predict climate change caused by anthropogenic greenhouse gas emissions.
Aim	The aims of this module are to: 1) understand that deterioration of natural ecosystems due to climate change could possibly have negative consequences for the world's economy, 2) introduce climate change history, models and predictions , 3) discuss nternational action on climate change: The Earth Summit and The Kyoto

	Protocol.
Learning Outcomes	At the end of this module, learners will be able to: • Understand that major alterations to natural ecosystems due to climate change could possibly have negative consequences for the world's economy • Examine trends in greenhouse gas emissions • Explore assumptions of climate change scenarios • Discuss the Earth Summit and The Kyoto Protocol that includes three incentive- based economic instruments.
Units	Unit 1: The scientific aspect of climate change Unit 2: Assessing the Benefits and Costs of Climate Change Unit 3: Policy Initiatives
Readings	• Hackett ch 11
Activity	An Inconvenient Truth (movie)
Module 5	Climate Change and Economic Development
Key Concepts	Global warming, Greenhouse gas emissions, impact of climate change on developing nations

Overview

This module examines global warming and climate change impacts on developing nations, particularly the poor, and identifies the most vulnerable zones across the world. In addition, weather related problems are also discussed. The cost of these direct and indirect environmental catastrophes will be primarily borne by the poor as they directly depend on environmental resources for their livelihood and are impacted by adverse health conditions and poor/inadequate housing and sanitation that can be affected by climate change. Strategies to impede the progress of global warming and policy adaptations to help the “poor” are also discussed.

Aim

The overriding aims of this module are: 1) to examine the topic of global warming and climate change and its impact on developing nations, particularly the poor; and 2) to discuss the strategies that need to be pursued to impede the pace of global warming and climate change.

Learning

Outcomes

At the end of this module, learners will be able to:

• Demonstrateknowledgeontheconceptofclimatechange • Analyze the development challenges caused by climate change • Examine strategies to slow down global warming and adapt policies to help the

poor, mostly affected by this global problem

Units

Unit 8.1: The scientific controversies related to estimating the human and environmental impacts of global environmental problems, such as climate change Unit 8.2: The impacts of climate change on developing nations, particularly the poor Unit 8.3: Policies to impede the progress of global warming

- □http://www.ipcc.ch/
- □http://climatechange.worldbank.org/
- □Adaptation to a changing climate in the Arab countries: a case for adaptation governance and

leadership in building climate resilience
http://www.preventionweb.net/english/professional/publications/v.php?id=29948

Readings

- Discuss the role and responsibilities of developing and developed countries with respect to climate change and its impact on the economy and the lives of people.

- Watch the movie: An Inconvenient Truth.

Activity

Key Concepts

The Rational Actor Paradigm, Self-interest vs. social goals, Cooperation in social dilemmas, Individual behavior and collective action

Overview

This module provides an overview on how individuals make decisions in collective action situation

Aim

The aim of this module is to explain individual behavior in the case of a collective action by integrating social psychological theories of environmentalism with the parallel theories of behavior in commons dilemmas

Learning Outcomes

At the end of this module learners will be able to:

- Understand the social dimension of environmental problems
- Analyze decision-making from an economic perspective (RAP)

Understand cooperation in social dilemma situations

Units

Unit 1. Environmental problems are social issues Unit 2. The Rational Actor Paradigm Unit 3. Collective action cooperation

Readings

Ostrom, E. 1990. Governing the Commons: The Evolution of Institutions for Collective Action. Cambridge University Press, New York

Ostrom, E. 2000. Collective Action and the Evolution of Social Norms. Journal of Economic Perspectives 13 (4): 137-158.

12

	Titenberg, T. 2002. The tradable Permits Approach to Protecting the Commons: What Have We Learned? Pages 197-232 in E. Ostrom, T. Dietz, and N. Dolsak, eds. The Drama of the Commons. National Academy

	Press, Washington, DC.
Activity	Discuss the climate change problem in terms of individual vs. collective decisions to reduce its impact on the economy and the lives of people
Module 7	Climate Change Mitigation and Adaptation
Key Concepts	Options for mitigation of Climate Change. Impacts, Adaptation and Vulnerability. Risk, uncertainties and ethical foundations
Overview	This module is two-fold: (1) it provides the options for mitigating climate change and their underlying technological, economic and institutional requirements. It lays out risks, uncertainty and ethical foundations of climate change mitigation policies on the global, national and local level, investigates mitigation measures for all major sectors and assesses investment and finance issues; (2) it considers the vulnerability and exposure of human and natural systems, the observed impacts and future risks of climate change, and the potential for and limits to adaptation. The module assesses risks and opportunities for societies, economies, and ecosystems around the world.
Aim	The overriding aims of this module are to
Learning Outcomes	At the end of this module, learners will be able to: Examine options for mitigating climate change and their underlying technological, economic and

	institutional requirements. Assess the vulnerability and exposure of human and natural systems, the observed impacts and future risks of climate change, and the potential for and limits to adaptation.
Units	Unit 1. State of scientific knowledge relevant to climate change Unit 2. Climate change mitigation Unit 3. Climate change adaptation
Readings	http://www.ipcc.ch/publications_and_data/publications_and_data_reports.shtml
Activity	Visit to the Ministry of Environment of Lebanon – division of climate change to examine the new related studies done by the government
Module 8	Economic Valuation Methods
Key Concepts	Present value, future value, social discount rate, cost benefit analysis, willingness to pay, contingent valuation method, travel cost method, hedonic pricing, ecosystem assessment, protected areas management
Overview	This module overviews basic microeconomics as it applies to climate change economics. Also, it presents the methodologies available for quantifying benefits and costs. A discussion of economic valuation methods include:

	• □Tradeoffs between current and future consumption. • □Using an appropriate social discount rate. • □How to correctly value the environment as a resource whose depletion represents a cost to future generations. • □How to internalize negative externalities and correct for market failures. • □A review of the circular flow diagram, including the link between nature and the economy.
Aim	The overall aims of this module are: 1) to run a cost-benefit analysis, 2) to define types of economic values and total willingness to pay, 3) to understand the various nonmarket valuation methods , 4) to present the biases associated with each valuation method, 5) to provide an overview of cost estimation methods, 6) to

	illustrate other complexities including the valuation of human life, benefits transfers, the monetization of intangibles, the treatment of risk and the choice of the discount rate.
Learning Outcomes	At the end of this module, learners will be able to: • □Outline the complexities of cost-benefit analysis • □Define types of values: use value, option value, existence value and total willingness to pay

	• Classify the available nonmarket valuation methods • Examine the potential biases and complexities associated with the contingent valuation method and other cost estimation methods
Units _____	Unit 1: Current conditions of ecosystems and the effect of climate change on human well-being Unit 2: Essential tools of environmental analysis and economic valuation, including the assessment of trade-offs, benefits, costs, cost-effectiveness, contingent valuation, travel cost method, hedonic pricing Unit 3: Ecological and social systems interactions, as well as trade-offs involved in decisions concerning climate change Unit 4: Economic policy to better achieve human development
Readings _____	• The Millennium Ecosystem Assessment (http://www.maweb.org/en/index.aspx) • Environmental valuation http://cmsdata.iucn.org/downloads/09_compendium_of_case_studies_introducti on.pdf • Environmental Valuation: Challenges and Practices http://www.rff.org/Documents/08_Tropics_Conference/Tropics_Conference_Pap ers/Tropics_Conference_Dixon_Environmenal_Valuation.pdf • The Economic Valuation of Environmental Amenities and Disamenities: Methods and Applications: http://environment.yale.edu/files/biblio/YaleFES-00000201.pdf

Activity	• An in-class example or problem set related to discounting will let the students learn with a hands-on example and will likely ease their minds about the difficulty of the concept of environmental valuation. A spreadsheet problem is a hypothetical example of two proposed uses for an area (development project vs. protected area). A set of costs and benefits is given for a 5-year period. The problem is set up so that the net present value changes from positive to negative with a change in the discount rate. This is a nice illustration of the effect of the discount rate. The example is also set up so that a different project would be pursued at a different rate. • Case study

Environmental and Resource Economics

FBAE MWF ECN 211, 212 http://www.ndu.edu.lb

Course Description/Overview

This course will develop in students an in-depth understanding of environmental and resource economics.

The course covers topics in environmental, resource, and ecological economics, with a focus on the sustainability of human-economic activities and their impact on the natural environment and economic valuation of environmental issues and development policies. We will discuss both traditional neoclassical economic models and recent extensions in the areas of behavioral and ecological economics. The focus will be on international issues with important environmental implications that have become prominent on the environmental policy agenda recently; particularly biodiversity loss and climate change. Besides examining global environmental issues, we will link global environmental problems with that of Lebanon's environmental situation.

Course Learning Objectives

The overarching goals of this course are:

1

a) to provide a critical approach to environmental and resource economics in the context of the global issues, such as climate change;

b) to examine and assess environmental challenges using a multi-disciplinary methodology within the context of sustainability;

c) to raise awareness of the role of learners to assess economic policies in enabling them to reflect critically

on possible sustainable solutions for today's environmental problems; thus preparing for a sustainable future for all; and

d) to use case studies as tools to help learners identify risks related to environmental issues in various countries.

Course Content Learning Outcomes

Upon successful completion of this course, students will be able to:

110. a) Use economic logic and basic analytical tools to discuss sustainability and the impacts of human-environment interactions

111. b) Analyze environmental and resource economic issues at an intermediate microeconomic level

112. c) Understand the scientific controversies related to estimating the anthropogenic and natural impacts of global environmental problems

113. d) Use economic tools to analyze policy options available for addressing the impacts of environmental problems and the political struggles surrounding both the estimates of potential damage and the proposed policy responses

114. e) Apply the economic concepts learned in class to the analysis of real-world problems

Course Resources

Course Website(s)

All materials, including class lectures and relevant readings will be available on Blackboard.
http://bb.ndu.edu.lb/

Useful web sites

- The World Bank web site (www.worldbank.org)
- World Bank Development Data and Statistics (www.worldbank.org/data/)
- International Monetary Fund (www.imf.org)
- United Nations Economic and Social Development (www.un.org/ecosocdev/)
- United Nations Statistics Division (unstats.un.org/unsd/)
- United Nations Development Program (www.undp.org)
- Human Development Report (hdr.undp.org)

Required Course Texts and Materials

- Hackett, S. C. (2006) Environmental and Natural Resource Economics: Theory, Policy, and the

Sustainable Society. M.E. Sharpe, Armonk, NY (3rd ed.)

- Titenberg, T. (2006). Environmental and Natural Resource Economics. Pearson. 2

Other readings from a variety of sources will be suggested as we go along the different topics. Where possible, I will post links to these supplementary readings on blackboard. Additional recommended readings for interested students are available from the instructor.

I strongly recommend that you have a microeconomics text as a reference, such as: Karl E. Case, Ray C. Fair, and Sharon M. Oster. Principles of Economics, 10th ed., Prentice Hall International.

Optional Course Texts and Materials

- Stavins, R. N. (2000) Economics of the Environment: Selected Readings. W. W. Norton and Company, NY (4th ed.)
- Farrow, S. and Zerbe, R. (2013). Principles and Standards for Benefit-Cost Analysis
- World Bank: World Development Reports
- United Nations: Human Development Reports
- Millennium Ecosystem Assessment reports

- • □Arab Forum for Environment and Development Assignments and Grading Scheme Grading System The University uses the following system of grades. This system consists of letter grades with their corresponding numerical ranges (i.e. percentage equivalent, and the 4.0 point maximum).

Grading Policy

Grade Description

A^+ Outstanding A Excellent A^- Very Good B^+ Good

B Good B^- Good C^+ Satisfactory C Satisfactory C^- Passing D^+ Passing D Lowest Passing F Failure UW Unofficial Withdrawal

Quality Point Value

4.0 4.0 3.7 3.3 3.0 2.7 2.3 2.0 1.7 1.3 1.0 0.0 0.0 The grade "UW" is assigned by the instructor when a registered student has never attended a class or has ceased attending and has not submitted an official course withdrawal request to the Office of the Registrar. This grade is computed as an F grade in the grade-point average.

Tasks Participation & class work 5% Group project/practicum 20% Presentation 10% Current events/articles collection and analysis 10% Mid Term 25% Final Exam 30% Total 100%

Percentage Equivalent

97-100 93 - 96 89 - 92 85 - 88 80 - 84 77 - 79 73 - 76 70 - 72 66 - 69 63 - 65 60 - 62 0 - 59

Assessment

The assessment will call upon students to demonstrate:

- • □Thorough understanding of the acquired knowledge.
- • □Critical thinking and complex problem solving ability. Assessments: In addition to the Mid Term and Final examinations, there are the following assessments: Practicum assignment: Each group consists of 3 students who are required to choose a local or global environmental problem and examine its impact on economic development. With the practicum assignment, students choose a topic, collect data, work in group, and communicate with each other and with other stakeholders involved in the project. Each group will consist of 3 students. Each group is required to submit a report of about fifteen pages in length where they highlight their topic. Also, students are required to present data about their selected topic. This assignment helps integrate the knowledge acquired in class to real life applications by merging theory with practice. Possible themes to explore this semester: socio- economic evaluation of maritime activities, climate change economics, socio-economic assessments, valuation of ecosystems, assessment of the cost of environmental degradation, analyses of the marine and coastal environment in collaboration with stakeholders/ policy influence. The objectives of this assignment are: 1) Contribute to the awareness-raising of decision-makers; 2) Promote the progressive appropriation of environmental assessment principles and integration of systematic environmental and socio- economic evaluation into national policy-

making; 3) Contribute to the elaboration of common methods for such socioeconomic assessments adapted to Mediterranean countries. Presentation: Each member of the group will present one aspect of the group project studied above. Thus, each student will be graded individually for his part of the presentation. Please note that you will be tested on the other group presentations. Current events / Articles collection and analysis: Each student will collect articles throughout the course related to climate change issues and you will write up a short summary of each article discussing the relationship between the article and what you learned in class. At the start of each class, and without prior notice, one or two students will be asked to present their article in class. I will devote ten minutes of class time to a brief discussion about the articles and how they relate to what is covered in the course or will shortly be covered. At the end of the semester, each student will submit all the articles he/she collected along with the summaries.

Course Policies

NDU's Attendance Policy

Students should attend all classes on time. The maximum number of absences for this class is six per semester. Any student whose absences exceed the maximum limits shall automatically fail the course unless the student withdraws. No absence absolves a student from the responsibility of acting upon the

material presented during his/her absence.

Make-up Exams

There are no make-ups for missed tests or for the final examination. Failure to sit for a scheduled test and/or final exam will result in an F on the test/exam. A student may be excused in exceptional cases if the student presents a valid documented excuse (from the SAO in case of illness) to the chairperson of the department within 72 hours of the scheduled exam date. In such a case, a make-up exam will be given in accordance with the NDU academic rules and procedures.

Late Assignments

Late regular home assignments are not accepted. A penalty of 10% for every 24 hours of delay is put into effect for late assignments.

Office Hours

I am available for office hours during the week MWF at ... PM. Office hours may be used ideally to ask for guidance on an assignment or to ask questions concerning a subject that you were not clear on during class time. I encourage you to see me during my office hours if you are having difficulty with the class material or if you would like to discuss a research topic of interest to you. If you need to reach me at a time outside of office hours, you should send me an email in advance to schedule an appointment.

Classroom Protocol

• While understanding that we all are busy, your decision to register for this course is an indication that you have made it a high priority. Thus, extensions of assignment due dates are given only in extreme situations (death of a close family member, hospitalization, etc.) and require documentation on your part. Otherwise, due dates are fixed and non-negotiable. All assignments should be submitted on or before the assigned due date. Assignments past the due date will not be accepted for full credit. Examples of unreasonable extensions for an assignment include frequent computer malfunctions, outside class-work, or job responsibilities that inhibit meeting the required deadlines. If you anticipate missing a deadline on an assignment, you should send me an e-mail before the deadline. Unexcused assignments submitted after the due date may be returned ungraded or assigned a lower evaluation. Whether an extension is allowed will be at the instructor's discretion.

• All assignments must be typewritten and submitted in a professional manner. I reserve the right to return, for resubmission, any work that is not neat, legibly, and professionally submitted.

• Mobile phones should be turned off and out of sight. Phones may not be answered.

• Students must attend class with the required material (i.e. original textbook, notebook, pens, etc.).

- Once in class, students are expected to remain in class for the entire period.

- English must be the only language spoken in class at all times.

- Students must check their NDU email daily as this is the means used by the instructor to communicate. Students will receive notice via NDU email when the instructor posts announcements on the course's Blackboard. NDU's Academic Integrity Policy Students are expected and encouraged to be honest and to maintain the highest standards of academic integrity in their academic work and assignments at the University. They shall refrain from any academic dishonesty or misconduct including; but not limited to:

- Plagiarism: the presentation of someone else's ideas, words or artistic, scientific, or technical work as one's own creation. Also, paraphrasing, summarizing, as well as well as direct quotations are considered as plagiarism, if the original source is not properly cited.

- Cheating and assisting in cheating.

- Substituting a student in the taking of an examination.

- Substituting examination booklets.

- Submitting the same work for more than one course and the like or submitting papers written by others.

- Receiving or providing unauthorized help or assistance in any academic work or assignment. Intentional violation of program and degree requirements and regulation as established by the University.

- Dishonest reporting of computational, statistical, experimental, research, results, or the like. Disability Special needs: Any student who feels s/he may need an accommodation due to a disability should contact me to discuss those specific needs. Important Dates to Remember The date of Mid Term is announced in class, it will be on January 4. The final exam will be scheduled by the university at the end of the semester . Reading and writing assignments will be due on a regular basis and they will be announced in class and on blackboard. All important deadlines will be available on Blackboard and in the course schedule below.

Detailed Course Schedule

8

Course	Environmental and Resource Economics
Module 1	Introduction to Environmental and Resources Economics
Key Concepts	Scarcity, economic decision, opportunity cost, economic rationality, production possibilitiy frontier (PPF)
Overview	This module provides an overview of basic microeconomics as it applies to natural resource and environmental economics. It includes much of the basic economics terminology and describes the framework

	from within which the various topics in the text will be presented. Students without much background in economics may find this material abstract and difficult. It is recommended to spend extra time on this module, especially when teaching the non-major.
Aim	The overriding aim of this module is to turn students able to discourse on environmental and resource economics.
Learning Outcomes	At the end of this module learners will be able to: 1. Understand the concept of scarcity 2. Define opportunity cost. 3. Understand economics and economic rationality
Units	Unit 1. Fundamental Concepts Unit 2. The relationship between environment and economics Unit 3. Applying the Concepts
Readings	• Hackett (chapter 1); • Case and Fair (ch 1, 2)
Activity	Price is a simple indicator of value for things traded in markets. Yet if the economic pro also applies to something like a wilderness area, which has no price to indicate value, how are we to assign value to it? In your answer, consider the following: a. Think of some specific indicators of the monetary value of a wilderness area th analyst could measure. b. What are some monetary indicators of the opportunity cost of wilderness preservati c. If we were to make a decision regarding how to manage the land area under an based on the information you provided in (a) and

	(b) above, what other elements of might be omitted and thus not be reflected in the policy decision?
Module 2	Value Systems and Economic Systems
Key Concepts	Deontological Ethics, Teleological Ethics, Utilitarianism, Self-Interest, the Common Good, and Social Order , Private Property, Positive and normative economics, Pareto efficiency and the Kaldor/Hicks criteria
Overview	Throughout time, societies have been motivated by widely different social and philosophical value systems for determining benefits and costs and so have had different answers to the question of what a good way to allocate things might be. As a consequence, many different kinds of economies were observed. Understanding economic systems provides insight into otherwise inexplicable aspects of our lives and the choices that we make. In this module, students will investigate several fundamental questions related to human values and economic systems.
Aim	The aim is to examine basic economic questions of (1) what should we allocate resources to produce, (2) by what method should we produce, and (3) who receives what is produced? The fundamental issues discussed in this chapter provide a broad foundation for the analysis of markets, market failure, and social policy that is to follow
Learning Outcomes	At the end of this module learners will be able to: 1. Understand the fundamentals of ethical systems

blem then

at an

on? alysis value

	2. Define utilitarianism 3. Understand Self-Interest, the Common Good, and Social Order 4. Define Private Property 5. Define the economic approach and distinguish between positive and normative economics 6. Understand Pareto efficiency and the Kaldor/Hicks criteria
Units	Unit 1. Fundamental of ethical systems Unit 2. Utilitarianism in economics Unit 3. Self-Interest, the Common Good, and Social Order Unit 4. Define Private Property Unit 5. Compare positive and normative economics Unit 6. Understand Pareto efficiency and the Kaldor/Hicks criteria
Readings	• Hackett (chapter 2) • Business Plan for protected areas management in Lebanon (Ministry of Environment report Internet Classics Archive (http://classics.mit.edu/Browse/index.html): Free on-line classic texts, primarily of Greco-Roman origin. • McMaster University Archive for the History of Economic Thought (www.economics.mcmaster.ca/ugcm/3113/): Free full-text books on the Internet by authors such as Aristotle, Locke, Ricardo, Rousseau, and Smith who wrote about economics. This is a good place to get primary source material.

Activity	Classroom debate activity: Debate consists of reasoned arguments for or against a given proposition. Form two groups in the class (affirmative and negative) for the purpose of debating the following proposition: Resolved: All social policy should be utilitarian-ethical. Members of each group should be given a week or so to research the issues. The debate will occur in a panel moderated by the professor. Two members of each group will serve as panelists, and any additional group members can serve as researchers.
Module 3	The Economics of Market Allocation
Key Concepts	Well-functioning competitive market, market demand and supply, market equilibrium and efficiency, market failure (monopoly, cartels, market power), externalities, common-pool resources and public goods
Overview	In this module, students will learn the basis of neoclassical market microeconomics, with particular attention to the conditions that are required for the existence of a well-functioning competitive market. In the process, we will develop a model of supply and demand. We will also learn what it means to say that this market will efficiently allocate scarce resources in equilibrium. The conditions required for such a market to function may fail to hold, however, and so we will find out how markets are distorted and efficiency is impaired by these market failures.
Aim	The aim of this module is to examine the fundamentals of neoclassical market microeconomics. This basic understanding of market economics will form the analytical framework for the chapters that follow, which review the theory of externalities and forms the economic argument for environmental regulations.

Learning Outcomes	At the 1. 2. 3. 4. 5. 6. end of this module learners will be able to: Understand market capitalism Examine the conditions required for a well-functioning competitive market Develop the theory of market demand and supply Address the concept of market equilibrium and efficiency Identify some possible sources of market failure Define externalities, common pool resources and public goods

10

Units

Unit 1. Market capitalism Unit 2. A well-functioning competitive market Unit 3. Market demand and supply Unit 4. Market equilibrium and efficiency Unit 5. Market failure Unit 6. Externalities Unit 7. Common pool resources and public goods

Classroom debate activity: Debate consists of reasoned arguments for or against a

given proposition. Form two groups in the class (affirmative and negative) for the purpose of debating the following proposition: Due to overwhelming market failures, the invisible hand of the market must be directed by the visible hand of government regulation. Members of each group should be given a week or so to research the issues. The debate will occur in a panel, moderated by the professor

Key Concepts

Individual and market demand, total and marginal benefits, total willingness to pay and marginal willingness to pay, marginal and total cost, the present value of net benefits, discounting, how benefit-cost analysis, optimality and

economic efficiency.

Overview

This module provides the basic microeconomic concepts related to valuing the environment.

Aim

The aim of this module is to teach students the economic principles, graphs and jargon to apply when valuing the environment.

Learning Outcomes

At the 1.

2. 3.

4.

5. 6.

end of this module learners will be able to: Derive a demand curve and distinguish between individual and market demand, total and marginal benefits, total willingness to pay and marginal willingness to pay. Derive the marginal cost curve. Distinguish between marginal and total cost. Define present value and the discount rate. Illustrate the basic discounting equations. Calculate the present value of net benefits and show how benefit-cost analysis can be used to evaluate specific options. Derive net benefits graphically. Define optimality and economic efficiency. Apply these concepts to real world examples

Units

Unit 1. The Human Environment Relationship Unit 2. Normative Criteria for Decision-Making Unit 3. Finding the Optimal Outcome Unit 4. Applying the Concepts

- Titenberg (chapter 2: Valuing the Environment: Concepts)

Readings

- Should humans place an economic value on the environment? Discuss the issues related to the monetization of nonmarket values. Can you think of a local example where this is relevant? Controversial?

- An in-class example or problem set related to discounting will not only let the students learn with a hands-on example, but will likely ease their minds about the difficulty of the concept of valuing the environment. Having the students learn how to use a program such as excel will facilitate the teaching in later chapters.

- A spreadsheet problem set can be used as a hypothetical example of two proposed uses for a coastal area. Obviously, one can think of many different

Activity

11

	scenarios and sets of numbers. You can tell the students, for example, that a coral reef area will either be

	protected or mined. A set of costs and benefits is given for a 10-year period. Show students that the net present value can change from positive to negative with a change in the discount rate. This is a nice illustration of the effect of the discount rate.
Module 5	Valuing the Environment: Methods
Key Concepts	Quantifying benefits and costs, valuation techniques, benefit-cost analysis, cost- effectiveness analysis, impact analysis, discount rate, policy process, nonmarket goods and services.
Overview	This modules presents the methodologies available for quantifying benefits and costs. The concepts presented in module 4 are combined with the valuation techniques available. The quantification of costs (including damages) and benefits is discussed with an emphasis on the complexity of monetizing nonmarket goods and services. Valuation methods are classified and the "how-to" of benefit-cost analysis, including the treatment of risk, are outlined. Types of values are also presented. Alternatives to benefit-cost analysis such as cost-effectiveness analysis and impact analysis are also discussed.
Aim	The overriding aims of this module are: to outline the complexities of cost-benefit analysis including the monetization of costs and benefits, define types of values, classify the nonmarket valuation methods, present the potential biases associated with the contingent valuation method and illustrate other complexities including the valuation of human life, benefits transfers, the monetization of intangibles, the treatment of risk and the choice of the discount rate.
Learning	At the end of this module, learners will be able to: 1. Outline the complexities of cost-benefit analysis

Outcomes	including the monetization of costs and benefits. 2. Define types of values: use value, option value, existence value and total willingness to pay. 3. Classify the available nonmarket valuation methods by whether they are based on observed behavior or a hypothetical market and whether they are direct or indirect. 4. Present the potential biases associated with the contingent valuation method. 5. Provide an overview of cost estimation methods. 6. Illustrate other complexities including the valuation of human life, benefits transfers, the monetization of intangibles, the treatment of risk and the choice of the discount rate. 7. Present alternatives to benefit-cost analysis: cost-effectiveness analysis and impact analysis. 8. Illustrate the valuation of the environment using examples.
Units	Unit 1: Valuing Benefits (Types of Values, Classifying Valuation Methods) Unit 2. Issues in Benefits Estimation Unit 3. Approaches to Cost Estimation Unit 4. Treatment of Risk Unit 5. Choosing the Discount Rate Unit 6. Cost-Effectiveness Analysis Unit 7. Impact Analysis
Readings	Titenberg (chapter 3: Valuing the Environment: Methods)
Activity	Ask the students to fill out a questionnaire that illustrates various types of willingness to pay questions. I intentionally build into the questions some of the potential biases that can be associated with contingent valuation surveys in order to illustrate to them (a) how easy it is to unintentionally bias a question; (b) how to avoid some biases; and (c) what protest bids looks like.

Module 6	Property Rights, Externalities and Environmental Problems. Market Failures and Policy Interventions
Key Concepts	Inefficiencies caused by the lack of well-defined property rights, market failures, the role for the government, positive externalities, negative externalities
Overview	In this module, we discuss markets, market failures, and efficiency by evaluating the economic theory of externalities. Externalities are positive or negative impacts on society that occur as a by-product of production and exchange. These effects are called externalities because they are not included in the factors that underlie market supply and demand, and their omission leads to the market failing to efficiently allocate resources. The inefficiency due to externalities can be used as a justification for government intervention in otherwise well-functioning competitive market systems.
Aim _____	The aim of this module is to discuss how many environmental goods and services will be underprovided under certain property rights regimes while environmental "bads" will be over provided. Markets and market failures are emphasized. The role for the government is introduced.
Learning Outcomes	At 1. 2. 3. 4. 5. 6. 7. 8. 9.

	the end of this module, learners will be able to: Define property right and efficient property right structure. Illustrate how well-defined, exchangeable property rights will lead to economic efficiency. Review consumer surplus, producer surplus and the maximization of net benefits. Define externality and illustrate market failure. Use examples to illustrate both positive and negative externalities. Discuss remedies for negative externalities Distinguish between various property rights regimes including private property, common property resource regimes and open access resources. Illustrate how open access regimes lead to overexploitation. Define public goods. Define free-rider. Illustrate other market imperfections such as the effects of monopoly power. Discuss the effects of discount rates on allocation decisions. Examine the reasons for the divergence of social and private discount rates. Define government failure. Define the Coase Theorem. 10. 11.
Units	Unit 1: Property Rights Unit 2: Externalities as a Source of Market Failure Unit 3: Designed Property Rights Systems Unit 4: Public goods Unit 5: Imperfect Market Structures Unit 6: Divergence of Social and Private Discount Rates Unit 7: Government Failure Unit 8: The Pursuit of Efficiency Unit 9: An Efficient Role for

	Government
Readings	Hackett Chapter 4: Externalities, Market Failures, and Policy Interventions Titenberg chapter 4: Property Rights, Externalities and Environmental Problems
Activity	Write a one-page essay in which you explain why, in the absence of government subsidies, competitive markets underproduce goods that feature positive externalities. Be sure to provide an example of a good that generates a positive externality, explain the nature of the external benefits and the two demand curves, and describe how they lead to different market equilibria. Draw and carefully label a diagram to illustrate your arguments.

13

	Write a one-page essay in which you explain why, in the absence of government environmental regulation, competitive markets overproduce goods whose production involves the creation of negative externalities. Be sure to provide an example of a good that generates a negative externality, explain the nature of the external costs and the two supply curves, and describe how they lead to different market equilibria. Describe why allowing firms to pollute amounts to a production subsidy, and why this is inefficient, creating an economic motive for government policy intervention. Draw and carefully label a diagram to illustrate your arguments.
Module 7	Case study: solid waste: cost of degradation
Key Concepts	Importance of assessing the cost of environmental degradation, waste management, tragedy of the

	commons, rational actor paradigm, methodologies for cost of environmental degradation
Overview	This module identifies the waste problem in Lebanon. It describes the dumpsites that impose high environmental pressures; thus, actions are needed to solve this problem. It examines the waste problem and the cost of environmental degradation caused by this problem. This can be understood as a measure of the lost welfare due to environmental degradation. A loss in welfare includes but is not necessarily limited to: • Loss of healthy life and well-being of the population (e.g., burden of disease); • Economic losses (e.g., efficiency losses, competitiveness, forgone revenues); • Loss of environmental opportunities (e.g., loss of tourism, fisheries, biodiversity).
Aim	The aim of this module is to assess the cost of environmental degradation caused by the different dumpsites in Lebanon.
Learning Outcomes	At the end of this module, learners will be able to: • Demonstrate knowledge on the concept of cost of degradation due to waste • Analyze the economic challenges and loss of welfare caused by waste management • Understandthedifferentmethodologiestoassesscostofdegradation
	• Unit 1: The Importance of assessing the cost of environmental degradation

Units	• Unit2:ThewasteprobleminLebanon • Unit 3: methodologies for cost of environmental degradation
Readings	• Hardin, G. 1968. The Tragedy of the Commons. Science 162: 1243-48. • UNEP-Ministry of Environment (2013b). Environmental Resources Monitoring in Lebanon project, Analysis of the current land use and socio-economic activities in the coastal zone.
Activity	• Discuss the waste management problem in Lebanon and its impact on the economy and the lives of people in different regions of Lebanon
Module 8	Case study: protected areas: cost of biodiversity loss
Key Concepts	Total Economic Value (TEV), use values, non-use values, option values, bequest values and existence values, Willingness to Pay (WTP), Cost Benefit Analysis (CBA)
Overview	This module identifies and assesses the economic values of biodiversity. The goods and services provided by biodiversity include recreation and tourism, plant and wildlife habitat, genetic resources, etc. Many of these are not traded on commercial markets and therefore have no evident market value. The values of non-market goods and services need to be measured and expressed in monetary terms, so that they can be weighed on the same scale as commercially traded components. The concept of Total Economic Value (TEV) is a useful framework for identifying the various values associated with biodiversity. The TEV consists of its use values and non-use values. Students will also learn to estimate the WTP to preserve & protect

	biodiversity in a protected area, identify and assess the potential financial benefits that can be generated from the area, identify and value potential economic benefits to the local community, and conducting CBA to assess the overall feasibility
Aim	The overriding aims of this module are: to learn about use values (made up of its direct use values, indirect use values, and option values) and non-use values (include bequest values and existence values); to estimate the WTP to preserve & protect biodiversity in a protected area; to identify and assess potential financial benefits that can be generated from the area; to identify and value potential economic benefits to the local community, and to conduct CBA to assess the overall feasibility
Learning Outcomes	At the end of this module learners will be able to: • □Identify and assess the economic values of biodiversity (use and non-use values) • □Estimate the WTP to preserve & protect biodiversity • □Identify and assess potential financial benefits • □Identify and value potential economic benefits to the local community • □Conduct CBA • □Assess various policy options for biodiversity conservation
_____	Unit 1: Economic Values Unit 2: Contingent Valuation Method and WTP Unit 3: Costs and benefits

Units	identification and quantification Unit 4: CBA scenarios
Readings	• Case: Business Plan for protected areas management in Lebanon (Ministry of Environment report)
Activity	• Debate between ecologists and economists about developing an area or protecting it. • A spreadsheet problem can be used as a hypothetical example of two proposed uses for an area (development project vs. protected area). A set of costs and benefits is given for a 5-year period. The problem is set up so that the net present value changes from positive to negative with a change in the discount rate. This is a good illustration to show different CBA scenarios.
